SUIT by the Electrical Accumulator Company against the New York & Harlem Railroad Company for infringement of a patent. Decree for complainant.

Mr. Frederic H. Betts for the complainant.

Mr. Thomas W. Osborn for the defendant.

COXE, *J.:*

This is an action for infringement of Reissued Letters Patent No. 11,047, granted to the Electrical Accumulator Company of New York, as assignee of Joseph Wilson Swan on the 17th of December, 1889, for an improvement in secondary batteries. The invention of the reissue is intended to facilitate the construction of secondary-battery plates by preparing them with perforations, cells, or holes extending through the plate, in which holes the active material is packed. The original patent, No. 312,599, dated February 17, 1885, was considered by this court in the case of *Electrical Accumulator Co.* v. *Julien Co.*, (38 Fed. Rep., 117.) The original was held invalid (pp. 140–142) for the reason that it described and claimed a plate the outer surface of which might be covered by the active material. This construction, in view of the work done by Professor Eaton, was held to be anticipated. The theory of the reissue is that the valuable feature contributed by Swan consists in confining the active material to the holes without permitting it to extend beyond them to the surface of the plate. That portion of the original which refers to the coating of the outer surface of the plate has been omitted in the reissue. In other respects the description is unchanged.

The claim is as follows:

> A perforated or cellular plate for secondary batteries, having the perforations or cells extending through the plate and the active material or material to become active packed in the said perforations or cells only, substantially as described.

This is the claim of the original, except that the word "only" has been added. The patent cannot be criticised as a reissue. The claim, instead of being broadened, is greatly restricted. The application was filed within a reasonable time after the inventor was informed of the facts which made a narrower claim

necessary. The facts bring the case within the provisions of section 4916 of the Revised Statutes.

The field of invention is concededly a narrow one. The counsel for the defendant correctly states that Swan's improvement consists—

wholly in the idea of putting on the surface of a perforated plate for secondary batteries no active material beyond the contents of the perforations. Everything except this is conceded to be old.

The date *de jure* of Swan's invention is January 18, 1882. Prior to that time Professor Eaton had filled the perforations; but he had covered both sides of his plate as well. Mr. Brush had rammed or pressed absorptive substance in the form of dry powder into grooves or receptacles without covering the surface of the plate. No one had packed active material into holes extending through the plate, confining it entirely to these holes. This combination was original with Swan. Did it involve invention? In approaching this subject it is well to remember, as the Court has frequently had occasion to remark before, that we are dealing with a comparatively new and abstruse art, where the most important results are said to follow from changes apparently of the most unimportant character. Complete success has not been attained; but if we may credit the statements of those who are entitled to speak *ex cathedrâ* on the subject the rapid strides in that direction during the last decade are due to changes of form and material which in many other arts would be insufficient to support invention. The substitution of one material for another in a door-knob is the work of the mechanic. The substitution of one material for another in secondary-battery electrodes may solve a problem which will revolutionize the motive power of the world.

In holding that there is sufficient invention disclosed to support the reissue the Court is influenced by the following considerations: The Swan electrode is to-day the electrode of commerce. It has largely taken the place of other structures and is almost universally used. The advantage of having the active material composed of small disconnected masses packed in holes extending through the plate is unquestioned. The electrolyte is thus permitted to reach and operate upon both sides of these small masses instead of on one side, where the active materiat is packed in cells or pockets. The expansion and contraction of the electrode when the battery is in use cause the active material, if packed in cells or grooves or spread upon the surface of the plate, to crack and portions of it to be pushed out of place and to fall away. These defects, which produce "buckling," "short-circuiting," and other disastrous results, are entirely remedied by the Swan construction. If one of the small masses in his plate becomes injured or falls out, it does not affect injuriously the other parts of the electrode. As Sir William Thomson puts it:

The perforated plates have also the great advantage of extending the area of electric communication between the continuous metallic conductor and the porous or spongy material and so minimizing the electric resistance. The application of the oxide in the form or numerous mutually-detached parts separately held by the perforations has also a great advantage in almost annulling the warping or fracturing effects of the expansion and contraction produced by the changes of oxidation to which the active material is exposed in the charging and discharging of the battery.

It is true that the step from the structures of Eaton and Brush to the electrode of Swan seems to be very short when looking back upon the work of these men; but, standing where Brush and Eaton did and looking forward to the ideal electrode, which should avoid the then existing difficulties and possess the excellencies of the present Swan structure, the steps undoubtedly seemed many and long. If it had occurred to Eaton to scrape off the active material from his plate, leaving the holes full, he would have hit upon the invention; but it never did. If Brush had thought of punching out the bottom of his receptacles and had then rammed them full of active material without covering the external plate, he would be entitled to the credit of having made the successful structure; but he did not think of it. The experiments at that time seemed to be proceeding along different lines, the object being to keep as much material as possible upon the surface of the plate. The conviction cannot be avoided that the idea which has made these plates a commercial success was first given to the world in a practical embodiment by Mr. Swan.

Confirmation of these views is found in two recent decisions of the Supreme Court. In *Washburn & Moen Manufg. Co.* v. *Beat 'Em All Barbed-Wire Co.* (58 O. G., 1555; 12 Sup. Ct. Rep., 443) the Court says:

The difference between the Kelly fence and the Glidden fence is not a radical one; but, slight as it may seem to be, it was apparently this which made the barbed-wire fence a practical and commercial success. The inventions of Hunt and Smith appear to be scarcely more than tentative, and never to have gone into general use. The sales of the Kelly patent never seem to have exceeded three thousand tons per annum, while plaintiff's manufacture and sale of the Glidden device (substituting a sharp barb for a blunt one) rose rapidly from fifty tons in 1874 to 44,000 tons in 1886, while those of its licensees in 1887 reached the enormous amount of 173,000 tons. * * *. Under such circumstances courts have not been reluctant to sustain a patent to the man who has taken the final step which has turned a failure into a success. In the law of patents it is the last step that wins. It may be strange that, considering the important results obtained by Kelly in his patent, it did not occur to him to substitute a coiled wire in place of the diamond-shaped prong; but evidently it did not, and to the man to whom it did ought not to be denied the quality of an inventor.

In *Magowan* v. *Belting, etc., Co.* (57 O. G., 845; 141 U. S., 332; 12 Sup. Ct. Rep., 71) it was held that the fact that the patented improvement—

went at once into such an extensive public use as almost to supersede all packings made under other methods * * * was pregnant evidence of its novelty, value, and usefulness.

These quotations seem peculiarly applicable to the present controversy. The principles which are there so clearly and pointedly reaffirmed require a decision sustaining the validity of the complainant's patent. As to defendant's infringement there can be no doubt. The question arising upon the expiration of the Danish patent has not been argued. The casual examination which the Court, in the absence of explanation, has been able to give to this patent leads to the conclusion that it is not for the same invention as the Swan reissue.

There should be a decree for the complainant.

U. S. Circuit Court—Southern District of Ohio, Eastern Division.

RIPLEY *v.* ELSON GLASS COMPANY.

Decided March 12, 1892.

1. DESIGN PATENTS—ANTICIPATION—GLASS BOTTLES AND JARS.

Design Patent No. 17,243, issued April 5, 1887, to Daniel C. Ripley, for footed bottles and jars consisting of a spherical body, a figured ring-neck covering a zone of the body and having a raised pattern on its entire surface, was not anticipated by certain Designs having a general resemblance thereto in shape, but lacking the raised ornamentation of the neck.

2. SAME—EVIDENCE—METHOD OF PRODUCING.

Although the suit does not involve the method of producing the result, yet in considering the question of anticipation the court may properly take into consideration the fact that the patentee invented the method of making articles of glassware having a "blown" body and a "pressed" neck, thereby rendering possible the raised ornamentation of the neck in the patent.

3. SAME—CONSTRUCTION—INTERPRETATION OF WORDS.

The words of the claim and specification which refer to the body of the vessel as "globe-shaped" or "spherical" must be taken in their ordinary rather than their mathematical signification, and infringement cannot be avoided by merely elongating the body so as to render it an ovoid, rather than a sphere or globe.

4. SAME—TEST OF INFRINGEMENT—GENERAL RESEMBLANCE.

In determining whether a Design patent is infringed the test is whether there is a substantial similarity in appearance not to the eye of the expert, but to that of the ordinary observer giving such attention as would ordinarily be given by a purchaser of the article bearing the Design.

5. SAME—PENALTY.

Where the infringement of a Design patent is deliberate and intentional, the court will impose upon the defendant the penalty of $250 provided for by act of February 4, 1887.

SUIT by Daniel C. Ripley against the Elson Glass Company for infringement of patent. Decree for complainant.

Messrs. W. Bakewell & Sons and *Mr. T. B. Kerr* for the complainant.

Mr. F. L. Dyer and *Mr. J. D. Elson* for the defendant.

JACKSON, *J.*:

This suit is brought for the alleged infringement of Design Patent No. 17,243, issued April 5, 1887, to Daniel C. Ripley, the complainant, for a new and original Design for glass bottles and jars. After referring to Figures 1 and 2 of the accompanying drawings, the specification states that—

The characteristic feature of my Design consists of the globe-shaped body *b* and figured ring or neck portion *a*, surmounted on a zone of the spherical body *b*. The figured portion consists of a raised pattern covering the whole surface of the ring *a*; but the heads *d* may be omitted, as shown in Fig. 2. The body *b* has a foot, *c*. A suitable stopper, *e*, is used with some articles, and with others it is not. It therefore is not to be considered necessary to my Design, which is applicable to bottles, jars, pitchers, and similar footed articles.

The first claim based thereon is as follows:

The Design for footed bottles and jars, consisting of the spherical body *b*, the figured ring-neck *a*, covering a zone of the body *d*, the ring having a raised pattern on its entire surface, as shown and described.

Infringement is charged only as to this first claim of the patent. The defenses set up by respondent in its answer are, first, invalidity of the patent, because anticipated by certain prior Designs, and, secondly, non-infringement.

After a careful examination and consideration of the evidence introduced on both sides, which it is not deemed necessary to review or set out in detail, the conclusions reached by the court upon the whole case are the following, viz:

1. That the defense of invalidity and lack of invention in the patent sued on is not sustained. The sugar-caster shown on Plate 9 in defendant's exhibit, "Albert Jacquemort's Publication," and the glass pitcher shown on page 291 of defendant's exhibit, "Hamm's Catalogue," chiefly relied on to establish this defense, while resembling to some extent the jar embodying complainant's Design, cannot properly be said to anticipate the latter's patent. Defendant's expert witnesses find some general resemblance between said articles and the patent aside from or without considering the ornamentation of the latter. But it would be giving to complainant's Design too narrow a construction to limit and confine it to the exact conformation of jar shown in the drawings accompanying the specification of the patent and to ignore the ornamentation of the pressed neck surmounting the zone of the globe or spherical-shaped plain body. The Design does not consist in the precise shape of the body of the jar, nor in the body with the neck attached independent of the ornamentation upon the latter, but is found in the artistic association of all three features, which prevent agreeable contrasts and render the article of manufacture attractive to the eye. Thus considered, it would violate all sound principle to disregard the pressed neck ornamention, intended to promote, and by its contrast with the plain body of the article actually promoting, æsthetic effect, so as thereby to open the way to destroy the Design by showing that other features were previously in use. It is well settled that the patent is *prima facie* evidence of novelty and validity, which presumption is only to be overcome by clear, positive, and unequivocal proof. (*Miller* v. *Smith*, 18 O. G., 1047; 5 Fed. Rep., 359; *Thayer* v. *Hart*, 28 O. G., 542; 20 Fed. Rep., 693; *Lehnbeuter* v. *Holthaus*, 21 O. G., 1783; 105 U. S., 96.) Applying this rule to defendant's exhibits in connection with the other testimony in the case, the court is clearly of the opinion that complainant's patent was not anticipated thereby. On the contrary, the *prima facie* evidence of the novelty of the patent, instead of being overcome, is supported and established beyond any reasonable doubt by the evidence introduced on behalf of complainant. It is distinctly shown that complainant was the first to produce a footed globula or spherical-bodied glass jar having a neck covered with a raised pattern. Prior to the date of his Design no practicable method of making articles of glassware having a "blown" body and "pressed" neck was known. Complainant is shown to have invented the method by which the body of the glass jar or other article of glass could be blown so as to be of a rounded, globular, or spherical shape and the neck be pressed, thereby exhibiting the ornamentation of raised figures upon the latter, while the two parts—neck and body—united in one integral article. While this suit does not involve the method of producing or accomplishing this result, it is very properly urged by counsel for complainant that the Design should be considered as having originated with the invention of the method for giving it embodiment. But, without going further into details, the entire proof in the case fails to establish the defense of invalidity in the patent sued on.

2. That, the patent being valid, the first claim thereof is clearly infringed by the defendant. This, as a question of fact, is fully established not only by the testimony in the case, but also by the comparison of the exhibits made by the Court. It is shown both by inspection and by the proof that defendant's article of manufacture is substantially the same as that of the complainant. Minor differences are pointed out by the ingenuity of experts, but, notwithstanding such differences, there still remains that substantial iden-

2. SAME—EVIDENCE—METHOD OF PRODUCING.

Although the suit does not involve the method of producing the result, yet in considering the question of anticipation the court may properly take into consideration the fact that the patentee invented the method of making articles of glassware having a "blown" body and a "pressed" neck, thereby rendering possible the raised ornamentation of the neck in the patent.

3. SAME—CONSTRUCTION—INTERPRETATION OF WORDS.

The words of the claim and specification which refer to the body of the vessel as "globe-shaped" or "spherical" must be taken in their ordinary rather than their mathematical signification, and infringement cannot be avoided by merely elongating the body so as to render it an ovoid, rather than a sphere or globe.

4. SAME—TEST OF INFRINGEMENT—GENERAL RESEMBLANCE.

In determining whether a Design patent is infringed the test is whether there is a substantial similarity in appearance not to the eye of the expert, but to that of the ordinary observer giving such attention as would ordinarily be given by a purchaser of the article bearing the Design.

5. SAME—PENALTY.

Where the infringement of a Design patent is deliberate and intentional, the court will impose upon the defendant the penalty of $250 provided for by act of February 4, 1887.

SUIT by Daniel C. Ripley against the Elson Glass Company for infringement of patent. Decree for complainant.

Messrs. W. Bakewell & Sons and *Mr. T. B. Kerr* for the complainant.

Mr. F. L. Dyer and *Mr. J. D. Elson* for the defendant.

JACKSON, *J.*:

This suit is brought for the alleged infringement of Design Patent No. 17,243, issued April 5, 1887, to Daniel C. Ripley, the complainant, for a new and original Design for glass bottles and jars. After referring to Figures 1 and 2 of the accompanying drawings, the specification states that—

> The characteristic feature of my Design consists of the globe-shaped body *b* and figured ring or neck portion *a*, surmounted on a zone of the spherical body *b*. The figured portion consists of a raised pattern covering the whole surface of the ring *a*; but the heads *d* may be omitted, as shown in Fig. 2. The body *b* has a foot, *c*. A suitable stopper, *e*, is used with some articles, and with others it is not. It therefore is not to be considered necessary to my Design, which is applicable to bottles, jars, pitchers, and similar footed articles.

The first claim based thereon is as follows:

> The Design for footed bottles and jars, consisting of the spherical body *b*, the figured ring-neck *a*, covering a zone of the body *d*, the ring having a raised pattern on its entire surface, as shown and described.

Infringement is charged only as to this first claim of the patent. The defenses set up by respondent in its answer are, first, invalidity of the patent, because anticipated by certain prior Designs, and, secondly, non-infringement.

After a careful examination and consideration of the evidence introduced on both sides, which it is not deemed necessary to review or set out in detail, the conclusions reached by the court upon the whole case are the following, viz:

1. That the defense of invalidity and lack of invention in the patent sued on is not sustained. The sugar-caster shown on Plate 9 in defendant's exhibit, "Albert Jacquemort's Publication," and the glass pitcher shown on page 291 of defendant's exhibit, "Hamm's Catalogue," chiefly relied on to establish this defense, while resembling to some extent the jar embodying complainant's Design, cannot properly be said to anticipate the latter's patent. Defendant's expert witnesses find some general resemblance between said articles and the patent aside from or without considering the ornamentation of the latter. But it would be giving to complainant's Design too narrow a construction to limit and confine it to the exact conformation of jar shown in the drawings accompanying the specification of the patent and to ignore the ornamentation of the pressed neck surmounting the zone of the globe or spherical-shaped plain body. The Design does not consist in the precise shape of the body of the jar, nor in the body with the neck attached independent of the ornamentation upon the latter, but is found in the artistic association of all three features, which prevent agreeable contrasts and render the article of manufacture attractive to the eye. Thus considered, it would violate all sound principle to disregard the pressed neck ornamention, intended to promote, and by its contrast with the plain body of the article actually promoting, æsthetic effect, so as thereby to open the way to destroy the Design by showing that other features were previously in use. It is well settled that the patent is *prima facie* evidence of novelty and validity, which presumption is only to be overcome by clear, positive, and unequivocal proof. (*Miller* v. *Smith*, 18 O. G., 1047; 5 Fed. Rep., 359; *Thayer* v. *Hart*, 28 O. G., 542; 20 Fed. Rep., 693; *Lehnbeuter* v. *Holthaus*, 21 O. G., 1783; 105 U. S., 96.) Applying this rule to defendant's exhibits in connection with the other testimony in the case, the court is clearly of the opinion that complainant's patent was not anticipated thereby. On the contrary, the *prima facie* evidence of the novelty of the patent, instead of being overcome, is supported and established beyond any reasonable doubt by the evidence introduced on behalf of complainant. It is distinctly shown that complainant was the first to produce a footed globula or spherical-bodied glass jar having a neck covered with a raised pattern. Prior to the date of his Design no practicable method of making articles of glassware having a "blown" body and "pressed" neck was known. Complainant is shown to have invented the method by which the body of the glass jar or other article of glass could be blown so as to be of a rounded, globular, or spherical shape and the neck be pressed, thereby exhibiting the ornamentation of raised figures upon the latter, while the two parts—neck and body—united in one integral article. While this suit does not involve the method of producing or accomplishing this result, it is very properly urged by counsel for complainant that the Design should be considered as having originated with the invention of the method for giving it embodiment. But, without going further into details, the entire proof in the case fails to establish the defense of invalidity in the patent sued on.

2. That, the patent being valid, the first claim thereof is clearly infringed by the defendant. This, as a question of fact, is fully established not only by the testimony in the case, but also by the comparison of the exhibits made by the Court. It is shown both by inspection and by the proof that defendant's article of manufacture is substantially the same as that of the complainant. Minor differences are pointed out by the ingenuity of experts, but, notwithstanding such differences, there still remains that substantial iden-

tity of appearance in the two Designs which under well-settled rules for testing the question renders defendant an infringer. It is not and cannot be questioned that the first jar manufactured by defendant, like the small jar exhibited, was almost an exact imitation of complainant's design. When defendant ceased, upon notice, to manufacture that article, it sought to accomplish the same result and avoid the admitted infringement by merely elongating the body of its jar, so as to make it more of oval than globular or spherical in shape. But it is too plain for discussion that complainant's design is not to be limited or restricted to an exact globe or sphere in the body of the jar, but must be extended to any body that is globular or spherical—pertaining to a globe or sphere. The defendant's large jar is unquestionably spherical in shape, and it is a mere play upon words—making a distinction without any real difference—to call it an "oval" or "ovoid," and thereby escape the charge of infringement. When complainant's specification and claim refer to the body of the jar being "globe-shaped" or "spherical," these terms are to be understood, according to their natural and ordinary meaning and signification, as indicating and covering a body not mathematically exact in dimension, but comparatively so. The terms are relative, and as thus employed embrace any-shaped body that is globular or spherical in character, such as an egg or acorn. To test the two Designs by the technical mathematical distinction between an oval or ovoid and a globe or sphere would be not only to place an improper construction upon the language of the patent, but would involve a total disregard of the well-settled principles laid down by the authorities for determining the question of infringement in such cases. Since the case of *Root* v. *Ball*, (4 McLean, 177,) decided in 1846, the rule applied in such cases is that—

it is not necessary in order to constitute infringement that the thing patented should be adopted in every particular; but if the Design and figures were substantially adopted by the defendants, they have infringed the plaintiff's right. It is an infringement to adopt the Design so as to produce substantially the same appearance.

And upon the question of substantial identity or similarity in Design patents the test to be employed or applied is not the eye of the expert, but that of the ordinary observer giving such attention as would ordinarily be given by a purchaser of the article bearing the Design. In *Gorham Co.* v. *White* (14 Wall., 528) the rule is stated thus:

We hold, therefore, that if in the eye of an ordinary observer giving such attention as a purchaser usually gives, two Designs are substantially the same, if the resemblance is such as to deceive such an observer, inducing him to purchase one supposing it to be the other, the first one patented is infringed by the other.

The test of infringement in Design patents is more analogous to that applied in trade-mark cases than to that adopted in respect to patents on mechanism. Testimony of experts is admissible in determining whether two mechanisms are substantially identical; while in Design patents, resting almost wholly upon "appearances," the test of sameness is determined by the eye of the ordinary observer giving such attention as a purchaser usually gives, which is substantially the same principle applied in trade-mark cases. Applying this rule to the present case, the Court has, without hesitation or doubt, reached the conclusion that defendant's large jar as now made is an infringement of complainant's patent. The decisions which in the opinion of the Court fully sustain this conclusion, both on the testimony and inspection of the articles and Designs, are the following: *Root* v *Ball*, (4 McLean, 177;) *Perry* v. *Starrett*, (3 Ban. & A., 485;) *Gorham Co.* v. *White*, (14 Wall., 511;) *Miller* v. *Smith*, (18 O. G., 1047; 5 Fed. Rep., 359;) *Jennings* v. *Kibbe*, (32 O. G., 653; 10 Fed. Rep., 669;) *Wood* v. *Dolby*, (20 O. G., 523; 7 Fed. Rep., 475;) *Dryfoos* v. *Friedman*, (18 Fed. Rep., 825;) *Tomkinson* v. *Manufacturing Co.*, (32 O. G., 382; 23 Fed. Rep., 895;) *New York Belting & Packing Co.* v. *New Jersey Car Spring Co.*, (57 O. G., 1888; 48 Fed. Rep., 556.)

3. That defendant's infringement of the first claim of the patent was so deliberate and intentional as to warrant the court, under the act of February 4, 1887, in imposing upon it the payment of the two hundred and fifty dollars, as prayed for in the bill. It follows from the foregoing conclusion that complainant is entitled to the relief sought by his bill, and a decree in his favor is rendered accordingly. The defendant will be enjoined from further infringement, will be charged with the sum of $250, will be taxed with the costs of the suit, and the usual reference for an account to ascertain profits made by defendant or damages sustained by complainant will be directed.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., July 11, 1892.

SIR: The Secretary of the Interior has ordered that James F. Morgan, of Bloomington, Ind., be not recognized after this date as agent or attorney in the prosecution of any claim or other matter before this Department or any Bureau thereof.

Very respectfully, E. M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

International Protection of Industrial Property.

Supplemental convention between the United States, Belgium, Brazil, France, Great Britain, Guatemala, Italy, The Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, and Tunis, amendatory of the convention of March 20, 1883, for the protection of industrial property.

Concluded at Madrid April 15, 1891; ratification advised by the Senate March 2, 1892; ratified by the President March 30, 1892; ratifications exchanged June 15, 1892; proclaimed June 22, 1892.

By the President of the United States of America:

A PROCLAMATION.

Whereas, Protocol 3, amendatory of the convention of March 20, 1883, for the protection of industrial property was signed at Madrid on the fifteenth day of April, one thousand eight hundred and ninety-one, by the plenipotentiaries of the United States and other powers, a certified copy of which Protocol 3, in the French language, is word for word as follows:

[*Translation.*]

THIRD PROTOCOL.

Protocol concerning the dotation of the International Bureau of the Union for the Protection of Industrial Property between Belgium, Brazil, Spain, the United States of America, France, Great Britain, Guatemala, Italy, Norway, The Netherlands, Portugal, Sweden, Switzerland, and Tunis.

The undersigned plenipotentiaries of the governments above named, in view of the declaration adopted March 12, 1883, by the International Conference for the Protection of Industrial Property convened at Paris, have, with one accord and subject to ratification, concluded the following Protocol:

ARTICLE 1. The first paragraph of No. 6 of the final Protocol annexed to the International Convention of March 20, 1883, for the Protection of Industrial Property is annulled and replaced by the following provision:

"The expenses of the International Bureau instituted by Article 13 shall be supported by the contracting States in common. They cannot in any event exceed the sum of sixty thousand francs per annum."

ART. 2. The present Protocol shall be ratified, and the ratifications thereof shall be exchanged at Madrid within a period of six months at the latest.

It shall take effect one month after the exchange of ratifications, and shall have the same force and duration as the Convention of March 20, 1883, of which it shall be considered as forming an integral part.

In testimony whereof the plenipotentiaries of the States above named have signed the present Protocol at Madrid, the fifteenth day of April, one thousand eight hundred and ninety-one.

For Belgium: TH. DE BOUNDER DE MELSBROECK.
For Brazil: LUIS F. D'ABREU.
For Spain: S. MORET, MARQUIS DE AGUILAR, ENRIQUE CALLEJA, LUIS MARIANO DE LARRA.
For the United States of America: E. BURD GRUBB.
For France and Tunis: P. CAMBON.
For Great Britain: FRANCIS CLARE FORD.
For Guatemala: J. CARRERA.
For Italy: MAFFEI.
For Norway: ARILD HUITFELDT.
For The Netherlands: GERICKE.
For Portugal: COUNT DE CASAL RIBEIRO.
For Sweden: ARILD HUITFELDT.
For Switzerland: CH. E. LARDET.
For Switzerland: MOREL.

And whereas the said Protocol 3 has been duly ratified by the signatory powers, and the ratifications thereof were exchanged at the city of Madrid, on the fifteenth day of June, one thousand eight hundred and ninety-two;

Now, therefore, be it known that I, BENJAMIN HARRISON, President of the United States of America, have caused the said Protocol 3 to be made public, to the end that the same and every article and clause thereof may be observed and fulfilled with good faith by the United States and the citizens thereof.

In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

Done at the city of Washington this twenty-second day of June, in the year of our Lord one thousand eight hundred and ninety-two and of the Independence of the United States the one hundred and sixteenth.

[SEAL] BENJ. HARRISON.

By the President:
WILLIAM F. WHARTON,
Acting Secretary of State.

NOTE.—Ratifications of Protocol 4 were not exchanged. The Protocol was referred to the next Conference to be held at Brussels. See telegram from United States Chargé at Madrid, June 15, 1892.

Copies of Decisions Furnished.

Hereafter an uncertified copy of every decision or action by any tribunal in this Office will be furnished by such tribunal to the interested party or parties without charge.

This order does not include the written statements of the grounds of decisions made by Examiners to the appellate tribunal in *ex parte* cases.

Notice.

All solicitors, agents, or attorneys who, in circulars or advertisements or otherwise, refer to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of July 19, 1892.

Patents	415—No. 478,976 to No. 479,390, inclusive.
Designs	18—No. 21,714 to No. 21,731, inclusive.
Trade-Marks	56—No. 21,455 to No. 21,510, inclusive.
Labels	None.
Reissue	1—No. 11,254.
Total issue	490

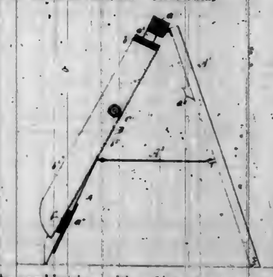
APPLICATIONS UNDER EXAMINATION.



Condition at Close of Business July 12, 1892.

Division No.	Subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended	No. of applications awaiting action.
	Between one and two months in arrears.			
11	Boots and Shoes, Clasps, Buckles and Buttons, Harness, Hose and Belting.	May 23	July 9	235
14	Metal-Bending, Wire-Working, Coin-Controlled Apparatus, Farriery, etc.	May 20	July 8	101
31	Gas, Painting, Leather, Tanning, Alcohol, Oils, Fats, and Glue, etc.	May 27	July 5	111
30	Lamps, Gas-Fittings, Type-Writers, Matrix-Making Machines.	May 14	June 28	203
7	Harvesters, Games and Toys	May 20	June 25	268
20	Builders' Hardware, Cutlery, Safes, Dentistry, Surgery, Undertaking, Artificial Limbs, etc.	May 14	June 18	258
5	Fine Arts, Stationery, Book-Binding, Music, etc.	May 12	June 8	238
	Between two and three months in arrears.			
16	Telegraphy, Telephony, Electric Lighting and Signaling.	May 2	July 9	197
24	Sewing-Machines and Apparel	Apr. 16	July 6	122
21	Textiles, etc.	Apr. 26	July 2	186
32	Advertising, Baggage, Packing and Storing Vessels, etc.	Apr. 21	July 2	314
17	Paper-Manufactures and Printing.	Apr. 25	June 28	175
22	Fire-Arms, Navigation, Signals, etc.	Apr. 27	June 23	198
6	Chemistry, Medicines, Fertilizers, Preserving, Photography, Sugar and Salt, etc.	Apr. 19	June 23	189
2	Farm Stock, Products, etc	Apr. 18	June 23	299
23	Instruments of Precision, Acoustics, Optics, etc.	Apr. 20	June 21	276
8	Furniture, Toilet, Umbrellas and Canes, etc.	Apr. 25	June 17	391
3	Metallurgy, Metal Founding, Forging, Rolling, Coating, Annealing and Tempering, etc.	Apr. 14	June 15	205
12	Mechanical Engineering, Stores-Service, etc.	Apr. 29	June 13	199
9	Hydraulics, Fire-Extinguishers, etc.	Apr. 20	June 2	394
1	Tillage and Fences	Apr. 28	May 3	320
	Between three and four months in arrears.			
25	Artesian and Oil Wells, Butchering, Mills and Thrashing, Stone-Working, etc.	Apr. 11	July 2	289
18	Steam-Engineering, etc	Mar. 24	June 17	282
10	Carriages and Wagons and Railway-Cars.	Mar. 30	June 15	671
27	Brushing and Scrubbing, Grinding and Polishing, Laundry, etc.	Apr. 8	June 11	335
15	Plastics, Paper-Making, Paving, Glass, Fuel, Bread-Making, etc.	Mar. 28	May 24	360
19	Stoves and Furnaces	Mar. 24	May 19	413
4	Civil Engineering, etc	Mar. 31	May 14	469
	Between four and five months in arrears.			
29	Wood-Working Machines, Carpentry, Coopering and Roofing, etc.	Feb. 29	June 4	506
13	Metal-Working, Arms and Projectiles, etc.	Mar. 1	May 16	393
28	Pneumatics, Refrigeration, Air and Gas Engines, etc.	Mar. 11	May 5	461
	Between five and six months in arrears.			
26	Electricity, Generation, Distribution, etc.	Jan. 26	June 14	377
	Total number of applications awaiting action			9,435
	Under one month in arrears.

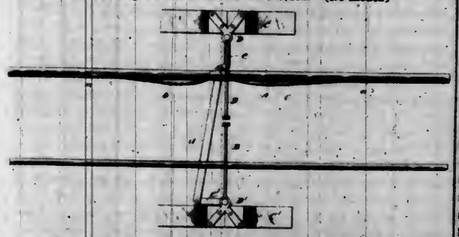
PATENTS

GRANTED JULY 19, 1892.

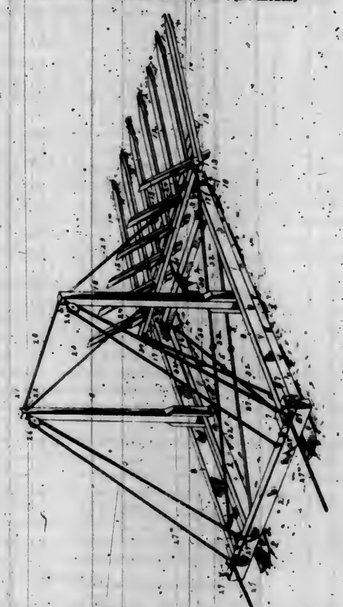
478,976. SIEVE. WILLIAM L. ARMSTRONG, Bellport, N. Y. Filed Aug. 25, 1891. Serial No. 403,732. (No model.)

Claim.—The combination, with a frame having a bottom piece secured to the rear side of the side pieces, of a sieve pivoted intermediate of its ends to the side pieces of said frame and constructed to oscillate when material is thrown against its upper portion above the pivotal point, the said sieve having sufficient length to contact with the bottom piece of the frame, a prop for the frame, and a stop on the prop for limiting the tilting of the sieve, substantially as specified.



478,977. OIL-CUP. WILLIAM H. BAILEY and ALFRED J. BAILEY, Salford, England. Filed Apr. 4, 1892. Serial No. 427,703. (No model.) Patented in England Feb. 27, 1891, No. 3,564.

Claim.—1. In combination with a lubricator, a valve controlling the outlet thereof and a disk eccentrically pivoted to the stem of the valve and having a suitable bearing for its periphery, substantially as described.

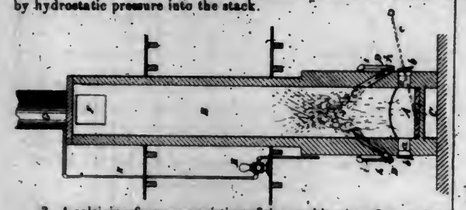


2. In combination with the cup *a*, the valve, and stem *d*, passing through the cup, a disk pivoted eccentrically to the upper end thereof and bearing on the upper part of the cup, substantially as described.

478,978. RAILWAY-GATE. LYCURGUS S. BARNETT, Birch Tree, Mo. Filed Aug. 22, 1891. Serial No. 403,412. (No model.)

Claim.—In an automatically-operated railway-gate, a train-actuated bar A, located adjacent to the rail and adapted by its movement to accommodate itself to the wheels of a passing train, in combination with the swinging gates B B and mechanism for operating the same, consisting of the rods *b e* beneath and parallel to the train-bar and connected therewith by means of the vertically adjusted bent levers *a a*, fulcrumed between the train-bar and rods *b* and *c*, the arms *c d*, secured to the rear mullions of the gates, and the cross link *d*, parallel to the closed gates and having one end articulated to the rods *b c* and arm *c* and the other to the arm *c'*, the whole being adapted to co-operate with automatic closing mechanism, substantially as described.

478,979. HAY-STACKER. PHILIP BERNARD, Jefferson, S. D. Filed Sept. 8, 1891. Serial No. 405,071. (No model.)



Claim.—In a hay-fork, the combination, with a runner-frame, of parallel fork-arms pivoted on opposite sides and at one end of said frame and provided with reduced outer tapered ends having squared shoulders at their extremities, opposite swinging standards pivoted at their lower ends between said fork-arms and to opposite sides of the runner-frame, a transverse connecting-rod loosely connected to the upper end of one of said standards and detachably to the opposite standard, wedge-blocks resting upon the tapered ends of said arms, the fork having front and rear cross-bars above and below the tines thereof, respectively, the front bar resting in said outer shoulders and the rear bar upon said wedge-blocks, clip-bolts encircling the tapered ends of the fork-arms and clamped to said bars to hold them to their respective places, diagonal jointed brace and securing rods loosely connected at one end to the fork-arms near their pivotal points and removably connected at their other ends to the rear cross-bar of the fork, fork-rods loosely connected to said opposite standards and detachably to said rear cross-bar, and means for moving said standards to elevate and lower the fork, substantially as set forth.

478,980. APPARATUS FOR RECOVERING ALKALI. HENRY BLACKMAN, New York, N. Y. Filed Sept. 20, 1889. Serial No. 324,551. (No model.)

Claim.—1. A calcining-furnace consisting of the combination of an upright stack, an inlet for gases of combustion at the lower part thereof, so that the gases ascend therethrough, and an upwardly-directed nozzle entering said stack, through which a liquid to be treated may be injected.

2. A calcining-furnace consisting of the combination of an upright stack, an inlet for gases of combustion at the lower part thereof, so that the gases ascend therethrough, an upwardly-directed nozzle entering said stack, and an elevated reservoir of liquid to be treated connected by a pipe with said nozzle, whereby the liquid to be treated is injected by hydrostatic pressure into the stack.

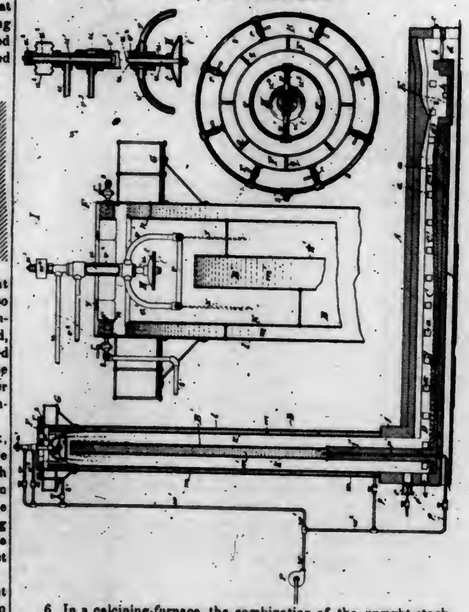
3. A calcining-furnace consisting of the combination of an upright stack, an inlet for gases of combustion at the lower part thereof, so that the gases ascend therethrough, an upwardly-directed nozzle entering said stack through which a liquid to be treated may be injected, and an evaporator for the liquid to be treated arranged to be traversed by the gases of combustion after the latter have passed beyond the injected liquid, whereby the gases first evaporate the spray of denser liquid injected beneath and subsequently their heat is utilized to concentrate the less dense liquid.

4. In a calcining-furnace, the combination of an upright stack, an inlet for gases of combustion at the lower part thereof, so that the gases ascend therethrough, a nozzle entering said stack through which a liquid to be treated may be injected into the ascending gases, and an evaporator for the liquid to be treated arranged to be traversed by the gases after they have passed beyond the injected liquid and consisting of shelves or trays, over which the liquid is flowed, arranged in the path of the gases, whereby the liquid is brought into direct contact therewith.

5. A calcining-furnace consisting of the combination of an upright stack, an inlet for gases of combustion at the lower part thereof, so that the gases ascend therethrough, an upwardly-directed nozzle entering said stack through which a liquid to be treated may be injected, and an evaporator for the liquid to be treated arranged to be traversed by the gases of combustion after the latter have passed beyond the injected liquid and consisting of a horizontal trunk through which the gases pass from the stack, and superposed trays therein for holding the liquid.

6. In a calcining-furnace, the combination of a calcining-chamber extended horizontally and provided with a calcining hearth or floor divided into two portions, a primary calcining-hearth at the entering end of the chamber and a secondary calcining-hearth extending thence to the discharge end, separated by an inclined plane leading up from the primary to the secondary hearth, an inlet for gases of combustion at the discharge end of said chamber, and means for introducing the material to be treated at the entering end thereof.

478,981. APPARATUS FOR AND PROCESS OF RECOVERING ALKALI. HENRY BLACKMAN, New York, N. Y. Filed Dec. 12, 1889. Serial No. 333,503. (No model.)



Claim.—1. The process consisting in introducing the liquid to be treated in a concentrated condition in a bath on the calcining-hearth, subjecting said bath to the heat of gases of combustion, whereby its volatile constituents are vaporized, moving the material from said bath along the calcining-hearth while under the influence of burning gases until its combustible constituents are calcined out, and finally fusing the purified material and causing it to flow off from said hearth.

2. In a calcining-furnace, the combination of an upright stack, an inlet for gases of combustion at its lower part, so that the gases ascend therethrough, a liquid-reservoir constructed as part of said stack and having a passage from the upper part of said reservoir into the stack, whereby the liquid to be treated is heated in said reservoir and discharged thence into the stack to descend therethrough.

3. In a calcining-furnace, the combination of an upright stack constructed in part of double walls constituting a liquid jacket or reservoir between them, and the inner wall ascending to less height than the outer wall and having a pipe for introducing the liquid to be treated into the lower part of said reservoir, whereby the liquid is caused to ascend through said reservoir and overflow the top of the inner wall into the stack.

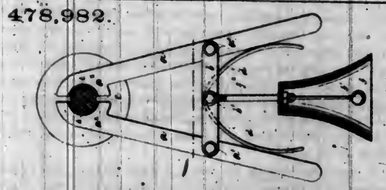
4. In a calcining furnace, the combination of an upright stack, an annular trough or liquid-vessel constructed in the upper part of said stack, and a pipe for introducing the liquid to be treated into said trough and causing it to overflow therefrom within the stack.

5. In a calcining-furnace, the combination of an upright stack, an annular liquid-vessel or trough constructed at the upper part thereof and divided into compartments, and separate valved liquid-inlet pipes communicating with the respective compartments.

6. In a calcining-furnace, the combination of the upright stack thereof through which pass hot gases of combustion from the furnace, with a spray-valve within the upper part of said stack constructed to throw a spray of liquid to be treated across the stream of ascending gases and against the walls of the stack, whereby the liquid is exposed to the gases first in the form of spray and subsequently while streaming down said walls.

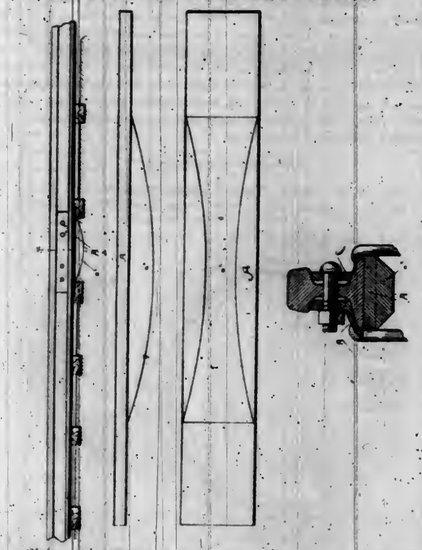
7. In a calcining-furnace, the combination of an upright stack with a vertical column arranged within it and an inlet for the liquid to be treated constructed to flow said liquid against the sides of said column and cause it to stream down the surface thereof.

8. In a calcining-furnace, the combination of an upright stack with a vertical column therein, constructed in part as a heating-reservoir for the liquid to be treated, with the top of said reservoir open to admit the liquid to overflow therefrom down the outer sides of the column, and an inlet-pipe for admitting liquid to the lower part of said reservoir to cause it to ascend therethrough.



9. A calcining-furnace consisting of a horizontal chamber having a calcining hearth or floor, an inlet for the gases of combustion at the discharge end thereof and an outlet therefor at the receiving end, a bath at the receiving end for the concentrated liquid to be treated, and a calcining-hearth constructed to ascend from said bath toward the discharge end of the furnace, and the chamber constructed with doors or openings for the insertion of stirring-tools by which to push the material being calcined up said inclined portion of the hearth.

10. A calcining-furnace consisting of a horizontal chamber having a long calcining hearth or floor and constructed with a pit or vat for receiving fused material at the discharge end of the chamber and with the portion of the hearth adjacent to said pit constructed to slope toward the pit, an inlet for gases of combustion at the discharge end of the chamber and an outlet therefor at the receiving end, and the chamber shaped to direct the gases flowing over the calcining-hearth to impinge upon and impart the most extreme heat to the downwardly-inclined portion thereof, so that the calcined material may be fused thereon and caused to drain into said pit.



478,982. ALARM. FRANK F. BOSGNER, New York, N. Y. Filed Apr. 1, 1892. Serial No. 427,336. (No model.)

Claim.—The combination of a pair of converging levers *a*, having concave jaws a^2, with the connecting-arm *b*, to which the levers are pivoted, a spring *d* for forcing the jaws a^2 together, and a bell *f*, suspended from the connecting-arm substantially as specified.

478,982.

478,983. RAILWAY-JOINT. FREDERICK W. BOND, Springfield, Mo. Filed Nov. 30, 1889. Serial No. 332,124. (No model.)

Claim.—A rail-joint bridge consisting of a plate having ends adapted to rest upon the ties and having on its under side a curved strengthening-rib whose ends are adapted to bear against the said ties, the said rib having its sides curved inward toward its center, whereby the rib at its center is largest in vertical section and smallest in transverse section, substantially as described.

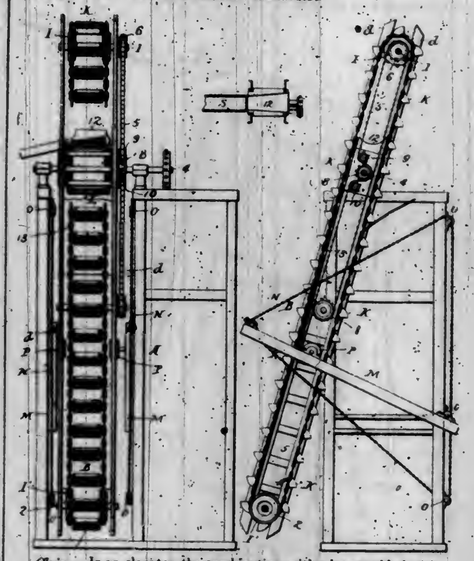
478,984. THERMOMETER-SCALE. FRANZ BRANDT, Philadelphia, Pa. Filed Apr. 13, 1892. Serial No. 428,940. (No model.)

Claim.—1. A panel for thermometers, composed of composite or flashed glass and having on its face an etched scale, substantially as and for the purposes set forth.

2. A panel composed of composite or flashed glass and adapted for the reception of a thermometer-tube and having on its back a ground-glass surface and having on its face an etched scale, substantially as and for the purposes set forth.

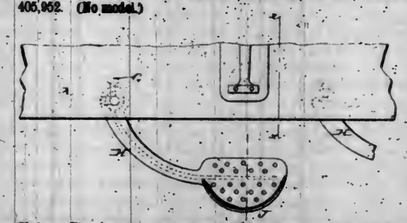
3. A panel composed of etched composite material, as flashed glass, for holding a thermometer tube and bulb, substantially as and for the purposes set forth.

478,985. ORNAMENTAL FENCE-WIRE. CHARLES W. BRIDGES, Indianapolis, Ind. Filed Apr. 7, 1892. Serial No. 428,137. (No model.)



Claim.—1. In an ornamental wire ribbon, a main wire whose shape in cross-section is oval or flattened, and a secondary round wire formed in double loops, such loops bent closely to the main wire in opposite directions, the ends of the loops extending alternately from the opposite sides of the main wire in a plane with the longer diameter of the main wire, substantially as shown and described.

2. In an ornamental fence-wire ribbon, a main wire whose shape in cross-section is oval or flattened, and a secondary wire formed in double loops, such loops bent around the main wire in opposite directions and fitting closely thereto, the ends of the loops extending alternately in opposite directions from the main wire, the form of the main wire preventing them from turning, substantially as shown and described.

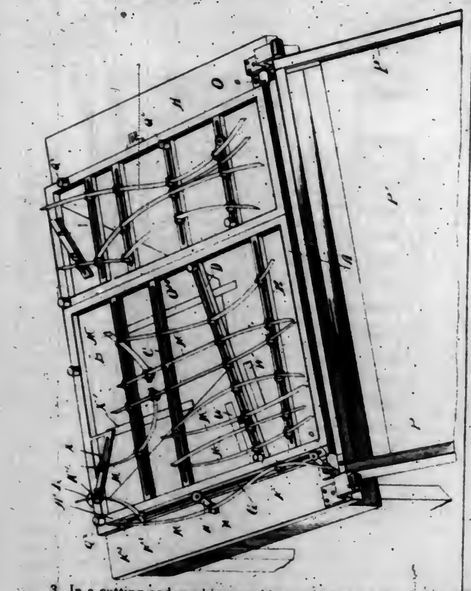


3. A wire ribbon composed of a straight wire whose shape in cross-section is oval or flattened and a secondary wire bent around the same, forming loops on opposite sides, substantially as shown and described.

478,986. ELEVATOR. CHARLES A. CASE, New York, N. Y. Filed Aug. 29, 1891. Serial No. 404,136. (No model.)

Claim.—In an elevator, the combination, with a leg provided with drums at its upper and lower ends and an endless chain of buckets extending around said drums, of a guide-block, a driving-shaft having a sprocket-wheel and extending through the guide-block, and a driving-chain extending around the wheel upon the driving-shaft, the wheel upon the shaft of the upper drum, and a wheel 7, mounted upon the leg below the driving-shaft, substantially as set forth.

478,987. OPERATOR'S SEAT. CHARLES H. COLBY, Brooklyn, N. Y., assignor to J. Colby & Co., same place. Filed Sept. 17, 1891. Serial No. 405,952. (No model.)



Claim.—The combination, substantially as hereinbefore set forth, of a table, a support thereof having upper and lower bearings, the line of which is somewhat inclined from the vertical, a bar pivoted at its upper and lower ends to said bearings, a sleeve carrying a set-screw, fitted to slide up and down on said pivot-bar, and an arm rigidly attached to said sleeve and carrying at its outer end an operator's seat *J*.

478,988. MACHINE FOR CUTTING AND MARKING GARMENTS. SARAH A. COOKE, Chicago, Ill. Filed Oct. 28, 1891. Serial No. 410,146. (No model.) Patented in England Nov. 4, 1887, No. 15,021.

Claim.—1. In a cutting and marking machine, in combination with the outline-frame and the flexible blades projecting edgewise from the plane of said frame, bars extending transversely across the outline-

frame, shafts extending longitudinally through said bars and journaled therein, and pinions fixed on the opposite ends of said shafts, the side bars of the outline-frame having racks in which said pinions engage and travel, and the blade supports adjustable longitudinally with respect to said bars, substantially as set forth.

2. In a cutting and marking machine, in combination with a base-frame comprising a plurality of bars, the flexible blades and supports for such blades, mounted and adjustable longitudinally and adapted to be secured in adjusted position on such bars, said blade-supports having the immediate seat for the blades adapted to permit the blade to slide longitudinally therethrough and swiveled to the secured portion of the support, whereby the blades are permitted to assume flowing outlines controlled by the position of the support on the frame, substantially as set forth.

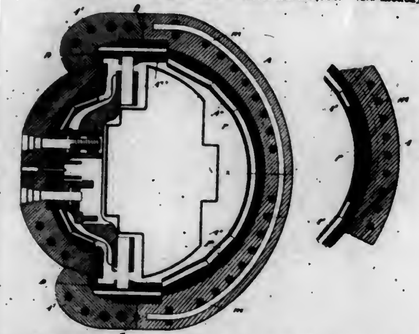
3. In a cutting and marking machine, a slotted bar, in combination with a blade-support, which consists of the yoke N^4 within the bar, having a stem projecting through the slot at one side of the bar and a clamp-nut on said stem outside the bar, and the immediate seat for the blade, located at the opposite side of the bar and provided with a stem projecting through the slot at that side and swiveled to the yoke, said yoke having an aperture n^4, substantially as set forth.

4. In a cutting and marking machine, in combination with a bar slotted longitudinally through from side to side, the blade-support adapted to slide longitudinally in such slot, consisting of the yoke N^4 within the bar and having a stem projecting out through the slot at one side, and the immediate seat for the blade, having a stem projecting in through the slot from the opposite side and swiveled to the yoke, the clasp N^5 on the protruding stem of the yoke and having flanges which embrace the bar, and the clamp-nut on the stem outside the clasp, substantially as set forth.

5. In combination with the frame comprising a longitudinally-slotted bar, the blade-support adapted to be adjusted and secured in said bar, having an arm adjustably secured to it provided with a swiveled seat for the blade at one end, substantially as set forth.

6. In combination with the frame comprising a longitudinally-slotted bar, and the blade-support adapted to be adjusted and secured in such bar and having an arm swiveled to it, said arm being provided at the free end with a swiveled seat for the blade, substantially as set forth.

7. In combination with the base-frame and the blades secured thereto, the stools Q, removably secured to the frame and having their upper surfaces at the plane of the operating edges of the blades, substantially as set forth.



8. In a cutting and marking machine, in combination with the outline-frame comprising side bars having longitudinal racks a', the bar D, extending transversely between said side bars and having telescoping end pieces, and the pinions having ball-and-socket joint bearing on said end pieces, said pinions being adapted to engage the racks, the side bar having a guard-lip behind which the pinions are retained, substantially as set forth.

9. In a cutting and marking machine, a base-frame and the flexible blades and their supports adjustable with respect to said frame, combined with a stand, to one edge of which such base-frame is hinged, such hinge being adapted to permit the frame to swing from a horizontal position on the table to an upstanding position above the hinge, such stand being recessed at the side opposite the hinge, whereby the operator may approach the upstanding frame to operate it from the side which is downward when the frame is horizontal on the stand, substantially as set forth.

10. In combination with the stand, a frame having the cutting-blades secured to it, hinged to the stand, and adapted to be set upright or laid horizontal at will and a frame having the flexible fabric P' also hinged to the stand and adapted to fold down over the blade-carrying frame, substantially as and for the purpose set forth.

11. In combination with the stand, the blade-carrying frame hinged thereto and adapted to be folded down thereupon, the frame P, having the flexible fabric P', also hinged to the stand and adapted to be folded down upon the blade carrying frame, said frame P having rigid with its side bars racks overhanging the plane of the fabric P', and the roller S, having equal pinions S^2, rigid with its shaft, at its opposite ends and adapted to engage the racks, respectively, and the forked handle having bearings for the roller-shaft between the roller and the pinions, substantially as set forth.

478,989. SAFE. WILLIAM CORLISS, Providence, R. I. Filed July 28, 1891. Renewed May 27, 1892. Serial No. 434,531. (No model.)

Claim.—1. In a burglar-proof safe, a shell the exterior face of which is of hard metal and the interior portion of which is made separately, as a lining, and is traversed by bars of hard metal, all combined and arranged substantially as herein specified.

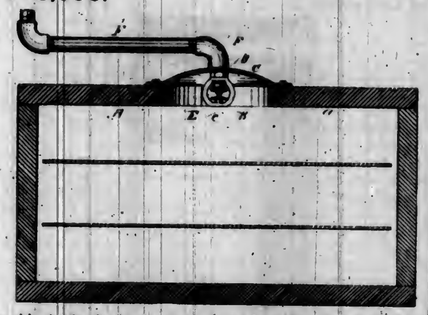
2. In a burglar-proof safe, an exterior shell of hard metal traversed by bars of soft iron and a separately-formed lining of soft iron traversed by bars of hard steel applied together, substantially as herein specified.

3. In a safe, a lining of separately-formed pieces matched together like the voussoirs of domes, so as to be self-supporting, as herein specified.

4. In a burglar-proof safe, an exterior shell formed of separate pieces screw-threaded interiorly near the lines of junction, in combination with an exteriorly-screw-threaded connecting-ring, substantially as set forth.

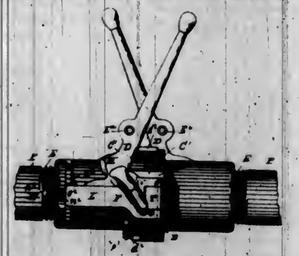
5. In a burglar-proof safe, an exterior shell formed of separate pieces screw-threaded interiorly near the lines of junction, in combination with a lining formed of detached pieces matched together, and an exteriorly-screw-threaded connecting-ring forming a part of the lining and abutting against the outermost of the other lining-pieces, substantially as set forth.

6. The burglar-proof safe described, having an exterior shell A A' in separate pieces screw-threaded in their interior near the lines of junction, and lining A, extending across the joint on the interior, separately formed of soft iron correspondingly screw threaded, with hard-steel bars P inclosed therein, adapted to serve the double function of a burglar-proof lining and a connection for the parts of the outer shell, as herein specified.



478,990. TRUNK FOR USE WITH COTTON-PICKERS, &c. ROBERT L. CUNDOCK, Henderson, Ky. Filed Mar. 31, 1892. Serial No. 427,167. (No model.)

Claim.—1. A conveyer-trunk having an opening closed on the outside by a cap, in combination with an automatic sprinkler having its head or rose contained within said opening and cap, all as set forth.



2. A conveyer-trunk having an opening closed on the outside by a dome-shaped removable cap, in combination with an automatic sprinkler having its head or rose secured to the cap and contained within said opening and cap, all as set forth.

3. The sprinkler-hanger above described, consisting of a dome-shaped piece having a hole through its center, through which a sprinkler may be hung and adapted to be suitably attached at its edges to the outer wall of the conveyer-trunk, all as set forth.

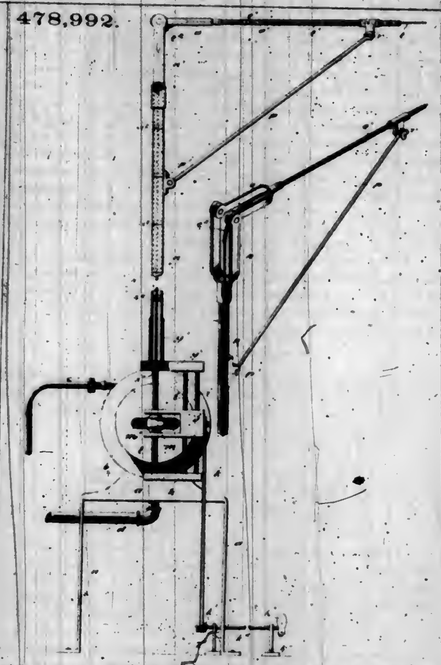
478,990.

478,991. STEAM-PIPE COUPLING FOR RAILWAY-CARS. THOS. CURLEY, Troy, N. Y. Filed July 18, 1891. Serial No. 399,967. (No model.)

Claim.—The combination of the two coupler parts C C, each having the packing-face O and packing p' and each made with a hinged latch L, constructed with an end recess l^7, and each of said coupler parts constructed with a pivoted lever D, made with the finger F, and cam K, constructed and arranged to operate connectedly, substantially in the manner as and for the purposes set forth.

478,992. DENTAL ENGINE. FRANK A. DAMON, Fitchburg, Mass. Filed Apr. 6, 1892. Serial No. 428,013. (No model.)

Claim.—1. In a dental engine, a motor and a power-transmitting shaft, combined with a friction-gearing composed of a disk having a concave portion and a friction-wheel having contact with said disk, excepting at its concave portion, and means to move said friction-wheel across the faces of said disk while in contact therewith to obtain motion in either of two directions and at varying speed and also to move it opposite such concave portion to stop the machine, substantially as described.



2. In a dental engine, a motor and a power-transmitting shaft, combined with a friction-disk on the end of the motor-shaft having a concave portion, a short vertical shaft connected with the power-transmitting shaft, a friction-wheel connected with said short shaft to turn it and movable longitudinally thereof, a pedal, and connections between the pedal and friction-wheel, whereby said friction-wheel is adapted to be moved up and down said shaft to effect an engagement with and disengagement from the friction-disk and thereby to change the direction of rotation, vary the speed, and stop the machine, substantially as described.

3. In a dental engine, a frame, a motor supported thereby, a vertical friction-disk arranged on the motor-shaft and having a concave portion, brackets projecting from said frame and containing vertical guide-rods, a carrier arranged upon said guide-rods, means to move it longitudinally thereof, and a vertical short shaft supported in said brackets, combined with a friction-wheel arranged to slide on said short shaft and to turn it and movable into and out of engagement with the friction-disk by its said carrier, substantially as and for the purpose described.

4. In a dental engine, a motor and a power-transmitting shaft, combined with intermediate gearing, and a rock-shaft for controlling such gearing, having a pedal at one side of the operator's chair and extending across to the other side thereof, substantially as described.

5. In a dental engine, the column or standard, combined with the power-transmitting shaft, and washers to support it in the said column or standard, substantially as described.

478,992.

478,993. CAR-COUPLING. JAMES C. DEVLIN, Hernando, Miss., assignor of four-fifths to Don M. Dockery, James P. Meredith, and Stillman W. McLaughlin. Filed Oct. 10, 1891. Serial No. 408,376. (No model.)

Claim.—1. The combination, with a draw-bar, of a jaw pivotally mounted thereon and adapted to engage its duplicate upon another car and a keeper mounted to swing laterally with said jaw and independently away from the same, and devices offering yielding resistance to such independent motion.

2. The combination, with the draw-bar having the partial cylindrical cavity in its enlarged free end, of the jaw and keeper projecting from said cavity and swinging freely from side to side therein, and devices offering yielding resistance to the increase of the distance between said jaw and keeper, said draw-bar being provided with shoulders limiting the swinging of the jaw and keeper to either side.

3. The combination, with the draw-bar and a laterally-swinging hooked jaw mounted therein and adapted to engage a like jaw of another coupler, of a wedge sliding in the jaw first named transversely to the plane thereof to force the engaging jaw out of engagement, substantially as set forth.

4. The combination, with a hooked jaw of a coupler, of a rearwardly-inclined uncoupling-wedge sliding in the jaw transversely to the plane thereof, substantially as and for the purpose set forth.

5. The combination, with the hooked jaw adapted to engage the like hook of another coupler, of the bar pivoted in the jaw to swing into or across the hook for uncoupling, the rearwardly-inclined wedge sliding in the jaw and adapted to force the swinging of said bar, the shaft having the handles and intermediate crank, and a chain connecting the free end of the crank to said wedge to raise it.

6. The combination, with the draw-bar having the cylindrical cavity in its enlarged free end, of the jaw pivoted in the axis of said cavity, fitting against its side and rear walls and projecting at the front as a hook, and the keeper lying alongside said jaw, fitting the cavity in like manner and separated from the jaw at the rear of the cavity by the rubber cushion, substantially as and for the purpose set forth.

7. The combination, with the draw-bar having in its enlarged free end the cylindrical cavity, whose horizontal walls terminate in curved shoulders whose center is the axis of the cavity and whose vertical walls end in vertical shoulders, of the hooked jaw and keeper mounted in said cavity to swing about its axis and provided with shoulders to meet the shoulders above named, the cushion interposed between the rear ends of the jaw and keeper, and means for forcing out of the jaw's hook the hook of another coupler.

8. The combination, with a draw-bar, of a hooked jaw and a keeper mounted therein to swing from side to side together and adapted to receive the like parts of another coupler and devices to exert a yielding pressure tending to keep the free end of the keeper at its minimum distance from the hook.

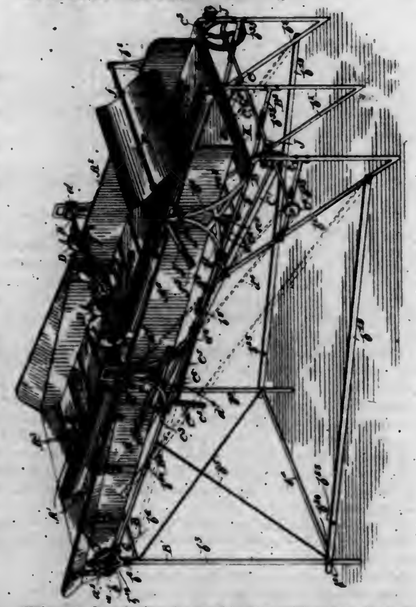
478,994. OVERSEAMING SEWING-MACHINE. PHILIP DIEHL, Elizabeth, N. J., assignor to The Singer Manufacturing Company of New Jersey. Filed Apr. 6, 1891. Serial No. 387,793. (No model.)

Claim.—1. In a sewing machine, the combination, with a needle-bar, needle, a loop-taking device co-operating with said needle, means for reciprocating said needle-bar and needle both vertically and horizontally, and a driving-shaft from which said needle and loop-taking device are both operated, of a compensating mechanism for causing the said needle and loop-taking device to meet each other earlier in the rotation of the said driving-shaft when the needle is working in one vertical plane than when it is working in the other.

2. In a sewing-machine, the combination, with a needle-bar, needle, a loop-taking device co-operating with said needle, means for reciprocating said needle-bar horizontally, and a driving-shaft from which said needle-bar and loop-taking device are both operated, of a pitman connected to said driving-shaft and a horizontally-rocking lever carrying said needle-bar and having a stud engaged by said pitman.

3. In a sewing-machine, the combination, with a needle-bar and needle and means for reciprocating the same horizontally, of a horizontally-reciprocating shuttle, a driving-shaft from which said needle-bar and shuttle are both operated, a pitman connected to said driving-shaft, and a horizontally-rocking lever to which said needle-bar is attached and which is provided with a stud engaged by said pitman.

4. In a sewing-machine, the combination, with the shuttle, the swinging needle-bar frame, the driving-shaft, and means for operating said shuttle and frame from said shaft, of the pitman L, connected to said shaft, the stationary rod O, and the rocking lever *m*, having a fork embracing said rod and having, also, the ball-headed stud m^3 entering an aperture in said pitman, and the needle-bar attached to said block.



478,995. REFRIGERATOR-CAR. GEORGE A. FOWLER, Kansas City, Mo. Filed Oct. 3, 1891. Serial No. 407,629. (No model.)

Claim.—1. A refrigerator-car provided at each end with a vertical transverse partition extending from near the floor of the car toward its roof, two sets of parallel longitudinal skids secured to the floor of the car and each set extending from one side of the transverse center of the car to one end thereof and beneath the corresponding partition, and two sets of air-conducting pipes secured beneath the roof and each set of pipes extending from one side of the transverse middle of the car through the corresponding partition and opening into the top of the corresponding end of the car, the ends of the pipes which are adjacent to the transverse center of the car being bent downward, and said pipes being of different lengths, so as to bring their bent ends nearer to and farther from the transverse center of the car, substantially as set forth.

2. A refrigerator-car provided at each end with a vertical transverse partition extending from near the floor of the car toward its roof, two sets of parallel longitudinal skids secured to the floor of the car and each set extending from one side of the transverse center of the car to one end thereof and beneath the corresponding partition, two sets of air-conducting pipes secured beneath the roof of the car and each set extending from one side of the transverse center of the car through the corresponding partition and opening into the top of the corresponding end compartment of the car, the pipes of each set being of different lengths and the inner ends of the pipes being bent downward, a number of vertical receptacles for refrigerant located in each end compartment and disposed with vertical spaces between them to receive the ends of the air-pipes, and a number of skeleton-formed supports for the bottoms of the receptacles, each of said supports being attached to the end of the car at the lower part thereof by inverted-L-shaped portions and each having at an opposite end two legs, the feet of which are secured to cleats attached to the bottom of the car, substantially as set forth.

478,996. BAND-CUTTER AND FEEDER FOR THRASHING-MACHINES. CHARLES F. GRAHAM, Ludlow, Ill. Filed Oct. 24, 1891. Serial No. 409,643. (No model.)

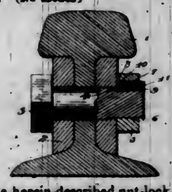
Claim.—1. In a feeder, the combination, with a trough, of two spreaders consisting of two transverse rods pivoted in the bottom of the trough, provided with teeth extending into the trough, an adjusting-lever attached to the one spreader, a link for connecting the lever with the other spreader, and means for holding the adjusting-lever in its positions of adjustment, substantially as set forth.

2. In a feeder, the combination of the following parts: a series of band-cutters mounted on a rotary shaft, provided with a sprocket-wheel, vertically-movable bearings for the shaft, a crank-shaft for swinging the feed-troughs, provided with a sprocket-wheel, a chain connecting the two sprocket-wheels, and an adjusting-lever for raising and lowering the movable bearings of the band-cutter shaft, the said lever being provided with a belt-tightener, substantially as shown and described.

3. In a feeder, as a means for supporting the rear end of the trough or troughs, a main frame provided with serrated upper surfaces, in combination with a trough-supporting transverse frame having serrated lower surfaces at its outer ends to engage with the serrated surfaces of the main frame, and means for securing the said trough-supporting frame to the main frame, substantially as shown and described.

4. In a feeder, as a means for supporting the rear end of the trough or troughs, a main frame provided with serrated upper surfaces, in combination with a transverse trough-supporting frame provided with a slotted plate having lower serrated surfaces, and bolts for securing the two together, said bolts passing through the main frame and into the slots of the slotted plates, substantially as shown and described.

5. In a feeder, a transverse frame for supporting the troughs, consisting of a horizontal rectangular frame provided with serrated and slotted end plates, in combination with standards rising from the rectangular frame, and depending links pivoted in eyes in the standards, substantially as shown and described.



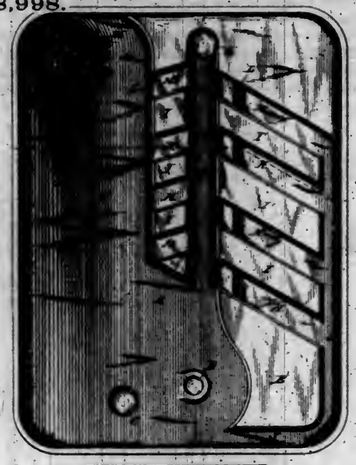
6. In a feeder, two troughs arranged side by side provided with outer walls and inner walls bent over toward each other so as to meet in a longitudinal line, in combination with three standards rising from the supporting-frame, the inner standards being arranged within the space between the inner bent-over walls of the troughs, cross-bars attached to the bottoms of the troughs, and links pivoted to the three standards and to the said cross-bars, substantially as shown and described.

7. In a feeder, a supporting-frame consisting of the rear rectangular frame, as B', the forward triangular frames b^3, connected together, and connecting-rods, as B^4, hinged to the rear frame and the outer triangular frames, substantially as shown and described.

8. In a feeder, the combination, with the supporting-frame, of clamps attached thereto, each clamp consisting of an angle-iron, as *j*, a jaw, as j', and means to force the two together and adapted to secure the feeder to the separator, substantially as shown and described.

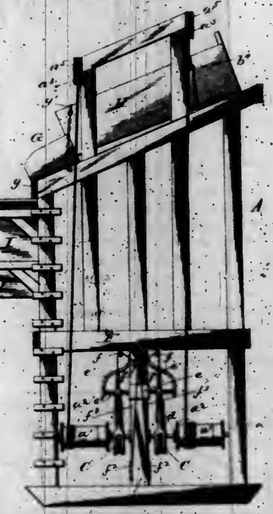
9. In a feeder, the combination, with the supporting-frame, of a clamp secured thereto, said clamp consisting of an angle-iron, as *j*, provided with a jaw or clamping portion and a slotted tongue, as j^3, in combination with a movable jaw, as j', having a clamping-screw threaded thereinto and adapted to engage with the slotted tongue j^3, substantially as set forth.

478,997. NUT-LOCK. JAMES C. GRIMM, Jules burg, Mo., assignor of one-half to John W. Johnson, same place. Filed May 17, 1892. Serial No. 433,322. (No model.)



Claim.—1. The herein-described nut-lock, the same consisting of the bolt provided with a longitudinal groove, the nut threaded on the bolt and provided at one side of its opening with a perforation, a cylindrical locking-pin mounted in the perforation, a head at one end of the same countersunk into the rear face of the nut, a kerf for the reception of a screw-driver at the outer end of the pin, and a fragmentary thread formed at one side of the pin and adapted to form a continuation of the threads of the nut, substantially as specified.

2. The bolt having the series of longitudinal grooves curved in cross-section, combined with the nut threaded thereon and provided at one side of its opening with a perforation, and the pin mounted for rotation in the perforation and locked against withdrawal and provided at one side with fragmentary threads forming a continuation of those of the nut, substantially as specified.

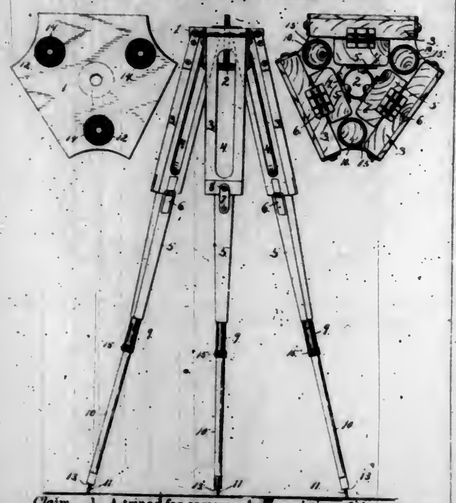


478,998. PUZZLE. CHARLES E. O. HAGER, Hagersville, Canada. Filed July 25, 1891. Serial No. 401,012. (No model.)

Claim.—In a game-board, the cavities C, D, G, and M, raised portions E, I, and I', rounded Narrow Pathway F, sunken Broad Road K, side passages H, with declivities L and L', passage-way J, and raised ledge B, as described and shown.

478,998.

478,999. ELEVATOR. PLEASANT D. HARPER, Fullerton, Ill. Filed Apr. 25, 1892. Serial No. 430,561. (No model.)

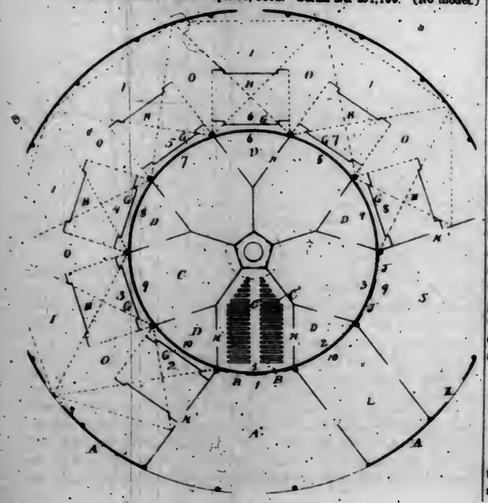


Claim.—1. The combination of the frame A, spools *a'*, rigidly secured on the axle *a*, ratchet-wheels *c*, rigidly secured on said axle, levers *d*, pivoted on said axle and carrying the dogs *d'*, levers d^3, pivoted to the free ends of said levers *d* and provided with feet d^5, levers d^6, pivoted to the rear ends of levers *d*, bar d^7, one end pivoted to the lower end of said lever d^3 and its other end to the dog *d'*, rods d^8, uniting the upper ends of said levers d^3 and d^6, cables a^2, one end attached to the spools a^3 and their other ends passing over pulleys a^4 and a^5 in the upper end of said frame, and a body-lifter B, substantially as shown and described, and for the purposes set forth.

2. The combination of the frame A, spools *a'*, rigidly secured on the axle *a*, ratchet-wheels *c*, rigidly secured on said axle, levers *d*, pivoted on said axle and carrying the dogs *d'*, levers d^3, pivoted to the free ends of said levers *d* and provided with feet d^5, levers d^6, pivoted to the rear ends of levers *d*, bar d^7, one end pivoted to the lower end of said lever d^3 and its other end to the dog *d'*, rods d^8, uniting the upper ends of said levers d^3 and d^6, axle e^3, passing through central upright E and secured in position by braces *e'*, dogs e^2, pivoted on said rod and working in the teeth of the ratchet-wheels *c*, levers f^3, pivoted one on each side of the center upright E, cords f^2, their lower ends attached to said levers and their upper ends passing over the pulleys *f* and *f'* and secured to the dogs e^2, cables a^2, one end attached to the spools a^3 and their other ends passing over pulleys a^4 and a^5 in the up-

per end of said frame, and the body-lifter B, substantially as shown and described, and for the purpose set forth.

3. In an elevator, substantially as shown and described, the body-lifter B, consisting of the upper cross-beam *b*, lower cross-beams *b'*, elbow-braces *b³*, pivoted at their elbows, one at each end of said beams, and chains *b⁴*, attached to the outer ends of said braces and of the beam *b*, substantially as shown and described.

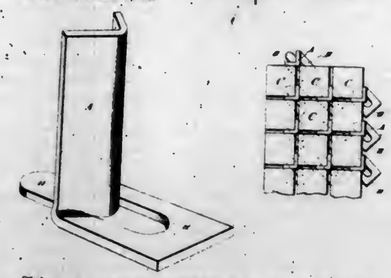


479,000. TRIPOD. OSCAR H. HAWENSTEIN, Buffalo, N. Y. Filed Apr. 28, 1892. Serial No. 430,972. (No model.)

Claim.—1. A tripod for cameras, &c., consisting of the upper sections 3, hinged to the platform 1, the smaller intermediate sections 5, hinged to the lower ends of the sections 3, so as to form a rule-joint, and adapted to be secured in line by the hinged catch-plates 7 and screws 8, and the lower spurred sections 10, adapted for insertion in the sockets 9 of the sections 5, substantially as shown and described.

2. A tripod for cameras, &c., adapted to be packed in small compass, consisting of the platform 1, having the apertures 12 and pads 14, the upper sections 3 and intermediate sections 5, hinged together, so as to form a rule-joint, and provided with catches 7 8, and the removable lower sections 10, having the bands 15, the whole arranged to be taken apart, folded together, and packed, substantially as shown and described.

479,001. THEATRICAL APPLIANCE. JESUS H. Y GUTIERREZ, Mexico, Mexico. Filed Apr. 28, 1892. Serial No. 431,199. (No model.)



Claim.—1. In a building for theatrical, scenic, and other displays, a series of stationary, separate, and independent scenic compartments, in combination with a revolving platform having separate audience-chambers to coincide with said scenic compartments, substantially as described.

2. The combination within a suitable building of a stage divided into separate independent stages or scenic compartments, spaces for green-rooms and communicating passages with a revolving platform having audience-chambers arranged to coincide with the said scenic compartments, a lobby or vestibule having passages leading to said scenic compartments and also to said audience-chambers, substantially as described.

3. The revolving platform having the central space for music-stand, separate audience-chambers extending from said space, angular ante-chambers between the audience-chambers, a lobby communicating with said structure, and communicating passages between said chambers, substantially as described.

4. The combination, with a circular stationary stage provided with entrance-vestibule, independent scenic compartments, and exit-saloon, of a central-revolving audience platform or chamber and communicating passages, substantially as described.

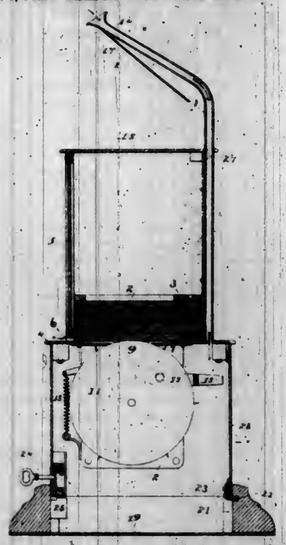
479,002. PAVEMENT. ERNEST HILL, Sheffield, England. Filed Sept. 12, 1891. Serial No. 405,559. (Model.) Patented in England June 7, 1890. No. 8,796.

Claim.—A pavement consisting of a suitable foundation upon which is superposed a series of rectangular blocks connected at their angles by wrought-metal studs having a horizontal base B, an integral tongue D, cut therefrom and bent in opposite direction in the same plane and having the other end of the plate struck up into vertical angular form, substantially as and for the purpose set forth.

479,003. BUCKLE. STEPHEN T. HIBLEY, Syracuse, N. Y. Filed July 2, 1891. Serial No. 398,305. (No model.)

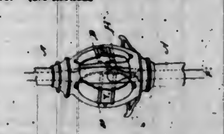
Claim.—In a buckle, a body consisting of a plate of metal, arms projecting from one end thereof adjacent to the edges, flanges turned longitudinally along and standing at substantially right angles to the plane of said arms and forming the outer edges thereof, and mortises cut in the angles between and partly in and transverse to said flanges and partly in and transverse to the portions of said arms which lie in the same plane as the body, in combination with a lever having pintles projecting laterally into said mortises and lying, normally, in those portions thereof which are in the flanges and across the flat portions of said arms and when operated bearing against said flanges as to one edge of the pintles and against part of the flat portions of said arms as to the other edge of said pintles.

479,004. FRAMED PICTURE, MIRROR, AND THE LIKE, AND METHOD OF FORMING THE SAME. JOHN JACOBSON, Boston, Mass. Filed June 26, 1891. Serial No. 397,531. (No model.)



Claim.—1. A framed article—such as a picture—having the frame formed of plastic material molded about and inclosing the edges of the article front and back, substantially as described.

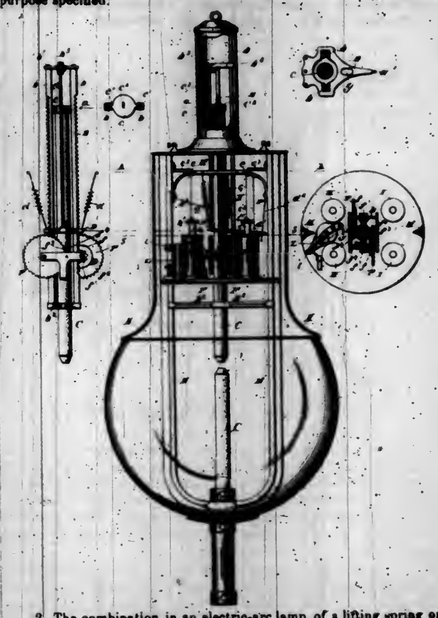
479,004.



2. The method of framing articles, which consists in supporting the article to be framed in a mold and leaving the edges of such article free at front and back, then introducing into said mold a frame-forming material in plastic condition and working it about the front and back edges of the article, thereby to inclose such article in such plastic material and to fashion the frame, then allowing the frame to set, and then separating it from the mold, substantially as described.

479,005. VENDING-MACHINE. VIRGIL A. KREPS, Kenosco, N. Y., assignor, by mesne assignments, to Daniel I. Caldwell, Lynn, and Robert Mills, Newton, Mass., trustees, and Harry W. Mason, Newton, Mass. Filed Nov. 9, 1891. Serial No. 411,285. (No model.)

Claim.—A vending apparatus comprising a receptacle for the merchandise, provided with a slot or opening in line with the bottom package, a spring-actuated wheel-train, a series of radial spurs driven by a shaft of the train and adapted to sweep through an opening in the bottom of the receptacle and engage the bottom package, said spurs being out of contact with the package when the apparatus is inactive, and a coin-operated detent to release the train.



479,006. LAMP-POST SIGN. CHARLES F. KUECHLER, Chicago, Ill., assignor of one-half to Frederick Rahn, same place. Filed Dec. 11, 1890. Serial No. 374,275. (No model.)

Claim.—In combination with a lamp-post bearing at the top thereof an electric lamp for street-lighting and a chamber below the lamp, said chamber having one or more transparent walls or wall-sections adapted to receive and support signs, lamp-wires for supplying the lamp with an electric current, and a lamp within the chamber and included in the lamp-circuit, substantially as described.

479,007. ELECTRIC-ARC LAMP. MAURICE S. LOGAN, Otterville, assignor of one-half to James H. Bailey, Sedalia, Mo. Filed Aug. 29, 1891. Serial No. 404,167. (No model.)

Claim.—1. The combination, in an electric-arc lamp, of a coil permanently located in the arc circuit, a feed-regulating coil in a branch circuit around the arc, an auxiliary coil located (temporarily while the arc circuit is open) in a second branch circuit around the arc, and means for switching said auxiliary coil into the arc circuit in multiple with the coil permanently located therein, substantially as and for the purpose specified.

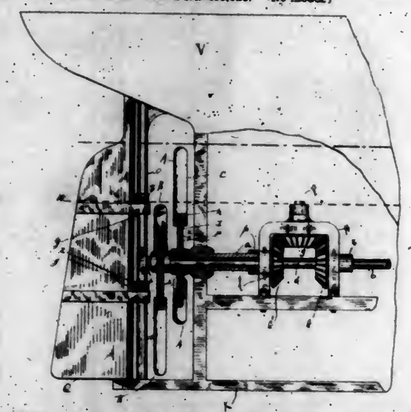
2. The combination, in an electric-arc lamp, of a lifting spring or springs, a feed-controlling magnet, feed-regulating mechanism controlled thereby, an auxiliary magnet located, first, (when the lamp is out of action,) in a branch circuit around the arc, and, second, (during the action of the lamp,) in a branch of the arc circuit, performing the office first, of starting the lamp, and, second, of assisting the feeding-magnet, a switch for changing the circuit of said auxiliary magnet, and a magnet in the arc circuit for actuating said switch, all substantially as shown and described.

3. The combination, in an electric-arc lamp, with feed-regulating mechanism, of the combination-lever E, the lifting spring or springs K, a feeding-magnet I, an auxiliary magnet H, capable of being switched from a branch circuit around the arc into the arc circuit in multiple with a magnet J, a switch for changing the circuit of said auxiliary magnet, and a magnet J for actuating said switch, substantially as shown and described.

4. In an electric-arc lamp, a combination feed-regulating lever consisting of a combination of two separate levers, each provided with the lateral arms *e e*, supplemented by corresponding arms of the other and adapted to admit of a vertical motion of the magnet cores or plungers, each lever being further provided with such other arms or shoulders, or both, as may be necessary, each arm or shoulder being supplemented by a corresponding arm or shoulder of the other, substantially as specified.

5. In an electric-arc lamp, a carbon-feed rod or carbon-holding rod provided with means for holding the carbon in a collateral position therewith, and also provided with means by which said carbon travels thereon in a longitudinal direction.

6. In an electric-arc lamp, a combination feed-rod embracing in its construction two parallel bars *b b*, having suitable space between them adapted to receive the carbon therein, in combination with the carbon inserted between the bars *b b* and having means provided whereby the carbon travels upon said bars in addition to the feeding movement of the bars *b b*.



7. In an electric-arc lamp, the combination of a double-rack feed-rod with two trains of wheels adapted to engage therewith, substantially as specified.

8. In an electric-arc lamp, the combination of the stationary guide rod or rods G with a traveling arm or arms *b'*, attached to the upper end of the feed rod B and adapted to move up and down upon said guide rod or rods, substantially as specified.

9. A dash-pot substitute consisting of one, two, or more iron strips

or rods so placed that their free ends come in contact with the armature plate or plates and held in place by the magnetism thereof with sufficient force to check the sudden motions of said armature plate or plates, substantially as described.

479,008. **PROPELLER-WHEEL.** CHARLES J. LOWE, Chicago, Ill. Filed Jan. 14, 1892. Serial No. 418,023. (No model.)

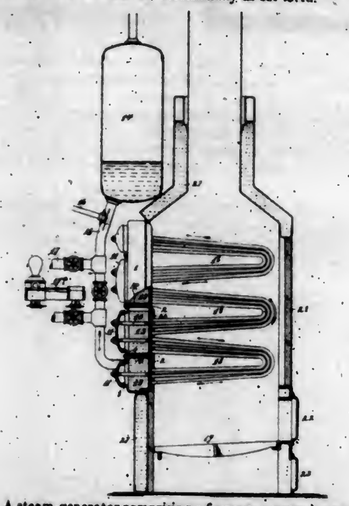
Claim.—1. A propeller composed of two wheels revolving concentrically in different directions, the shaft of one passing through the shaft of the other, each blade of said wheels having an approximately straight surface across the forward and central portions *d* and E, for the purpose described, and curved more abruptly at its rear edge D to complete the turning of the water, substantially as and for the purpose set forth.

2. A propeller composed of two wheels revolving concentrically in different directions, the shaft of one passing through the shaft of the other, each blade of said wheels having an approximately straight surface across its forward and central portions *d* and E, for the purpose described, and curved more abruptly at its rear edge D, for the purpose set forth, and with the outer end R turned over, as and for the purpose set forth.

3. A propeller-wheel made of composite parts, consisting of the blade C, fastened to the integral wheel L, the key N, passing through a slot in said blade and underneath the rim of said wheel L, as shown, said blade having the projection I, fitting into the slot *f* of said integral wheel, and the aperture R, fitting over the projection S of the arms of said integral wheel, said parts adapted to be placed and held together, substantially as shown and described.

4. A propeller composed of two wheels revolving concentrically in different directions, the shaft of one passing through the shaft of the other, each blade of said wheels being approximately straight in its length, and curved over at the outer end for the purpose of arresting the centrifugal action, substantially as described.

5. A propeller-wheel composed of composite parts, detachable blades C, a central hub-wheel L, the arms P of which are single at their insertion in the hub and divided at their outer end, a part being inserted into the rim on each side of the propeller-blade, substantially as shown and described.



6. A propeller composed of two wheels revolving concentrically in different directions, the shaft of one passing through the shaft of the other, and each blade of said wheels being approximately straight across the forward and central portions *d* and E and curved more abruptly at its rear edge D and approximately straight throughout its length and curved over at its outer end *L*, as and for the purpose specified.

7. A propeller-wheel composed of a central or hub wheel L, detachable blades C, secured to said wheel, substantially as described, said blades being straight across the forward and central sections *d* and E and curved at their rear edge D and straight in their length and curved over at their outer ends, as and for the purposes set forth.

479,009. **STEAM-GENERATOR.** EDWARD A. MACEE, Brooklyn, N. Y. Filed Aug. 15, 1891. Serial No. 402,706. (No model.)

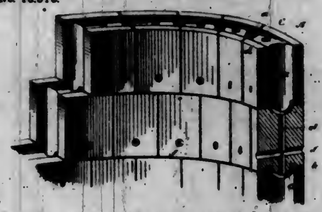
Claim.—1. In a steam-generating apparatus, the combination, with a furnace, of steam-generating pipes, compartments or chambers connected by said pipes, pipes to carry off the steam to be used independently from the several compartments or chambers, and means, as a separating-drum and a pipe leading from the water-space thereof, for separating the water and returning it to the boiler, all substantially as herein specified.

2. A steam-generator having a series of compartments connected by heat-pipes extending into the furnace, the ends of the series being connected, respectively, with the water-space and the steam-space of a separating drum or receiver, substantially as set forth.

3. A steam-generator comprising a furnace, a water leg or column forming a wall of the same and having a series of compartments, steam-generating tubes connecting said compartments in pairs and extending into the furnace, and a drum having its steam and water spaces independently connected with separate compartments of the generator, substantially as set forth.

4. The combination of a steam-generator having a series of compartments, steam-generating tubes connecting said compartments in pairs and extending into the furnace, connection between one compartment and the water-space of the receiving-drum, and a connection between a higher compartment and the steam-space of said drum, substantially as set forth.

5. The combination of a water leg or column having separate compartments, a furnace, return-pipes connecting the compartments in pairs and extending forward into the furnace, a steam and water drum and connection between the water-space of the latter and one compartment of the generator, an inlet-pipe for feed-water near the upper end of such connection, and connections between the steam-space of the drum and the remaining compartments of the generator, substantially as set forth.



6. In a steam-generator, the combination of a furnace, a water-leg forming the back wall of the same and having a series of compartments, circulating or generating pipes connecting such compartments in pairs, netting or holding material attached to the front wall of the water-leg around and between such generating-pipes, and a covering of refractory material attached to such netting or holding device, substantially as set forth.

7. In a device of the class described, the combination, with the furnace, of a boiler having water-tubes or other efficient steam-generating surfaces, a non-conducting wall exterior thereto, and a surrounding water reservoir or receptacle exterior to the whole, the lower and upper ends of which are connected, respectively, with a source of supply and with a condenser, substantially as and for the purpose set forth.

8. In a device of the class described, the combination, with the boiler proper, of a water jacket or receptacle, the lower and upper ends of which are adapted to be connected, respectively, with a source of supply and with a condenser, and an outer shell or casing placed adjacent to said outer jacket or receptacle, arranged to allow the partial vacuum or draft of the furnace to draw the air downwardly through the space between said outer casing and the water jacket or receptacle for the purpose of supplying hot air to support combustion, substantially as set forth.

9. The combination of a furnace, a water-jacket, an exterior shell or casing placed adjacent to said water-jacket and forming an air duct or passage, the water-leg having suitable compartments, the circulating and generating pipes connecting said compartments in pairs, the steam and water drum, the pipe connecting the water-space of the latter with the lowermost compartment of the water-leg and having a supply-pipe near its upper end, and connections between the remaining compartments and the steam-space of the drum, substantially as set forth.

479,010. **WELL-CURBING.** ALOYS MÖHLE, Saarbrücken, Germany. Filed Apr. 7, 1892. Serial No. 428,130. (No model.) Patented in Germany July 8, 1891, No. 61,661; in France Sept. 12, 1891, No. 216,078; in Belgium Sept. 29, 1891, No. 96,582, and in England Sept. 29, 1891, No. 16,518.

Claim.—1. The improved blocks or stones for use in the sinking of wells or shafts, consisting of segmentally-shaped pieces having side flutings *a*, a channel *c* at the top, and a corresponding but smaller projection *b* at the bottom, together with two drill-holes *d* and *f*, the former of which is placed vertically and centrally, while the latter is horizontal and passes from the front to the back of the block or stone and is formed in the vicinity of the lower edge of the stone and intersects the drill-hole *d*.

2. A block of stone or analogous material having its vertical sides fluted and provided with a vertical drill-hole *d* and transverse drill-hole *f*, meeting and crossing each other, substantially as described, and for the purposes set forth.

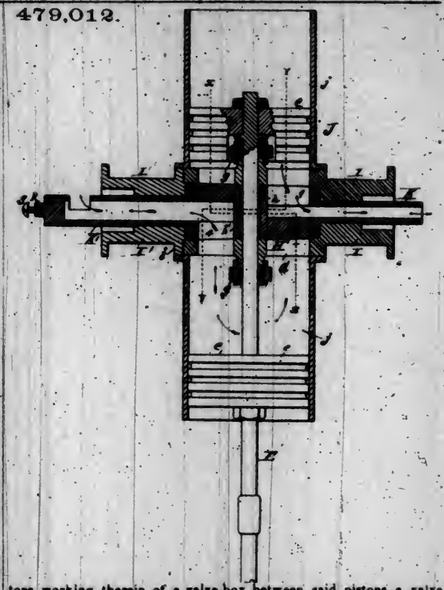
3. A block of stone or analogous material having its sides fluted, its upper end being partially concave and its lower end being provided with a convex projection *b*, and also with vertical and transverse drill-holes, substantially as described, and for the purposes set forth.

4. In a series of blocks of stone, the combination of side flutings *a*, adapted to form tubular grooves *d* for the reception of cementing material, channels *c*, and projections *b*, substantially as described, and for the purposes set forth.

479,011. **CAN-OPENER.** CHARLES MORGAN, Latah, Wash. Filed Jan. 28, 1892. Serial No. 419,569. (No model.)

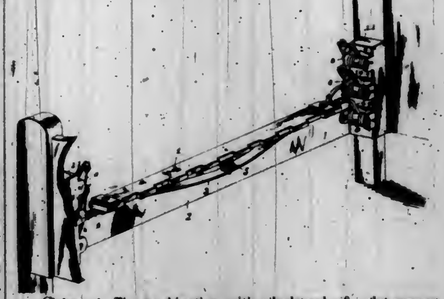
Claim.—1. In a can-opener, the combination of a frame having standards provided with notches, a vertically-reciprocating plunger mounted in the frame and carrying a blade, an adjustable base supported by the standards, and spring-actuated levers mounted on the lower face of the base and arranged to engage the notches, substantially as described.

2. In a can-opener, the combination of a frame having a vertical casing, a plunger mounted for vertical reciprocation in the casing, a blade secured to the lower end of the plunger, and a spiral spring disposed on the plunger and arranged within the casing and holding the plunger elevated, substantially as described.



3. In a can-opener, a blade provided with a spring-lip formed by slitting the body of the blade and adapted to engage the lower face of the cut portion of a can to lift the same out of the can, substantially as described.

4. In a can-opener, the combination of a frame having standards, a vertically-reciprocating plunger mounted in the frame and carrying a blade, and a vertically-adjustable base supported by the standards, substantially as described.

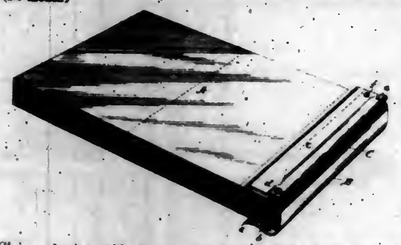


479,012. **OSCILLATING ENGINE.** JULIAN MOSS, Detroit, Mich., assignor of two-thirds to Edward Richard Blanchard and Holden B. White, same place. Filed Dec. 11, 1891. Serial No. 414,671. (No model.)

Claim.—1. An oscillating engine having two pistons, a reversing-valve between said pistons, and a rod connecting said pistons, passing through an aperture in said valve, and having enlarged ends to permit the shifting of the valve, substantially as described.

2. The combination, with an oscillating cylinder having two pistons working therein, of a valve-box between said pistons, a valve working in said valve-box, and a removable trunnion attached to said valve-box to allow of the insertion of the valve in the valve-box, substantially as described.

479,013. **BEDSTEAD.** CHARLES E. MCCLINTOCK, Ozark, assignor of one-half to Hymenus G. Sadler and Ralph A. Sadler, Paris, Ark. Filed Mar. 3, 1892. Serial No. 423,614. (No model.)



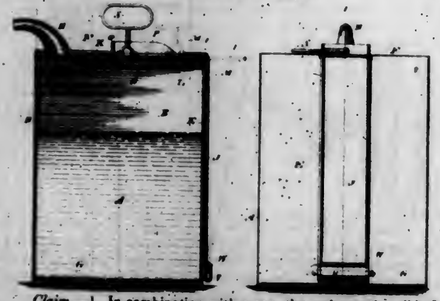
Claim.—1. The combination, with a bedstead, of a slat-supporting bar provided at its ends with hinged loops, and the series of springs arranged at the ends of the bedstead and having right and left hand coils, and a centrally-arranged hooked upwardly-extending arm detachably engaging the loops, substantially as described.

2. The combination, with a bedstead, of a slat-supporting bar provided at its ends with loops, a series of supporting-springs arranged at each end of the bedstead and each spring having a centrally-arranged hooked arm, and coils arranged on opposite sides of the arm, and the detachable link-hooks connecting the arms of the springs, the lower spring having its arm engaging the adjacent loop of the slat-supporting bar, substantially as described.

3. The combination of the bedstead provided with blocks 11, the supporting-springs secured to the blocks and each provided with a centrally-arranged hooked arm and with coils arranged on opposite sides of the arm, the hook-links connecting the arms of the springs and provided at one end with a loop and at the other end with a hook, the cylindrical cores arranged within the coils, the slat-supporting bar, the truss-strap secured to the lower face of the bar and provided at its ends with loops engaging the arms of the lowermost springs, and an elastic spring-strut interposed between the strap and the slat-supporting bar, substantially as described.

479,014. COMBINED BOOK AND CARBON-SHEET HOLDER. JAMES S. MCDONALD, Chicago, Ill. Filed Aug. 3, 1891. Serial No. 401,591. (No model.)

Claim.—1. A combined book and carbon-sheet holder comprising a U-shaped book-holder composed of bent spring metal adapted to embrace and hold a series of sheets in book form and a carbon-sheet holder secured to the book-holder and provided with a spring-clamp for removably holding a sheet of carbon-paper in position for use upon the book, substantially as described.



2. A combined book and carbon-sheet holder comprising a U-shaped book-holder composed of bent spring metal adapted to embrace and hold a series of sheets in book form, a plate secured thereto, and a spring-clamp for embracing the edge of said plate, so as to constitute a carbon-sheet holder for removably holding a sheet of carbon-paper in position for use on the book, substantially as described.

3. A combined book and carbon-sheet holder comprising a removable spring book-holder adapted to hold a series of sheets in book form and a carbon-sheet holder attached to and forming a part of the book-holder for holding a sheet of carbon-paper in position for use upon the book, substantially as described.

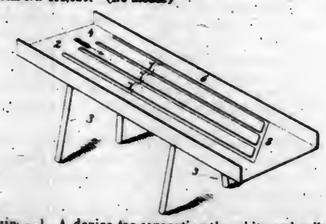
4. A combined book and carbon-sheet holder comprising a U-shaped book-holder and a supporting-plate for the carbon-holder, composed of a single piece of bent spring metal; and a U-shaped spring-clamp for embracing the edge of said plate, so as to constitute a carbon-sheet holder, substantially as described.

5. A combined book and carbon-sheet holder comprising a U-shaped book-holder composed of bent spring metal and adapted to embrace and hold a series of sheets in book form, a plate integral with said holder, a spring-clamp for embracing the edge of said plate so as to constitute a carbon-sheet holder, and a pivot connection between one end of said clamp and the plate, substantially as described.

479,015. TIN-CAN. ELEANOR E. OERTEN, New York, N. Y. Filed Mar. 23, 1892. Serial No. 426,093. (No model.)

Claim.—1. In combination with a can, the reciprocating slide I, guides therefor, a stop to prevent undue outward movement of the slide, and the handle J, hinged at one end to the body of the can and at its other end hinged to the outer end of said slide I, substantially as set forth.

2. In combination with a can having a discharge-spout, the slide I, adapted to close said spout, the guide L, in which said slide is adapted to have its movement, the opening P in the can in line with said slide, the hinged handle S, secured to the slide within the outline of said opening P, and means for locking said slide in its inward position, substantially as set forth.



3. In combination with an oil-can having the discharge-spout, the slide I, having the opening K, the guide L, receiving said slide and having the openings N O, the top F, having the opening P, the handle S, hinged to said slide within the outline of said opening P, the flange Q at the edge of said opening P, and the notch R in said flange, substantially as set forth.

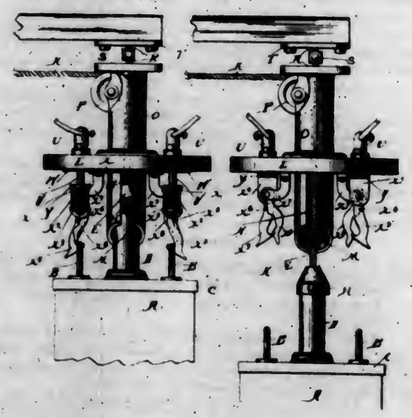
4. In combination with the can having the discharge-nozzle, the reciprocating slide I, adapted according to its position to open or close said nozzle, the guide in line with said nozzle and receiving said slide, and the handle J, hinged at one end to the can-body and at the other end to the outer end of said slide, substantially as and for the purposes set forth.

5. In combination with the can having the discharge-spout, the slide I, adapted to close said spout, the guide receiving said slide, the handle S, secured to said slide, and the handle J, hinged at its upper end to said slide and at its lower end to the can-body, substantially as set forth.

6. In combination with the can having the discharge-spout, the slide I, adapted to close said spout, the guide receiving said slide, the openings through said guide, slide, and can-body, forming a vent and a means for filling the can, and the handle J, hinged at its upper end to said slide and at its lower end to the can-body, substantially as set forth.

479,016. DEVICE FOR SEPARATING THE WHITE AND YELK OF EGGS. LYMAN F. PETTEE, Brooklyn, N. Y. Filed Jan. 22, 1892. Serial No. 418,929. (No model.)

Claim.—1. A device for separating the white and yelk of an egg, consisting of an inclined table, as 2, provided with a longitudinal slot as 7, and a transverse slot, as 8, substantially as shown and described



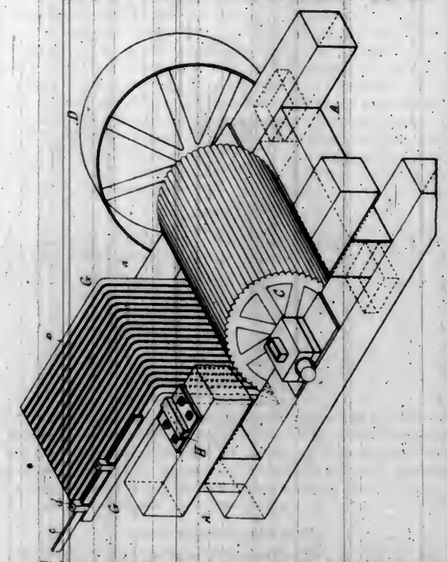
2. A device for separating the white and yelk of eggs, consisting of an inclined table or support provided with a longitudinal slot or slots and a transverse slot communicating with the longitudinal slot or slots, substantially as shown and described.

3. A device for separating the white and yelk of eggs, consisting of a table or support provided with a longitudinal slot or slots and a transverse slot and so supported as to give it an endwise and lateral inclination, substantially as shown and described.

4. A device for separating the white and yelk of eggs, consisting of a table or support provided with a longitudinal slot or slots and a transverse slot and an upwardly-extending flange 6, said device being so supported as to give it a lateral and longitudinal inclination, substantially as shown and described.

5. A device for separating the white and yelk of eggs, consisting of a table, as 2, provided with a longitudinal slot, as 7, a transverse slot, as 8, communicating with the longitudinal slot, and an upwardly-extending flange, as 6, said device being supported in a laterally and longitudinally inclined position, substantially as shown and described.

479,017. HANGER FOR ELECTRIC-ARC LAMPS. CHARLES A. PFLUGER, Chicago, Ill., assignor, by mesne assignments, of one-half to the Standard Electric Company, of Illinois. Filed Jan. 23, 1891. Serial No. 378,807. (No model.)

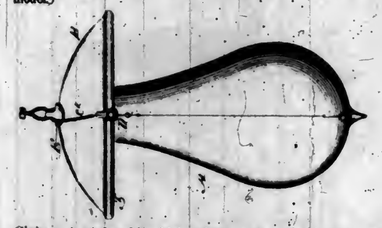


Claim.—1. In a hanger for an electric-arc lamp, the combination of two depending circuit-closing hooks with a circuit-closing loop on the lamp, adapted to engage the hooks, and cams which normally hang when the lamp is in position upon the same side of the loop as the hook and on the opposite side thereof when the lamp is lowered

2. In a hanger for an electric-arc lamp, the combination of a movable portion carrying a hook adapted by the movement of such portion to be cut in or out of the main circuit with a suspending-loop on the lamp, adapted to engage the hook and a cam, whereby the two are disengaged when the lamp is to be lowered, same cam fixed in position, and a pin on the hanger to be engaged by said cam.

3. In a hanger for an electric-arc lamp, the combination of two depending circuit-closing hooks with a circuit-closing loop on the lamp, adapted to engage the hooks and cams, consisting of a part which covers the hook when disengaged from above, but serves as a guide to it from below.

479,018. ORE AND COAL CRUSHER AND SEPARATOR. SAMUEL B. PRICE, Jr., CHARLES E. MARTIN, and BENJAMIN PURSER, Brookwood, Ala. Filed Mar. 20, 1891. Serial No. 385,791. (No model.)



Claim.—1. A coal and ore crusher consisting of a horizontal crushing-roller, in combination with a plurality of independently-movable narrow crushing-bars co-operating therewith and proportioned to the desired size of the crushed particles, as set forth, each crushing-bar consisting of an elbow-lever pivotally hung at its bend, one arm of which lever hangs vertically and tangentially to said roller and constitutes a crushing-arm and the other arm of which extends horizontally and at an angle to said crushing-arm and constituting a weighting-arm, and an adjusting weighting-bar adjustable longitudinally on said weighting-arm, substantially as set forth.

2. A coal and ore crusher consisting of a horizontal crushing-roller, in combination with a plurality of independently-movable narrow crushing-bars co-operating therewith and proportioned to the desired size of the crushed particles, as set forth, each crushing-bar consisting of an elbow-lever pivotally hung at its bend, one arm of which lever hangs vertically and tangentially to said roller and constitutes a crushing-arm and the other arm of which extends horizontally and at an angle to said crushing-arm and constitutes a weighting-arm, substantially as set forth.

479,019. PROCESS OF HARDENING OBJECTS MADE OF CRUDE GYPSUM. CARL REINER, Halle, Germany. Filed Aug. 26, 1891. Serial No. 403,752. (No specimens.)

Claim.—The process of hardening and rendering water-proof objects cut from crude gypsum, consisting in drying the objects by the application of heat and steeping the dried objects first in a solution of hydrate of barium and afterward in a solution of oxalic acid, substantially as described

479,020. INCANDESCENT ELECTRIC LAMP. MAX A. RICHTER and JAMES G. NOLES, Chicago, Ill., assignors to the Illinois Electric Lamp Company, same place. Filed Feb. 10, 1892. Serial No. 420,954. (No model.)

Claim.—1. A combined incandescent electric lamp and moisture-shedding shade comprising the imperforate concavo-convex shade B, of glass or analogous vitreous material, and the bulb A, having its body and neck portion thereof of glass and united to the imperforate central portion of the shade as an integral part thereof by a direct union, substantially as set forth, between the glass or analogous vitreous material of the shade and the material forming the glass neck portion of the bulb.

2. A combined incandescent electric lamp and moisture-shedding shade comprising the bulb A and the imperforate concavo-convex shade B, one of said members being provided with a socket formed directly in the material of which it is composed and the other member being formed with a neck of the same material as the body of the member and fitted and cemented within said socket, substantially as described.

3. A combined incandescent electric lamp and shade comprising the shade provided with a pendent stem and the bulb having its neck drawn to form a seating concavity in which the stem on the shade is secured, substantially as described.

4. The combination, with the imperforate shade having the bulb of an incandescent electric lamp united thereto, substantially as set forth, of clips attached upon the rim of the shade, conducting-wires leading from the clips to the bulb, and conducting and suspending wires attached to the clips so as to suspend the shade without strain upon the wires leading from the clips to the bulb and at the same time electrically connect with said wires.

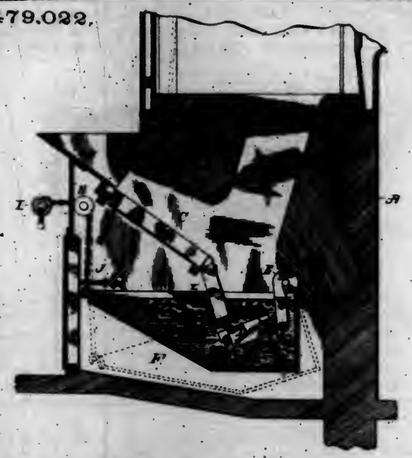
5. The shade provided upon its top portion with an eye and the bulb of an incandescent electric lamp united to the shade, substantially as set forth, and the suspending and conducting wires arranged to pass through said eye and connect with holders on the rim of the shade.

479,021. ENAMELED BRICK AND PROCESS OF MAKING THE SAME. ISAAC T. RUE, Matawan, N. J. Filed Dec. 14, 1891. Serial No. 415,026. (No specimens.)

Claim.—1. An enameled brick comprising the enameled surface, the brick-body, and a dust lining interposed between the two and constituting an integral part of the brick-body, whereby the liability to cracking and scaling of the lining is obviated, substantially as described.

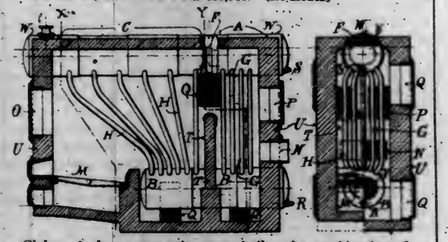
2. The method of making a lined enameled brick, which consists of forming the brick-body and the dust lining at the same time, pressing them together, and firing, whereby the lining is made an integral part of the brick-body, and subsequently applying the enamel, substantially as described.

3. The method of making a lined enameled brick, which consists of placing in the mold the material for the brick-body proper and also the material for the lining in the dust, submitting the whole to pressure, and firing, whereby the lining is made an integral part of the brick-body, and subsequently applying the enamel, substantially as described.



479,022. AIR-FEEDING DEVICE FOR FURNACES. HERMAN H. E. SCHOMBURG, Berlin, Germany. Filed Dec. 21, 1891. Serial No. 415,763. (No model.)

Claim.—1. The combination, with the fire-box of a furnace or the like, of a water-tank and grate-bars occupying a position normally without the tank and adapted to be submerged in the water, substantially as described.



2. The combination, with the fire-box of a furnace or the like, of a pivoted water tank and grate-bars adapted to be submerged in the said tank, substantially as specified.

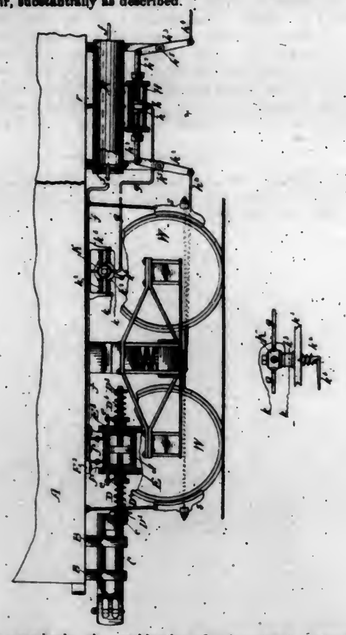
3. The combination, with the fire-box of a furnace or the like, of a pivoted water-tank, grate-bars adapted to be submerged in the said tank, and mechanism for raising or lowering the tank, substantially as described.

479,022.

479,028. STEAM-BOILER. MINOR SCOVEL, New York, N. Y. Filed Jan. 26, 1892. Serial No. 419,320. (No model.)

Claim.—1. In a water-tube steam-boiler, the combination of an elevated feed-water and steam chamber, a mud-drum, feed-water-heating tubes leading from the feed-chamber down to the mud-drum, an elevated steam disengaging and storage chamber, steam-generating tubes leading from the mud-drum to the steam-disengaging chamber, and a dam separating the elevated feed-water chamber from the steam-disengaging chamber, substantially as and for the purposes described.

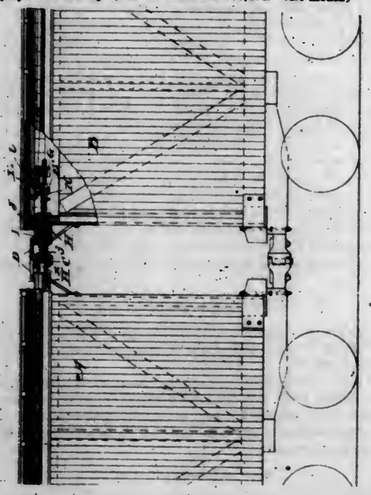
2. In a water-tube steam-boiler having an elevated feed-water chamber, an elevated steam-disengaging chamber, and a mud-drum, the combination of the feed-water chamber, mud-drum, and steam-disengaging chamber, with a feed-water-inlet pipe, feed-water-heating tubes leading from the elevated feed-water chamber down to the mud-drum, the said tubes having a total sectional area greater than the sectional area of the inlet-pipe, and steam-generating tubes leading from the mud-drum up to the elevated steam-disengaging chamber, the total sectional area of such steam-generating tubes being greater than that of the feed-water-heating tubes, substantially as and for the purposes described.



3. In a water-tube steam-boiler, an elevated feed-water and steam chamber, a mud-drum, and an elevated steam disengaging and storage chamber, in combination with a second steam disengaging and storage chamber separated from the first steam disengaging and storage chamber by a dam, and feed-water-heating tubes connecting the feed-water chamber with the mud-drum, and steam-generating tubes connecting the mud-drum with the elevated steam disengaging and storage chambers, substantially as and for the purposes described.

4. In a water-tube steam-boiler, two or more elevated drums or receptacles connected by a cross-drum or receptacle and divided by dams into feed-water and steam disengaging chambers, in combination with feed-water-heating tubes leading from the feed-water chambers down to a mud-drum space, and steam-generating tubes leading from the mud-drum space up to the steam-disengaging chambers, substantially as and for the purposes described.

479,024. CAR-COUPLING BRAKE. JESSE P. BRAWELL, Clarksburg, Mo. Filed Aug. 5, 1891. Serial No. 401,735. (No model.)

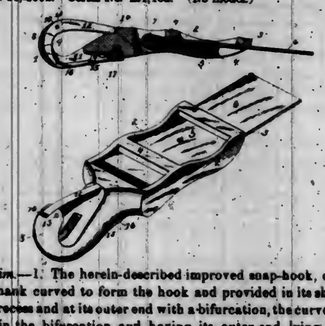


Claim.—1. In a car-brake, the combination of a draw-head, a piston-rod connected with said draw-head, a piston and its inclosing cylinder E, and check-valves in the ends of said cylinder, a spring between said cylinder and the draw-head, an air-reservoir and brake-cylinder, and means for connecting the brake-cylinder with the air-reservoir, substantially as described.

2. In a car-brake, the combination of a draw-head, a piston-rod connected with said draw-head and carrying a piston, the cylinder E, its check-valves and springs bearing against the packing-boxes at the ends thereof, with cushions within the cylinder, an air-reservoir and brake-cylinder, and means for connecting the brake-cylinder with the air-reservoir, substantially as described.

3. In a car-brake, the combination of a draw-head, a piston-rod and piston connected with said draw-head, the cylinder E, having check-valves at the ends, an air-reservoir, a brake-cylinder and pipes connecting the brake-cylinder and air-reservoir with the cylinder E, a three-way cock to control the air from the reservoir to the brake-cylinder, and means for operating said cock, substantially as described.

479,025. TOP BUFFER FOR FREIGHT-CARS. HENRY H. SESSIONS, Chicago, Ill., assignor to the Pullman's Palace Car Company, same place. Filed July 6, 1891. Serial No. 398,471. (No model.)



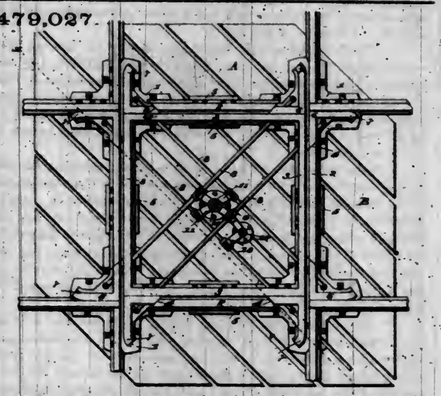
Claim.—1. In combination with the end of a car, a chafing-plate pivotally connected to rods having a sliding support and capable of movement in the direction of the length of the car, a yoke or equivalent coupling having a bearing upon said rods, an outwardly-forcing spring interposed between the chafing-plate and the end of the car, and a tie-rod connecting the outer end of the spring with the yoke, substantially as described.

2. In combination with a car, a chafing-plate mounted toward the top thereof upon rods pivotally connected thereto and having a sliding support in the end wall of the car, a yoke adapted to bear at its ends upon each of said rods, a tie-rod pivotally connected to said yoke, and a spring connected at one end to the rod and adapted to exert an outward pull thereon, substantially as described.

3. In combination with an end of a car, a casting or equivalent frame-piece secured therewith near the top of the car and having apertures to form ways, and a spring-pocket, a spring seated in said pocket, rods mounted to slide in said ways, and a chafing-plate pivotally connected to the forward end of said rods, a yoke having a bearing on said rods, and a tie-rod connecting the spring and the yoke and passing through an elongated aperture, whereby said yoke is adapted to permit the chafing-plate to assume an angular position with reference to the end wall of the car, substantially as described.

4. In combination with an end of a car apertured for the passage of rods therethrough, said rods passing through said apertures and supported from the car-roof, a chafing-plate pivotally connected to said rods at their outer ends, shoulders upon said rods, and a yoke having its ends embracing said rods, so as to slide thereon and adapted to rock over said shoulders, a guide-plate having a slot therein and a lug on the yoke entering said slot, a spring interposed between the end of the car and the chafing-plate, and a tie-rod bearing upon the outer end of the spring and projecting through the axis thereof and pivotally connected to the yoke, substantially as described.

479,026. SNAP-HOOK. WILSON R. SHEAL, Grahamton, Pa. Filed Feb. 11, 1892. Serial No. 421,182. (No model.)

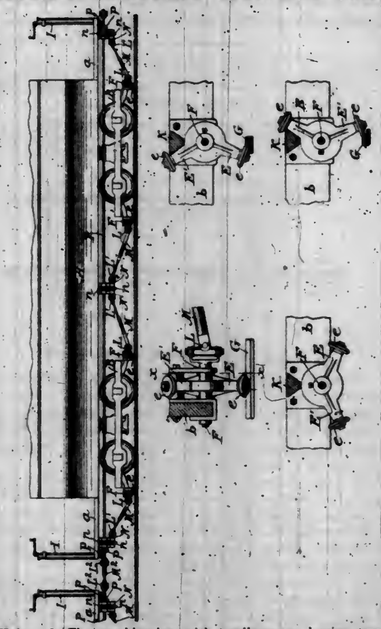


Claim.—1. The herein-described improved snap-hook, consisting of the shank curved to form the hook and provided in its shank with a slot or recess and at its outer end with a bifurcation, the curved tongue pivoted in the bifurcation and having its outer end lying upon the shank and its inner end curved to approximate the hook and terminating in the opening or slot in the shank thereof immediately adjacent to the end of the locking-lever, and the locking-lever pivoted between its ends in said slot and having its outer end spring-pressed into the path of the inner end of the tongue, substantially as specified.

2. The combined snap-hook and buckle, the same consisting of the curved shank forming the hook and provided at its inner end with a slot and at its outer end with a bifurcation, the curved tongue pivoted in the bifurcation and having its outer end lying upon the shank and its inner end curved to approximate the hook and terminating in the slot immediately adjacent the outer end of the locking-lever, the locking-lever pivoted between its ends in said slot and having its outer end spring-pressed into the path of the inner end of the tongue, the frame comprising the front and rear cross-bars, from which former the shank extends, the opposite side bars connecting the front and rear bars, the intermediate cross-bars arranged at opposite edges of the side bars and out of alignment with each other, the rearmost of said intermediate bars having an upwardly-disposed stud 5, and the cross-bar 7, arranged in front of the two intermediate cross-bars and opposite the space between the same, substantially as specified.

479,027. RAILROAD-CROSSING. THOMAS SMITH, Philadelphia, Pa. Filed Sept. 13, 1891. Serial No. 406,081. (No model.)

Claim.—1. The combination of the track-rails, the guard-rail, the fixed rail-sections, and the movable rail-sections adapted to move from the guard-rail to the track-rails between the track-rails and the fixed rail-sections.



479,027.

2. In a railroad-crossing of the character described, the movable rail-sections having one end turned slightly outward, substantially as and for the purposes set forth.

3. The combination of the movable rail-sections, the rods connecting the same in pairs, links connecting the rods in pairs, an angle-lever connecting the pairs of rods, and means for operating the said lever.

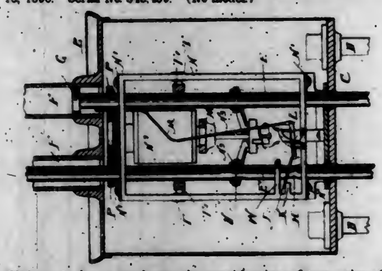
479,028. STREET-RAILWAY SWITCH. ROSWELL T. SMITH, Nashua, N. H. Filed Jan. 27, 1892. Serial No. 419,395. (No model.)

Claim.—1. The combination, with a railway-car having two or more trucks, of a switching device supported in front of each truck, a common actuating device, and connections therefrom to said switching device, substantially as shown and described.

2. The combination, with a railway-car having two or more trucks of a switching device supported in front of each truck, a common shaft running lengthwise of the car, means to rotate said shaft, and connections from said shaft to each of said switching devices, substantially as shown and described.

3. The combination, with a railway-car having a truck with two or more pairs of wheels, of a switching device supported in front of the truck, a second switching device supported in the rear of the truck, a longitudinal rotatable shaft, gears between said switching devices and said shaft, whereby said switching devices may be moved in the

same direction at the same time, and means to operate said shaft, substantially as shown and described.



4. The combination, with two or more railway-cars adapted to be coupled together, of a switching device comprising a swinging arm adapted to engage a switch-rail or guide-rail and supported in front of each truck-frame, a common actuating device, connections therefrom to each of said switching devices, whereby they may move together, and means to operate said actuating device, substantially as shown and described.

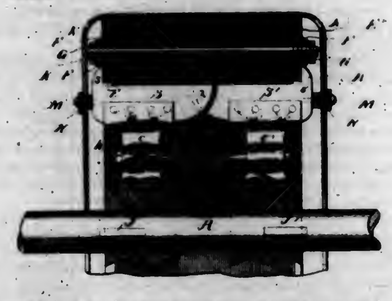
5. The combination, with two or more railway-cars adapted to be coupled together, of switching devices supported by the truck-frames of the cars and each comprising a swinging arm adapted to engage a switch-rail or guide-rail, a shaft running lengthwise of the first car, means to rotate said shaft, connections from said shaft to the switching device of the first car, a shaft supported by the second car, and intermediate connections to the switching device of the second car, and a coupling between said shafts, substantially as shown and described.

6. In a street-railway switching device, the combination, with the truck-frame, of a short shaft mounted upon said truck-frame, oppositely-placed arms secured to said shaft and adapted to engage a guide or switch rail, a hand-shaft mounted upon the platform of the car, a short shaft also supported by said platform and geared to said hand-shaft, and an extensible shaft intermediate the short shaft supported by the platform and that supported by the truck-frame and connected thereto by universal joints, substantially as shown and described.

7. In a street-railway switching device, the combination, with the truck-frame, of a substantially straight bar pivotally supported at its middle on a cross-bar of the truck-frame and having its members extended to the line of the wheels on either side and having its ends adapted to engage switch-rails at the side of the track, an operating device mounted upon the platform of the car, and extensible and yielding transmitting means between said hand operating device and said pivoted bar, substantially as shown and described.

479,029. ELECTRIC-ARC LAMP. ELMER A. SPERRY, Chicago, Ill., assignor to the Sperry Electric Company, same place. Filed Apr. 18, 1890. Serial No. 348,459. (No model.)

Claim.—1. In an arc lamp, the combination of two pairs of carbons with encircling feeding-clamps for the two upper carbon-rods and a similar suspending-clamp for one of such carbon-rods, and a groove or ledge encircling said carbon-rod and receiving such clamp, so as to retain such carbon-rod at a proper elevation for a determinate period, as and for the purpose shown and described.



2. In an electric-arc lamp, the combination of a spring-supported frame with a shunt-magnet, a lever on which such frame rests, a cut-out magnet normally open, and an angularly-bent rod one end of which is attached to a lever by which the cut-out magnet can be closed and the other placed in proximity to a moving portion of the spring-supported frame of the shunt-magnet lever.

3. In an arc lamp, the combination of two pairs of carbons with feeding-clamps for the two upper carbon-rods and a suspending-clamp for one of such carbon rods, and a groove or ledge encircling one of said carbon-rods and receiving such clamp so as to retain such carbon-rod at a proper elevation, the same carbon-rod being also provided with a second groove or ledge encircled by one of the feeding-clamps, so as to prevent feeding of this carbon when the other carbon is burning.

4. In an arc lamp, the combination of two pairs of carbons with feeding-clamps for the two upper carbon-rods and a suspending-clamp for one of such carbon-rods, the same carbon-rod being also provided with a second groove or ledge encircled by one of the feeding-clamps, so as to prevent feeding of this carbon when the other carbon is burning.

5. In an arc lamp, the combination of two pairs of carbons with feeding-clamp N^3 for the two upper carbon-rods E and E' and a suspending-clamp J, encircling a groove or ledge H on carbon-rod E' at a proper elevation, the carbon-rod E being also provided with a second groove or ledge V, the said groove or ledge V being encircled by one of the feeding-clamps N^3, so as to prevent feeding of carbon D^4 when carbon D^4 is burning, the said rod E being released by action of the rod E raising the clamp J, thereby allowing rod E' to descend.

479,030. ARMATURE FOR ELECTRIC MACHINES. ELMER A. SPERRY, Chicago, Ill., assignor to the Thomson-Houston Electric Company, Boston, Mass. Filed Dec. 17, 1891. Serial No. 415,397. (No model.)

Claim.—1. In an armature for electric machines whereof the core is made up of thin rings or disks, axially-extending projections secured to the end disks or rings through which the tie-bolts pass and from which they are insulated.

2. In an armature for electric machines whereof the core is made up of thin rings or disks insulated from each other, a thicker ring or disk on the end of the core, having axially-extending projections secured thereto, in combination with tie-bolts passing through the projections and insulated therefrom.

3. In an armature for electric machines whereof the core is made up of thin rings or disks insulated from each other, a thicker ring or disk on each end of the core, provided with axially-extending projections, said projections being provided with a shoulder bearing against the outer side of the ring and riveted on the inner side, in combination with tie rods passing through the projections and insulated therefrom.

4. In an armature for electric machines, a laminated sheath surrounding the coils and the core, said sheath consisting of a series of thin annular metallic rings insulated from the coils and the core.

5. In an armature for electric machines, a laminated sheath surrounding the coils and the core, said sheath consisting of a series of thin annular rings of magnetic metal insulated from the coils and from the core.

6. In an armature for electric machines, a laminated sheath surrounding the core and the coils, said sheath consisting of a series of thin annular rings of soft iron insulated from the coils and the core.

7. In an armature for electric machines whereof the coils are wound in grooves in the core, a laminated sheath covering the coils and the core and insulated therefrom, said sheath consisting of thin annular rings of soft iron.

8. In an armature for electric machines, a laminated sheath covering the coils and the core and insulated therefrom, said sheath consisting of a series of thin annular metallic rings and retained in position by caps rotating with the armature and bearing against the ends of the sheath.

9. In an armature for electric machines, a laminated sheath covering the coils and the core and insulated therefrom, said sheath consisting of a series of thin annular metallic rings, in combination with caps secured to the armature and insulated therefrom and bearing against the ends of the sheath.

10. In an armature for electric machines, a laminated sheath covering the coils and the core and insulated therefrom, said sheath consisting of a series of thin annular metallic rings, in combination with caps bearing against the ends of the sheath and rotating with the armature and provided with ventilating-holes.

11. In an armature for electric machines, a laminated sheath covering the coils and the core and insulated therefrom, said sheath consisting of a series of thin annular metallic rings, in combination with caps of aluminium-silver rotating with the armature and bearing against the ends of the sheath.

12. In a ring-armature for electric machines, the combination of the shaft, two hubs mounted thereon, supports secured to the hubs and insulated therefrom, those of one hub bearing against one end of the armature-core and those of the other hub bearing against the other end of the armature-core, and means for drawing the hubs together on the shaft and clamping the core between the supports, coils upon the armature-core, and a laminated sheath covering the coils and insulated therefrom, with caps secured to the supports borne by the hubs, insulated therefrom, and bearing against the ends of the sheath.

13. In a ring-armature, in combination with the core and the shaft, two hubs mounted upon the shaft, supports secured to the hubs and insulated therefrom, those of one hub bearing against one end of the armature-core and those of the other hub bearing against the other end of the armature-core, and means for forcing the hubs toward each other on the shaft and clamping the armature-core between the supports.

14. In a ring-armature, in combination with the core and the shaft, two hubs mounted upon the shaft, supports secured to the hubs and insulated therefrom, those of each hub overlapping those of the other between the hubs and bearing against the respective ends of the armature-core, with bolts passing through the two hubs and adapted to draw the hubs together, whereby the core is clamped between the supports, substantially as described.

15. In a ring-armature, two hubs mounted upon the armature-shaft, supports secured to the hubs and insulated therefrom and bearing against the inner side of the core, the supports secured to each hub overlapping those of the other in alternate order between the hubs and bearing against the respective ends of the armature-core, with bolts passing through the hubs and adapted to draw them together, whereby the core is clamped between the supports.

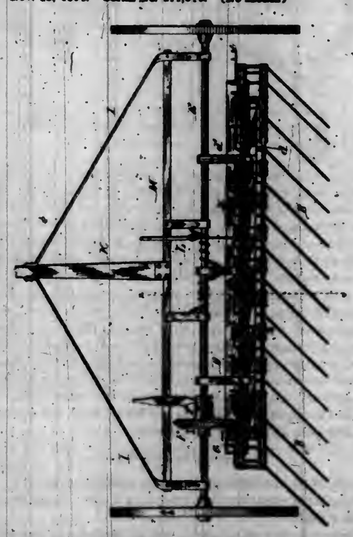
16. In a ring-armature, in combination with the core, two hubs mounted upon the armature-shaft, supports secured to the hubs and insulated therefrom and bearing against the inner side of the core, the supports secured to each hub overlapping those of the other between the hubs and bearing against the respective ends of the armature-core, with bolts passing through the hubs, adapted to draw them together, whereby the core is clamped between the supports.

479,031. DELIVERY-WAGON. CHARLES H. SUPPLEE, Philadelphia, Pa. Filed Mar. 14, 1892. Serial No. 424,760. (No model.)

Claim.—1. A two-wheel delivery-wagon provided with a body having a driver's seat adjacent to the rear wall and entrances and exits located in the side walls opposite the ends of the seat and having a closed lower front portion adapted to contain parcels, cans, and the like and to afford a space above the same for the passage of the reins, substantially as and for the purposes set forth.

2. A two-wheel delivery-wagon provided with a body having a driver's seat, a closed rear wall forming a back for said seat, side walls having entrances and exits opposite the extremities of said seat, and a dasher at the front of the body, over which the reins pass, substantially as and for the purposes set forth.

3. A two-wheeled delivery-wagon comprising a body provided with a driver's seat located at the rear thereof and with entrances and exits opposite the ends of said seat, an axle cranked downward at the center thereof to accommodate the body, shafts connected by front and rear distance-pieces and curved upward to accommodate the axle, transversely-ranging springs connecting the front and rear of the body to said shafts, and side springs attached, respectively, to the under side of the straight portions of the axle and having their extremities connected with the shafts, substantially as and for the purposes set forth.



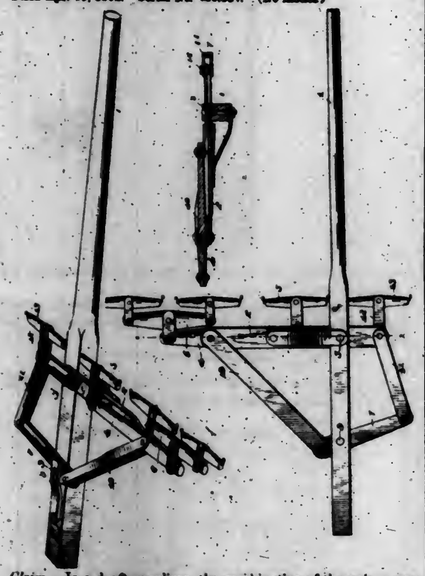
479,032. FLEXIBLE HANDLE FOR TOOLS. JOHN S. BURBADGE, Ottumwa, Iowa. Filed Aug 10, 1891. Serial No. 402,215. (No model.)

Claim.—1. As an improved article of manufacture, a handle for striking-tools, consisting of a length of coiled wire having its one end adapted in shape to enter the eye of a tool, and means for securing it therein, for the purposes stated.

2. A handle for striking-tools, consisting of a length of coiled wire having its one end adapted in shape to enter the eye of a tool, and a plug adapted to enter the end of the handle when in the eye of the tool, and means for jointly fastening the end of the handle and the plug within the eye of the tool.

3. A tool-handle consisting of two or more concentric coils of wire and a solid-metal filling in the inner coil, substantially as set forth, for the purposes stated.

479,033. HORSE HAY-RAKE. ERNEST SWIFT, De Kalb, Ill. Filed Nov. 12, 1891. Serial No. 411,810. (No model.)

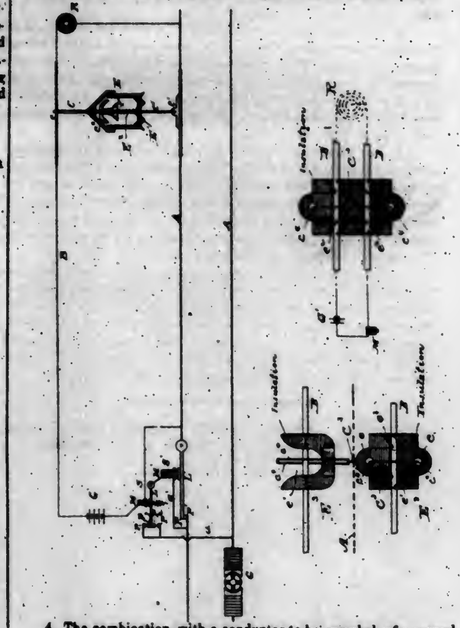


Claim.—1. A hay-rake comprising a transversely-positioned endless rake-tooth carrier arranged across the machine and operated for side delivery and a set of curved rake-teeth attached to the endless carrier and supported to set while raking with their curved portions in planes oblique both to the line of progression of the machine and to the line of travel of the endless carrier toward one side of the machine, the teeth engaged in raking being carried diagonally forward and maintained to respectively exert upon the material being raked a forward pull in a direction coincident with the plane occupied by the curved portion of the tooth, substantially as described.

2. A hay-rake comprising a tilting frame arranged in rear of and supported by the wheeled axle, an endless carrier supported upon the tilting frame and arranged parallel with the axle, so as to travel from side to side of the machine, a set of curved rake-teeth attached to the endless carrier and supported to set while raking with their curved portions in planes oblique both to the line of progression of the machine and to the line of travel of the endless carrier, substantially as described.

3. The combination, in a hay-rake, of the endless transversely-positioned carrier arranged across the machine and the curved rake-teeth attached to the carrier so as to set while raking with their curved portions in planes oblique both to the line of progression of the machine and to the line of travel of their endless carrier and having horizontal stems or shanks which are arranged transversely to and pivotally supported by the endless carrier, substantially as described.

479,084. DRAFT-EQUALIZER. JOHN S. THOMPSON, Cyrus, Minn. Filed Apr. 16, 1892. Serial No. 429,367. (No model.)



Claim.—In a draft-equalizer, the combination of the pole, a supplemental beam extending outwardly from and terminating at its inner end at the pole and having a beam eccentrically connected to the outer portion thereof and carrying a singletree at the inner end thereof and a doubletree at the outer end of the same, a pair of connecting-bars, attached at their forward ends to the outer end of the beam, secured to the supplemental beam, all of said parts being arranged on one side of the pole, a lever eccentrically mounted on the pole in rear of the supplemental beam, to one end of which the rear portion of said connecting-bars are attached, said lever being confined in position by a clip, a pair of connecting-bars extending from the opposite side of said lever, a lever carried by the bolt of the said supplemental beam independent of and extending outward in line with said supplemental beam, on the outward end of which the last-named connecting-bars are secured, and a singletree secured to the latter lever and the adjacent connecting-bars, substantially as described.

479,085. SAFETY DEVICE FOR ELECTRIC CIRCUITS. MANDEVILLE TEWS, Louisville, Ky. Filed June 5, 1891. Serial No. 395,266. (No model.)

Claim.—1. The combination, with a conductor to be guarded, of a second or guard conductor arranged in proximity thereto and constituting a part of an electric circuit, a safety device in said circuit and adapted to effect a change in the guarded circuit, and conducting and electric contact devices between said conductors adapted to complete an electric connection between them upon an undue displacement of one of the said conductors, substantially as set forth.

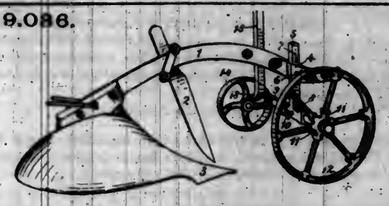
2. The combination, with a conductor to be guarded, of a second or guard conductor constituting a part of an electric circuit, a safety device in said circuit adapted to effect a change in the guarded circuit, a source of electrical energy for said circuit separate from the generator of the guarded circuit, and normally-open circuit-closing devices between said conductors, substantially as set forth.

3. The combination, with a conductor to be guarded, of a second or guard conductor in an electric circuit and arranged in proximity to the first conductor, a safety device in said circuit, and conducting and electric contact devices between said conductors adapted to complete an electric connection between them upon an undue displacement of one of the said conductors, substantially as set forth.

4. The combination, with a conductor to be guarded, of a second or guard conductor in an electric circuit in which the guarded conductor is included and arranged in proximity to the latter, a safety device in said circuit, and conducting and electric contact devices between said conductors adapted to complete an electric connection between them upon an undue displacement of one of the said conductors, substantially as set forth.

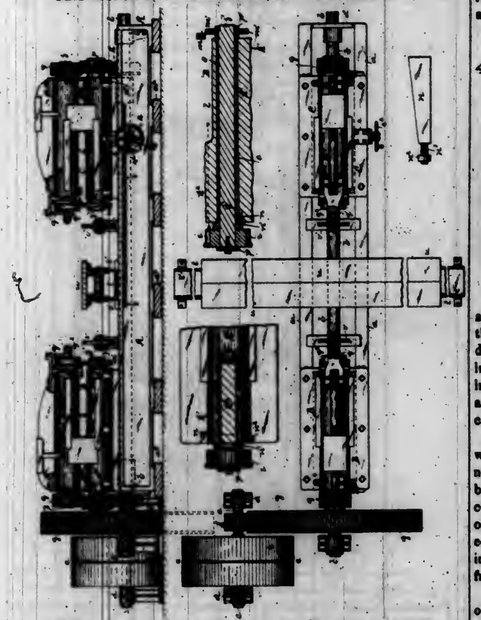
5. The combination, with a guarded conductor and a guarding-conductor, of an electrical connection joined to one of said conductors and extending beyond the other conductor, and an insulating-guide mounted on the latter conductor and engaging said connection, the latter being adapted to engage the conductor beyond which it extends upon undue displacement of one of the conductors, substantially as set forth.

6. The combination, with a conductor and a second conductor acting as a guard therefor, of a circuit-closing conductor connected with the first conductor and extending above and adapted to engage said guard, and an insulating-guide depending from the guard and engaging the circuit-closing conductor, substantially as set forth.



7. The combination, with the conductor A and the guard B, having a connection C^3, of an insulating-guide E^3, mounted on the guard and engaging said connection, substantially as set forth.

8. The insulating support and guide E^3, adapted to be mounted upon a conductor and having slot e^3 for engaging the conductor, and apertures e, adapted to receive and guide an electrical connection, substantially as set forth.

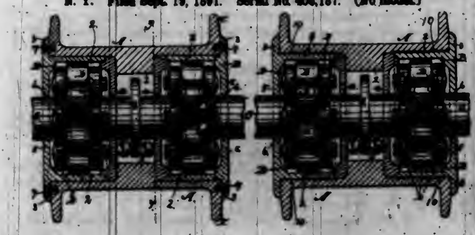


479,086. PLOW. THOMAS TINKLER, Whitchurch, Canada. Filed Aug. 24, 1891. Serial No. 403,517. (No model.) Patented in Canada Apr. 21, 1891, No. 36,433.

Claim.—In a plow, the combination of the furrow-wheel secured to revolve on the end of the crom-bar adjustably secured in the T-headed lower extremity of a vertical standard adjustably secured toward its upper extremity to the front end of the plow-beam, the whole to regulate the width and depth of the score, and the land-wheel secured to revolve on the lower extremity of another vertical standard adjustably secured to the plow-beam at a point conveniently in rear of the standard of the furrow-wheel to maintain the plow at right angles to the surface of the land, substantially as shown and described.

479,086.

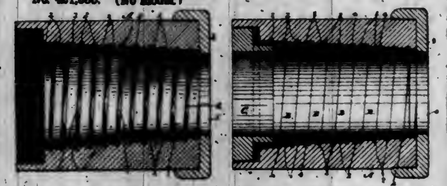
479,087. ROTARY SHEARS. SAMUEL TRETHEWEY, Pittsburg, Pa., assignor to the Trethewey Manufacturing Company, same place. Filed June 30, 1891. Serial No. 398,023. (No model.)



Claim.—1. In rotary shears, the combination, with a bed or frame, of cutter-shafts journaled therein, cutters secured to said shafts, and a bracket projecting out over the upper cutter and having a depending arm carrying a roller, said roller being adapted to press upon the upper face of the sheet, plate, &c., being cut, substantially as and for the purposes set forth.

2. In rotary shears, the combination, with the frame, of cutter-shafts journaled therein, the one above the other, and a wedge-shaped key engaging a flange on a bushing surrounding the lower cutter-shaft, said key acting to force back the said cutter-shaft and prevent any longitudinal movement on the part of the cutter secured thereto, substantially as and for the purposes set forth.

3. In rotary shears, the combination, with the frame, of the lower cutter-shaft *f*, a bushing *o*, having the flange *n'*, the wedge *n*, the plate *p*, secured to the shaft *f*, the cutter *m'*, and nut *p'*, substantially as and for the purposes set forth.



479,088. ROLLER-BEARING. FRANK VAN BENTHUYSEN, Albany N. Y. Filed Sept. 19, 1891. Serial No. 406,167. (No model.)

Claim.—1. The combination of a shaft provided with a circumferential flange which separates the journal into two parts, a wheel-hub having at each end a recess for containing a roller-bearing, said recesses being separated by an internal circumferential flange or rib and each of said roller-bearings being contained in a cage that is removable from said hub, and anti-friction balls or rollers interposed between the inner end of said cages and the flange of said shaft, as and for the purpose herein specified.

2. The combination of a hub A, having an open-ended chamber, an annular end piece 4, having at the periphery of its outer face an annular groove, said end piece being fitted to bear against the inner end of said chamber, a cage B, consisting of a body-piece 2 and the end piece 4, said body-piece having its inner end fitted to engage in the annular groove of said end piece and its outer end provided with a circumferential flange which overlaps onto the outer face of said hub, and a roller-bearing D, contained in said cage and fitted to revolve therein, as and for the purpose herein specified.

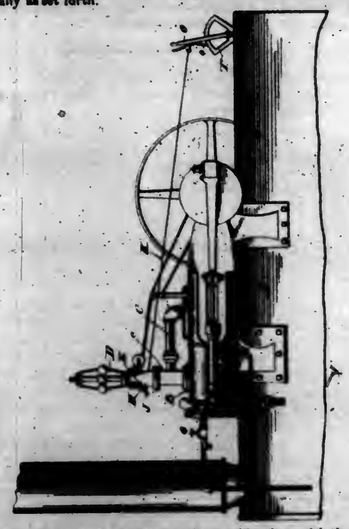
479,089. REDUCIBLE LINING FOR JOURNAL-BEARINGS. FRANK VAN BENTHUYSEN, Albany, N. Y. Filed Feb. 12, 1892. Serial No. 421,335. (No model.)

Claim.—1. A reducible lining for journal-bearings, consisting of a metallic ribbon which tapers uniformly in thickness from one end to the other, said ribbon being coiled in a helicoidal form, so as to produce a bore of uniform diameter, said lining being uniformly reduced in its outer diameter from one end of the coil to the other and having its outer face provided with means, substantially as described, for adapting said lining to be screwed into the corresponding bore of a casing, as and for the purpose herein specified.

2. The combination of a reducible lining for journal-bearings, which consists of a metallic ribbon which tapers uniformly in thickness from one end to the other and is coiled in a helicoidal form, the bore of said coil having a uniform diameter, and the outer face of said coil decreasing uniformly in diameter from one end of the coil to the other, and a casing whose bore is formed by a series of helicoidal steps corresponding to the outer surface of said lining, the bore of said casing decreasing uniformly in diameter by means of said helicoidal steps from one end to the other, as and for the purpose specified.

3. The combination of a reducible lining for journal-bearings, made of a metallic ribbon of uniform width, but tapering in thickness from one end to the other and having on one face a longitudinal rib, said metallic ribbon being coiled in a helicoidal form to produce a bore of uniform diameter and the said rib being arranged on the outer face of said lining, and a casing for containing said lining, whose bore is composed of a series of helicoidal steps corresponding to the formation of the outer face of said lining and provided with a helicoidal groove for receiving the rib of said lining, as and for the purpose herein specified.

4. The combination of a lining for journal-bearings, which is made in a helicoidal form, whose outer diameter decreases uniformly from one end to the other, a casing whose bore is formed of a series of helicoidal steps fitted to receive said lining, and means, substantially as herein described, for securing said lining in said casing, as and for the purpose herein specified.

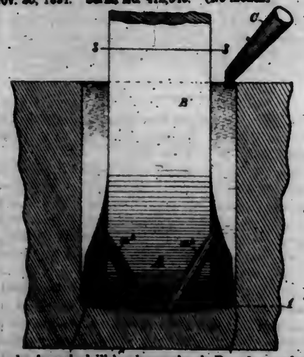


479,040. SPEED-GOVERNOR ATTACHMENT. WILLIAM B. WARNER and HENRY F. WARNER, Monticello, Iowa. Filed Dec. 31, 1891. Serial No. 416,706. (No model.)

Claim.—1. In a governor-valve regulator, the combination, with the governor-valve and the stem-casing thereabove, of an actually-rocking shaft journaled in the valve-stem casing, a lever or rock-arm keyed to said shaft and loosely connected with the valve-stem, an oscillating head loosely working upon said shaft, a coiled spring secured to said lever and head, and means for oscillating said head, substantially as set forth.

2. In a governor-valve regulator, the combination, with the governor-valve and the stem-casing thereabove, of an actually-rocking shaft journaled at one end in the valve-stem casing, a forked lever or rock-arm keyed to said shaft and loosely embracing and connected with the valve-stem, an oscillating head loosely working upon said shaft and provided with an inner flanged arm, and a supplemental inwardly-projecting arm opposite to said flanged arm, a coiled spring

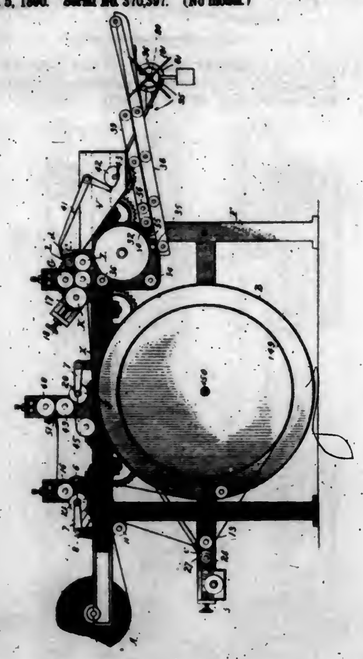
secured to said forked lever and head, an operating chain and rod secured to said flanged arm and passing under said supplemental arm, and means for operating said chain and rod, substantially as set forth.



3. In a governor-valve regulator, the combination, with the governor-valve and the stem-casing thereabove, of an actually-rocking shaft journaled at one end in the valve-stem casing, a forked lever or rock-arm keyed to said shaft and loosely embracing and connected with the valve-stem, an independent actuating-lever keyed to and depending from the outer end of said shaft, an oscillating head loosely working upon said shaft and provided with an inner flanged end or arm, and an outwardly-projecting tappet-arm adapted to engage with said independent lever, a coiled spring secured to said forked lever and said head, a lever-and-segment attachment, and an operating chain and rod connected with said flanged end or arm and said attachment, substantially as set forth.

4. In a governor-valve regulator, the combination, with the governor-valve and the stem-casing thereabove, of an actually-rocking spring-actuated shaft journaled in the valve-stem casing and having a rock-arm connected with the valve-stem, and means for controlling the spring rocking said shaft, substantially as set forth.

5. In a governor-valve regulator, the combination, with the governor-valve and the stem-casing thereabove, of an actually-rocking spring-actuated shaft journaled in the valve-stem casing, a lever or rock-arm keyed to said shaft and connected with the valve-stem, and means for controlling the spring oscillating said shaft, substantially as set forth.



479,041. ROCK-DRILLING TOOL. GEORGE L. WELLER, Elyria, Ohio, assignor to Parks Foster and Eugene K. Mussey, same place. Filed Nov. 23, 1891. Serial No. 412,849. (No model.)

Claim.—1. A rock-drill having a shank B and an enlarged head provided with the channels a^2 a^2, the operating-face of said head having V-shaped ends, substantially as set forth.

2. A rock-drill having a shank B and an enlarged head provided with the channels a^2 a^2, the operating-face of said drill having V-shaped ends and straight sides, which are parallel to and equidistant from a straight line extending between the points of said V-shaped ends, substantially as set forth.

479,042. ENVELOPE-MAKING MACHINE. JAMES WEST, St. Louis, Mo., assignor of one-half to Samuel Cupples, same place. Filed Nov. 5, 1890. Serial No. 370,397. (No model.)

Claim.—1. The combination, with the rolls for creasing and folding the strip and the cutter for severing the blanks from the web, of a transverse cutter for severing the corners of the strip, substantially as set forth.

2. The combination, with the transverse cutting devices and the feed-rolls, of the cutter-bar C, blades *d*, arranged to shear with the bar C, and means for moving said blades periodically, substantially as described.

3. The combination, with the creasing, folding, and cutting device arranged to deliver the blanks downward with the flaps uppermost, of a carrier for carrying the folded blanks forward and a folder constructed to turn down the flaps, substantially as described.

4. The combination, with the folding and cutting rolls, of a cylinder recessed to receive the flap of the envelope and carrying a folding-bar, with means for bringing the latter against the flap to fold it down against the body of the envelope, substantially as set forth.

5. The combination, with the cylinder 32, of the sliding and hinged folding-bar 61 and side guides wherein it can slide peripherally upon the cylinder, arranged substantially as set forth.

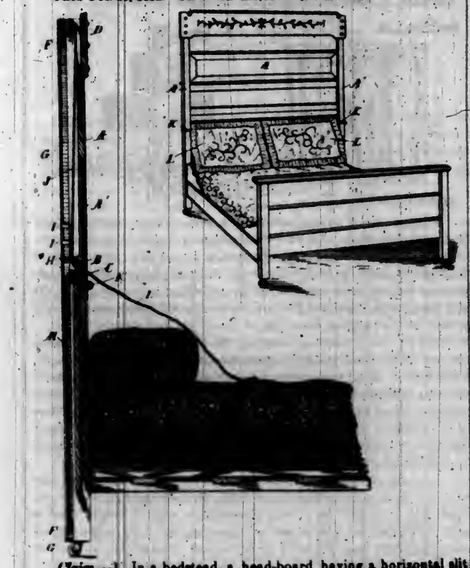
6. The combination, with the cylinder, of the plate 160, sliding peripherally in guides upon the cylinder, the folding-bar 61, hinged thereto, and the detent for temporarily holding the bar in one position, substantially as described.

7. The combination of the cylinder 32, supporting one or more hinged folding-bars and recessed to receive the flaps of the envelopes and traveling bands arranged to hold the body of the envelopes against the cylinder, substantially as specified.

8. The combination, with the devices for feeding the envelopes and finishing them by folding down the flaps, of traveling conducting-bands and means for driving them at a speed slower than that at which the envelopes pass from the said devices, and mechanism for separating the envelopes into bundles, substantially as described.

9. The combination, with the traveling bands 28, of one or more revolving blades 181 and means for carrying them at intervals forward against the envelopes, substantially as described.

10. The combination, with the traveling bands, of a shaft carrying cross-blades and means for imparting an intermittent revolution to the shaft, substantially as set forth.



11. The combination, with the shaft and its carrying-blades, of a disk provided with projections, a weighted arm carrying a pawl, and means, substantially as described, for raising and lowering the arm and for carrying said pawl to and from said projection, substantially as set forth.

12. The combination, with the shaft 80 and its blades, of a disk 81, having projections 94, a rotating disk 85, having projections 86, a weighted arm provided with a pivoted dog, and a fixed stop for making contact with said dog, substantially as set forth.

13. The combination, with the disks 81 and 85, their projections, and weighted arm and dog, of cams 88 89, substantially as set forth.

14. The combination, with the disk 81, weighted arm, and operating appliances, of a ratchet 81 82 and pawl 83, extended to make contact with a part of the weighted arm, substantially as described.

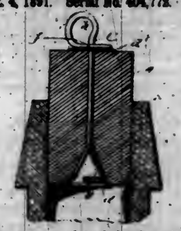
479,043. BEDSTEAD. PETER L. WHITE, Grand Rapids, Mich. Filed Feb. 10, 1892. Serial No. 421,017. (No model.)

Claim.—1. In a bedstead, a head-board having a horizontal slit near the middle, a roll journaled in the upper side of said slit, a roll journaled near the top of and behind said head-board, tapes attached to the upper edge of the pillow-shams and passing under the first-named roll and over the upper roll, and a bar attached to the other end of said tapes, substantially as described.

2. In a bedstead, a head-board having a horizontal slit near the middle, a roll near the top and behind said head-board, pillow-shams having their upper edges inserted in said slit and extended upward and over said roll and attached to a bar sliding in vertical grooves in the head-board posts, and an adjustable stop for said sliding bar, substantially as described.

3. In a bedstead, a head-board having a horizontal slit near the middle, rolls journaled in the same near its respective upper and lower sides and a short distance apart, a roll journaled near the top of and behind said head-board, vertical grooves in the head-board posts, weight-bars running in said grooves, shams passing between said rolls, tapes attached to the upper edge of said shams, passing over said upper roll, and attached to said upper weight-bar, and a netting also passing between said rolls, attached to said lower weight-bar at its rear end, and having a laterally-projecting rod attached to its forward end, substantially as described.

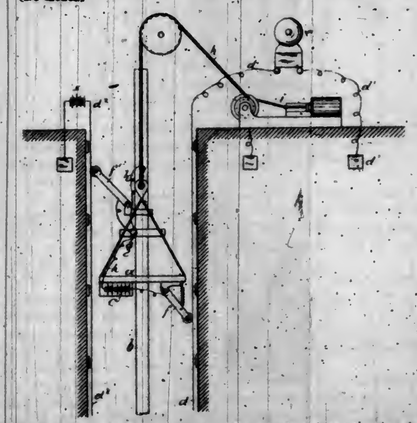
479,044. COFFIN-HANDLE. LEWIS H. WILLIAMS, Akron, Ohio. Filed May 24, 1892. Serial No. 434,201. (No model.)



Claim.—1. In a coffin-handle, a screw-threaded shaft and a handle pivotally connected therewith, combined with two nuts meshing on said shaft, one to form an adjustable abutment for the other to draw against, substantially as shown.

2. In a coffin-handle, an arm having a knuckle-joint member, and a finger projecting beyond said member, and an escutcheon having a hollow boss with an opening to receive, fit, and conceal the jointed part of said arm, and a diaphragm back of said boss, combined with a screw-threaded shaft having knuckle-joint members to receive said arm member, a shoulder to engage said diaphragm, and a nut to attach the whole to a coffin, substantially as shown and described.

3. In a coffin-handle, the combination of a screw-threaded shaft having knuckle-joint members and two nuts meshing on its screw-threaded portion, an arm having a knuckle-joint member pivoted to the members of said shaft, and a projecting finger to engage the upper part of said shaft members when the arm is rocked upward, an escutcheon having a boss with an opening to receive and conceal the joint of the handle and shaft, and a diaphragm to engage the back of the joint members of said shaft, substantially as shown and described

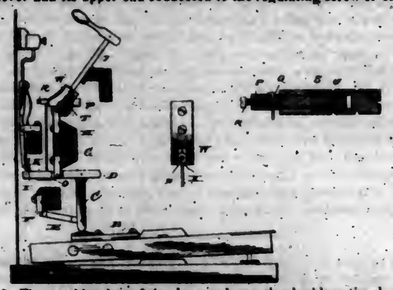


---

479,045. BOTTLE-STOPPER. GEORGE F. ATWOOD, Malden, Mass., assignor, by direct and mesne assignments, to George M. French, same place. Filed Sept. 4, 1891. Serial No. 404,772. (No model.)

Claim.—A bottle-stopper of cork having a conical recess in its bottom, a conical wooden button B to fit closely within and against the walls of said recess, and a lifting-wire C, the lower end of which is secured to said button in the groove, while the upper end is bent to form both a loop and clamping-arm, substantially as specified.

479,046. ELECTRIC SIGNAL FOR MINE-SHAFTS. FREDERICK W. BACORN, Marysville, Mont. Filed Feb. 27, 1892. Serial No. 422,995. (No model.)



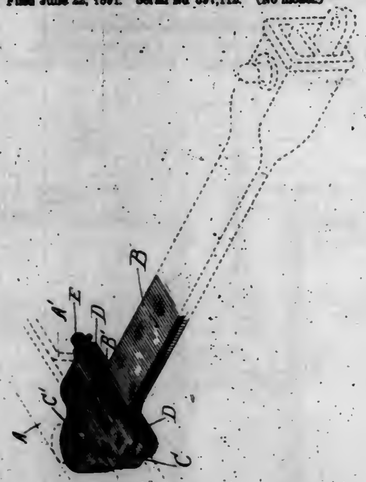
Claim.—The combination, with a mine-shaft and an electric wire therein extending through its length, electrically open at its lower end and connected at its upper end with signaling mechanism, and a cage provided with a trolley on said wire, of a second open wire extending through the length of the shaft, and a trolley thereon, and a push-button electrically connecting said trolleys and wires, said wires completing the circuit through said signaling mechanism, substantially as specified.

479,047. PIANO-ACTION. EUGENE C. BAUMAN, Philadelphia, Pa. Filed Apr. 18, 1891. Serial No. 389,431. (No model.)

Claim.—1. In a piano-action, the combination of the double-act-

ing lever, the hammer, and a perpendicular spring-rod connecting the double-acting lever and the hammer.

2. The combination of the double-acting lever, the hammer, the regulating screw or case mounted in the hammer-butt, and the perpendicular spring-rod having its lower end secured to the double-acting lever and its upper end connected to the regulating screw or case.

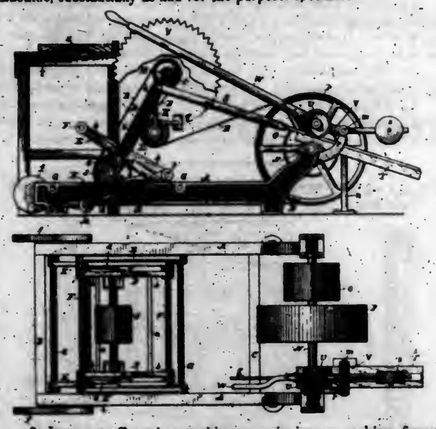


3. The combination of the damper-lever, the double-acting lever having its rear end acting on the damper-lever, the hammer, and the perpendicular spring-rod having its lower end secured to the double-acting lever and its upper end connected to the hammer.

4. The combination of the hammer, the spring-rod acting thereon, the plug having the end of the spring-rod secured thereto, and the rotatable barrel engaging the plug.

5. The combination of the hammer-butt, the barrel mounted therein, the pin engaging the barrel, and the spring-rod having its upper end secured to the plug.

6. The combination of the hammer-butt, the double-acting lever, the plug carried by the hammer-butt, the spring-rod having its upper end secured to the said plug and its lower end bent under and inserted into the double-acting lever, and the clamping-plate secured to the double-acting lever over the said bent end of the spring-lever.

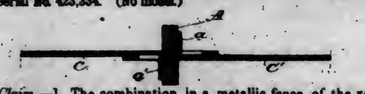


479,048. DRAW-BAR FOR CARS. JOHN L. BLESSING, Chicago, Ill. Filed June 22, 1891. Serial No. 397,113. (No model.)

Claim.—In a draw-bar for cars, the combination, with two parallel supporting cross-bars, of a block having an eye in its rear and horizontal ears, the upper and lower faces of the entire block being parallel and flat throughout its entire width and length, a pin passing through the eye and cross-bars, a draw-bar having a horizontal eye in its end and a coupling device on its opposite end, and a pintle passing through the ears of the block and eyes of the draw-bar, substantially as described.

479,049. CUT-OFF SAWING-MACHINE. MAURICE R. BLOOD, Kalamazoo, and CLARENCE C. BLOOD, Petoskey, assignors of one-half to Orville T. Blood, Petoskey, and the Fuller Brothers Manufacturing Company, Kalamazoo, Mich. Filed Nov. 19, 1890. Serial No. 371,968. (No model.)

Claim.—1. In a cut-off sawing-machine, a swinging or rocking frame carrying the saw-arbor H in its upper part and an idler-pulley J in its lower part, the said rocking frame being pivoted at its four lower corners to the upper end of four arms E E E E, the said arms E E crossing each other at the sides of the said rocking frame and being pivoted at the lower end to the main or stationary frame of the machine, substantially as and for the purposes specified.

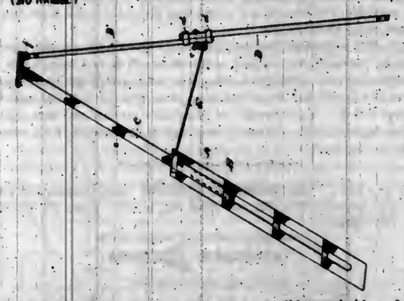


2. In a cut-off sawing-machine, a swinging or rocking frame for carrying the saw, and the location and arrangement on said rocking frame of the saw-arbor H, idler-pulley J, and the pivot points or bearings on the four lower corners for hinging the supports, in combination with suitable supports having a yielding action hinged to the said pivot-points on the lower corners of the said frame, substantially as and for the purposes specified.

3. In a cut-off sawing-machine, the swinging frame that carries the saw-arbor made of side pieces in the form of an inverted cross, the outer ends of these cross-arms pivoted to the upper ends of arms or supports, which arms or supports cross each other at the sides of the swinging frame and are pivoted at their lower ends to the main frame of the machine, all the parts arranged in such a manner as to carry the saw-arbor forward and backward in a straight or nearly straight line, substantially as and for the purposes specified.

4. A cut-off sawing-machine having a rocking or swinging frame to carry the saw-arbor and the swinging frame supported on the pivoted arms E E E E, in combination with a counter-weight *f*, rock-shaft M, having an arm *d*, and a connecting-link *e* for balancing the swinging frame and throwing it backward, substantially as and for the purposes specified.

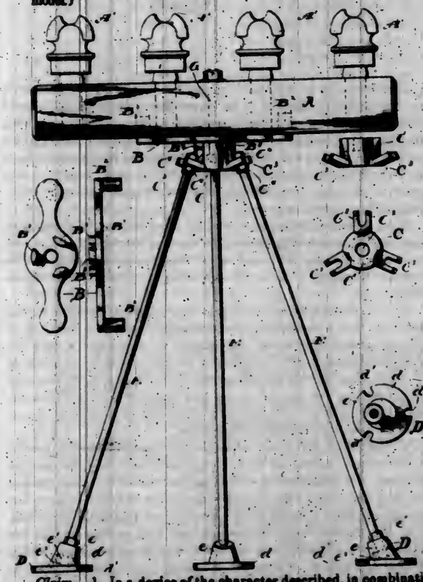
5. In a cut-off sawing-machine, a swinging or rocking frame pivoted on the upper ends of four arms E E E E, which arms are each pivoted to the main frame A at their lower ends, the said swinging or rocking frame carrying on its upper part the saw-arbor and also carrying a tightener-pulley L, which is on a frame K, pivoted to the said swinging or rocking frame, substantially as and for the purposes specified.



479,050. FENCE. ALBERT L. BONNAFFON, Philadelphia, Pa., assignor of one-half to James G. Lindsay, same place. Filed Mar. 1, 1892. Serial No. 423,334. (No model.)

Claim.—1. The combination, in a metallic fence, of the vertical posts A, having vertical slots *s*, provided therein, of a length about equal to the width of the rail ends to be inserted, longitudinal rails C C, passing through the slots *s*, enlargements provided opposite each other in each side of the vertical slot *s* to allow of the entrance of the spur provided in the rail when only partially struck out, and locking-spurs *a a'*, provided in the respective rails integral therewith, struck outwardly away from the adjacent rail, and adapted to engage on opposite sides of the vertical post A, securing the rails rigidly thereto in opposite directions, substantially as described.

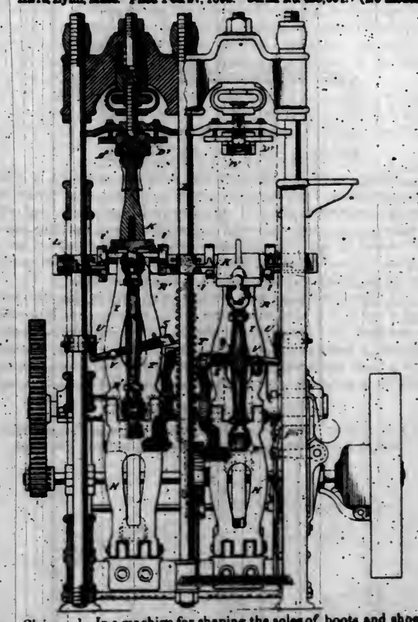
2. In a metallic fence, the combination of vertical posts A, having vertical slots *s*, each of a length about equal to the width of the rail ends to be inserted therein, enlargements being provided in the sides of the vertical slot opposite each other to allow of the introduction of the rail ends when the spurs provided therein are but partially struck out, longitudinal rails C C, and spurs *a a'*, stamped in the ends of the rails, said spurs having their ends when formed adjacent to the end of the rail in which they are formed, the spurs of the rails when in position in the post struck outwardly from the adjacent rails at a substantially right angle to the face of the rails and on opposite sides of the said post, substantially as described.



479,051. STEP-LADDER. LAFAYETTE E. BOWER and ARBURY E. BOWER, San Francisco, Cal. Filed July 30, 1891. Serial No. 400,658. (No model.)

Claim.—1. The combination, with an extensible step-ladder, of the sliding ladder-support pivotally secured thereto, thumb-screw working in an opening formed in said support and adapted to hold the sections securely together, and of the brace-wires for holding the ladder-support firm, as and for the purpose set forth.

2. The combination of a permanent section of a step-ladder, a sliding or telescoping upper section moving in an elongated slot in the lower section, a hinged support pivoted at the upper end to said sliding section and provided with an elongated slot, a lower support provided with an elongated slot, a set-screw passing through the registering slots of the two supports, guide-loops secured to the lower support, a transverse rod having one end pivotally secured to the upper support and its opposite end connected to the lower section of the ladder, oblique brace-rods having their extremities secured to the upper and lower ends of the upper support, and similar rods having their upper extremities secured to the upper end of the lower support and their lower ends to the base-piece thereof, substantially as set forth.



479,052. ELECTRIC-WIRE SUPPORT. WILLIAM B. BRAGDON, Cumberland Mills, Me. Filed Mar. 4, 1892. Serial No. 423,760. (No model.)

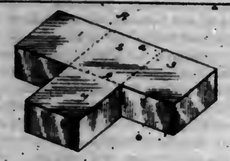
Claim.—1. In a device of the character described, in combination, the rods E, the castings D, forming the feet of the tripod and adapted to be bolted to the lower ends of the rods E, and the castings C, having body portion C' and inclined bifurcated arms, the upper ends of the rods being secured within the bifurcations of said arms by nuts upon the rods, substantially as described, and for the purpose specified.

2. The herein-described tripod for supporting electric-wire insulators, the same comprising, in combination, the rods E, forming the legs of the tripod, the castings D, detachably secured to the lower ends of the rods E and adapted to be secured to the roof of a building, the casting C, having inclined bifurcated arms to receive the upper ends of the rods E, the nuts C^4 upon said rods, the casting B, having upwardly-extended arms or projections B^2 and bosses B^3 upon its lower face, said bosses being adapted to engage recesses in the casting C, the cross-bar A, seated upon the casting B, and the bolt G, passed through said cross-bar and castings and serving to hold the same together, substantially as described.

479,053. SOLE-MACHINE. MAURICE V. BRENNAHAN and JOHN J. HAYS, Lynn, Mass. Filed Feb. 27, 1892. Serial No. 423,091. (No model.)

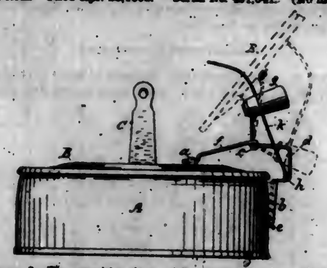
Claim.—1. In a machine for shaping the soles of boots and shoes, the combination of a mold or form D^3, a last and last-carrier, two toggle-levers, and the adjustable connection R, substantially as shown and described.

2. In a machine for shaping the soles of boots and shoes, the combination of a pair of toggle-levers, a latch and a catch for locking said toggles, and an incline plane or longitudinal cam for releasing said latch from the catch, substantially as described, and for the purpose set forth.



3. In a machine for shaping the soles of boots and shoes, the combination of a pair of toggle-levers, a last-block mounted on one of said toggles, a latch and a catch, a longitudinal cam, an adjustable connection connected from lower toggle to said last-block, a crank-shaft, and a connection from said crank to said toggles, substantially as described, and for the purpose set forth.

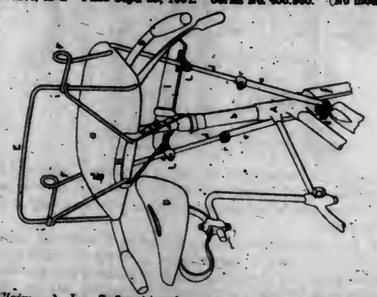
4. In a machine for shaping the soles of boots and shoes, the combination of a mold-carrier, a pivoted hook mounted on said mold-carrier, and an adjustable screw mounted on mold D^3, said pivoted hook arranged to drop over the head of the adjusting-screw at any part of said adjustment, for the purpose set forth, and substantially as described.



479,054. BUILDING-BLOCK. GEORGE R. BROWN, Pittsburg, Pa. Filed Feb. 24, 1891. Serial No. 382,661. (No model.)

Claim.—As an improved article of manufacture, the herein-described building-block, comprising the oblong part A and the substantially square part 4, said part 4 being secured to the edge of the part A opposite the middle thereof and extending therefrom on a line with the top and bottom thereof, said parts being of greater width than depth, substantially as shown and described

479,054.



479,055. LID-LIFTER FOR KETTLES, &c. ALTON B. COBB, Phœnix, Ariz. Filed Apr. 23, 1892. Serial No. 431,041. (No model.)

Claim.—1. The combination, with a vessel having a lid, of a lid-lifter consisting of a stanchion formed of a bent rod, two lifting-arms pivotally connected with said stanchion and loosely connected with a finger-piece, a cross-rod loosely connected with said stanchion and a rod carried by said cross-rod and extending upward therefrom, and a finger-piece provided with a clamp for connection with the rod carried by the cross-rod, substantially as set forth and described.

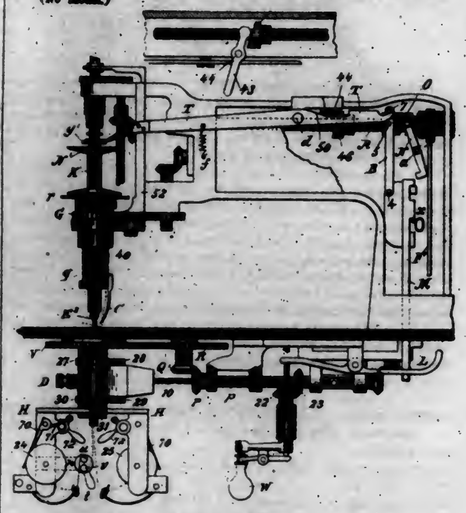
2. The combination, with a vessel having a lid and provided with lugs *a* and *b*, of a stanchion *d*, bent rod *f*, forming two lifting-arms constructed to be connected with the lid, a rod *h*, made fast to a cross-rod having bearings in the stanchion, and a finger-piece *g*, provided with a clamp and loosely connected with rod *f* and movably connected with the finger-piece, substantially as and for the purposes described.

479,056. SEAT FOR VELOCIPEDES. HOWARD R. COOKE, Woonsocket, R. I. Filed Sept. 26, 1891. Serial No. 406,865. (No model.)

Claim.—1. In a Safety bicycle or tricycle, the combination of the handle-bar B and carrying-arm C with a child's carrying-chair arranged centrally over and above the head of the carrying-arm and secured thereto either in a permanent or detachable manner, substantially as described.

2. In a Safety bicycle or tricycle, a child's carrying-chair having groove *m* formed in the under side of the seat, in combination with the handle-bar B and carrying-arm C, arranged centrally upon and over the handle-bar and head of the carrying-arm and secured thereto either in a permanent or detachable manner, substantially as described.

3. In a Safety bicycle or tricycle, a child's carrying-chair consisting of seat G, having therein grooves *c c* and *m*, frame E, and strap N, arranged centrally over and upon the handle-bar B and head of carrying-arm C and secured thereto either in a permanent or detachable manner, in combination with the connecting-rods *d d*, connecting the chair to the front forks, substantially as described.



4. In a Safety bicycle or tricycle, a child's carrying-chair consisting of seat G, having therein grooves *c c*, *l l*, *m*, and *h*, the frame E, back-braces F, and strap N, arranged centrally over and upon the handle-bar B and head of the carrying-arm C and secured thereto either in a permanent or detachable manner, in combination with connecting-rods *d d*, connecting the chair to the front forks, substantially as described.

5. In a Safety bicycle or tricycle, a child's carrying-chair arranged centrally over and above the handle-bar B and head of the carrying-arm C and secured thereto either in a permanent or detachable manner, in combination with connecting-rods *d d*, connecting the chair to the front forks, substantially as described.

6. In a Safety bicycle or tricycle, the child's carrying-chair arranged centrally over and above the handle-bar B and carrying arm C and secured thereto either in a permanent or detachable manner, in combination with adjustable connecting-rods *d d* and clamp-sockets *e e*, provided with clamps *r r*, connecting the chair to the front forks, substantially as described.

7. The adjustable foot-rest I, having therein slots *n n*, the brackets L L, provided with lugs *o o*, the screws M M and clamps *p p*, in combination with a child's carrying-chair arranged centrally over and above the handle-bar B and the head of carrying-arm C and secured thereto either in a permanent or detachable manner and converging connecting-rods *d d*, connecting the chair to the front forks, substantially as described.

479,057. EMBROIDERING-MACHINE. EMIL CORBELY and ROBERT CORBELY, Paris, France. Filed Jan. 9, 1892. Serial No. 417,502. (No model.)

Claim.—1. In an embroidering-machine organized to produce a seam composed of parallel rows of stitches with a thread wound around both rows, the combination of the nipple-tube, the revolving thread-carrier, the spool surrounding said nipple-tube for supplying thread to said carrier, and the two needle-bars and their support, each of said needle-bars being adjustable transversely with respect to said support, so that they may work at different distances from each other, substantially as described.

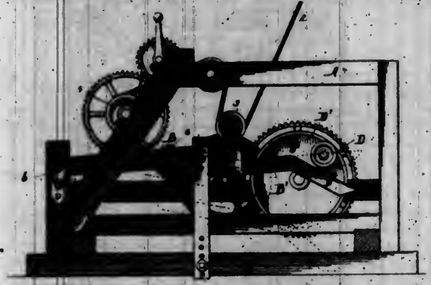
2. In an embroidering-machine, the combination, with a suitable looper and its actuating mechanism, of the nipple-tube and two needle-bars inclosed thereby, said needle-bars being each carried by a slide adjustable transversely in the needle-bar support, substantially as described.

3. In an embroidering-machine of the character specified, having a universal feed, a nipple-tube, a revolving thread-carrier, and a spool surrounding said nipple-tube and adapted to supply said thread-carrier, the combination of a brake-lever having its end in proximity to said tube, a cam, and means actuated from the handle of the universal feed for shifting the cam to couple and uncouple the main from the driving shaft, and a lever actuated by said cam to apply and release the brake-lever, substantially as described.

4. The combination, with the spool surrounding the nipple-tube, the brake-lever, and means for applying the latter when the machine is stopped, of a hand-lever for releasing the brake-lever while the machine is at rest, and a cam for restoring said hand-lever to its normal position when the machine is set in operation, substantially as described.

5. The combination, with the universal feed mechanism, the two needles, and their needle-bars connected with the operating-handle of said feed mechanism, of a looper co-operating with said needles to form a double row of chain stitches, a double-spool holder, also connected with said operating-handle, and an adjustable tension device carried by said spool-holder, substantially as described.

479,058. HAT-HOOK. THOMAS CORNADEAU, New Britain, Conn., assignor to the Stanley Works, same place. Filed Oct. 10, 1890. Serial No. 367,663. (No model.)



Claim.—1. The herein-described hook, made from a flat piece of sheet metal slit and separated into two members, one of which constitutes a hat-hook with integral fastening-shank and the other a supporting-brace for said hook, substantially as described, and for the purpose specified.

2. The herein-described sheet-metal hook, having the front end of the complete hook curved upwardly and the rear portion and body thereof slit into a central and two side members separated from each other, with one part extending rearwardly and terminated in a fastening-shank, while the other part is curved downwardly and forms a brace, substantially as described, and for the purpose specified.

3. The herein-described sheet-metal hook, having the perforated outer end curved upwardly, as described, two side portions 13, extended rearwardly therefrom and terminating in barbed fastening-shanks, and the central member curved downwardly to form a brace, substantially as described, and for the purpose specified.

479,059. APPARATUS FOR DRILLING WELLS, &c. JOHN R. DAVIS, Chicago, Ill. Filed Feb. 8, 1892. Serial No. 420,822. (No model.)

Claim.—1. An apparatus for drilling wells and like purposes, comprising the combination, with an eccentric-pin and suitable adjunctive devices, of a walking-beam provided with an inclined extension or end portion, along which said eccentric-pin will travel and whereby the drop of the walking-beam will be moderated, substantially as described.

2. An apparatus for drilling wells and like purposes, comprising the combination, with suitable adjunctive devices, of a walking-beam and an extension for said walking-beam, having an inclined end portion, said extension being detachably connected to said walking-beam, substantially as described.

3. An apparatus for drilling wells and like purposes, comprising the combination, with suitable adjunctive devices, of a walking-beam having an extension or end portion provided with a part B^3 and means for adjusting said part at different inclines, substantially as described.

4. An apparatus for drilling wells and like purposes, comprising the combination, with suitable adjunctive devices, of a walking-beam provided with an extension B', adjustably connected to the walking-beam, and a part B^3, adjustably connected to said extension B', substantially as described.

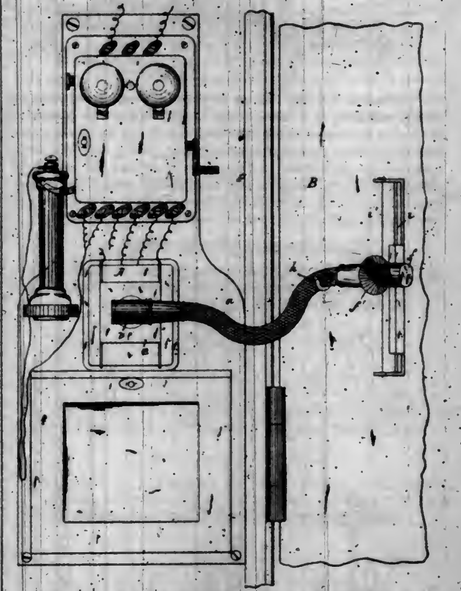
479,060. COMPOSITION OF MATTER FOR PLASTERING. EDWARD W. DIXON, Clyde, N. Y. Filed Feb. 23, 1892. Serial No. 422,451. (No specimens.)

Claim.—The above-named composition of matter, consisting of sand, plaster-of-paris, shell marl, glue, alum, sulphate of zinc, lime, and cut rope or hair, combined in the manner and in about the proportions hereinbefore set forth.

479,061. GRADUATED COCK FOR PNEUMATIC TOOLS. DANIEL DRAWBAUGH, Eberly's Mill, Pa., assignor to the Pneumatic and Electric Tool Company, New York, N. Y. Filed Apr. 13, 1892. Serial No. 429,004. (No model.)

Claim.—1. In a graduated cock for pneumatic tools, adapted to be held in the hand, the combination, with the body having longitudinal and transverse passages therethrough and the key seated in the transverse passage, of the finger-piece pivotally connected to the top of the key and the retaining projection and ring, substantially as described.

2. In a graduated cock for pneumatic tools, the combination, with the body and key, of the finger-piece pivoted to the upper end of the key, the projection and co-operating retaining-ring, and the spring engaging the finger-piece to keep the ring and projection in engagement, substantially as described.

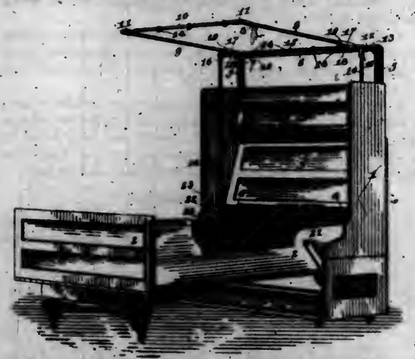


3. In a graduated cock for pneumatic tools, the combination, with the body and key having the upper end recessed, of the finger-piece pivoted to the upper end of the key, the spring seated in the recess and engaging the under side of the finger-piece, and the projection and co-operating retaining-ring held in engagement by the spring, substantially as described.

4. In a cock for pneumatic tools, adapted to be held in the hand, the combination, with the body having the handle projecting at one end, of the key and the finger-piece mounted on the upper end of the key, substantially as described.

5. In a cock for pneumatic tools, adapted to be held in the hand, the combination, with the body having one end formed for attachment to the tool and the handle on the opposite end, with means for attaching the supply-pipe thereto, of the key and the finger-piece mounted on the upper end of the key, substantially as described.

479,062. SPEAKING ATTACHMENT FOR TELEPHONES. DANIEL ELDERIDGE, Boston, Mass. Filed Feb. 26, 1892. Serial No. 422,843. (No model.)



Claim.—1. The telephone-receiver and long flexible connections therefor and the telephone-transmitter and stationary support therefor, combined with the speaking-tube having a mouthpiece at one end and an end piece at the opposite end and adapted to abut against the face of said transmitter and completely inclose the speaking-orifice thereof, a retaining device for holding said end piece firmly abutted against the face of the transmitter, the support B, swinging on a vertical axis, and an adjusting device thereon, which supports the outer end of said speaking-tube, whereby the mouthpiece may be moved at an angle with relation to the face of the transmitter and adjusted as to its height, substantially as described.

2. A telephone-transmitter and stationary support therefor, com-

bined with a flexible speaking-tube *e*, having an end piece at one end, comprising the cap *c*, of suitable size and shape to abut against the face of the transmitter and completely inclose the speaking-orifice thereof, a yielding pad having a hole through it interposed between the cap and the face of the transmitter, and a retaining device for holding the cap *c* firmly abutted against the face of the transmitter, and an end piece *f* at the opposite or outer end of said speaking-tube, provided with the mouthpiece *f'*, and the swinging support B for said outer end of the speaking tube, substantially as described.

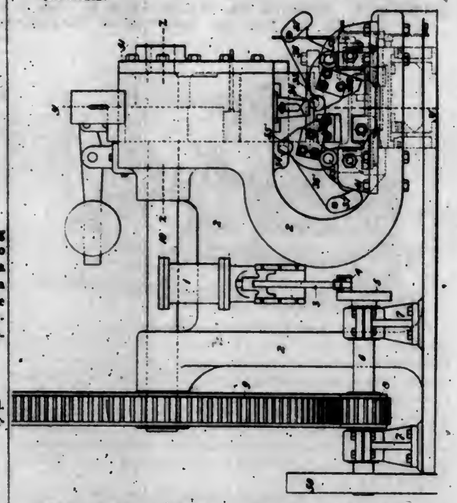
3. A telephone-transmitter, combined with a speaking-tube having a mouthpiece at one end and an end piece at the opposite end, comprising the cap *c*, the yielding pad *d*, interposed between said cap and the face of the transmitter, and a retaining device comprising the plate *e*, having a hole through it to receive the cap *c*, and spring-acting fingers *d'*, secured to said plate, by means of which it is held in position on the transmitter, and a packing ring interposed between the cap *c* and the edge of the hole of the plate *e*, substantially as described.

479,068. CANOPY FOR FOLDING BEDS. ADDISON H. EVA, Austin, Tex. Filed Oct. 3, 1891. Serial No. 408,126. (No model.)

Claim.—In a folding bed, an automatically raising and lowering canopy consisting of a raising-frame having vertical bars pivoted to the bed at the bottom and a horizontal connecting-bar at the top, a canopy-top frame pivoted to the bed-casing, having side bars and a horizontal connecting-bar, and couplings connecting the bars of the raising and canopy frames, within which the side bars of the canopy-frame have a sliding movement and the horizontal bar of the raising-frame has an oscillating movement, substantially as set forth.

479,064. VELOCIPEDE. CHARLES FELL, Southport, England. Filed Nov. 23, 1891. Serial No. 412,889. (No model.) Patented in England Oct. 8, 1891. No. 17,101.

Claim.—1. In a velocipede for carrying more than two riders, a series of sections flexibly connected by means of couplings and spring-buffers, the first or leading section only being provided with a steering arrangement, substantially as hereinbefore described, and as illustrated by the accompanying drawings.

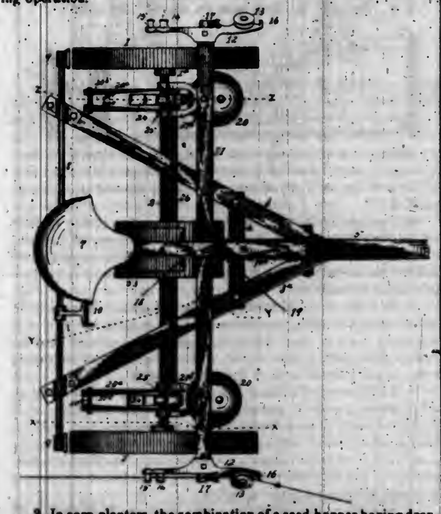


2. In an articulated or flexible velocipede, the combination and arrangement, with a spring-buffer, of a coupling passing axially through the buffer, substantially as hereinbefore described, and as illustrated by the accompanying drawings.

479,065. NUT-LOCK. HENRY FRESER, Granburg, Ohio. Filed May 16, 1892. Serial No. 433,180. (No model.)

Claim.—The combination, with the bolt and nut, the former having a front square end, of an inner U-shaped plate perforated to receive the bolt and having its side walls embracing the side walls of the nut and beyond the same provided with pairs of opposite perforations, and the outer U-shaped plate having its side walls taken between those of the inner plate and having a central portion provided with a square opening to receive the square end of the bolt and its opposite edges slotted to receive the side walls of the inner plate, and the split pins passed through the perforations formed in the inner plate beyond the plane of the outer plate and having their extremities clinched, substantially as specified.

479,066. MACHINE FOR CUTTING RIGHT-ANGLED STRUCTURAL SHAPES. ROBERT W. GRACE, Pittsburg, assignor of one-half to John A. Potter, Munhall, Pa. Filed May 16, 1890. Serial No. 352,052. (No model.)



Claim.—1. In a machine for severing I-beams, channels, angles, and other merchant shapes, the combination of a power-block sliding in guides, a gag-block at the base of said power-block, a web-block carrying the upper knife-blade, and two bed-knives between which said upper knife-blade descends, substantially as shown, and for the purposes set forth.

2. In a machine for severing I-beams, channels, angles, and other merchant shapes, the combination of a power-block sliding in guides, a gag-block at the base of said power-block, a flange-block, a gag-block at the base of said flange-block to communicate power to a tilting knife-holder carrying an upper knife, and two bed-knives between which said upper knife descends, substantially as shown, and for the purposes described.

3. In a machine for severing I-beams channels, angles, and other merchant shapes, the combination of a power-block, devices for communicating power therefrom to a web-block and to a flange-block, a web-block carrying the upper knife, bed-knives between which said upper knife descends, a flange-block, means for communicating power from said flange-block to a tilting knife-holder, said tilting knife-holder carrying the upper knife, and two bed-knives between which said upper knife descends, substantially as shown, and for the purposes set forth.

479,067. CORN-PLANTER. LEVI P. GRAHAM, Decatur, Ill. Filed May 9, 1890. Serial No. 351,148. (No model.)

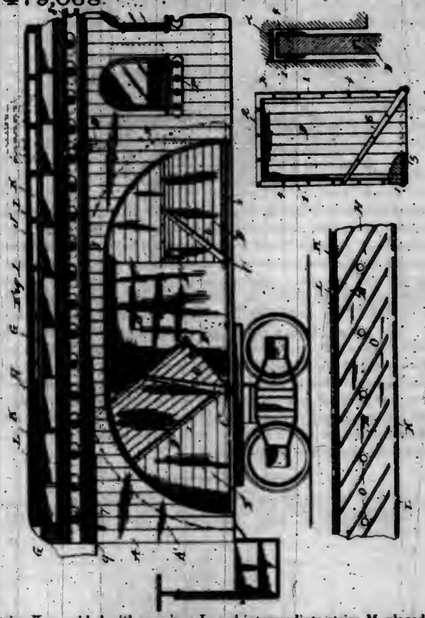
Claim.—1. In corn-planters, the combination of a seed-hopper having dropping mechanism in its lower end, a rock-arm pivoted at or near the upper end of the hopper, and a seed-depositing prod-bucket suspended from the rock-arm held normally under the vent of the hopper and adapted to swing rearwardly from the hopper at each planting operation.

2. In corn-planters, the combination of a seed-hopper having dropping mechanism in its lower end, a valve on which the grain falls from the dropping mechanism, a rock-arm having a pivot at or near the upper end of the hopper, and a seed-depositing prod-bucket suspended from the rock-arm and adapted to open the valve and receive the grain therefrom.

3. In corn-planters, the combination of a rock-arm, a corn-receiving prod-bucket suspended from the arm at some distance from the pivot thereof, and a corn-depositing plunger in the prod-bucket and suspended from the rock-arm at a greater distance from the pivot, whereby the plunger may travel farther than the prod-bucket and the travel of both may be regulated by varying the extent of the oscillation of the rock-arm.

4. In corn-planters, the combination of a prod-bucket having a front valve, an actuating-bar secured to the prod-bucket approximately midway between the valve and the rear wall, and a plunger in the space between the bar connection and the rear wall of the prod-bucket.

5. In corn-planters, the combination of a seed-depositing prod having a downward and upward motion and also a pendulous motion, and a latch or catch securing the prod against pendulous motion until the downward motion shall have begun.



6. In corn-planters, the combination of a rock-arm, a seed-depositing prod-bucket swung therefrom, and an extension-spring connected with the prod-bar and with a relatively immovable part of the planter in an oblique position.

7. In corn-planters, the combination of carrying-wheels on a main shaft, a rock-shaft carrying seed-depositing prod-buckets, a crank adapted to impart motion to the rock-shaft, and clutch-gearing connecting the main shaft with the crank and adapted to be actuated by the knots on a check-row line, whereby the rock-shaft is oscillated by the rotation of the crank when the clutch is in mesh.

8. A check-row bar or head for corn-planters having guide-pulleys and the customary forked lever, and also having tilting motion on a pivot parallel with the axle of the planter, whereby the rear guide-pulleys are elevated, the front pulley depressed, and the check-row line automatically discharged from the pulleys and lever.

9. In corn-planters, the combination of a wheel or carrying-frame, a seed-hopper pivoted in the frame on a transverse pivot, a check-row head carried by the hopper above the pivot, and planting mechanism carried by the hopper below the pivot, whereby the planting mechanism is raised and the check-row line discharged when the hopper is tilted on its pivot.

479,068.

stripe K, provided with openings L, and intermediate stripe M, placed diagonally between the stripe K and projected across the openings L therein, substantially as shown, and for the purpose described.

2. In a combined freight and passenger car, the combination of the roof H, provided with adjustable ventilating-openings O, the deck J, interposed longitudinal stripe K, provided with openings L, and diagonal intermediate stripe M, projected past said openings, substantially as shown, and for the purpose described.

479,069. PACKAGE-CARRIER FOR VELOCIPEDES. ELIOT H. HEATH, Boston, Mass. Filed Aug. 15, 1891. Serial No. 402,731. (No model.)

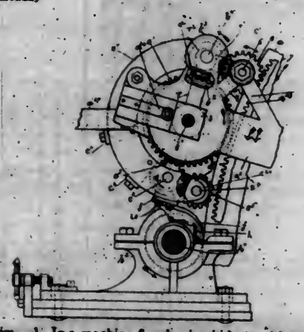
Claim.—The bar B and the hammock-supporting clamps and their bolts, combined with a hook and a hammock, substantially as described.

479,070. GRAIN-DOOR FOR CARS. EDWARD A. HILL, Chicago, Ill., assignor of one-half to James L. Mallory and Edgar A. Hill, same place. Filed Jan. 5, 1892. Serial No. 417,053. (No model.)

Claim.—The combination of a door, a pivot at or near each upper corner thereof, a guide-rod at each side of the doorway, and a shackle connecting each pivot and rod, said shackle having separate apertures through which the pivot and rod respectively pass, substantially as described.

479,071. BED-LOUNGE. STEWARD A. HOLSTEIN, Cleveland, Ohio. Filed Mar. 5, 1892. Serial No. 423,867. (No model.)

Claim.—1. A bed-lounge having a box-body and a removable



479,071.

back provided with folding legs, which, when disconnected from the body of the lounge, forms an independent bed, suitable means of attachment of the back to the lounge, and a series of independent removable finished beds in the body of said lounge provided with folding legs, said beds being entirely disconnected from the body of the lounge, both in and out of use, and adapted to be set up in different parts of the room away from the lounge, substantially as described.

2. A lounge having a box-body, a removable back provided with folding legs, which, when disconnected from the lounge, forms an independent bed, and a hinged head-rest provided with a concavity for the reception of a bed-spread, a series of independent removable finished beds in the body of said lounge, which are provided with folding legs, said beds being entirely disconnected from the body of the lounge and adapted to be set up in different parts of the room away from the lounge, substantially as described.

479,072. MACHINE FOR SHAVING HIDES OR SKINS. ALFRED A. HUNTING, Salem, Mass. Filed June 15, 1891. Serial No. 396,235. (No model.)

Claim.—1. In a machine for shaving hides or skins, the following instrumentalities, viz: a movable drum or carrier for the hide or skin to be shaved, a retarding device to bear upon and hold the hide or skin between it and the said drum or carrier, a pressure-bar comprising a series of independently-yielding fingers, and a rotating cylindrical cutter contacting with the hide or skin adjacent to the ends of said yielding fingers, to operate substantially as described.

2. In a machine for shaving hides and skins, a movable drum or carrier, a retarding device, and a pressure-bar comprising a series of independently-yielding fingers curved at their ends to partially surround the cutter, combined with a rotating cylindrical cutter and mechanism intermediate the retarding device and the cutter to impart thereto a reciprocating motion during its rotation to thus enable the knives or blades on the cutters to act with a drawing cut upon the hide or skin, substantially as described.

3. In a machine for shaving hides or skins, a movable drum or carrier, a retarding device, and means including a gear having movable bearings supported by pivoted links to move it in the same direction, but at a slower surface speed than that of the drum or carrier, combined with a pressure-bar having yielding fingers to bear upon the hide or skin, a swinging frame to which it is attached, and with a rotating cylindrical cutter, to operate substantially as described.

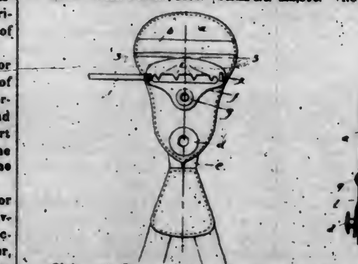
4. In a machine for shaving hides or skins, a movable drum or carrier, a retarding device, and means to move it in the same direction, but at a slower surface speed than that of the drum or carrier, combined with a swinging frame, a pressure-bar having yielding fingers attached to said frame, and with a rotating cylindrical cutter, and with a pressure-roll carried by said frame between the retarding device and the pressure-fingers, to operate substantially as described.

5. In a machine for shaving hides or skins, a rotating drum or carrier, a widthwise stretching-roll provided with spiral grooves extended right and left from its center and jaws to engage and hold the end of the hide or skin, combined with a retarding device intermediate said stretching-roll and the cutter, substantially as described, and with a rotating cylindrical cutter to act upon the surface of the skin or hide.

479,073. FOLDING STAND. HERMAN A. KOEHLER, New York, N. Y. Filed Mar. 16, 1892. Serial No. 425,097. (No model.)

Claim.—1. In a device for exhibiting goods, the slides D and folding wings E hinged thereto, in combination with each other and with the series of shelves G' G³, all arranged to serve substantially as herein specified.

2. In a device for exhibiting goods, the series of shelves G' G³, and the folding wings E, adapted to support them in stepped positions, in combination with each other and with the flexible connections H between the several shelves, all arranged for joint operation substantially as herein specified.

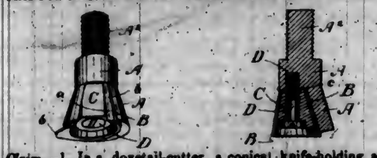


3. In a device for exhibiting goods, the series of shelves G' G³, and the folding wings E, slotted horizontally, as indicated by d' d^2 d^3, adapted to support them therein in stepped positions, and with the slides or side pieces D, also slotted horizontally, the slots registering as shown and adapted to serve as herein specified.

4. In a device for exhibiting goods, the series of shelves G' G³, and the folding wings E, slotted horizontally, as indicated by d' d^2 d^3, adapted to support them therein in stepped positions, and with the slides or side pieces D, also slotted horizontally, the slots registering as shown, and with the tongue *g*, carried on one of the shelves and extending beyond the parts when folded, adapted to facilitate locking in the closed position, as herein specified.

5. In a device for exhibiting goods, the series of shelves G' G³, and the folding wings E, slotted horizontally, as indicated by d' d^2 d^3, adapted to support them therein in stepped positions, and with the slides or side pieces D, also slotted horizontally, the slots registering as shown, and with the cover composed of plates M M', &c., flexibly connected, and locking means adapted to secure the whole, all arranged to serve substantially as herein specified.

6. In a device for exhibiting goods, the series of shelves G' G³, and the folding wings E, slotted horizontally, as indicated by d' d^2 d^3, adapted to support them therein in stepped positions, and with the slides or side pieces D, also slotted horizontally, the slots registering as shown, and with the tongue *g*, carried on one of the shelves and extending beyond the parts when folded, adapted to facilitate locking in the closed position, and with the clamping means C, arranged to secure the parts in the extended or contracted position at will, all substantially as herein specified.

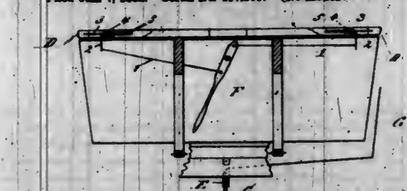


479,074. SUSPENDER-BUCKLE. HYMAN LIEBENTHAL, Bay City, Mich. Filed Feb. 23, 1892. Serial No. 422,990. (No model.)

Claim.—1. In a suspender, the piece *a*, having a transverse strap *b*, between which and said piece a suspender-web is adapted to pass, a plate *f*, located below said strap and having a slot provided at one edge with teeth *i*, a cross-bar *j*, pivoted at one end to the slotted plate and constructed at its opposite end to engage a catch *k* on the plate, and a button *d*, mounted on the lower end of the piece *a* for engaging a suspender-end *e*, substantially as described.

2. A suspender-buckle consisting of a piece *a*, having a button *d* to engage the suspender-end *e*, a plate *f*, having teeth *i* and a catch *k*, a cross-bar *j*, pivoted at one end to the plate and constructed at its opposite end to engage a catch, and a transverse strap *b*, arranged above the toothed plate and between which and the piece *a* a suspender-web is adapted to pass, substantially as described.

479,075. DOVETAIL-CUTTER. ALBERT C. MEAD, Boston, Mass. Filed Feb. 17, 1892. Serial No. 421,839. (No model.)



Claim.—1. In a dovetail-cutter, a conical knife-holding socket with the axis of rotation of which the conical exterior surface of said socket is concentric and the conical interior eccentric, whereby the socket is open along one side, in combination with an open hollow conical cutting-knife, a conical plug, and a fastening-screw, all constructed and arranged substantially as described.

2. In a dovetail-cutter, the combination, with an open hollow conical knife-holding socket, of an open hollow conical cutting-knife suitably clamped within said socket eccentric with the axis of rotation, whereby the size of the cut may be varied by the lead of the sharpened knife-edge beyond the edge of the socket, substantially as described.

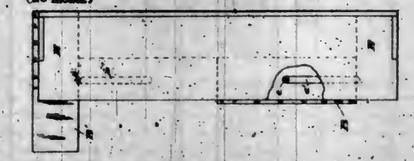
3. In a dovetail-cutter, an open hollow conical knife-holding socket, in combination with an open hollow conical cutting-knife suitably clamped within said socket, said knife being provided on its outer end with a sharp horizontal outwardly-projecting cutting-lip integral with said knife, substantially as described.

4. In a dovetail cutter, the holder-shank A, provided with the screw A^3, and the hollow open conical knife-holding socket A', in combination with the open hollow conical knife B, eccentrically set within said socket, the plug C, provided with the projection *c*, engaging with a depression in the inner end of said socket, and the fastening-screw D, all constructed and arranged substantially as and for the purposes described.

479,076. WAGON END-GATE. PIERRE MILLET, Bonnet Carre, La., assignor of two-thirds to Ernest Millet and Albert Millet, same place. Filed Jan. 7, 1892. Serial No. 417,295. (No model.)

Claim.—The combination, with the wagon-body having the side rails extended rearwardly and provided with the apertures, of the end-gate having the angular clasps D to embrace said extended ends, the slidable rods 3 3, having springs 4 and arms 2, the lever F, pivoted on the end-gate, the rods 1 1, connecting said lever on opposite sides of its pivoted point with the arms 2, the spring-catch E, arranged beneath the body, and the latch-lever G, all adapted to operate substantially as specified.

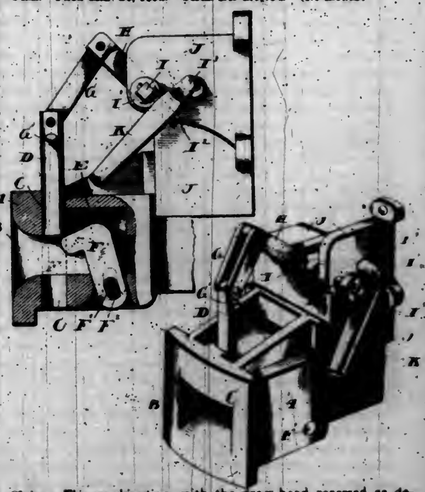
479,077. AXLE-LUBRICATOR. JAMES S. PATTEN, Baltimore, Md. Filed Sept. 16, 1891. Serial No. 406,056. (No model.)



Claim.—1. In a car-axle lubricator, the combination, with the lubricant-holding box and take-up roller, of the reversible bearing-blocks supported in the former, each of said blocks having a journal-groove extending entirely across its face, whose width is twice the length of the journals of said roller, as shown and described.

2. In a car-axle lubricator, the combination, with the lubricant-holding box and take-up roller, of the bearing-blocks for the latter having journal-grooves arranged opposite and parallel in upper and under sides, and adapted to be reversed top for bottom, as shown and described.

3. In a car-axle lubricator, the body portion of the lubricant-holding box, having the rearwardly-extended and inwardly-inclined semi-circular flange which conforms to the axle, provided with a series of ribs and a series of intervening grooves, which become gradually shallower as they extend outwardly to vanishing points, whereby they serve to reconvey into the box that portion of the lubricant scraped off the journal by the said ribs, as specified.

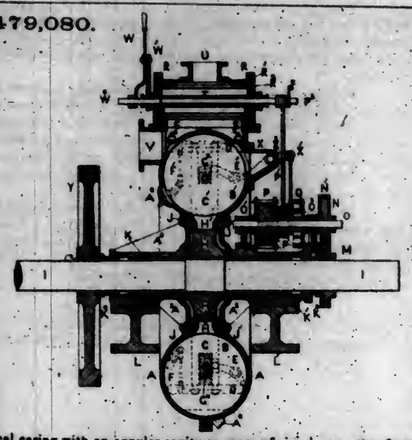


4. In a car-axle lubricator, the body A of the lubricant-holding box, constructed integrally and having in its outer sides and outer end the oil-conducting grooves a^2 and a^3, which incline downwardly, and an opening in said outer end for allowing the lubricant received in the grooves to re-enter the box, as shown and described.

479,078. WARDROBE, CHIFFONIER, &c. THOMAS W. PURCELL and JOHN B. CRAIG, St. Louis, Mo. Filed Dec. 28, 1891. Serial No. 416,312. (No model.)

Claim.—The combination, in a folding bed having a chiffonier or book-case connected therewith by means of guide-pins and guides at the top and bottom and supported upon ball-bearings, of the base provided with a hinged extension at each end adapted to receive and support the sliding front parts when open, substantially in the manner shown and described, and for the purposes set forth.

479,079. CAR-COUPLING. RICHARD S. ROBERTSON, Castle Gate, Utah. Filed Mar. 28, 1892. Serial No. 426,734. (No model.)

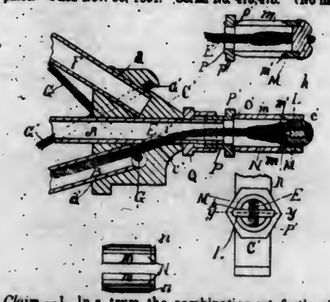


Claim.—The combination, with the draw head recessed as described, of the casting F, pivoted within a recess to the rear of the coupling-pin opening, the coupling-pin having lugs extending laterally therefrom near its upper end, the shaft I, journaled in bearings above and to the rear of the draw-head, pivoted link connections, as described, between the shaft and pin, the casting I^1, having upon one of its sides the stub-shaft I^2, and the lever K, sleeved at a point near one of its ends upon the stub-shaft, the short arm of the lever being curved, as described, and adapted to be thrown into engagement with an opening in the casting J, substantially as described, and for the purpose specified.

479,080. ROTARY ENGINE. JEFFREY SHELLING, East Greenwich, England. Filed Oct. 9, 1890. Serial No. 367,622. (No model.) Patented in England Dec. 24, 1889, No. 20,703.

Claim.—1. The combination, in a rotary engine having a cylin-

479,080.



drical casing with an annular cavity or space of circular or other form and conical faces formed upon the inside of the casing, of the spring-rings between said faces, the piston-wheel with recesses formed in its periphery and fitted upon a shaft between the spring-rings, the pistons of circular or other form, with sliding bolts, bars, levers, springs, and connecting-rods fitted within the pistons for connecting and disconnecting to and from the piston-wheel and casing, respectively, and used as pistons and partitions alternately, the releasing-levers, shaft, and cam-rod for connecting and disconnecting the pistons to and from the piston-wheel, the shaft, cam, and wheels for actuating the releasing-levers and valve-gear, and the reversing or expansion and inlet valves, with their ports, for controlling the admission and release of steam, air, gas, and other fluids to and from the annular cavity of a simple non-reversing rotary-engine casing, substantially as described.

2. The combination, in a rotary engine having a cylindrical casing with an annular cavity or space of circular or other form and removable cover and conical faces formed upon the inside of the casing, of the spring-rings between said faces, the piston wheel with recesses formed in its periphery and fitted upon a shaft between the spring-rings, the pistons of circular or other form with sliding bolts, bars, levers, springs, and connecting-rods fitted within the pistons for connecting and disconnecting to and from the piston-wheel and casing, respectively, and used as pistons and partitions alternately, the releasing-levers, shaft, and cam-rod for connecting and disconnecting the pistons to and from the piston-wheel, the shaft, cam, and wheels for actuating the releasing-levers and valve-gear, and the reversing or expansion and inlet valves, with their ports, for controlling the admission and release and also altering the direction of the steam, air, gas, and other fluids to and from the annular cavity of a reversing rotary-engine casing, substantially as described.

3. The combination, in a rotary engine having a cylindrical casing with an annular cavity or space of circular or other form and removable cover and conical faces formed upon the inside of the casing, of the spring-rings between said faces, the piston-wheel with recesses formed in its periphery, forged solid upon the shaft, and fitted between the spring-rings, the pistons of circular or other form, with sliding bolts, bars, levers, springs, and connecting-rods fitted within the pistons for connecting and disconnecting to and from the piston-wheel and casing, respectively, and used as pistons and partitions alternately, the releasing-levers, shaft, and cam-rod for connecting and disconnecting the pistons to and from the piston-wheel, the shaft, cam, and wheels for actuating the releasing-levers and valve-gear, and the reversing or expansion and inlet valves, with their ports, for controlling the admission and release of steam, air, gas, and other fluids to and from the annular cavity of compound or other expansion and condensing rotary-engine casings, substantially as described.

4. The combination, in a rotary engine having a cylindrical casing with an annular cavity or space of circular or other form, of a steel lining fitted within annular cavity, leaving a space between the lining and casing for a water-jacket, and conical faces formed upon the steel lining, the spring-rings between said faces, the piston-wheel with recesses formed in its periphery, forged solid upon the shaft, with a hole formed through the center of the shaft for water-service, and fitted between the spring-rings, the pistons of circular or other form, with sliding bolts, bars, levers, springs, and connecting-rods fitted within the pistons for connecting and disconnecting to and from the piston-wheel and casing, respectively, and used as pistons and partitions alternately, the releasing-levers, shaft, and cam-rod for connecting and disconnecting the pistons to and from the piston-wheel, the shaft, cam, and wheels for actuating the releasing-levers and valve-gear, and the reversing or expansion and inlet valves, with their ports, for controlling the admission and release of steam, air, gas, and other fluids to and from the annular cavity of a high-speed rotary-engine casing, substantially as described.

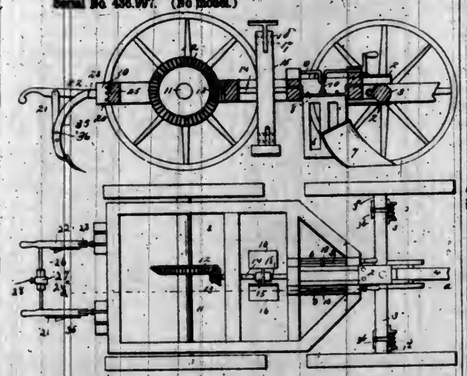
479,081. SUSPENSION TRUSS-BRIDGE. GEORGE A. STEPHENSON, Los Angeles, Cal., assignor of one-half to John Francis Butler, same place. Filed Nov. 30, 1891. Serial No. 413,475. (No model.)

Claim.—1. In a truss, the combination set forth of the thrust-beam, the tubular lower chord converging thereto at the ends, two thrust or head blocks arranged, respectively, at the points of convergence of the thrust-beam and the lower chord to seat the ends thereof, a series of interposed brace-blocks arranged between the lower chord and the thrust-beam, the suspension-cable extending through the lower chord and through the head-blocks, means for securing such cable and thrust-beam to the head-blocks, and suitable means for straining the cable against the thrust-beam and head-blocks.

2. The truss set forth, comprising the combination of the thrust-beam, the tubular lower chord converging thereto at the ends, two thrust or head blocks arranged, respectively, at the points of convergence of the thrust beam and the lower chord to seat the ends thereof, a series of interposed brace-blocks D, arranged between the lower chord and thrust-beam, the suspension-cable extending through the lower chord and through the head-block, suitable means for straining the cable against the thrust-beam and head-blocks, the upper chord parallel at its mid-length with the thrust-beam and converging at its ends to the head-blocks and seated thereagainst, a series of interposed brace-blocks D', arranged between such upper chord and the thrust-beam coaxial with the brace-blocks D, and suitable tension-cables secured to the head-blocks and arranged to compress the upper and lower chords against the brace-blocks and draw the head-blocks against the ends of the chords.

3. In a truss, the combination set forth of the thrust-beam, the tubular lower chord converging thereto at the ends, the thrust-blocks arranged at the points of convergence of the thrust-beams and lower chord to seat the ends thereof, the interposed brace-blocks, the suspension-cable passing through the lower chord and thrust-blocks and provided with a loop at each end, the adjusting-ferrule screwed upon the end of the thrust-beam and arranged to engage the head-blocks, the ring-ferrule, the anchor-key passed through the loop of the cable and arranged to rest against the ring-ferrule, the screw-ferrule screwed upon the end of the thrust-beam, and the divided straining-ferrule arranged between the screw-ferrule and the ring-ferrule.

4. The combination of the ring-ferrule provided in its inner end with the annular channel, the anchor-key arranged to rest against the outer end of such ring-ferrule, the divided ferrule provided on one end with the chine arranged to fit in such annular channel, the screw-ferrule provided with the annular channel arranged to receive the other end of the divided ferrule and arranged to screw upon a suitable support, and the straining-cable secured to the anchor-key and extending through the ring-ferrule, divided ferrule, and screw-ferrule.



5. In a truss of the class described, having the screw-ferrule and the ring-ferrule, as set forth, the divided ferrule N, arranged between the screw-ferrule and ring-ferrule.

479,082. BRUSH. SAMUEL P. STORRS, New Britain, Conn. Filed Oct. 31, 1891. Serial No. 410,631. (No model.)

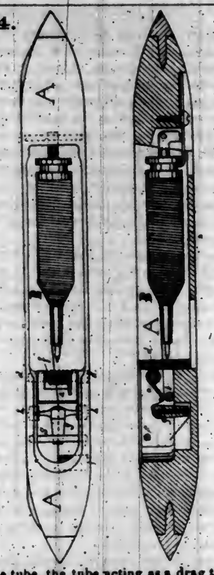
Claim.—In a brush, the combination of an aluminum back provided with an undercut recess adapted to receive the cap, the brush-tufts and means for securing them in their perforations, and the cap secured in the recess by pressure, substantially as described.

479,083. COMBINED COTTON CHOPPER AND CULTIVATOR. LORANEY H. ABERNATHY, Holland, Ark., assignor of one-half to S. W. Levelling, same place. Filed June 20, 1891. Renewed June 16, 1892. Serial No. 436,997. (No model.)

Claim.—1. The combination of the pivoted front axle-section 3, the end sections 3^a, hinged to the ends of the main section 3, and the spiral springs 5, secured at their inner ends to the main section and at their outer ends to the hinged sections 3^a, substantially as set forth.

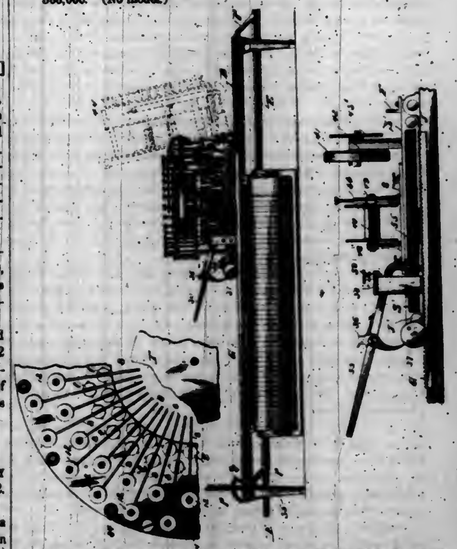
2. The combination, with the machine-frame, of the scraper-frames 6, having the inclined blades 7 and mounted on the longitudinal crank-shafts 8, the upper crank-shafts 9, having the operating-handles, and the links 10, connecting the crank-shafts 9 and 8, substantially as and for the purpose set forth.

3. The combination, with the main frame and the series of bearing-blocks 19, connected thereto and having a series of apertures 20, of the plow-handles, the vertical plates 23, hinged to the forward ends of said handles and having the apertures 24, and the removable pivot-rod 25, substantially as and for the purpose set forth.



4. The combination of the machine-frame formed with the pointed or V-shaped forward end and having the horizontal bearing-plates 2 2 arranged as specified, the main axle-section 3, centrally pivoted between said plates, the end axle-sections 3^a 3^a, hinged to the ends of the main section 3, and the springs 5, connecting the hinged sections with the main section, substantially as set forth.

479,084. TENSION DEVICE FOR LOOM-SHUTTLES. HENRY BARDSLEY, Philadelphia, Pa. Filed Dec. 29, 1891. Serial No. 416,442. (No model.)



Claim.—A loom-shuttle having a tension device consisting of a bar *b*, a plate *a*, mounted on the adjusting screw or pin *d* and held in contact with the bar *b* by the coiled spring *f*, one end of which rests in the slot *c* of the pin *d*, whereby the pressure of the plate *a* may be regulated, the said screw or pin *d* and spring *f*, and a swinging tube *g*, through which the weft passes, and a stop *s* to limit the upward movement of the tube, the tube acting as a drag to take up the slack in the weft, substantially as shown and described.

479,084.

479,085. TYPE-WRITING MACHINE. HENRY T. BEAURDOARD and FRANCIS S. FLOWER, Chicago, Ill. Filed Apr. 13, 1891. Serial No. 388,660. (No model.)

Claim.—1. In a type-writing machine, the combination of a main frame provided on two of its sides, respectively, with a parallel rack-bar and slide-bar, means suspended pivotally from said frame for elevating adjustably the book or page to receive the type-stroke, and a superposed frame supporting and carrying a type-writing carriage and operating devices and provided with pinions engaging said rack-bars, all substantially as shown.

2. In a type writing machine, the combination of a main frame provided with a parallel rack-bar and slide-bar on its two respective sides, means connected with said frame for elevating adjustably the book or page to receive the stroke of the type, a superposed frame in two sections hinged together at one side and capable of opening

and folding together, the lower section thereof resting and moving upon the slide bars of such frame, pinions engaging said rack-bars, and means for operating said pinions, and said upper section being provided with slide-bars, upon which rests and is carried the carriage of said type-writing machine, all substantially as shown.

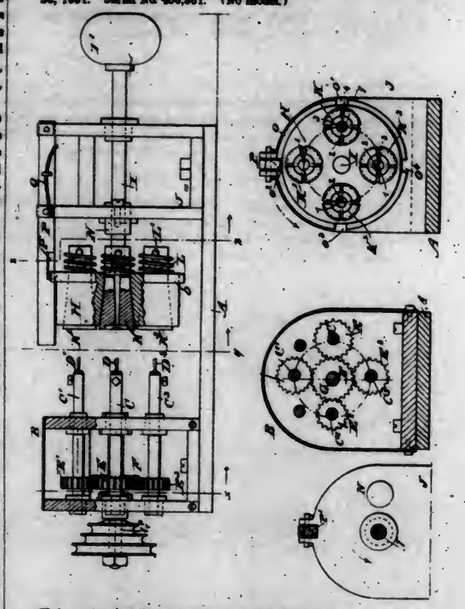
3. In a type-writing machine, the combination of a main frame provided with rack-bars and slide-bars, one or more swinging bars suspended pivotally from opposite sides of said frame and having means to elevate and lower them adjustably, two angular cross-bars, the ends of which are adjustably connected with the two opposite sides of said frame, a superposed frame in two sections hinged together at one side, and a type-writing carriage movably attached to said second frame, all substantially as shown.

4. In a type-writing machine, the combination of a main frame with a superposed frame having two sections hinged together at one side, provided with slide-bars, and means for propelling said frame along upon said main frame, and a type-writing carriage supported movably upon said superposed frame, and means for propelling said carriage by regular and limited movement along upon said last-mentioned frame, substantially as shown.

5. In a type-writing machine, the combination of a main frame, a second frame superposed movably upon said main frame and having pinions engaging with the rack-bars of said main frame, and means to operate said pinions, a type-writing carriage movable upon said superposed frame and provided with a central plate T, operated by each respective type-key of the said carriage, a pivoted lever 6, the movable plate *d*, and the levers *h* and *k*, pivotally connected to the plate *c* with their respective dogs, whereby the operation of the type-keys causes the respective dogs *i* and *l* to engage and disengage the rack-bar H and said type-writing carriage to move in spaces regulated thereby, all substantially as shown.

6. In a type-writing machine, the combination of a main frame provided with rack-bars and slide bars or ways with a superposed frame provided with means for moving it along upon said main frame, said second frame provided, also, with a rack-bar and slide bars or ways, a type-writing carriage movable upon said superposed frame and provided with a central plate capable of vertical movement, the pivoted levers 8, operated by their corresponding type-keys, the type-arms 22, connected pivotally with the stems 9 of said type-keys by connecting-rods, the pivoted lever 6, the plate *d*, movably attached to the plate *c*, the levers *h* and *k*, with their respective dogs *i* and *l*, and the rack-bar H, whereby the stroke of the type-keys operates the type-arms and produces the spacing or step-by-step movement of the carriage across the superposed frame at the same time, all substantially as shown.

7. In a type-writing machine, the combination of a series of type-keys held in bearings in the frame of the carriage, corresponding type-levers pivotally supported on said frame, pivoted levers 8, corresponding to and each operated by its respective type-key, a plate T, capable of vertical movement and supported in bearings in said frame, the lever 6, pivotally connected with said frame, the plate *d*, movably attached to the plate *c*, connected with said frame, the levers *h* and *k*, with their respective dogs *i* and springs, and the rack-bar H, all substantially as shown.



8. In a type-writing machine, the combination of the carriage-frame provided with keys held in bearings therein with a plate T, having a post supported in bearings in said frame, type-arms pivotally held by brackets attached to said frame and each connected with and operated by its respective type-keys, means for operating said plate T by the operation of each type-key, respectively, the pivoted lever 6, the movable plate *d*, attached to the plate *c*, the two locking-levers *h* and *k*, with their respective dogs and springs, and the rack-bar H, all substantially as shown.

9. In a type-writing machine, a plate *c*, permanently attached to the carriage, in combination with a plate movably attached thereto and means whereby the downward stroke of the type-key causes said movable plate to bear upon and move the locking-levers, said locking-levers being provided with springs restoring them and said movable plate to their normal positions all as substantially shown.

10. In a type-writing machine, the combination of a frame provided with a rack-bar, a carriage movable on said frame, the two locking-levers *h* and *k*, each provided with its respective dog *i* and *l*, and means for alternately engaging and disengaging said dogs, respectively, with and from said rack-bar, and a carriage-lever pivotally attached to said carriage and connected by a rod or link with the locking-lever *k*, whereby the dog of the said locking-lever *k* may be disengaged from said rack-bar and said carriage moved freely upon said frame, all substantially as shown.

11. In a type-writing machine, a frame adapted to support a movable carriage and provided with a rod held in bearings in the opposite ends of said frame, the ends of said rod carrying pinions, a post rigidly attached to said frame and carrying a lever pivotally held thereon, and a thumb-screw to regulate the stroke of said lever and engaging with one of said pinions, and a spring restoring said lever to its normal position, all substantially as shown.

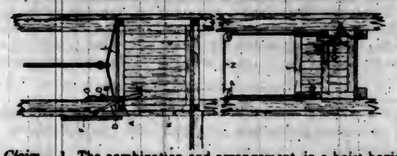
479,086. DRILLING-MACHINE. OTTO STERNOFF-BEYER, Cartstadt, N. J., assignor to Bohm Brothers, New York, N. Y. Filed Sept. 26, 1891. Serial No. 406,881. (No model.)

Claim.—1. A drilling-machine provided with a series of simultaneously-revolable drills arranged in a circle and eccentric to the axis of the article supporting devices, substantially as shown and described.

2. A drilling-machine comprising a disk carrying a series of article-supporting devices arranged in a circle and a series of simultaneously-revolving drills arranged in a circle eccentric to the circle in which the article-supporting devices are arranged, substantially as shown and described.

3. A drilling-machine comprising a series of simultaneously-revolving drills arranged in a circle and a series of chucks for supporting the article to be drilled and arranged in a circle eccentric to the circle in which the drills are arranged, substantially as shown and described.

4. A drilling-machine provided with a wheel mounted to turn and to slide and a series of spring-pressed chucks arranged in a circle on the said wheel and formed with split sections, and a recess to centrally support the article to be drilled, substantially as shown and described.



5. A drilling-machine provided with a wheel mounted to turn and to slide, a series of spring-pressed chucks arranged in a circle on the said wheel and formed with split sections, and a recess to centrally support the article to be drilled, and a fixed lug adapted to engage the chuck to open the latter, substantially as shown and described.

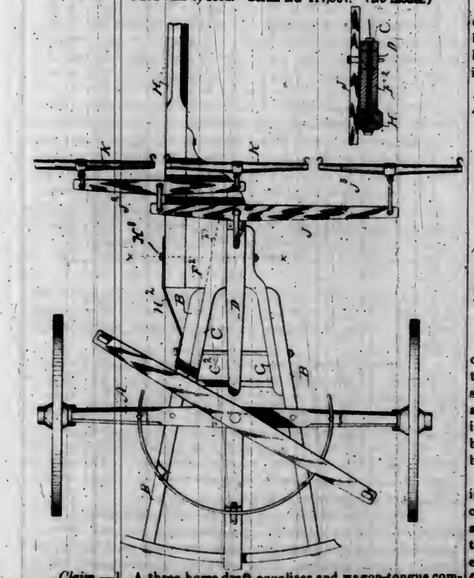
6. In a drilling-machine, the combination, with a series of simultaneously-revolving drills arranged in a circle, of a wheel mounted to slide and to turn and arranged opposite but eccentric to the said drills and chucks arranged in a circle on the said wheel and adapted to support centrally the articles to be drilled, substantially as shown and described.

7. In a drilling-machine, the combination, with a series of simultaneously-revolving drills arranged in a circle, of a wheel mounted to slide and to turn and arranged opposite but eccentric to the said drills, chucks arranged in a circle on the said wheel and adapted to support centrally the articles to be drilled, and means, substantially as described, for opening and closing one of the chucks at a time, as set forth.

8. In a drilling-machine, the combination, with a series of simultaneously-revolving drills arranged in a circle, of a wheel mounted to slide and to turn and arranged opposite but eccentric to the said drills, chucks arranged in a circle on the said wheel and adapted to support centrally the articles to be drilled, and means, substantially as described, for holding the said wheel in position while sliding forward and backward, as set forth.

479,087. HOIST. JAMES GARNER, THOMAS COCKERILL, and CHRISTOPHER PORRETT, Manchester, England. Filed Feb. 23, 1892. Serial No. 422,501. (No model.) Patented in England Oct. 5, 1891, No. 16,677.

Claim.—1. The combination and arrangement, in a hoist having vertically-sliding doors, with a locking device consisting of a bent lever, a catch, and a fixed projection, of a rocking shaft mounted in the cage and having secured thereon an arm arranged to trip said lever and raise the door, substantially as hereinbefore described, and as illustrated by the accompanying drawings.

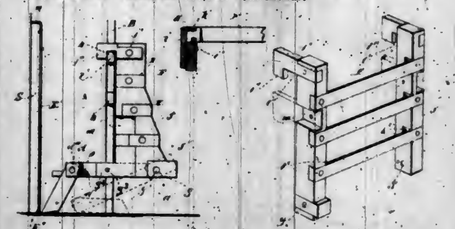


2. The combination and arrangement, in a hoist having vertically-sliding doors, of a door locking device consisting of a bent lever, a catch, and a fixed projection, with a rocking shaft having the arm B and the hook E secured thereon, a cam-surface to engage the arm B, and the rope N, adapted to be engaged by the hook E and to liberate the locking device and lift the door, substantially as hereinbefore described, and as illustrated by the accompanying drawings.

3. The combination, in a hoist having vertically-sliding doors, of a door locking device consisting of a bent lever and catch pivoted on the door and a fixed projection on the door-casing, a rocking shaft mounted in the cage, an arm on said rock-shaft arranged to trip the lever and lift the door, a second arm arranged to travel in proximity to the framework, and a cam-surface on said framework lying in the path of said second arm, substantially as described.

4. The combination, in a hoist, of a vertically-sliding door having pivoted thereon the lever H and latch Q, the link R, connecting said parts, the bridge M, spanning the latch, the rope N, attached at one end to the door and at the other end to the latch and running over pulleys P, and a cage having a rock-shaft mounted thereon carrying a hooked arm to engage with said rope, substantially as described.

5. In a hoist, the combination, with vertically-sliding doors having pivoted catches and devices whereby they may be operated, of a cage having the rock-shaft A, mounted therein, carrying the arms B, D, and E, and a handle Z, and cam-surfaces on the framework to engage the arm B and cause the arms D E to operate the catches, substantially as described.



479,088. DRAFT-EQUALIZER. THOMAS J. FREDERICKS, Audubon, Iowa. Filed Jan. 9, 1892. Serial No. 417,587. (No model.)

Claim.—1. A three-horse draft-equalizer and wagon-tongue comprising tongue-hounds pivoted between the hounds of a wagon, a short tongue-section secured between the said tongue-hounds, a block secured to one side of the said tongue-hounds and tongue-section, a wagon-tongue secured to the side of the said block, a trebletree secured to the forward end of the said tongue-section, having arms of unequal length, a doubletree pivoted to the shorter arm, having its ends on opposite sides of the wagon-tongue, and a singletree pivoted to the longer arm, substantially as set forth.

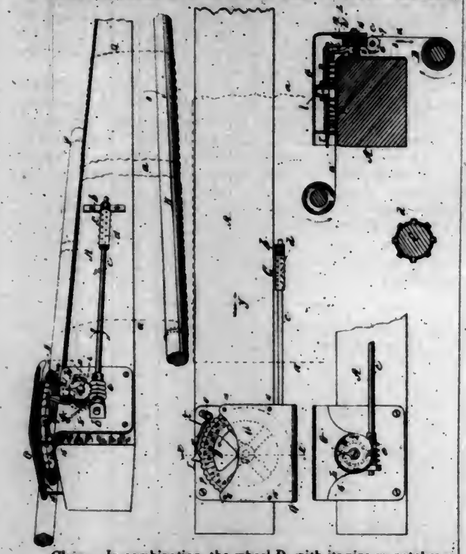
2. A three-horse draft-equalizer and wagon-tongue comprising tongue-hounds pivoted between the hounds of the running-gear of a wagon, a section fixed between the said tongue-hounds, a laterally-extending portion on one side of the tongue-hounds, a tongue fixed to one side of the laterally-extending portion, a brace fixed to the tongue and to the hounds of the running-gear, a bolt extended through the tongue, the tongue-hounds, and the said section, a trebletree pivoted to the forward end of the said section, comprising a bar having arms of unequal lengths, a doubletree pivoted to the shorter arm and a singletree pivoted to the longer end, the singletree of the said doubletree being on opposite sides of the tongue, substantially as shown and described, to operate in the manner set forth.

479,089. FIRE-GRATE. ROBERT GILCHRIEST, Louisville, Ky. Filed Apr. 22, 1891. Serial No. 389,940. (No model.)

Claim.—1. The herein-described fireplace-grate, comprising a front grate-section having an adjustable support, a bottom section having its forward end bar removably journaled in the lower forward portion of the front section, and adjustable oblique supports for the rear portion of said lower section, substantially as specified.

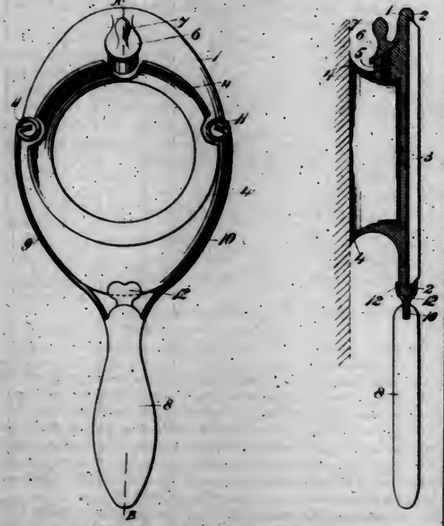
2. The grate-section comprising the end castings having shouldered recesses therein to receive the grate-bar ends, the grate-bars having shouldered recessed ends engaging said recesses and shoulders of the end castings and held therein by removable lugs or castings, and adjustable supporting lugs secured to the upper portion of said end castings, substantially as specified.

3. The grate section comprising the end castings having shouldered recesses therein to receive the grate-bar ends and the grate-bars having recessed shouldered ends secured therein by removable lugs or castings, said bars having the oblique rear faces and arranged in different vertical planes, substantially as specified.



479,090. SHEARS. HERMAN HERDER, Philadelphia, Pa. Filed Apr. 30, 1892. Serial No. 431,332. (No model.)

Claim.—1. In shears, means for pivotally connecting the blades and operating to facially separate the blades when opening the shears and to draw them facially toward each other when closing the same, consisting of a connecting-pin with a screw-threaded end adapted to fit and be rotated in a screw-threaded recess in one of the blades, a bearing on the pin for preventing rotation of the same in the opposite blade, and a spring bearing on the outer face of the latter blade and beneath the locking-nut, substantially as described.

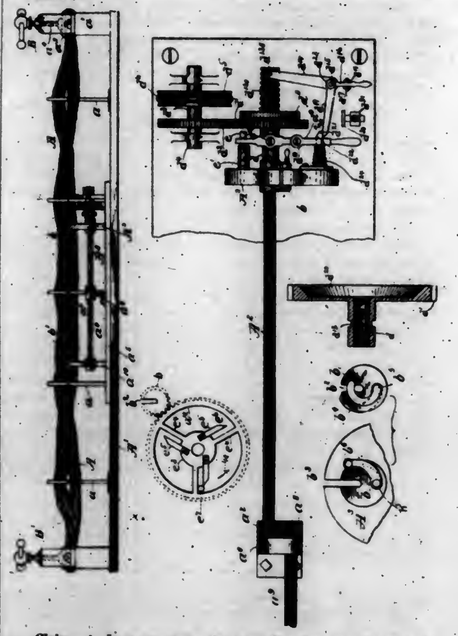


2. In shears, the combination, with the blades, one of them having a screw-threaded recess and the other a polygonal-shaped recess opposite each other, of a connecting-pin screw-threaded at each end and provided intermediately with a polygonal-shaped bearing adapted to fit said polygonal-shaped recess in the upper blade, with a spring encircling the connecting-pin and having a bearing between the outer face of the upper blade and the locking-nut on said pin, substantially as described.

479,091. FABRIC-MEASURING DEVICE. LLEWELLYN H. HUSTOCE, Madison, Me. Filed Mar. 3, 1892. Serial No. 423,559. (No model.)

Claim.—In combination, the wheel D, with its pins *m*, notches *p*, index I, graduations, and dial figures, the pinion A, with its finger *k* and index L, the shaft e, with its serrated roll C and worm *e*, and the guard G cut away to expose to view the index I and the numeral on the dial of the wheel D expressing the whole number of yards woven, said guard having, also, a dial 18, graduations, and figures expressing the fractional portion of a yard, as and for the purpose set forth.

479,092. HAND-MIRROR. WILLIAM A. JULIAN, Cincinnati, Ohio. Filed Mar. 10, 1892. Serial No. 424,373. (No model.)



Claim.—1. In a hand-mirror, the combination, with a mirror-casing, of an elastic outwardly-flaring flange formed integral on the back surface thereof, a suitable opening formed in said flange, and suitable means for opening and closing said opening, substantially as and for the purpose set forth.

2. In a hand-mirror, the combination, with a mirror-casing, of an elastic or flexible outwardly-flaring flange formed on the rear surface thereof, a vent-opening, and an automatic closing-flap valve over said opening, substantially as and for the purpose set forth.

3. The combination, with the mirror-casing, of a handle provided with clamping clips engaging with the end of the casing and the curved rods secured to the handle and extending part way around the sides of the casing and provided with forked ends coiled against the front and the back of the casing, substantially as described and shown.

479,093. MACHINE FOR MAKING WAX-ENDS. ROBERT M. MACINTOSH, Boston, Mass. Filed Mar. 7, 1892. Serial No. 423,980. (No model.)

Claim.—1. In an apparatus for providing threads with tapering ends, the combination of the following instrumentalities, viz: two clamps or thread-holding devices, one of which is rotatable, a driving mechanism for said rotatable clamp, a clutch to engage the rotatable clamp with its driving mechanism, a locking device to hold the clutch in its operative position to produce rotation of the rotatable clamp, and an automatically-operated stopping mechanism actuated by the driving mechanism to act on the lock and release the clutch, and means to act on the clutch after it has been thus released and disengage the rotatable clamp from its driving mechanism, substantially as described.

2. In an apparatus for providing threads with tapering ends, the combination of the following instrumentalities, viz: a shaft A^3, provided at one end with a worm, a shaft a^9, connected to the shaft A^3 to rotate in an opposite direction, a rotary thread holding device or clamp connected to each shaft, a main or driving shaft, a clutch to couple the driving-shaft with the shaft A^3, a locking device for the clutch, a pivoted lever having one arm d^{14} provided with a pin or stud to engage the worm on the shaft A^3 and having its other arm d^{15} adapted to engage the locking device for the clutch, substantially as described.

3. In an apparatus for providing threads with tapering ends, the combination of the following instrumentalities, viz: two clamps or thread-holding devices, one of which is rotatable, a shaft to which the rotatable clamp is connected, a driving-shaft, and a clutch mechanism to couple the driving-shaft to the clamp-rotating shaft, means to lock the clutch mechanism in engagement with the clamp-rotating shaft, and an automatically-operated stopping mechanism to disengage the clutch from the clamp-rotating shaft and stop the rotation of rotatable clamp, substantially as described.

4. In an apparatus for providing threads with tapering ends, the combination of the following instrumentalities, viz: two clamps or thread-holding devices rotatable in opposite directions, a drifting-shaft for said rotatable clamps, a clutch to couple the driving-shaft with the rotatable clamps, and an automatic stopping mechanism actuated by the driving-shaft when the latter is coupled to the rotatable clamps to act on the clutch and disengage the driving-shaft from the rotatable clamps, substantially as described.

5. In an apparatus for providing threads with tapering ends the combination of the following instrumentalities, viz: two clamps or thread-holding devices, one of which is rotatable, a shaft A^3, to which the rotatable clamp is connected, a driving-shaft, and a clutch mechanism to couple the driving-shaft to the clamp-rotating shaft, a gear a^{12}, mounted on the shaft A^3, a toothed hub *b* in mesh with said gear and provided with a slot b^3, and a clamping device secured to said hub, substantially as described.

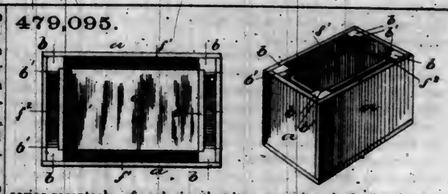
6. In an apparatus for providing threads with tapering ends, the combination of the following instrumentalities, viz: two clamps or thread-holding devices, one of which is rotatable, a shaft A^3, to which the rotatable clamp is connected, a driving-shaft, and a clutch mechanism to couple the driving shaft to the clamp-rotating shaft, a gear a^{12}, mounted on the shaft A^3, a toothed hub *b* in mesh with said gear and provided with a slot b^3, a clamping device secured to said hub, and an automatic stopping device to disengage the shaft A^3 from the driving-shaft and stop the rotation of the gear a^{12}, substantially as described.

7. In an apparatus for providing threads with tapering ends, the combination of the following instrumentalities, viz: a shaft A^3, a shaft a^9, connected to the shaft A^3, to rotate in an opposite direction, a rotary thread-holding device or clamp connected to each shaft A^3 a^9, a main or driving shaft, and a clutch to couple the driving-shaft with one of the shafts A^3 a^9, substantially as described.

8. The combination, with hank-holding devices, of a thread-untwisting mechanism interposed between the said devices and consisting of two clamps or thread-holding devices, one of which is rotatable, a driving-shaft for the rotatable clamp, a clutch to couple the driving-shaft with the rotatable clamp, a lock to hold said clutch in engagement with the driving-shaft, and an automatic stopping mechanism to act on said lock and release the said clutch and stop the rotation of the clamp, substantially as described.

9. In an apparatus for providing threads with tapering ends, the combination of the following instrumentalities, viz: two clamps or thread-holding devices, one of which is rotatable and consists of a slotted hub, through which the thread is passed, means to lock the said thread in the slot of the hub, a gear a^{12} to rotate said slotted hub and consisting of a toothed rim, a hub c^2, and arms connecting said hub and rim, spring-arms c^3, secured to the hub c^2, an inclosing case in which said gear is located, a shaft A^3, extended through the said case and upon which the said gear is mounted within the case, the said case or shell being provided with an opening c^7, a rod *e*, adapted to enter said opening, a clutch-lever to actuate said rod, a driving-shaft, and a clutch operated by the said clutch-lever to connect the shaft A^3 with the driving-shaft, a pivoted lever having one arm adapted to engage the locking device and having a second arm provided with a stud or pin, a worm on the shaft A^3, with which the said stud or pin engages, and means to act on the clutch-lever and move the rod *e* into the case or shell to be engaged by one of the spring-arms c^3, substantially as described.

479,094. AGRICULTURAL IMPLEMENT. MALCOLM MACLEOD, Los Angeles, Cal. Filed Dec. 12, 1890. Serial No. 374,527. (No model.)



Claim.—1. In an agricultural machine organized substantially as set forth, the combination of the frame, the front oscillating cutter-shaft D, having the crank-arm *x*, the rear oscillating cutter-shaft angular in part of its cross-section, the hand-lever detachably connected with such rear shaft, and the connecting-rod Q, provided with the angular catch R to clasp the angular portion of the shaft.

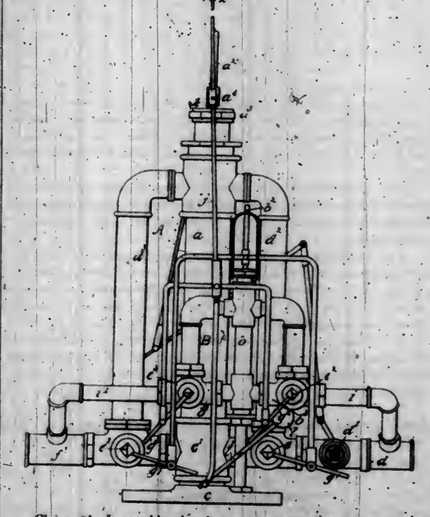
2. An agricultural machine comprising the roller-supported frame, and the cutter-shaft provided with the cultivator-cutters and having the weed cutter-knife fixed thereon and extending from side to side thereof in front of the cultivator-cutters.

479,095. PACKAGE FOR BUTTER. FREDERIC M. PECK, Hartford, Conn. Filed July 16, 1891. Serial No. 399,697. (No model.)

Claim.—A package for merchandise consisting of two receptacles, an exterior receptacle with solid air-excluding walls, interior corner-posts extending from top to bottom, to which the walls are secured, having their inner edges channeled, and an interior receptacle with solid air-excluding walls of less length, width, and depth than the ex-

479,095.

terior receptacle, of such size that its corners loosely fit the channels in the corner-posts, and loose strips passing across above and below the inner receptacle between the channels of the two adjacent posts, whereby the inner receptacle when in place is held from contact with but braces and strengthens the outer air-tight receptacle, substantially as specified.

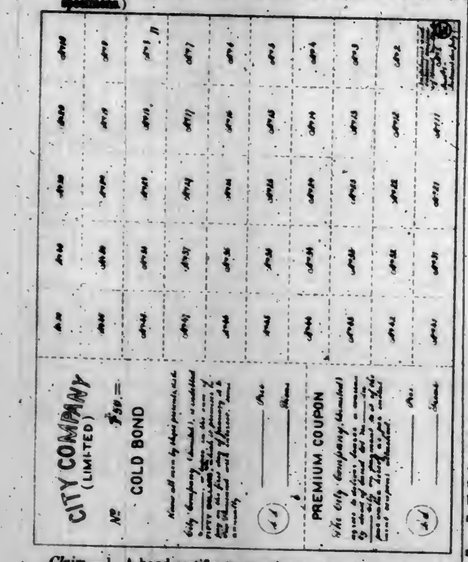


479,096. REIN-HOLDER. EDMUND RANKIN, Jr., Lincoln, Ill. Filed Sept. 23, 1891. Serial No. 406,580. (No model.)

Claim.—1. A rein-holding device consisting of a base-plate having formed in its under side a recess or recesses for the reception of the harness-straps, a flat spring secured to the under side of the base-plate and having a free end or ends for detachably securing the holder to the harness-straps, and rein-retaining loops secured to or formed integral with the base-plate, substantially as described.

2. A rein-holding device consisting of a plate provided with a recess on its under side, and a rearwardly-extending bearing-plate, retaining-loops constructed as described and secured on said plate, in combination with a leaf-spring secured to the under side of the base plate and having a free end or ends, substantially as described, and for the purpose set forth.

479,097. WATER-MOTOR. IRA H. SPENCER, Hartford, Conn. Filed Oct. 5, 1891. Serial No. 407,706. (No model.)

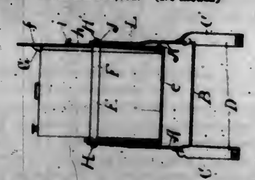


Claim.—1. In combination, in a water-motor, a main engine having the inlet and exhaust pipes connected with the opposite ends of the cylinder, the inlet and exhaust valves appurtenant to the inlet and exhaust pipes, a secondary engine having corresponding parts and valves, a yoke connected to the lever-handles of the valves of the secondary engine and to the cross-head secured to the piston of the main engine, the adjustable stops attached to the connecting-rod on opposite sides and in the path of movement of the yoke, and the yoke secured to the piston-rod of the secondary engine and connected with

the lever-handles of the inlet and exhaust valves of the main engine, all substantially as described.

2. In a fluid-motor, in combination with a main engine having a reciprocating piston with chambers at opposite ends of the cylinder and inlet and outlet pipes connected with said chambers, the inlet and exhaust valves located in the respective pipes, the secondary engine connected to the main supply-pipe at points beyond the said valves and having a reciprocating piston, and the inlet and exhaust valves, the valve-operating rods operatively connecting the inlet and exhaust valves of the secondary engine with the pistons of the main engine, and the secondary engine having its piston-rod operatively connected with the lever-handles of the inlet and exhaust valves of the main engine, all substantially as described.

479,098. CERTIFICATE REPRESENTING VALUE. WARREN W. C. STRONG, Boston, Mass. Filed Jan. 18, 1892. Serial No. 418,431. (No specimens.)



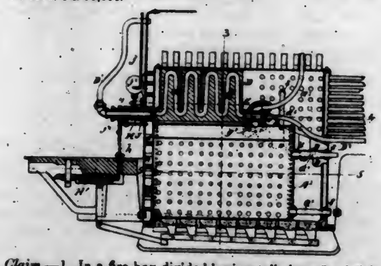
Claim.—1. A bond-certificate or other paper representing value or an obligation on the part of the maker, provided with a coupon representing a premium value or obligation additional to that borne by the body of said certificate or the interest thereon, substantially as described.

2. A certificate or other paper representing value, provided with a series of interest-coupons and a premium-coupon representing an additional value or an obligation on the part of the maker, substantially as described.

3. A certificate representing value, comprising a body bearing on its face the amount of such value, a series of installment-coupons, each representing an amount the aggregate of which equals the amount of said certificate-body, and a premium-coupon representing value additional to the amount of said body, substantially as described.

4. A certificate representing value, comprising the body B, a series of combined interest and installment coupons D, and a premium-coupon C, arranged substantially as described.

479,099. CAN-STAND. EDWARD THOMAS, Los Angeles, Cal. Filed July 16, 1891. Serial No. 399,602. (No model.)

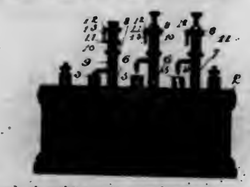


Claim.—1. The combination of the U-shaped metallic strap comprising the standards A A' and the tie B, secured to suitable supports, and the can-tilting frame pivoted to the standards and consisting of the can-encircling band F and the can-sustaining stirrup *e*, one side of which stirrup extends upward above the band and is provided with a lug arranged to engage the top of the can to hold it in the tilting frame.

2. The combination of the standards, the tilting frame pivoted thereto and comprising the band and stirrup, the stop-hook *i* on arm *h*, projecting beyond the frame and arranged to engage one of the standards when the frame is tilted, and the head of rivet J, projecting outward from the corner of the band and arranged to engage the standard.

3. The base comprising the combination, with the standards and cross-tie, of the two metallic straps, each twisted to form the vertical member *a*, secured to its standard, the two twisted members *b b'*, and the two transverse members *c c'*.

4. The combination of the tilting frame provided with the stop-hook *i*, projecting beyond the frame, and with the projecting rivet-head and the standards, one of which is provided with the beveled face L, arranged in the path of the rivet-head.



479,100. SMOKE-CONSUMING FURNACE. ROBERT L. WALKER, Boston, Mass. Filed Nov. 18, 1891. Serial No. 412,292. (No model.) Patented in England Mar. 4, 1890, No. 3,487; in France Mar. 10, 1890, No. 204,227; in Belgium Mar. 10, 1890, No. 89,781, and in Germany Mar. 14, 1890, No. 53,998.

Claim.—1. In a fire-box divided horizontally by a fire-brick partition B B' and water-damper D and longitudinally by the water-leg A^3, the damper D, having a channel *d* through it which connects at one end with the upper part of the boiler and at the other end with the lower part of the boiler, and the water-leg A^2, which connects at both ends and also at its upper edge with the boiler, the water-leg A^3 serving as support for the damper D, all substantially as described.

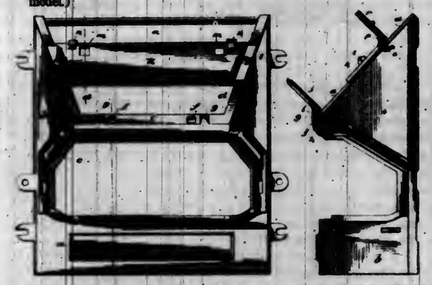
2. In combination with the water-damper D and water-leg A^3, the saddle G, having the water-ways *g g'*, substantially as and for the purposes specified.

479,101. RHEOSTAT. JOHN WARING, Manchester, Conn. Filed Apr. 28, 1892. Serial No. 431,063. (No model.)

Claim.—1. A resistance-box consisting of a base with an insulating-slab, bearing binding-screws, switches, coils, and contacts, with bridges movably supported adjacent to the contacts and held therefrom by a counter-balance, substantially as specified.

2. A resistance-box consisting of a base with an insulating-slab, bearing binding-screws, switches, coils, and contacts, with bridges movably supported above the contacts and held raised by a counter-balance, said bridges being provided with a stop, whereby they may be held depressed, substantially as specified.

3. A resistance-box consisting of a base with an insulating-slab, bearing binding-screws, switches, coils, and contacts, plates supported above the contacts, bridges movably borne by the plates and held raised by counter-balances, said bridges having pins which in their lower position may engage a strip on one plate to keep the bridges down, substantially as specified.

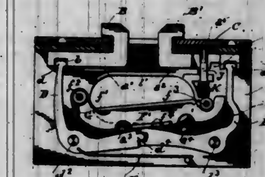


4. A bridge for a resisting-box, consisting of a plug of conducting material, an insulated support adapted to engage a box, and a counter-balance for holding the plug in the support away from the box, substantially as specified.

479,102. SCALPEL. EMIL WILLBRANDT, Indianapolis, Ind., assignor to Wm. H. Armstrong & Co., same place. Filed May 3, 1892. Serial No. 431,667. (No model.)

Claim.—As a new article of manufacture, a surgeon's knife having an aluminum handle, substantially as set forth.

479,103. BACK OR LINING FOR FIREPLACES. WILLIAM E. FITCH, Louisville, Ky. Filed Feb. 24, 1892. Serial No. 422,671. (No model.)

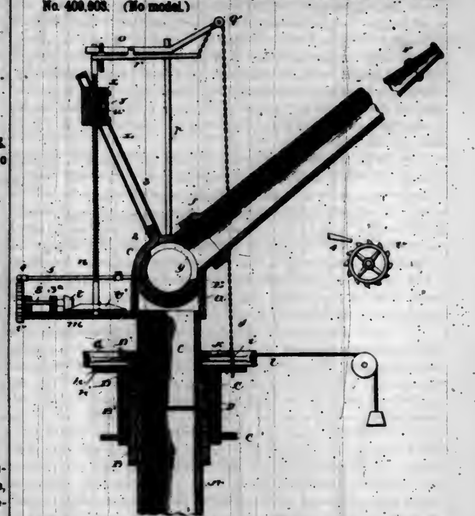


Claim.—1. A back or lining for fireplace-grates, having the inturned flanges *e d* on the upper or top edges of its rear and side walls, respectively, and a removable top secured thereto, substantially as described.

2. A back or lining for fireplace-grates, having rear and side walls, each of which is constructed with an integral flange at its top and projecting inwardly, combined with a removable top composed of a cross-piece bolted to the side walls, flanges, and hinged dampers, substantially as described.

3. A back or lining for fireplace-grates, having rear and side walls, each of which is constructed with an integral flange projecting inwardly, combined with a removable top composed of a cross-piece bolted to the flanges of the side walls, a damper hinged to such cross-piece, and a damper hinged to the flange of the rear wall, substantially as described.

479,104. LOCK. GEORGE FLEISCHEL and JOSEPH BERTRAND, San Francisco, Cal. Filed Mar. 24, 1892. Serial No. 426,288. (No model.)



Claim.—1. The combination, in a lock, of simultaneously-sliding bolts, spring-pressed interconnected levers engaging said bolts and normally keeping them in a locked position, and means to depress the connected ends of said levers and thereby withdraw the bolts, substantially as set forth.

2. The combination, in a lock, of simultaneously-sliding bolts normally kept in a locked position, spring-pressed interconnected levers controlling the same, a depressing device acting on said levers to withdraw said bolts, and means to keep said bolts retracted, substantially as set forth.

3. The combination, in a lock, of simultaneously-sliding bolts, interconnected levers engaged therewith, a spring pressing upon the connected ends of said levers and holding said bolts in a locked position, a device adapted to depress said levers oppositely to said spring and thereby retract the bolts, a spring-actuated outwardly-projecting pin engaging and holding the bolts when retracted, and a striker-plate contacting with the projecting end of said pin, substantially as set forth.

4. The combination, in a lock, of simultaneously-movable bolts, spring-pressed interconnected levers normally keeping the same in a locked position, a stop f^2, and a pivoted lever-depressing handpiece the free end whereof is normally wedged in between said stop and one of said levers, substantially as set forth.

479,105. APPARATUS FOR IRRIGATING AND SPRINKLING LAND. JAMES FRANKLIN, Montverde, Fla. Filed Oct. 23, 1891. Serial No. 409,603. (No model.)

Claim.—1. In an apparatus for sprinkling lands, a discharge-nozzle connecting with the source of water-supply and having a lever-arm extension, a follower adapted to travel up and down said extension to vary the inclination of the nozzle, and means for operating the follower, substantially as herein described.

2. In an apparatus for sprinkling lands, a nozzle mounted on a turning post so that it may move in horizontal planes, and a means for automatically locking the turning post to a non-rotary portion of the apparatus, whereby the horizontal movement of the nozzle is limited.

3. In an apparatus for sprinkling lands, a discharge-nozzle mounted on a horizontal axis, a follower adapted to move up and down on the nozzle to cause the discharge end of said nozzle to move in a reverse direction and to continuously rise and fall in vertical planes from a position approximately horizontal to one nearly vertical, and means for actuating the follower, substantially as herein described.

4. In an apparatus for sprinkling lands, the combination of a nozzle mounted upon a vertical turning post, a follower adapted to travel up and down said nozzle to move its outer ends in vertical planes, and a mechanism actuated by the follower to release the turning post at the predetermined times, whereby said post may move horizontally, substantially as herein described.

5. In an apparatus for sprinkling lands, a turning post adapted to be fitted to a source of water-supply and a nozzle mounted on said post at one side of its axis, in combination with means for automatically moving the discharge end of the nozzle in vertical planes from the point of maximum range to nearly vertical, and vice versa, and a means for periodically rotating the post, whereby the discharged end of the nozzle is moved horizontally.

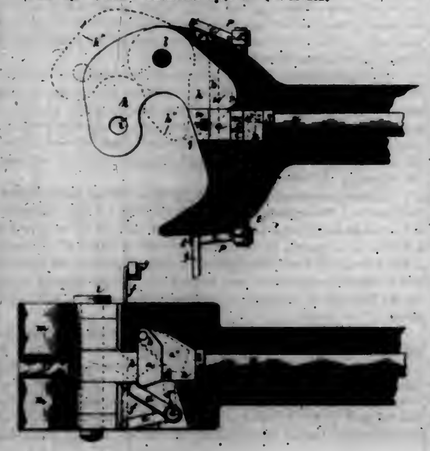
6. In an apparatus for sprinkling lands, a turning post adapted to be fitted to the source of water-supply and having a nozzle mounted on a horizontal axis at one side of the vertical axis of the turning post, said nozzle having an inclined lever-arm extending from it, in combination with a follower adapted to travel upon said arm to move the nozzle about its axis, whereby its inclination is varied, and means for actuating the follower.

7. In an apparatus for sprinkling lands, a turning post adapted to be fitted to a source of water-supply and having a nozzle mounted on a horizontal axis at one side of the vertical axis of the turning post, a lever-arm projecting at an inclination from the head of the nozzle, a follower adapted to travel upon said arm and to cause the discharge end of the nozzle to continuously rise and fall, and a mechanism tripped by the follower to impart a movement to the nozzle in a horizontal plane.

8. In an apparatus for sprinkling lands, a vertical turning post normally held against movement, a discharge-nozzle mounted on said post at one side of its vertical axis, an arm projecting at an inclination from the head of said nozzle, a follower adapted to travel up and down said arm to change the inclination of the nozzle, and a mechanism tripped by the follower at the limit of its movement for automatically and periodically releasing the vertical turning post from a

locked position and enabling it to have a slight rotary movement, whereby the discharge end of the nozzle is moved in a horizontal plane.

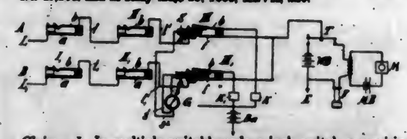
9. In an apparatus for sprinkling lands, a discharge-nozzle mounted so as to have a slight movement in a horizontal plane and having a horizontal axis about which it may be turned to change its inclination, an arm projecting at an angle from the head of the nozzle, a follower adapted to travel continuously up and down the lever-arm, whereby the discharge end of the nozzle alternately rises in one movement of the follower and lowers in the succeeding movement, means for operating the follower and imparting a periodical and partial rotation to the turning post.



10. In an apparatus for sprinkling lands, the bushing B, the pipe C, seated to rotate thereon, and a coupling-sleeve uniting said bushing and pipe so as to form a turning post, said sleeve having a flange provided with concentric circles of holes, in combination with a discharge-nozzle carried by the pipe C at one side of its axis, a spring-actuated pin carried by the turning post and adapted to normally engage the concentric circles of holes in the coupling-sleeve, and means for effecting the periodical and automatic disengagement of said pin with the holes, whereby the turning post may partially rotate and move the discharge end of the nozzle in a horizontal plane.

11. In an apparatus for sprinkling lands, the combination of a discharge-nozzle mounted on a horizontal axis and fitted to a vertical turning post, whereby the nozzle has both a vertical and horizontal movement, a slotted lever-arm projecting at an inclination from the head of the nozzle, a nut adapted to travel on said arm, a screw for operating the nut and causing it to move the discharge end of the nozzle to different angles in a vertical plane, means for rotating the screw, a spring-actuated pin for locking the turning post to a non-rotary part of the apparatus, a pivoted lever at the limit of movement of the nut and actuated by said nut, and a connection from said lever to the spring-actuated pin, whereby the latter may be withdrawn and the turning post periodically moved, substantially as and for the purpose described.

12. In an apparatus for sprinkling lands, a nozzle mounted upon a horizontal axis and a slotted lever-arm projecting from said nozzle, in combination with a vertically-supported screw having right-and-left threads, means for rotating the screw, a nut adapted to travel upon the slotted lever-arm and having a dog engaging the threads of the screw, so that it may be transferred from the right-hand threads to the left-hand threads at the limit of each movement of the nut, whereby the inclination of the nozzle is varied, substantially as herein described.



13. In an apparatus for sprinkling lands, a nozzle mounted to move in horizontal and vertical planes and having an inclined lever-arm, a means for temporarily holding the nozzle against horizontal movement, a double-threaded screw, a water-wheel and interposed gearing for revolving the screw, a nut adapted to travel upon the lever-arm and having a dog engaging the threads of the screw and mounted so that at the limit of movement of the nut the dog automatically shifts from one set of threads to the other, whereby the nozzle is continuously and automatically raised and lowered, and vice versa, and a pivoted adjustable lever, and connections automatically tripped by the traveling nut and temporarily releasing the nozzle, so that it may be turned in a horizontal plane, substantially as herein described.

479,106. CAR-COUPLING. GRANVILLE R. LEWIS, Lynchburg, Va. Filed Apr. 5, 1892. Serial No. 427,915. (No model.)

Claim.—The combination of the gravity lock-pin *a*, the lever *c*, rock-shaft or rod *d*, the levers *e e*, and chains or rods *f*, and levers *g*, substantially as and for the purpose described.

479,107. TELEPHONE-SWITCHBOARD. WILHELM OSTERRIEDE, Berlin, Germany, assignor to Mix & Genest, same place. Filed Aug 7, 1889. Serial No. 320,009. (No model.) Patented in Germany Mar. 16, 1887, No. 45,143; in Austria-Hungary June 26, 1888, No. 27,901 and No. 49,966, and in Italy Aug. 25, 1888, XLVII, 299.

Claim.—1. In multiple switchboards, a jack-switch comprising a switch-body one end of which is tubular, and a contact-spring having a V-shaped portion *o* and being secured to but insulated from said switch-body in such manner that the free end of the spring will normally contact with the tubular portion of a switch-body, and a telephone-line electrically connecting the switch-body of one jack-switch with the contact-spring of the next jack-switch throughout the series of the same telephone-line, in combination with a test-battery interposed in the ground connections of the terminal switch of a series of such, for the purpose set forth.

2. In a system of multiple switchboards, the combination, with the switches of a telephone, constructed and connected as described, of a three-part switch composed of a body *a*, a contact-spring *b*, provided with a projection *i*, of insulating material, the free end of which spring lies in contact with the switch-body when the parts are in a normal state, and a contact-spring *f*, that is permanently isolated from the switch-body, substantially as and for the purposes specified.

3. In multiple switchboards, the combination, with a series of jack-switches comprising a switch-body one end of which is tubular and a contact-spring secured thereto and insulated therefrom at the point of attachment, the free end of said spring normally contacting with the tubular portion of the switch-body, electrical connections connecting the switch-body of one jack-switch with the contact-spring of the next throughout the series of switches in the same telephone-line, and a telephone-line electrically connected with the tubular portion of one of the contact-switches of the series, of a line-tester comprising a galvanoscope, a test-plug composed of two elements insulated from each other and connected with the terminals of the coil of the galvanoscope, a local telephone-circuit, and a switch-lever interposed therein and connected with the galvanoscope-circuit, for the purpose set forth.

4. In multiple switchboards, the combination, with the switches of the telephone-lines, comprising a switch-body one end of which is tubular and a contact-spring secured thereto and insulated therefrom at the point of attachment, the free end of said spring normally contacting with the tubular portion of the switch-body, a telephone-line electrically connected with the switch-body of the initial jack-switch of a series, and electrical connections connecting the switch-body of one switch with the contact-spring of the next switch throughout the series, of a test-plug composed of two elements insulated from each other, a galvanoscope having the terminals of its coil respectively connected with said elements, a plug S, also connected with one of the terminals of the galvanoscope-coil, and a telephone in the ground branch of one of the lines, for the purpose set forth.

5. In multiple switchboards, the combination, with the jack-switches of the telephone-lines, comprising a switch-body one end of which is tubular and a contact-spring secured thereto and insulated therefrom at the point of attachment, the free end of said spring normally contacting with the tubular portion of the switch-body, a terminal switch from one end of said lines having a like tubular portion, and two contact-springs *b* and *f*, secured thereto and insulated therefrom at the point of attachment, said springs being provided with insulators *i* and *i'*, respectively arranged as set forth, and a telephone in the ground connections of one of the springs of the terminal switch of one of the series, of a line-tester comprising a galvanoscope, two plugs S and the two-part plug S', said plug S and one of the elements of the plug S' being connected to one of the terminals of the galvanoscope and the other element of plug S' with the other terminal of said coil, for the purpose set forth.

6. In multiple switchboards, the combination, with the described auxiliary jack-switch, of the plugs S and S', the rails I, II, and III, the contact-springs *p* and *q*, electric connections between the spring *p* and one element of plug S' and between the other element of said plug and the rail III, a like connection between the spring *q* and plug S, a galvanoscope having the terminals of its coil connected with rails II and III, a telephone-circuit connected with rails I and III, the contacts *r'* and *r*², respectively connected with rails I and II, and the switch-lever U, for the purpose set forth.

7. In multiple switchboards, the combination, with the described auxiliary jack-switch, of the plugs S and S', the rails I, II, and III, the contact-springs *p* and *q*, electric connections between the spring *p* and one element of plug S' and between the other element of said plug and the rail III, a like connection between spring *p* and plug S', a galvanoscope having the terminals of its coils connected with rails II and III, a telephone-circuit connected with rails I and III, the contacts *r'* and *r*², respectively connected with rails I and II, an annunciator-circuit having contacts *u* and *v* in proximity to the springs *p* and *q*, and the switch-lever U, for the purpose set forth.

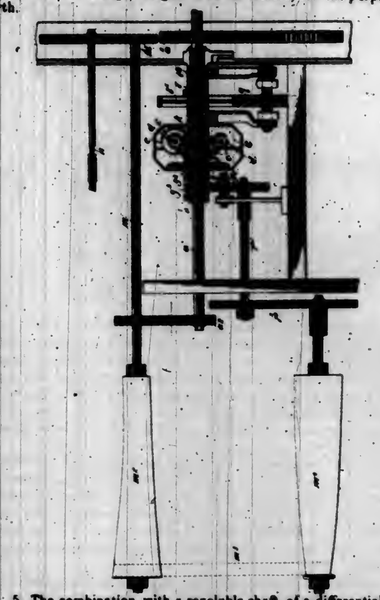
8. In multiple switchboards, the combination, with the described auxiliary jack-switch, of the plugs S and S', the rails I, II, and III, the contact-springs *p* and *q*, electric connections between the spring *p* and one element of plug S' and between the other element of said plug and the rail III, a like connection between spring *p* and plug S', a galvanoscope having the terminals of its coils connected with rails II and III, a telephone-circuit connected with rails I and III, the contacts *r'* and *r*², respectively connected with rails I and II, an annunciator-circuit having contacts *u* and *v* in proximity to the springs *p* and *q*, and the switch-lever U, for the purpose set forth.

9. In multiple switchboards, the combination, with the described auxiliary jack-switch, the rail IV, connected with the contact-spring of said switch, and an annunciator-drop in said connection, of the plugs S and S', the rails I, II, and III, the contact-springs *p* and *q*, electric connections between the spring *p* and one element of plug S' and between the other element of said plug and the rail III, a like connection between the spring *q* and plug S, a galvanoscope having the terminals of its coils respectively connected with rails II and III, a telephone-circuit connected with rails I and III, the contacts *r'* and *r*², respectively connected with rails I and II, an annunciator-circuit having contacts *u* and *v* in proximity to the springs *p* and *q*, and the switch-lever U, for the purpose set forth.

10. In multiple switchboards, the combination, with the described auxiliary jack-switch, the rails I, II, and III, the line tester comprising the plugs S and S', the contact-springs *p* and *q*, respectively connected with one of the elements of plug S' and with plug S, a connection between the other element of plug S' and rail III, a galvanoscope having its terminals connected with rails II and III, the contacts *r'* *r*², respectively connected with rails II and I, and the switch-lever U, adapted to operate the springs *p q*, of a telephone-circuit connected with rails I and III and a switch-lever interposed therein between the telephone and said rail III, for the purpose set forth.

11. In multiple switchboards, the combination, with the described auxiliary jack-switch, the rails I, II, and III, the line-tester comprising the plugs S and S', the contact-springs *p q*, respectively connected with one of the elements of plug S' and with plug S, a connection between the other element of plug S' and rail III, a galvanoscope having its terminals connected with rails II and III, the contacts *r'* *r*², respectively connected with rails II and I, and the switch-lever U, adapted to operate the springs *p q*, of a telephone-circuit connected with rails I and III, a switch-lever interposed therein between the telephone and said rail III, and a condenser interposed in the line between said lever and the telephone, for the purpose set forth.

12. A multiplex switchboard having the lowermost row of switch-holes in a horizontal plane and the successively-superposed rows in planes gradually increasing in inclination from a horizontal toward a vertical, substantially as and for the purpose specified.



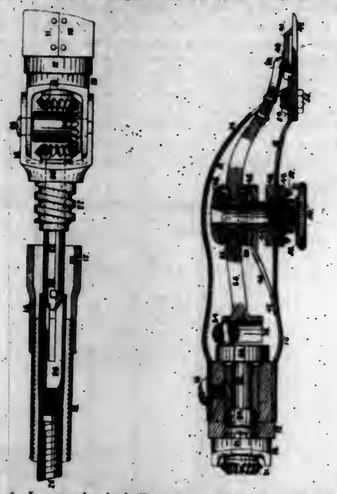
479,108. DIFFERENTIAL GEARING. GEORGE SHAW, Manchester, England, assignor of one-half to Samuel Herbert Brooks, same place. Filed Dec. 4, 1891. Serial No. 414,019. (No model.) Patented in England Nov. 26, 1890, No. 19,948, and in Belgium Sept. 4, 1891, No. 96,291.

Claim.—1. The combination, with a revoluble shaft, of a differential gearing comprising a gearing, as a worm-gearing, one element of which revolves with the shaft and the other of which has independent rotation thereon, a driving-gear on and adapted to revolve at a different speed from that of the shaft, and a transmitting-gear for transmitting the rotary motion of the driving-gear to the independently-revoluble element of the gearing through the like element that revolves with the shaft, for the purpose set forth.

2. The combination, with a revoluble main driving-shaft, of a differential gearing comprising a gearing, as a worm-gearing, one of whose elements revolves with the shaft and the other of which has independent rotation thereon, an auxiliary driving-shaft rotated by the main shaft, means for varying the speed of rotation of said auxiliary shaft, and transmitting-gearing for transmitting the rotary motion of the auxiliary shaft to the independently-revoluble element of the worm or helically-toothed gear through the element that revolves with the main driving-shaft, for the purpose set forth.

3. The combination, with a revoluble shaft, of a differential gear comprising a gear, as a worm-gearing, adapted to revolve in bearings secured to the shaft, a driving-gear revoluble on and at a different speed from that of the shaft for driving said worm or helically-toothed gear, and a transmitting-gear for transmitting the rotation of the worm or helically-toothed gear, for the purpose set forth.

4. The combination, with a revoluble main driving-shaft, of a differential gearing comprising a gear, as a worm-gear, mounted in bearings secured to the main shaft and adapted to revolve on its own axis, a like gear on and revolving independently of said main shaft and meshing with the gear secured thereto, an auxiliary driving-shaft rotated by the main shaft, means for varying the speed of said auxiliary shaft, and transmitting-gearing operated by the auxiliary shaft for transmitting the rotary motion thereof to the independently-revoluble gear on the main shaft through the gear secured thereto, for the purpose set forth.



5. The combination, with a revoluble shaft, of a differential gear comprising a gearing, as a worm-gearing, one element of which revolves with the shaft and the other of which has independent rotation thereon, a driving-gear on and adapted to revolve at a different speed from that of the shaft, a transmitting-gear for transmitting the rotary motion of the driving-gear to the independently-revoluble element of the gearing through the element thereof that revolves with the shaft, and a two-part casing or housing for said gear respectively connected with the differential gear, so as to rotate therewith at the same speed, for the purpose set forth.

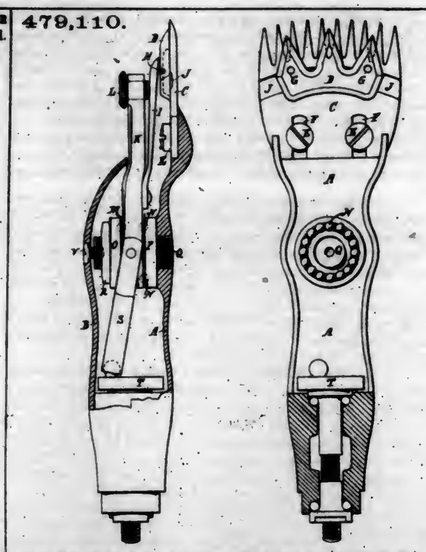
6. The combination, with the shaft *a*, the worm-wheel *k*, loose thereon, the worms *d*, in gear with worm *k* and revoluble in bearings secured to the shaft, the gear-wheels *e* on the worm-spindles, the gear-wheels *e'*, in gear with wheels *e* and revoluble on bearings also secured to the shaft *a*, and the bevel-wheels *f*, revoluble with the gear-wheels *e'*, of the wheel *g*, loose on shaft *a* and in gear with bevel-wheels *f*, substantially as and for the purpose set forth.

7. In a differential gear such as described, the combination of the wheel *g*, having a housing-section *g'* formed thereon, the transmitting-sleeve *l*, the housing-section *i*, loosely mounted thereon and fitting onto section *g'*, and the studs or short shafts *e*², projecting into recesses *i'*, formed in said housing-section *i*, substantially as and for the purpose set forth.

8. The combination, with the main driving-shaft of a slubbing, intermediate, or roving frame, the cone-drums, and the wheel *g*, of a differential gear comprising a gearing, as a worm-gearing, one element of which revolves with the main driving-shaft, the other having independent rotation thereon, a driving-wheel on and revoluble independently of said main driving-shaft, intermediate gearing operated by the driven cone-drum and operating the driving-wheel, transmitting-gear for transmitting the rotary motion of said driving-wheel to the independently-revoluble element of the differential gear through that element thereof which revolves with the driving-shaft, and transmitting-gearing for transmitting the rotary motion of said independently-revoluble element of the differential gear to the wheel *g*, for the purpose set forth.

479,109. ANIMAL-SHEARS. PHILIP ASHBERRY and WALTER BARBER, Sheffield, England. Filed Mar. 29, 1892. Serial No. 426,941. (No model.) Patented in England June 22, 1891, No. 10,572.

Claim.—1. In a mechanical clipper, the combination, with a handle-casing carrying a horizontal comb and with a reciprocating cutter superposed upon said comb, of a horizontal arm carrying vertical studs which drive the cutter and a spring-finger to press upon the cutter, two circles of anti-friction balls, between which said arm vibrates, and tension-regulating devices which comprise a vertically-movable pivot-post carrying supports for said balls and a tension-screw for adjusting said post endwise, substantially as hereinbefore specified.

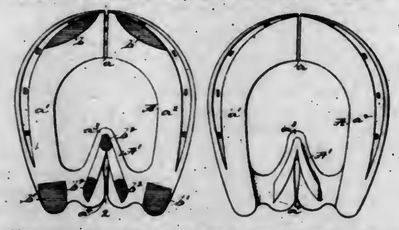


2. In a mechanical clipper of the kind hereinbefore specified, the combination, with the reciprocating cutter and handle-casing, and with a cutter-driving arm carrying a spring-finger to press upon said cutter, and a vertically-movable post supporting the bearings of said arm, of a rearwardly-projecting tension-spring attached to said post and co-acting at its rear end with the bottom of said casing, for the purpose set forth.

3. The combined tension-spring and lock-nut 46, in combination with the handle-casing and with the vertically-movable post 44, having the flange 43 and collar 45, the two circles of balls 37 38, supported by said post, and the cutter-driving arm 36, which vibrates between said circles of balls, substantially as hereinbefore specified.

4. In combination with the vertically-adjustable post 44 and the two horizontal circles of anti-friction balls 37 38, supported by said post, and with the crank-disk 33, having its crank-pin provided with the spherical roller 34, the cutter-driving arm 36, having at its respective ends the vertically-extended cylindrical socket 35 and stude 39, substantially as hereinbefore specified.

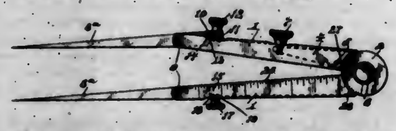
5. In combination with the flexible shaft 25, having the deeply-notched hollow terminal 26, and the spindle 27, having the lateral studs 28, the non-rotary shaft-casing 15, having the socket 16, provided with the inwardly-projecting stud 17, and the joint-piece 18, having the pin-end 22 fitted to said socket and provided with a quick screw-thread to coact with said stud, substantially as hereinbefore specified.



479,110. ANIMAL-SHEARS. PHILIP ASHBERRY and WALTER BARBER, Sheffield, England. Filed Mar. 31, 1891. Serial No. 387,149. (No model.) Patented in England May 6, 1890, No. 6,962.

Claim.—1. In a mechanical clipper, the two circles of anti-friction balls M N, in combination with the ball-supporting collars O P, the central stud Q, supporting both of said collars, and a cutter-driving arm K, supported between the two circles of balls, the opposing faces of said collars and said arm having ball-retaining grooves concentric with said stud, substantially as shown, whereby said arm is adapted to oscillate freely without contact with any relatively-fixed part, for the purposes set forth.

2. In a mechanical clipper of the class set forth, the screwed stud Q, provided with the fixed collar P, internally-threaded collar O, and lock-nut R, in combination with the two circles M N of anti-friction balls supported by said collars, the cutter-driving arm K, interposed between said balls and provided in common with said collars with ball-retaining grooves concentric with said stud, a combined tension-bar and driver I, movable relatively to said arm, a reciprocating cutter engaged by said tension-bar and driver, a relatively-fixed comb against which said cutter is pressed, and adjusting devices carried by said arm and by said tension-bar and driver, whereby the latter is adjusted to regulate the tension of the cutter without disturbing said arm and the arm is adapted to oscillate freely in a given plane without contact with any relatively-fixed part whatever, substantially as hereinbefore specified.



479,111. OPEN-TOED HORSESHOE. ARTHUR D. BAKER, Brooklyn, N. Y. Filed Mar. 9, 1892. Serial No. 424,330. (No model.)

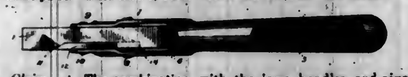
Claim.—1. A horseshoe consisting of two side portions separate one from the other at the forward ends and joined at the rear ends by a transverse portion rigidly attached to the shoe and providing a frog-protector, substantially as specified.

2. The combination, with the shoe, of the transverse portion joining the rear ends thereof and conforming substantially to the shape of a natural frog and calks on said shoe and transverse portion, substantially as specified.

479,112. DIVIDERS. WILLIAM A. BERNARD, New Haven, Conn. Filed Oct. 1, 1891. Serial No. 407,262. (No model.)

Claim.—1. A divider consisting of legs U-shaped in cross-section and having disks at the inner ends parallel with the sides and a washer between the inner disks and points pivoted at the outer ends of the U-shaped legs and adapted to fold within the legs, so as to be wholly covered and protected when in the closed position.

2. A divider consisting of legs U-shaped in cross-section, disks at the inner ends of said legs parallel with the sides of said legs, the disks upon one of the legs lying outside of the disks upon the other leg, a washer lying between the inner disks, and a pivoted locking-piece the rear end of which is adapted to engage the washer, thereby locking the legs at any required adjustment.



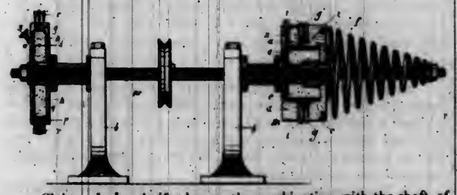
3. A divider consisting of legs U-shaped in cross-section, disks at the inner ends of said legs, a washer between the inner disks, a pivoted locking-piece in one of the legs, the rear end of which is adapted to engage the washer, and a set-screw engaging the other end of the locking-piece, whereby it is operated.

4. A divider having legs U-shaped in cross-section and folding points pivoted at the outer ends of the legs, one of said points having at its base screw-threads, and an adjusting piece having a thread adapted to engage the threads on the base of the point, whereby said point may be placed at any required adjustment.

5. A divider consisting of legs struck up from sheet metal and folding points pivoted in the outer ends of said legs, one of said points having at its base screw-threads and the back of the leg being provided with a rotary adjusting piece adapted to engage the threads upon the point.

6. A divider consisting of legs struck up from sheet metal and having folding points pivoted at their outer ends, one of said points having at its base screw-threads adapted to engage a thread upon a rotary adjusting-piece in the leg, the other point having at its base a shoulder adapted to be engaged by a rotary locking-button, whereby it is held in operative position, said locking-button having a cut-away portion, which permits the point to be folded inward, substantially as described.

479,113. COMBINED PLIERS AND CUTTER. WILLIAM A. BERNARD, New Haven, Conn., assignor to the William Schollhorn Company, same place. Filed Dec. 9, 1891. Serial No. 414,450. (No model.)

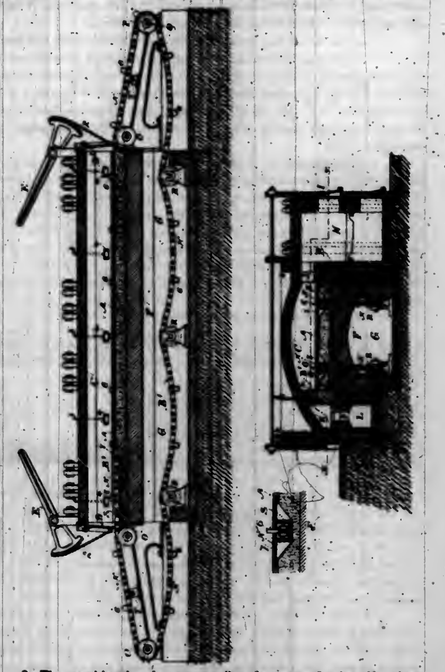


Claim.—1. The combination, with the jaws, handles, and pivots 6, 6*, 7, 8, 9, and 10 of parallel-jaw pliers, of a cutting-jaw 11, formed upon the back of one of the plier-jaws, and a cutting-jaw 12, pivoted on 10 and having a shank pivoted on 8.

2. The combination, with the handles, jaw 2, jaw 1, having a cutter 11, and pivots 6, 6*, 7, 8, 9, and 10, of cutting-jaw 12, recessed into jaw 1 and pivoted on 10 and having a shank pivoted on 8.

3. The combination, with the handles and jaws 1 and 2, having slots 5, said jaw 1 having a cutting-edge 11 and jaw 2 having a recess 15, and pivots 6, 6*, 7, 8, 9, and 10, of cutting-jaw 12, recessed into jaw 1 and having a boss through which pivot 10 passes and a shank through which pivot 8 passes, the end of said shank in the closed position lying in recess 15.

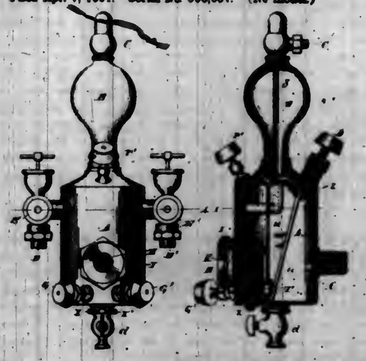
479,114. APPARATUS FOR POLISHING AND SHARPENING KNIVES, FORKS, &c. FRIEDRICH DOMS, Berlin, Germany. Filed Oct. 16, 1891. Serial No. 408,935. (No model.)



Claim.—1. In a knife-cleaner, the combination, with the shaft, of a disk keyed to said shaft, another disk loosely mounted and sliding on said shaft, a spring mounted on the shaft and bearing against said disk, the india-rubber disk mounted on the adjacent edges of the disks, recesses in the adjacent sides of the disk, and a perforated box fitting said recesses and containing the polishing material, substantially as described.

2. A knife and fork cleaner comprising a shaft having mounted upon one end a hollow disk having orifices in its periphery and brushes arranged thereon and having on its other end a disk keyed to said shaft, another disk loosely mounted and sliding on said shaft, a spring mounted on the shaft and bearing against said disk, india-rubber rings mounted on the adjacent edges of the disk, recesses in the adjacent sides of the disk, and a perforated box fitting said recesses, substantially as described.

479,115. ANNEALING-FURNACE. ALFRED A. COWLES, New York, N. Y., and JOSEPH F. GILPIN, Ansonia, Conn., assignors to the Ansonia Brass and Copper Company, Ansonia, Conn. Filed Nov. 9, 1891. Serial No. 411,287. (No model.)



Claim.—1. The combination, with the heating-chamber in an annealing-furnace and chains for moving the articles to be annealed through the heating-chamber, of tubular chainways introduced into the floor below the bottom of the heating-chamber, such tubular chainways being slotted along the top for the lug or connection between the chain and pan or article to be moved through the heating-chamber and also forming an air-tube to keep the chain cool, substantially as specified.

2. The combination, with the heating-chamber in an annealing-furnace and chains for moving the articles to be annealed through the heating-chamber, of tubular chainways below the bottom of the heating-chamber, such tubular chainways having projecting flanges 7 and being slotted along the top for the lug or connection between the chain and pan or article to be moved through the heating-chamber and also forming an air-tube to keep the chain cool, substantially as specified.

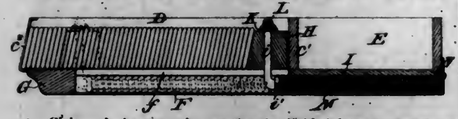
3. The combination, in an annealing-furnace, of a heating-chamber and doors at the ends, fire-chambers at one side and dampers and flues at the other side opening downwardly into an escape-flue, chains for moving the articles to be annealed progressively through the heating-chamber, and tubular chainways introduced below the floor of the heating-chamber and slotted along the top and forming air-tubes to keep the chain cool, substantially as specified.

479,116. LUBRICATOR. WARREN H. CRAIG, Lawrence, Mass. Filed Apr. 7, 1891. Serial No. 388,067. (No model.)

Claim.—1. In a lubricator, the reflector M, having the tongue N, which forms the reflector into two chambers, in combination with an

oil-induct pipe, leading into each chamber of the reflector, and an oil-educt pipe leading from each chamber to the part to be oiled, as set forth.

2. In a lubricator, the sight-feed-glass holder and its contained glass and the reflector, in combination with the follow-ring on the inside bearing against the glass, as set forth.



3. In a lubricator, the combination of a sight-feed glass, its holder, and the packing on the outside of the glass, and the follow-ring on the inside, as set forth.

4. In a lubricator, the sight-feed glass, its holder, and the follow-ring on the inside, in combination with the reflector and the spring which bears against the reflector, whereby the reflector is held resiliently against the follow-ring and holder, as set forth.

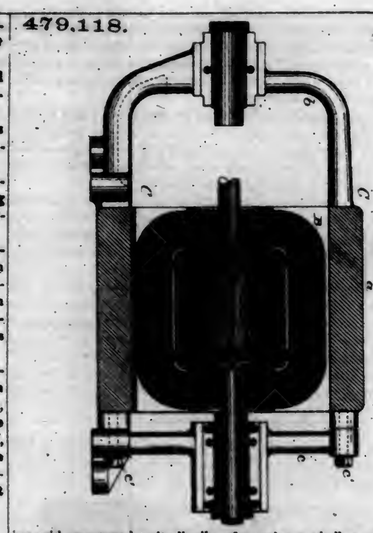
5. In a lubricator, the combination of the oil-reservoir A, the chambers V V', having a connection with such oil-reservoir through which oil passes to said chambers, the valves G G' controlling such connection, the double sight-feed chamber, the conduits W W', leading from the chambers V V' into the double sight-feed chamber, and oil-discharging conduits leading from such double sight-feed chamber, as set forth.

6. In a lubricator, the combination of the oil-reservoir A, the oil-discharging conduit u leading therefrom, the chamber T at the bottom of the oil-reservoir and into which the oil-discharging conduit leads, the chambers V V', connected with the chamber T and having the valves G G', controlling the opening between them, the conduits W W', the double sight-feed chamber, the conduits W W', leading from the chambers V V' into the double sight-feed chamber, and the oil-discharging conduits leading from such double sight-feed chamber, as set forth.

479,117. CASE FOR EXHIBITING NEEDLES. ERNEST R. DENNY, Spokane, Wash. Filed Mar. 5, 1892. Serial No. 423,810. (No model.)

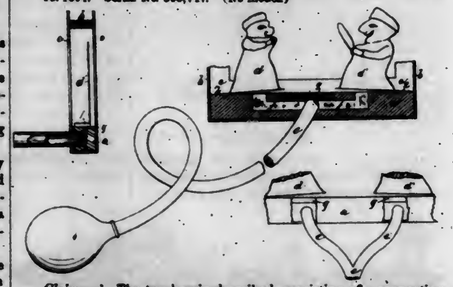
Claim.—1. A case, a drawer therein divided into compartments for the reception of packages, the front of said drawer having openings corresponding with the compartments, recesses formed along the bottom of the drawer under each of said compartments in the direction of their length and having direct communications with the compartments, followers within the compartments, and follower-actuating means located within the said recesses, substantially as set forth.

2. A case, a drawer therein divided by partitions into delivery and storage compartments, the storage-compartments being situated to the rear of the delivery-compartments, the front of each delivery-compartment being provided with an opening therethrough, and a spring-actuated follower within the delivery-compartment, substantially as set forth.



3. A case, a drawer therein divided into delivery and storage compartments, a recess along the bottom of the drawer underneath each of said compartments and having a communication therewith by means of a groove, a follower within the compartment, a pin within the recess, having an arm uprising therefrom and secured to the follower, a spring within the recess, exerting a forward pressure upon the pin, and thereby upon the follower, and means for confining the pin and spring within the recess, substantially as set forth.

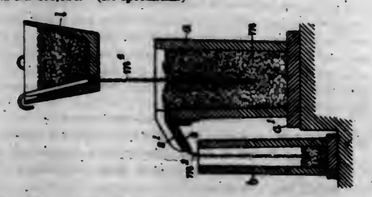
4. A case, a drawer therein divided into delivery and storage compartments, the front of said drawer provided with openings corresponding with the delivery-compartments, a recess extending along the bottom of the drawer under each set of delivery and storage compartments and having a direct communication with the delivery-compartment, a follower within the delivery-compartment, a pin within the recess, having an arm uprising therefrom and secured to the follower, a spring within the recess, exerting a forward pressure upon the pin, a strip of metal along the bottom of the drawer for confining the spring and pin, and a removable plate or cover over the rear end of the recess, whereby access is obtained to the spring, substantially as set forth.



479,118. DYNAMO-ELECTRIC MACHINE. RUDOLF EICKEMEYER, Yonkers, N. Y. Filed Dec. 21, 1889. Serial No. 334,468. (No model.)

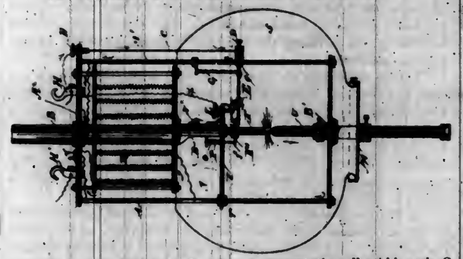
Claim.—1. In a dynamo-electric machine, the combination, with a cylindrical or drum armature having an iron core and field-coils surrounding said armature longitudinally, of an iron shell or casing which surrounds the field-coil and armature and is solid or continuous in planes at right angles to the axis of the armature, substantially as described, and for the purposes specified.

2. In a dynamo-electric machine, the combination, with a cylindrical or drum armature having an iron core and field-coils surrounding said armature longitudinally, of a casing or shell surrounding said field-coils and armature, composed of solid seamless soft-iron plates, each continuous in a plane at right angles to the axis of the armature, substantially as described.



479,119. TOY. MYRON A. GILMAN, Westfield, Mass. Filed June 10, 1891. Serial No. 395,747. (No model.)

Claim.—1. The toy herein described, consisting of a supporting-base *a*, formed with an air-passage opening up through the floor thereof, a yieldingly-supported figure having a base 1 integral therewith and turned laterally at right angles thereto and arranged over the air-passage, and a tube leading into the air-passage, substantially as and for the purpose specified.



2. The toy herein described, consisting of a suitable support having two or more air-passages and an inlet-tube provided with branches of collapsible material leading to each conduit in said support, substantially as and for the purpose specified.

479,120. PROCESS OF PREVENTING SEGREGATION IN LARGE INGOTS. WILLIAM R. HEBBDALE, Newark, N. J. Filed July 27, 1891. Serial No. 400,231. (No specimens.)

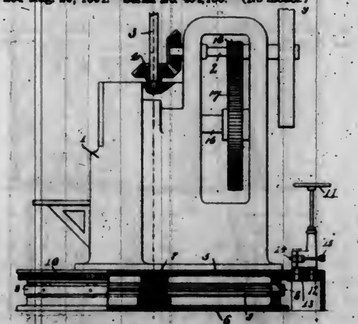
Claim.—The method of casting ingots, which consists in, first, filling the mold with a charge of fluid steel; second, pausing and allowing the ingot thus formed to partially cool, as described, and, third, pouring steel homogeneous with the first charge into the central fluid portion of the ingot, and thus displacing the same by a fresh supply of fluid steel, substantially as herein set forth.

479,121. ELECTRIC-ARC LAMP. WILLIAM E. IRISH, Chicago, Ill. Filed Jan. 2, 1892. Serial No. 416,786. (No model.)

Claim.—1. In a lamp for an arc current, the adjustable strip C, located in the main circuit, the pivoted lever E, provided with operating-spring G, the clutch E, spring K, and shunt-circuit X, substantially as described.

2. In a lamp, the combination of side rods A A', &c., upper disk A^1, supporting the carbon holder B, expansible strip C, adjustably secured by screw D to said strip-lever E, pivoted at *e* upon rod A', having one end secured to one extremity of the expansible strip and connected by spring G with rod A', the clutch F', rod P, spring C, and guide I, substantially as described.

3. In a lamp, the combination of an upper-carbon holder, a spring of irregular shape within the holder at the side thereof, a movable clamp within the holder, provided with a grooved head, and an inwardly-bent extremity to the spring adapted to engage said groove when the clamp is down in the lower end of the holder, substantially as described.



4. In an arc lamp, means for controlling automatically the upper carbon, consisting in the carbon-holder B, rod J, clutch F, provided with flanges *f* and *f'*, pins O and O', springs P and P', pivoted lever E, and expanding strip C, substantially as described.

5. In an arc lamp, means for controlling automatically the movement of the upper electrode, consisting of the combination of a tube surrounding loosely the electrode, outwardly-projecting flanges surrounding and attached to said tube at the upper and lower ends, springs resisting the upward movement of said flanges, an operating pivoted lever upon which one of the said flanges rests, and a thermo-expansive electric conductor and actuating-spring connected with and controlling said lever.

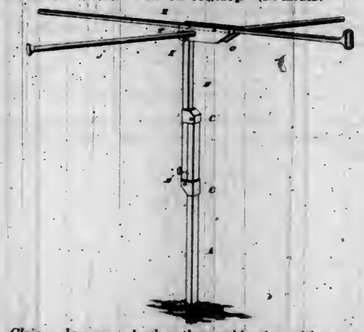
6. In an arc lamp, the combination of a thermo-expansive electric conductor in the main circuit, a clutch upon the electrode, a lever provided with a retractile spring and connected to said conductor and engaged with said clutch, a spring terminal K, a shunt-circuit conductor, and a terminal L therefor, lying in the path of said spring K, which lies in the path of said clutch or lever.

7. In an arc lamp, the combination, with the upper electrode, which is provided with a notch in its upper end, of a holder therefor provided with a slot and a spring passing through said slot and pressing upon said electrode.

479,122. SHEARING-MACHINE. JOHN M. LOVE, Hamilton, Ohio. Filed Aug. 29, 1891. Serial No. 404,153. (No model.)

Claim.—1. The combination, substantially as set forth, of a turn-table mounted for rotation on a vertical axis, a locking device to secure the same in adjusted position, a shearing-machine mounted on the turn-table, and a shear blade mounted in the shearing-machine and arranged to reciprocate in a vertical plane.

2. The combination, substantially as set forth, with a shearing-machine and mechanism for imparting operative motion to it in any position of rotary adjustment upon a vertical axis, of a foundation-plate below such machine, a sole-plate under said machine and over said foundation-plate and connected to the foundation-plate by a vertical axis of rotation, and means for rotating said sole-plate.



479,123. POST-TOP. MICHAEL E. LOUGHLIN, Indianapolis, Ind., assignor to the Cleveland Fence Company, same place. Filed Mar. 22, 1892. Serial No. 425,931. (No model.)

Claim.—1. The combination, with a post having a pin or projection near its top, of a top having a socket with vertical grooves for receiving said pins or projections, and circumferential and slightly-inclined grooves extending from said vertical grooves, into which said projections may be forced.

2. The combination, with a post having a pin formed of wire extending through a hole in its top, which pin has its ends bent down, of a top having a socket and internal grooves into which the ends of said pin will enter, and whereby the post and top are secured together, substantially as set forth.

479,124. CORN-SHOCKER. THOMAS J. MASON, Green Bay, Iowa. Filed Feb. 16, 1891. Serial No. 381,730. (No model.)

Claim.—In a corn-shocker, the combination, with a cross-arm H, pivoted through plates O to an extensible standard composed of bars A and B, clasps *c c*, and set-screw D, of a stop-pin T and a removable cross-arm *j* for locking the arm H in horizontal position, all substantially as described, and for the purpose set forth.

479,125. TOOL FOR TRIMMING HEADS OF CARTRIDGE-SHELLS. CHARLES R. RICHARDS, Bridgeport, Conn., assignor to the Union Metallic Cartridge Company, same place. Filed Feb. 8, 1892. Serial No. 420,739. (No model.)

Claim.—1. A tool for trimming heads of cartridge-shells, consisting of a revoluble body having at its lower end a recess adapted to receive a tool-carrier, suitable means for adjusting and locking said

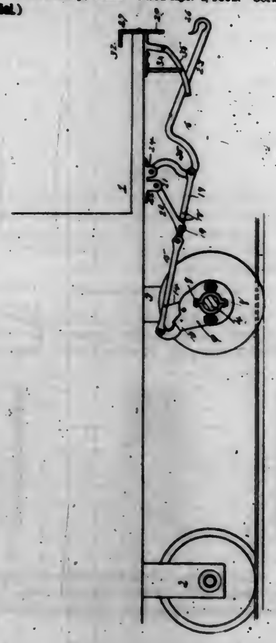
tool-carrier in position, a tool adapted to engage the head of a shell, and a pin adapted to engage the primer-pocket in the shell, whereby both tool and shell are centered.

2. A tool for trimming heads of cartridge-shells, consisting of a revolvable body having a transverse recess near its lower end, one end of which is cut through to the lower end of the body, an L-shaped tool-carrier lying in said recess and provided with notches 7, a tool adapted to engage the head of a shell, and set-screws engaging said notches, whereby the carrier and tool are adjusted.

479,126. FLOORING. JAMES W. SEE, Hamilton, Ohio. Filed July 6, 1891. Serial No. 398,466. (No model.)

Claim.—1. As an article of manufacture, a board with one of its surfaces held under transverse strain by hard-filling composition seated in uncut punctures in one surface of the board and displacing the fibers sidewise.

2. As an article of manufacture, a board having closely-grouped uncut punctures in its surface filled flush with filling composition and having its surface fibers between the punctures compressed sidewise.



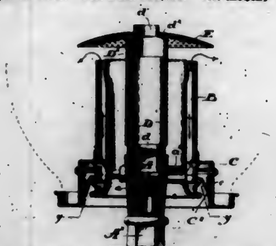
3. As an article of manufacture, a board having closely-grouped uncut punctures filled flush with colored filling composition, the fibers between said punctures being compressed sidewise.

4. As an article of manufacture, a board having a number of closely-grouped uncut punctures filled flush with a colored filling composition, and having similar punctures similarly filled with filling composition of a different color, the fibers between said punctures being compressed sidewise.

5. The improved flooring consisting of tongued and grooved boards laid close together edgewise and having their upper surfaces provided with closely-grouped uncut punctures filled flush with filling composition, the fibers between said punctures being compressed sidewise.

6. The improved flooring consisting of tongued and grooved floor-boards laid close together edgewise and having their upper surfaces provided with transverse cuts filled flush with filling composition and provided, also, with closely-grouped uncut punctures filled flush with filling composition, the fibers between said punctures being compressed sidewise.

479,127. CAR-STARTER. GEORGE B. WARNER and LEWELLYN J. ALLEN, Woodbury, Conn. Filed Apr. 4, 1892. Serial No. 427,687. (No model.)

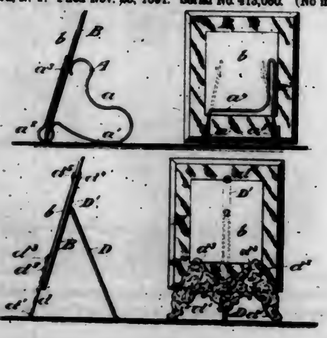


Claim.—1. The combination, with a car truck or body having its front axle provided with a ratchet-wheel, which is fixed thereto, an incasement surrounding said ratchet-wheel and provided with projecting lugs, and an opening above said lugs, of an arm connected with the ratchet-wheel, fulcrumed in the casing and projecting outwardly therefrom, of a sectional adjustable draw-bar connected with the arm of the ratchet-wheel, suspended in bearings depending from the floor of the car, and a spring-actuated foot-lever provided with depending hooks for holding and releasing the draw-bar, substantially as and for the purposes set forth.

2. In a car-starter, the combination, with a supporting-axle of the same, of a sectional ratchet-wheel, a sectional inclosing case provided with an opening in its front, and a detent pivoted in said opening, of a sectional draw bar supported in bearings beneath the car-body or car-floor and provided at its forward end with a draw-hook, and a spring-actuated foot-lever provided with connected holding and releasing hooks for engaging and disengaging the front section of the sectional draw-bar, substantially as specified.

3. The combination, with a car-body or car-truck provided with an incased ratchet-wheel and an arm projecting from an opening in the incasement, of a sectional draw-bar supported in bearings depending from the bottom of the car-body, a depending regulating-guard near the front end of the sectional draw-bar, and a foot-lever provided with an integral and a connected holding and releasing hook, substantially as specified.

479,128. GAS-BURNER. BENNET C. WILSON, Philadelphia, Pa. Filed Apr. 13, 1891. Serial No. 388,706. (No model.)



Claim.—1. In combination, an annular chamber or Argand burner, a gas-receiving chamber connected by branch pipes therewith, an extensible spreader-carrier composed of two telescopically-related perforated cylinders, one of which is connected with the burner and the other with the perforated spreader, and a perforated spreader, substantially as set forth.

2. In combination with an Argand burner provided with a longitudinally-adjustable spreader-carrier equipped with a perforated spreader, a chimney-holder applied to and vertically adjustable with respect to the walls of the burner and having an imperforate top and perforated walls, whereby the relative adjustment of the chimney and spreader is rendered possible, substantially as set forth.

3. In combination with an Argand burner and with a spreader-carrier connected therewith, a perforated metal spreader provided with a rim of incandescent material, substantially as set forth.

4. The combination, to form an extensible spreader-carrier for an Argand burner, of two telescopically-related perforated cylinders and means for connecting one of said cylinders with the burner proper, substantially as set forth.

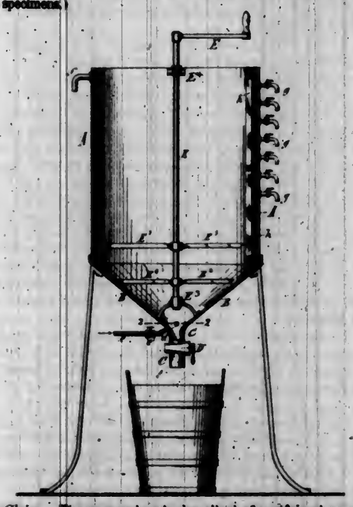
479,129. SETTING FOR CARDS OR PICTURES. MAURICE WIRTH, New York, N. Y. Filed Nov. 25, 1891. Serial No. 413,060. (No model.)

Claim.—1. The setting for a card or picture, comprising a transparent or translucent plate and a holder, said holder being adapted to confine the card or picture at the front of the plate, a margin being preserved on the plate, which presents a transparent or translucent border around the card or picture, substantially as set forth.

2. The setting for a card or picture, comprising a plate and a holder, said holder being adapted to confine the card or picture at the front of the plate, a margin being preserved on the plate, which presents a transparent or translucent border around the card or picture, substantially as set forth.

3. The setting for a card or picture, comprising a plate and a holder, said holder being adapted to confine the card or picture at the front of the plate, a margin being preserved on the plate, which presents a transparent or translucent border around the card or picture, the holder being further constructed to extend over the edge of the card or picture to be held and conceal its edge, substantially as set forth.

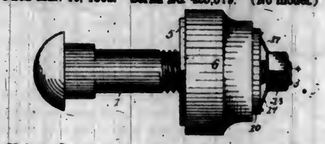
4. The combination, with the plate, of the card or picture holder, said holder being adapted to confine the card or picture at the front of the plate, a margin being preserved on the plate, forming a border around the card or picture, and a support for the plate, located at the rear of the plate and connected with the holder at the front of the plate, plate, substantially as set forth.



5. The combination, with a transparent or translucent plate, of a plate-support having an upwardly-projecting portion at the front of the plate, adapted to hold a card in position against the front of the plate, so as to leave a transparent or translucent border surrounding the card, substantially as set forth.

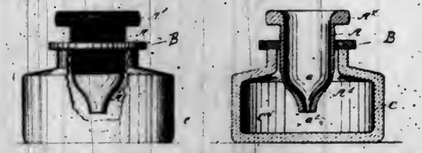
6. The combination, with a transparent or translucent plate, of a plate-support having a rearwardly-extending brace and an upwardly-extending portion adapted to receive a card between it and the front of the plate and hold the latter in position thereon, leaving a surrounding transparent or translucent border, substantially as set forth.

7. The plate-support comprising a rearward brace portion, and a plate and card holding portion connected with the brace and adapted to engage both the front and rear faces of the plate when the latter is in position, substantially as set forth.



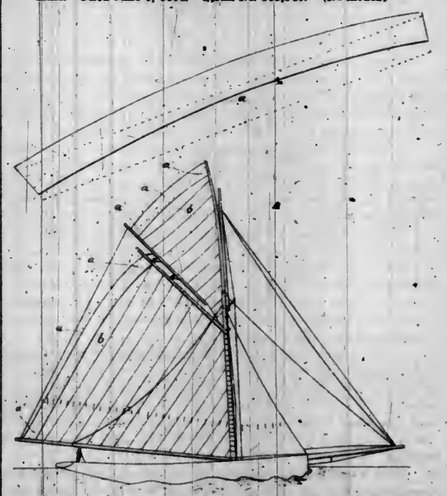
8. The plate-support comprising a wire or strip of metal having its ends in position to engage the rear of the plate to be held and extending from the ends downwardly and rearwardly to form rear treads, thence forwardly to form plate-holding loops and treads, and thence upwardly in position to engage a card at the front of the plate, substantially as set forth.

479,130. PROCESS OF SEPARATING YEAST-CELLS. RUDOLF ALLERT, New York, N. Y. Filed May 7, 1892. Serial No. 432,143. (No specimens.)



Claim.—The process herein described of purifying brewers' yeast, which consists of the following steps: first, mixing the body of yeast to be purified with a quantity of water; second, subjecting the liquid to agitation and the oxidizing influence of air-currents admitted to the lower part of said liquid; third, removing the bacteria and the light and degenerated yeast-cells from the upper part of the liquid; fourth, permitting the remaining yeast-cells to settle by subsidence, and, lastly, separating the smaller and weaker yeast-cells from the stronger and heavier yeast-cells collected at the bottom, substantially as set forth.

479,131. NUT AND BOLT LOCK. JOHN E. ARTHUR, Clinton, Ill. Filed Mar. 19, 1892. Serial No. 425,579. (No model.)



Claim.—In nut and bolt locks, the combination of a nut 5, and a bolt 1, having the usual threads, the rectangular part 2, and the extension 3, having lock-threads provided with recesses 4, the nut 5, adapted to the usual threads of the bolt, cap 6, having recess 8 and inclines 9, washer 10, having inclines 12, conforming to the inclines of the cap and also having a rectangular hole fitting part 2 of the bolt, spring-washer 16, and lock-nut 13, having threads adapted to engage the recesses 4 of the bolt.

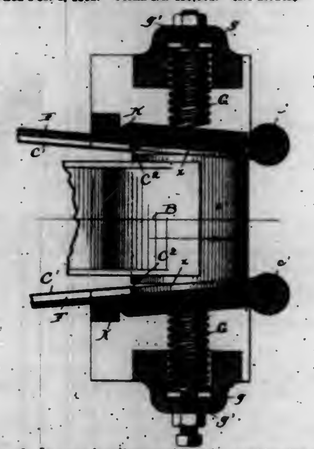
479,132. COVER AND ADJUSTABLE INK-WELL. ROBERT L. BOYD, New York, N. Y. Filed Mar. 33, 1892. Serial No. 426,069. (No model.)

Claim.—The combination of an inkstand with a cover loosely placed upon the top of the same and removable at will and provided with an orifice and with a therein-contained vertically-adjustable ink-well provided with an opening constructed and arranged to communicate with the reservoir of the inkstand, whereby by grasping the said cover with one hand and manipulating the ink-well with the other the said ink-well may be caused to descend into the inkstand-reservoir.

479,133. SAIL FOR VESSELS. JOSEPH H. COFFIN, Somerville, Mass. Filed June 6, 1891. Serial No. 395,341. (No model.)

Claim.—The improved sail for sailing-vessels, provided with a swelled leech, consisting of a curved strip of any suitable sail material, having a concave inner edge and a convex outer edge, said concave inner edge being attached to the length of the after-leech of the sail, as set forth.

479,134. INSULATOR. CHAUNCEY B. CONOVER, Cincinnati, Ohio. Filed Jan. 30, 1892. Serial No. 418,722. (No model.)



Claim.—An insulator consisting of a main body having a hole lon-

479,184.

gitudinally through its center for securing it with a nail or a screw to a fixed object and being provided at one side of said fastening-hole and in a plane at right angles therewith with a line-wire groove or seat, and having, also, in the same plane therewith and encircling said main body a tie-wire groove, a straight groove arranged diagonally with said line-wire groove or seat and leading thereto, and the ears 2 and 3, one at each end of said diagonal groove and above the line-wire groove or seat, for retaining the line-wire therein, substantially as described.

479,185. CAN-HEADING MACHINE. LEWIS E. CURTIS, Chicago, assignor to Edwin Norton, Maywood, and Oliver W. Norton, Chicago Ill. Filed Feb. 1, 1892. Serial No. 419,862. (No model.)

Claim.—1. In a can-heading machine, the combination of a mold which partly encircles the can with a can-head holder constructed to hold the can-head in position to complete the mold, whereby the can-body is trued to receive the head between the embrace of a portion of the head-flange and the part mold, substantially as specified.

2. In a can-heading machine, the combination of a mold which presses against the can-body at one side and a can-head holder constructed to hold the flange of the can-head in opposition thereto, and thereby size and round the can-body by external pressure thereon, and thus adapt it for entrance in the can-head, substantially as specified.

3. In a can-heading machine, the combination of a mold which presses against the can-body at one side and a can-head holder constructed to hold the flange of the can-head in opposition thereto, and thereby size and round the can-body by external pressure thereon, and thus adapt it for entrance in the can-head, and means for pressing or forcing the can-head on the body when the latter is thus sized and rounded, substantially as specified.

4. In a can-heading machine, the combination of a mold which presses against the can-body at one side and a can-head holder constructed to hold the flange of the can-head in opposition thereto, and thereby size and round the can-body by external pressure thereon, and thus adapt it for entrance in the can-head, said can-head holder being arranged at an angle to the axis of said mold, substantially as specified.

5. In a can-heading machine, the combination of a mold which presses against the can-body at one side and a pair of can-head holders arranged at an angle to the axis of said mold and constructed each to hold the flange of the can-head in opposition to said mold, and thereby size and round the can-body by external pressure thereon, and thus adapt it to enter the heads, substantially as specified.

6. In a can-heading machine, the combination, with a part mold B, of a can-head-holding device for holding the can-head against or to resist the pressure of said part mold, whereby the half-flange of each can-head is in turn made to serve as a temporary part mold to true up and round the can-body in conjunction with said part mold B, and a chute or passage for delivering the can-heads to said holding device, substantially as specified.

7. In a can-heading machine, the combination, with a part mold B, of a can-head-holding device for holding the can-head against or to resist the pressure of said part mold, whereby the half-flange of each can-head is in turn made to serve as a temporary part mold to true up and round the can-body in conjunction with said part mold B, a chute or passage for delivering the can-bodies to said part mold B, and a chute or passage for delivering the can-heads to said can-head-holding device, substantially as specified.

8. In a can-heading machine, the combination of means for sizing and rounding the can-body, consisting of a movable part mold B, in conjunction with a device for holding the can-head to adapt the half-flange of the can-head to serve as an opposing part mold between which and said part mold B the can-body is externally compressed, with means for forcing the can-head on the body when the latter is thus sized and rounded, and a device for delivering the can-bodies to said part mold, substantially as specified.

9. In a can-heading machine, the combination, with a movable carrier, of a series of molds mounted thereon, each of which presses against the can-body at one side, and a can-head holder constructed to hold the flange of the can-head in opposition thereto, and thereby size and round the can-body by external pressure thereon, and thus adapt it to enter the head, substantially as specified.

10. In a can-heading machine, the combination, with a movable carrier, of a series of molds mounted thereon, each of which presses against the can-body at one side, and a can-head holder constructed to hold the flange of the can-head in opposition thereto, and thereby size and round the can-body by external pressure thereon, and thus adapt it to enter the head, a chute or device for delivering the can-bodies automatically into the molds on said carrier, and a chute for delivering the can-heads to said holder, substantially as set forth.

11. In a can-heading machine, the combination, with a movable carrier, of a series of molds mounted thereon, each of which presses against the can-body at one side, and a can-head holder constructed to hold the flange of the can-head in opposition thereto, and thereby size and round the can-body by external pressure thereon, and thus adapt it to enter the head, a chute or device for delivering the can-bodies automatically into the molds on said carrier, and a chute for delivering the can-heads to said holder, said can-head holder being arranged at an angle to the axis of said molds, substantially as specified.

12. The combination, with a movable half-mold B, of a can-head-holding device C, furnished with a friction-roller c' to engage the can-head, and a yielding support for said can-head-holding device C, substantially as specified.

13. The combination, with a movable half-mold B, of a can-head-holding device C, furnished with a friction-roller c' to engage the can-head, a guide c, and a yielding support for said can-head-holding device, substantially as specified.

14. In a can-heading machine, the combination of a movable mold B, which partly encircles the can with a can-head holder C, arranged at an angle to the axis of said mold and constructed to hold the can-head in position to complete the mold, whereby the can-body is trued to receive the head between the embrace of a portion of the head-flange and the part mold, and a can-head chute F, having a portion adjacent to said can-head holder extending substantially in the path or direction of movement of said movable mold B, substantially as specified.

15. In a can-heading machine, the combination of a movable mold which presses against the can-body at one side, and a can-head holder arranged at an angle to the axis of said mold and constructed to hold the flange of the can-head in opposition thereto, and thereby size and round the can-body by external pressure thereon, and thus adapt it to enter the head, a can-head-delivery chute F, and a guard C^3 to prevent the rear edge of the can-head flange coming in contact with the end of the can-body before the can-body is trued up and rounded, substantially as specified.

16. The combination, with a movable half-mold B, of a can-head-holding device C, arranged at an angle to the axis of said half-mold and pivoted at one edge thereof, and a spring or yielding support for holding said can-head-holding device in position, substantially as specified.

17. The combination, with a movable half-mold B, of a pair of can-head-holding devices C, arranged at an angle to each other, said can-head-holding devices being pivoted to the frame at their front edges, and yielding supports for said can-head holding devices, substantially as specified.

18. The combination, with a movable half-mold B, of a pair of can-head-holding devices C, arranged at an angle to each other, said can-head-holding devices being pivoted to the frame at their front edges, and yielding supports for said can-head-holding devices, and each of said can-head-holding devices being furnished with a guide c, substantially as specified.

19. The combination, with a movable half-mold B, of a pair of can-head-holding devices C, arranged at an angle to each other, said can-head-holding devices being pivoted to the frame at their front edges, and yielding supports for said can-head-holding devices, each of said can-head-holding devices being furnished with a guide c and a projection c', substantially as specified.

20. The combination of a revolving carrier-wheel D, having a series of part molds B mounted thereon, the can-body-delivery chute E, guards or extensions b' on said carrier-wheel, and a pair of can-head-holding devices C, furnished with guides c and projections or shoulders c' and arranged at an angle to the axis of said part molds on said wheel, substantially as specified.

21. The combination of a revolving carrier-wheel D, having a series of part molds B mounted thereon, the can-body-delivery chute E, guards or extensions b' on said carrier-wheel, a pair of can-head-holding devices C, furnished with guides c and projections or shoulders c' and arranged at an angle to the axis of said part molds on said wheel, and a pair of can-head-delivery chutes F, substantially as specified.

22. The combination of a revolving carrier-wheel D, having a series of part molds B mounted thereon, the can-body-delivery chute E, guards or extensions b' on said carrier-wheel, a pair of can-head-holding devices C, furnished with guides c and projections or shoulders c' and arranged at an angle to the axis of said part molds on said wheel, and a pair of can-head-delivery chutes F, said can-head chutes having inner side pieces C', furnished with guards C^3 to prevent the flanges of the can-heads and the end of the can-bodies from clashing before the can-body is rounded, substantially as specified.

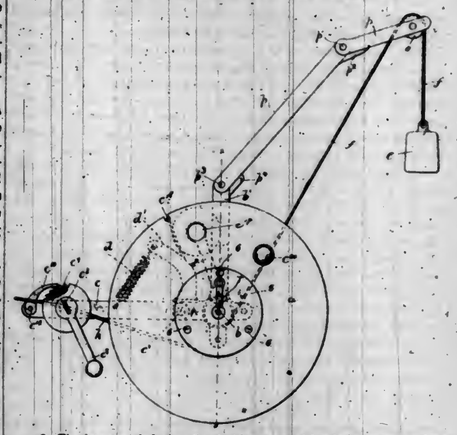
23. The combination of a revolving carrier-wheel D, having a series of part molds B mounted thereon, the can-body-delivery chute E, guards or extensions b' on said carrier-wheel, and a pair of can-head-holding devices C, furnished with guides c and projections or shoulders c' and arranged at an angle to the axis of said part molds on said wheel, the projecting shoulders c of said can-head-holding devices being adapted to yield or separate to permit the passage of the headed can between them, substantially as specified.

24. The combination of a revolving carrier-wheel D, having a series of part molds B mounted thereon, the can-body-delivery chute E, guards or extensions b' on said carrier-wheel, and a pair of can-head holding devices C, furnished with guides c and projections or shoulders c' and arranged at an angle to the axis of said part molds on said wheel, the projecting shoulders c' of said can-head-holding devices being adapted to yield or separate to permit the passage of the headed can between them, together with plates C C, upon which said projecting shoulders are mounted, substantially as specified.

25. The combination of a revolving carrier-wheel D, having a series of part molds B mounted thereon, the can-body-delivery chute E, guards or extensions b' on said carrier-wheel, a pair of can-head-holding devices C, furnished with guides c and projections or shoulders c' and arranged at an angle to the axis of said part molds on said wheel, and a pair of can-head-delivery chutes F, and movable latches or guards C^3, substantially as specified.

26. The combination of a revolving carrier-wheel D, having a series of part molds B mounted thereon, the can-body-delivery chute E, guards or extensions b' on said carrier-wheel, a pair of can-head-holding devices C, furnished with guides c and projections or shoulders c' and arranged at an angle to the axis of said part molds on said wheel, and a pair of can-head-delivery chutes F, and a pair of movable latches or guards C^3 for each of said can-head-holding devices, one arranged above and one below and adapted to be moved out of the way by the can-body as it is moved into position by the carrier and part molds, substantially as specified.

479,186. CLOTHES-LINE HOLDER. MARTIN R. BYERLEY, Portsmouth, N. H. Filed Mar. 12, 1892. Serial No. 424,647. (No model.)

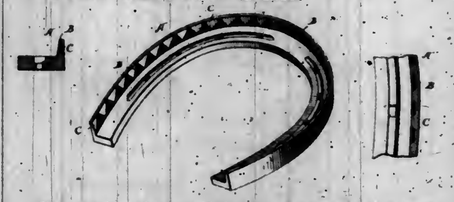


Claim.—1. A clothes-line holder comprising in its construction a frame or support, a clothes-line reel rotatively connected with said support, an automatic motor—such as a weight or spring—adapted to wind the line upon the reel, and a line stretching and locking device independent of the reel-shaft and carried by said support to prevent the line-winding action of the weight or spring, as set forth.

2. A clothes-line holder comprising in its construction a frame or support, a clothes-line reel rotatively connected with said support, a motor adapted to automatically wind the line upon the reel, and a rotary line tightening and locking device supported by the frame at one side of the reel, as set forth

3. A clothes-line holder comprising in its construction a frame or support, a clothes-line reel rotatively connected with said support, an arm pivotally connected with the support, a motor adapted to automatically wind the line upon the reel, a rotary line tightening and locking device mounted on the arm, and a spring which yieldingly holds the tightening device in its normal position and permits it to yield therefrom, as set forth.

4. A clothes-line holder comprising in its construction a frame or support, a motor adapted to automatically wind the line on the reel, separable connections between the reel and motor, a line-wiper arranged at one side of the reel, and means for detachably connecting said wiper with the frame or support, the reel and wiper being removable with the line from the support, as set forth.

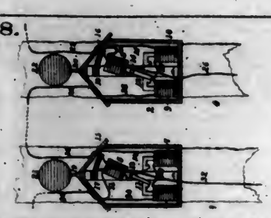


5. In a clothes-line holder, the combination of a frame or support provided with a stud, a drum mounted to rotate on the stud and provided with clutch-teeth, a clothes-line reel mounted on the stud and provided with clutch-teeth adapted to engage the teeth of the drum, means for detachably securing the reel on the stud and permitting its removal therefrom, and a motor connected with the drum and adapted to be adjusted for action by the rotation of the drum, as set forth.

6. The improved clothes-line holder, comprising in its construction a frame or support, a clothes-line reel having a socket, such as c^{17}, a motor to automatically wind the line on said reel, separable connections between the motor and reel, and a rotary line-tightening device having a stud or trunnion, such as c^3, detachably connected with the support and adapted to enter the socket c^{17}, as set forth.

7. The improved clothes-line holder, comprising in its construction a frame or support, a clothes-line reel having a socket, such as c^{17}, a motor to automatically wind the line on the reel, and a line tightening and locking device comprising a shaft rotatably and detachably connected with the support at one side of the reel and provided with a crank or handle, a ratchet affixed to said shaft, and a pawl on the support adapted to engage said ratchet, as set forth.

479,187. HORSESHOE. ROBERT F. LEWIS, Scranton, Pa. Filed Jan. 7, 1891. Serial No. 376,957. (No model.)



Claim.—A horseshoe provided with a continuous calk or outer wall formed of vertical layers of metal of different degrees of hardness, the harder metal being serrated to form teeth and the softer metal being disposed at the side of and between said teeth, substantially as shown and described.

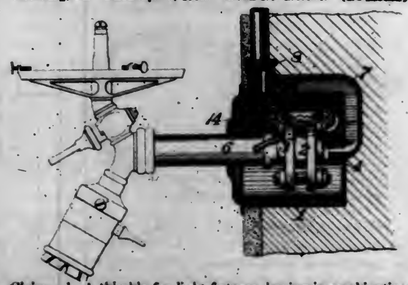
479,188. SIGNAL FOR ELECTRIC RAILWAYS. FRANK F. LOOMIS, Akron, Ohio. Filed Apr. 8, 1892. Serial No. 428,305. (No model.)

Claim.—1. In a signal-box for electric railways, an electro-magnet pivoted to rock vertically, combined with two fixed electro-magnets, the core of the pivoted magnet arranged to rock between the poles of the fixed magnets, the rocking magnet being connected with the source of electrical energy and having a ground-wire from its opposite terminal, the fixed magnets being connected in inverse directions with said source, and a signaling apparatus arranged to be actuated by the rocking magnet, substantially as shown and described.

2. In a signaling system for electric railways, a series of boxes,

479,188.

each having an electro-magnet pivoted to rock vertically, combined with two oppositely-disposed fixed electro-magnets, the core of each pivoted magnet arranged to rock between the cores of the fixed magnets of its box, each rocking magnet connected with the source of electrical energy in the same direction and each having a ground-wire, the fixed magnets being connected in inverse directions with said source, said boxes being electrically connected to permit their several magnets to be energized, and signaling devices arranged to be actuated by said rocking magnets, substantially as shown and described.



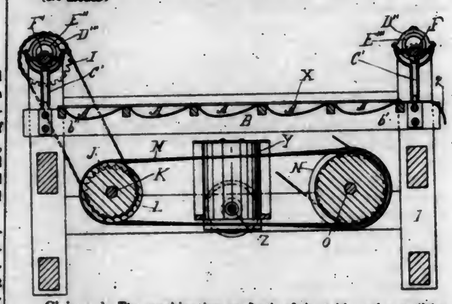
3. In a signal for electric railways, the boxes electrically connected, each having the rocking electro-magnets arranged to be constantly polarized in the same direction by the electric current, combined with the sets of fixed electro-magnets, the magnets of each set being arranged to be simultaneously polarized in opposite directions by the current from one direction and to be oppositely polarized by the current from the opposite direction, the cores of the pivoted magnets arranged to rock between the cores of the fixed magnets, and signaling devices arranged to be simultaneously operated by the rocking magnets, substantially as shown and described.

4. In a signal for electric railways, the rocking magnets arranged to be constantly polarized in the same direction and the sets of fixed magnets with the magnets of each set arranged to be oppositely polarized and the cores of the rocking magnets arranged to vibrate between the cores of their respective sets of fixed magnets, combined with a connecting-wire and a transmitter arranged to be engaged by the trolley and make electric connection between the trolley-wire and said magnets, substantially as shown and described.

5. The combination, with the signal-boxes and their mechanism and the connecting-wire, of the fixed spring 38, the rocking spring 39, the rocking loop 41, arranged to be engaged by the trolley and rock said spring 39 against the spring 38, to make connection between the trolley-wire and connecting-wire, substantially as shown and described.

6. The combination, with the electrically-connected signal-boxes and their mechanism and the connecting-wire 23, of the fixed spring 38, rocking spring 39, having the pin 40, rocking loop 41, sliding wire 43, having the pin 44, and spring 45, all constructed and arranged substantially as shown and described, and for the purpose specified.

479,139. THIMBLE FOR LIGHT-FIXTURES. JOHN J. MILLER, Pittsburg, Pa. Filed Apr. 6, 1892. Serial No. 428,071. (No model.)



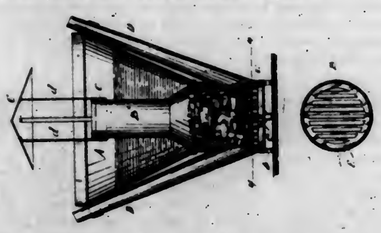
Claim.—1. A thimble for light-fixtures, having in combination a shell adapted to be embedded in a wall or partition and provided with openings in its walls for the insertion of electric-light wires and a nipple adapted to be connected at its ends to a fixture and a gas-supply pipe, respectively, the fixture end of the nipple being within the shell, substantially as set forth.

2. A thimble for light-fixtures, having in combination a cup-like shell adapted to be embedded in a wall or partition and provided with openings in its walls for the insertion of electric wires, a nipple projecting into the shell for connection with a fixture, and means for securing the shell in the wall, &c., substantially as set forth.

3. A thimble for light-fixtures, having in combination a shell adapted to be embedded in a wall or partition and a nipple adapted to be connected at its ends to a fixture and a gas-supply pipe, respectively, the fixture end of the nipple being within the shell, substantially as set forth.

4. The combination of a gas-fixture connected with a supply-pipe and a thimble embedded in the wall adjacent to the fixture and surrounding the joint between the fixture and supply-pipe, substantially as set forth.

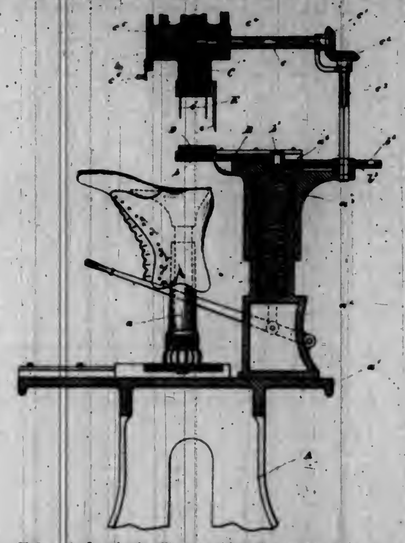
479,140. AMALGAMATOR AND ORE-CONCENTRATOR. LAVOISIER C. MORELAND, Ogilby, Cal. Filed May 2, 1891. Serial No. 391,439. (No model.)



Claim.—1. The combination set forth of the table and pan tilting and oscillating mechanism, and the table provided with the series of scoop-shaped pans which are deep at the rear and shallow at the front, each having a flat mouth or discharge end and rounded sides and rear end and arranged with the grade of the bottom of the pan sloping down from the front to the rear, and the grade of the top of the pan sloping down from the rear to the front, substantially as and for the purpose set forth.

2. The combination set forth of the frame of the machine, the supporting-shafts F F', provided with the sprocket-wheels, the sprocket-chain H, connecting such wheels, the eccentrics E E' E'' E''', arranged in pairs, respectively, upon the two supporting-shafts, the eccentric collars D D' D'' D''', mounted upon such eccentrics, the table-supporting swings which depend from such collars, the table suspended by such swings and provided with the series of sloping-bottomed pans deep at the rear and shallow at the front, and means for oscillating the table and rotating the supporting-shafts.

3. The combination set forth of the pan-table, the supporting-shafts F F', the eccentrics arranged upon the shafts, the eccentric collars, the table-suspending swings, the sprocket-wheels G G', mounted, respectively, upon the supporting-shafts, the sprocket-chain connecting such sprocket-wheels, the driven sprocket-wheel I, fixed upon one of the supporting-shafts, the driven pulley-shaft K, the sprocket-wheel J and cone-pulley L, fixed upon such pulley-shaft, the power-shaft O, the driving cone-pulley N, fixed upon the power-shaft, the crank-shaft V, operatively connected with the driven pulley-shaft K, and the oscillating pitman connecting the cranks of the crank-shaft with the pan-table.



479,141. WATER-HEATER. EDUARD NAGEL, Hoboken, N. J. Filed Mar. 25, 1892. Serial No. 426,350. (No model.)

Claim.—1. A water-heater consisting of a conical vessel or reservoir, a furnace closed at the bottom and extending into the lower part of the vessel, a chimney passing through the vessel, inclined air-tubes extending from the furnace to the upper part of the vessel, and a grate in the furnace, substantially as set forth.

2. A water-heater composed of a conical vessel or reservoir, a cylindrical furnace provided with a closed bottom and extending into the lower part of the vessel, air-tubes extending from the lower part of the furnace to the upper part of the heating-vessel and being attached to the latter by a fastening device, the chimney extending from the upper part of the furnace up through the center of the vessel, a hood supported above the chimney, and a grate formed of two semicircular sections, located near the bottom of the furnace, substantially as set forth.

479,142. HEEL-NAILING MACHINE. FREDERICK F. RAYMOND, 2d, Newton, Mass. Filed July 27, 1889. Serial No. 318,946. (No model.)

Claim.—1. In a heel-nailing machine, the combination of a carriage having ways in which a templet-plate is movable horizontally, the said templet-plate, its templet, and a nail-carrier having a set of awl-holes and a set of nail-carrying holes attached to the templet-plate over the templet and having a slight or limited movement upon said templet sufficient to permit the awl-holes to be moved out of line with the holes of the templet and the nail-carrying holes to be moved into line with said holes of the templet, as and for the purposes described.

2. The combination, in a heel-nailing machine, of a carriage having ways or guides in which a templet-plate is movable horizontally, said templet-plate, a nail-carrier attached to said templet-plate and movable therewith, having a set of awl-holes and a set of nail-carrying holes, a cam connected with said templet for simultaneously moving the same and the nail-carrier, and a reciprocating tappet for moving the nail-carrier in relation to the holes of the templet-plate, substantially as described.

3. The combination, in a heel-nailing machine, of the nail-driving devices, the horizontally-movable templet, a cam for moving it into and out of position, a nail-carrier attached to said templet-plate, movable therewith by said cam, a reciprocating actuating device in the form of a tappet for moving said nail-carrier or its hole-covering plate in relation to the holes of the templet, and said hole-covering plate having an opening and closing movement, substantially as described.

4. In a heel-nailing machine, the improved combined templet and nail-carrier comprising a templet-plate B, having the templet *b* at its front end and a separate nail holder or block secured to said templet or templet-plate in a position over said templet, a spring for holding the nail-holder out of alignment with the holes of the templet and adapted to deliver nails from its holes to the holes of the templet, and a reciprocating tappet for moving said nail-holder over the holes of the templet or template-plate, substantially as specified.

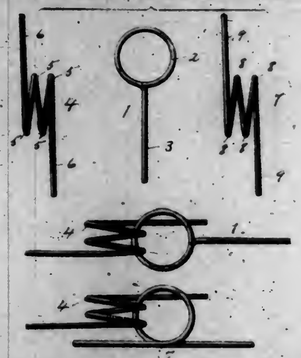
479,143. CAR-DOOR. ABRAHAM B. TAYLOR, Mount Airy, Ohio. Filed July 6, 1891. Serial No. 398,564. (No model.)

Claim.—1. A car-door suspended from a tram-rail by means of hangers C, the latter having a pulley in their top portions, said pulleys resting and adapted to travel on said rail, the lower end portions of said hangers being pivoted centrally within recesses in the top edge of said door, and suitable means for locking the latter, substantially as set forth.

2. The round tram-rail B, connected to the car-door A, hangers C, having a pulley *d* therein and resting on said tram-rail, circular recesses *d'* in said hangers, through which said rail passes, the lower end portion of said hangers being pivotally connected within recesses in the top edge of said door, and suitable means for manipulating and locking the latter, substantially as specified.

3. The combination of tram-rail B, hangers C, having pulleys in the housing thereof, said pulleys resting upon said tram-rail, door A, having recesses in the top portion thereof, plates *a*, secured within said recesses, the lower end portions of said hangers being pivotally connected to said plates centrally within the door, and suitable means for locking the latter, substantially as set forth.

479,144. CAR-DOOR. ABRAHAM B. TAYLOR, Mount Airy, Ohio. Filed Sept. 14, 1891. Serial No. 405,644. (No model.)



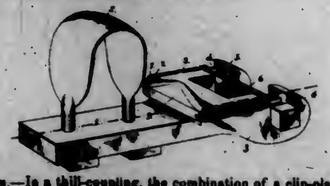
Claim.—1. A car having a suitable cased opening with guide-rails connected thereto above and below said opening, in combination with a door provided at top and bottom with lugs F, having a groove *f* therein, and lugs G, connected to the top and bottom casing of said opening, said latter lugs having a tongue *g*, and suitable means for sliding said door out of its opening onto the lower rail and for retaining said door thereon in a sliding position, substantially as set forth.

2. In combination with a car having a suitable opening therein, the rails D and E, connected to said car, said rails having flanges *d* and *e*, respectively, door A, having lugs F connected to the top and bottom thereof, said lugs having the extensions f^3 and groove *f*, the lower lugs having an auxiliary extension f^4, lugs G, connected to the top and bottom casing of said opening, said lugs having a tongue *g*, the lower rail having a recess e^2, the tongues *g* resting and adapted to slide within the grooves *f*, and suitable means for operating and locking said door.

3. A car having an opening with flanged guide-rails connected thereto above, below, and extending to one side of said opening, lugs F, connected to the top and bottom of said door, with grooves *f* in said lugs, lugs G, connected to the top and bottom casing of said opening, with tongues *g* on said latter lugs, and rod H, connected

to said door, said rod at each end having the angular portions A A^3, the portions A^3 engaging at the rear of the flanges on said guide-rails, for the purposes set forth.

479,145. WIRE PUZZLE. CHARLES E. WHITWORTH, Worcester, Mass., assignor of two-thirds to Thomas Hill and John W. Buckley, same place. Filed Mar. 16, 1891. Serial No. 385,911. (No model.)



Claim.—1. A wire puzzle consisting of two double coils with projecting ends and a single ring or coil with a projecting end, substantially as set forth.

2. The combination of a wire having its central portion formed into coils with its ends left projecting in opposite directions with a second wire having its central portion formed into coils with its ends left projecting in opposite directions, substantially as described.

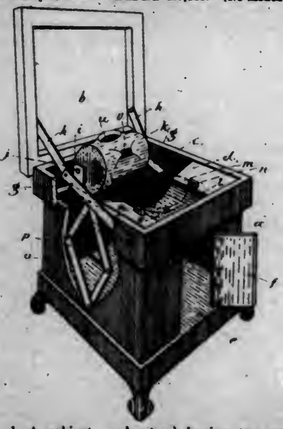
3. A puzzle consisting of two wires having their middle portions bent into coils, with their ends left projecting, and a ring encircling one or more of the wire coils, substantially as described.

479,146. THILL-COUPLING. WILLARD C. WILLIAMS, Rush Creek Valley, assignor of one-half to Levi S. Sanders, Campbellsville, Ind. Filed Jan. 5, 1892. Serial No. 417,073. (No model.)

Claim.—In a thill-coupling, the combination of a clip-plate provided with forwardly-projecting ears having open bearing-recesses and provided with longitudinal bolt-openings arranged at the upper ends of the bearing-recesses and disposed at right angles thereto, bolts arranged in the bolt-openings and closing the mouths of the bearing-recesses, spiral springs disposed on the bolts and arranged within the bolt-openings and bearing against the rear walls of the latter and shoulders of the bolts, a cross-piece connecting the rear ends of the bolts and provided with a central lip, and a coupling-bolt arranged within the recesses of the ears and secured thereto by the spring-actuated bolts, substantially as described.

479,147. ELECTRIC BELT. DUANE P. ANDRUS, St. Louis, Mo. Filed Dec. 14, 1891. Serial No. 415,012. (No model.)

Claim.—1. An electric belt having a pocket or pockets adapted to move upon said belt, a battery placed within the same, conducting-cords leading from the positive and negative poles of said battery, an electrode or electrodes electrically connected with the opposite end of said connecting-cord, and a U-shaped wire or wires attached to the concave surface of said electrode, substantially as set forth.



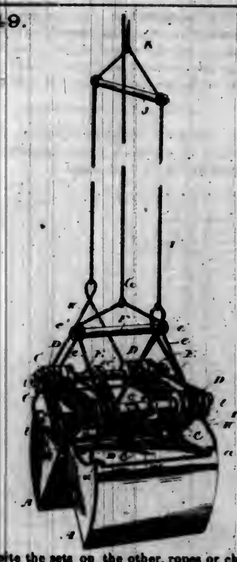
2. In an electric belt, an electrode or electrodes, consisting of a circular plate 9, a U-shaped wire attached thereto, having arms 11 out of contact with said plate, a metallic strip adapted to be held to the said electrode or electrodes by the said arms, and conducting-cords 16 and 17, leading from the positive and negative poles of the battery and connected to one end of the insulated wire or wires 15 of said strip or strips, the opposite end of said wire or wires 15 in electrical contact with said electrode or electrodes, substantially as set forth.

3. An electric belt having a battery composed of a series of cells, each of which consists of a plate 20, of oxidizable metal, having perforations 21, a copper wire 22, passing through the said openings and adapted to connect said plate with the next cell, a copper plate 25, adapted to receive the ends of the wires 22, and a suitable amount of absorbent material interposed between each of the said plates, substantially as set forth.

4. An electric belt having a battery composed of a series of cells each of which consists of a plate 20, of oxidizable metal, having perforations 21, a copper wire 22, passing through the said openings and adapted to connect said plate with the next cell, and a copper plate 25, adapted to receive the ends of the wires 22, substantially as set forth.

5. An electric belt having a battery composed of a series of cells, each of which consists of a plate 20, of oxidizable metal, having perforations 21, a copper wire 22, passing through the said openings and adapted to connect said plate with the next cell, and a copper plate 25, provided with perforations 27, through which the ends of the copper wire 22 are adapted to pass, substantially as set forth.

479,148. WASH-STAND. NATHAN O. BOND, Fairfax Court-House, Va., assignor to William F. Phinney, Standish, Me. Filed Mar. 26, 1891. Renewed Mar. 16, 1892. Serial No. 425,115. (No model.)

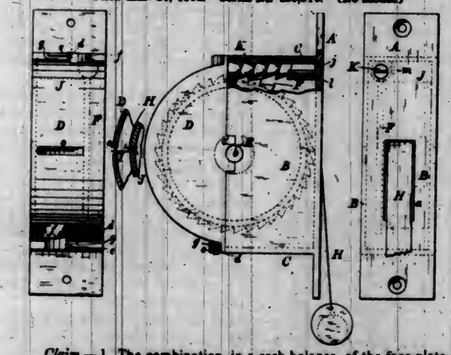


Claim.—1. A cabinet wash-stand having two compartments therein and a cover hinged to the top thereof at the back edge, a supporting-frame pivoted in one compartment near the front thereof and linked to said cover, a water-reservoir journaled in said frame, and a bow set in the other compartment, substantially as and for the purpose set forth.

2. In a cabinet wash-stand having a rear and front compartment and a cover hinged thereto, a supporting-frame pivoted to the casing in the rear compartment near the front thereof and linked to the cover, a collapsible lever pivotally connected to said supporting-frame and the cabinet-case, a reservoir journaled in the supporting-frame, and a bowl mounted on trunnions in the front compartment in such position that when the cover is raised and the water-reservoir is tipped the water will run into the bowl, substantially as and for the purposes set forth.

479,149. WELL-EXCAVATOR. GEORGE W. GALE, Greeley, Colo. Filed Jan. 5, 1892. Serial No. 417,087. (No model.)

Claim.—1. In combination, the two buckets, the shaft hinging them, the sets of radial arms on each bucket, the rods connecting such arms, the two sets of pulleys on each rod, the sets on one rod being



479,149.

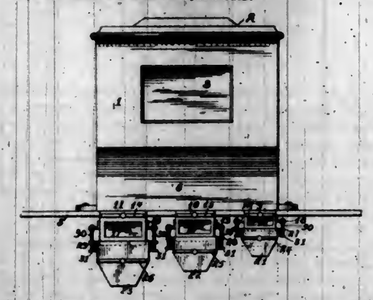
arranged opposite the sets on the other, ropes or chains connecting each set on one rope to the opposite set on the other, the bar connecting the two latter ropes, and the lifting means connected to said bar, substantially as described.

2. In combination, the two buckets, the shaft hinging them, the sets of radial arms on each bucket, the rods or shafts connecting such arms, the pulleys or wheels on the rods or shafts, the ropes or chains connecting in horizontal lines the pulleys of one rod with those of the other, the lifting rope or chain connected to said ropes or chains, and the lowering rope or chain connected to each bucket on the side of its hinge opposite the arms thereof, and the rod connecting said ropes, substantially as shown and described.

479,150. SASH-BALANCE. FREDERIC H. KIMBALL, Rochester, N. Y. Filed Mar. 26, 1892. Serial No. 426,516. (No model.)

Claim.—1. The combination, in a sash-balance, of the face-plate A, having cheeks B B, the cover D, and a spring-drum and suspension carried by a central spindle having journals supported in bearings formed in the meeting edges of the cheeks and cover, a ratchet-wheel attached to the central spindle, and a worm meshing with the ratchet and capable of being revolved from the exterior of the face-plate, substantially as described.

2. The combination, in a sash-balance, of the face-plate A, having cheeks B B, the cover D, and the spindle E, the spring-drum J, having tape H thereon, supported on the spindle on one side only and arranged to bear on a suitable friction-surface on the opposite side and a ratchet-wheel attached to the central spindle, and a worm meshing with the ratchet and capable of being revolved from the exterior of the face-plate, substantially as described.

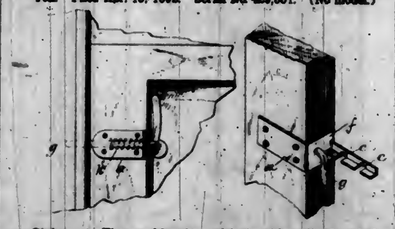


3. The combination, in a sash-balance, of the face-plate A, having cheeks B B and end plate C, provided with inwardly-projecting flange m, the spring-drum J, tape H, spindle E, ratchet F, and worm K, located in the angle between one of the cheeks and the end plate and supported laterally by the flange m, substantially as described.

4. The combination, with the mechanism of a spring sash-balance, of the face-plate A and casing B C, having lugs e e, and the removable cover D, having lugs f f and the pins d d, substantially as described.

5. The combination, in a sash-balance, of the face-plate A, having cheeks B B, the cover D, and a spring-drum and suspension carried by a central spindle having journals supported in bearings formed in the meeting edges of the cheeks and cover, substantially as described.

6. The combination, in a sash-balance, of the face-plate A, having cheeks B, the cover D, having slot o, and the slotted spring-drum J, and means for revolving the spindle to wind up the spring by drawing it through the slots, substantially as described.

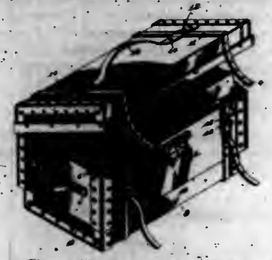


479,151. MEASURING-RECEPTACLE. CHARLES T. MEISER, St. Louis, Mo., assignor of one-half to Henry Gerlitz, same place. Filed Apr. 19, 1892. Serial No. 429,902. (No model.)

Claim.—1. In a measuring-receptacle, the combination, with a spout provided at opposite sides with right-angular apertured brackets, of a sleeve receiving said spout and provided with two oppositely-located brackets, the latter being in line with the brackets carried by the spout and provided with screw-threaded apertures, and reversible thumb-screws keyed to the spout-brackets and working in the sleeve-brackets, substantially as and for the purpose set forth.

2. A measuring-receptacle comprising a receptacle provided with an inclined bottom and with a transparent front, an opening formed in said receptacle above said inclined bottom, an outwardly-inclined face-plate for said opening, spouts located below said opening, glass plates secured in said spouts, right-angular brackets also secured to the same, adjustable spouts or sleeves mounted on said first-mentioned spouts, right-angular screw-threaded brackets secured to said adjustable sleeves, cut-off valves located in said first-mentioned spouts and similar outlet-valves located in said adjustable sleeves, and screw-threaded bolts mounted in said brackets for adjusting said adjustable sleeves or spouts, substantially as set forth.

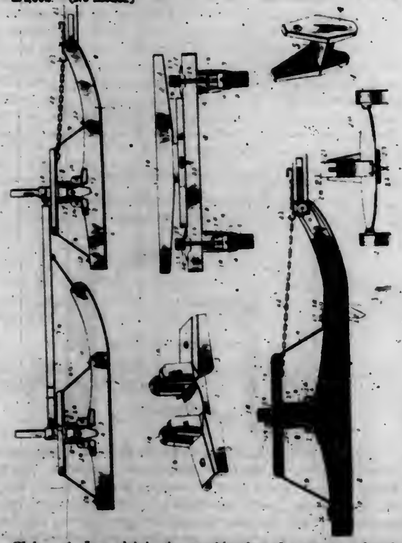
479,152. SASH-FASTENER. STEPHEN MCLELLAN, San Marcos, Tex. Filed Apr. 15, 1892. Serial No. 429,351. (No model.)



Claim.—1. The combination, with the side rail of a window-sash, of the plate a, having the longitudinal slot b, cross-slots c, and perforations f and f^3, bolt g, handle I, secured to said bolt and having a small perforation j, and torsional spring K, one end passing through the perforation f^3 and the other through the perforation j and adapted to throw the handle I into the cross-slots c, said lock adapted to be secured to said rail by any substantial means, substantially as shown and described.

2. The combination, with the side rail of a window-sash, of the plate a, having the longitudinal slot b, cross-slots c, perforated lugs d, and perforated nose f, bolt g, having the threads h, handle I, having a threaded perforation and screwing on the bolt g, and a small perfo-

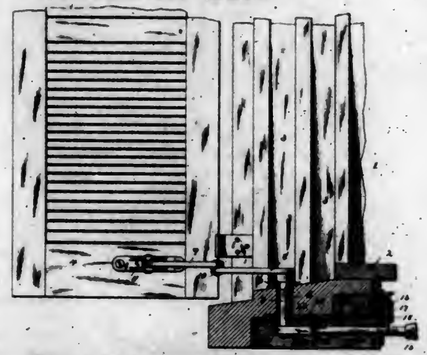
ration to receive one end of the spring K, and coil-spring K, one end passing through the perforation *j* and the other through the perforation of the nose *f*, said lock adapted to be secured to the rail by bolts or nuts passing through the perforated lugs *d*, substantially as shown and described.



479,153. TELESCOPIC TRUNK. FRANK J. PALIGA, Racine, Wis. Filed Sept. 24, 1891. Serial No. 406,669. (No model.)

Claim.—1. The combination, with the rectangular trunk-body having open upper and lower ends, and the triangular brackets 4, having the angular flanges 5, secured in the corners of the body, of the tray removably mounted on the brackets, the hinged cover surmounting the trunk, the removable bottom located in the trunk-body and having surrounding side walls adapted to abut against the brackets, and means for securing the bottom and cover in position, substantially as specified.

2. The combination, with the rectangular body having upper and lower open ends, and the triangular brackets 4, having angular flanges 5, secured in the corners of the body, of the hinged cover, the tray removably mounted upon the brackets, the removable bottom having surrounding side walls mounted within the open bottom of the body, the leather loops 16, riveted to the front wall of the body, the buckles 17 in the upper and lower ends of the loops, and the straps 11, passed around the cover, body, and bottom and perforated for adjustable engagement with the buckles, substantially as specified.



479,154. SLEIGH. ARTHUR P. PIPE, Antigo, Wis., assignor of one-half to Henry Leiber, same place. Filed Mar. 14, 1892. Serial No. 424,892. (No model.)

Claim.—1. In a sleigh, the combination of a runner, a bearing-plate secured to the runner and provided with ears arranged on opposite sides of its bearing-surface, a knee, and rods arranged on opposite sides of the knee and having their lower ends pivoted between the ears and their upper ends loosely secured, substantially as described.

2. In a sleigh, the combination of a runner, a bearing-plate provided with depending flanges and having perforated ears arranged at opposite sides of its bearing-surface, a knee, a journal-plate mounted on the bearing-plate and provided with depending extensions arranged between the flanges, and the rods arranged on opposite sides of the knee and having their lower ends pivoted between their ears and their upper ends rigidly secured, substantially as described.

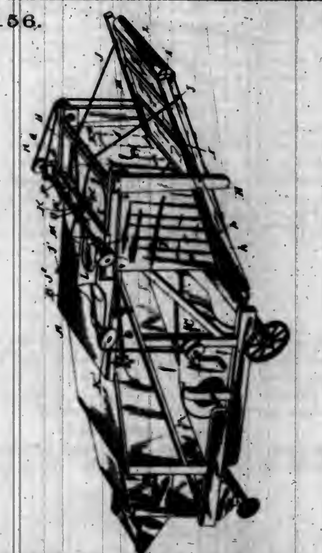
479,155. SHUTTER-WORKER. EDWIN H. PRICE, Lansdale, assignor of one-half to Jeremiah B. Alderfer, Souderton, Pa. Filed Apr. 7, 1892. Serial No. 428,196. (No model.)

Claim.—1. In a shutter-worker, the combination of a lazy-tong connection having one portion thereof pivotally connected to a shutter and a post depending from the other portion of the same, a link connected to the lower end of said post, and a rod or bar pivotally attached to the said link and having a push and pull and lateral movement, substantially as described.

2. In a shutter-worker, the combination of a lazy-tong connection having one portion thereof pivotally connected to a shutter and a post depending from the other portion of the same, a link connected to the lower end of said post, a sleeve surrounding said post and having a flange at the upper end thereof resting on the casing or frame, a bar or rod connected to said link and having a push, pull, and lateral movement and provided with a series of openings, and a spring-actuated latch-pin adapted to engage the openings of said bar or rod, substantially as described.

3. In a shutter-worker, the combination of a post depending from a part thereof, a sleeve surrounding said post, a flanged plate connected to said sleeve and having openings in the bottom thereof, and an arm secured to the frame or casing and having openings therein, said arm being adjustably fitted in the said plate and adapted to have the openings therein align with the openings in said plate to receive a fastening, substantially as described.

4. In a shutter-worker, the combination of a lazy-tong connection having one portion thereof pivotally connected to a shutter and a post depending from the other portion of the same, a link connected to the lower end of said post, a sleeve surrounding said post and having a flange at the upper end thereof resting on the casing or frame, a bar or rod connected to said link and having a push, pull, and lateral movement and provided with a series of openings, a spring-actuated latch-pin adapted to engage the openings of said bar or rod, a flanged plate connected to said sleeve and having openings in the bottom thereof, and an arm secured to the frame or casing and having openings therein, said arm being adjustably fitted in the said plate and adapted to have the openings therein align with the openings in the plate to receive a fastening, substantially as described.



5. An adjusting device for a shutter-worker, consisting of a flanged plate connected to the mechanism of the worker and having openings therein, and an arm secured to the frame or casing of the window and in like manner provided with openings, said arm being adjustably fitted in the said plate and adapted to have the openings therein align with the openings in the plate to receive a fastening, substantially as described.

479,156. THRASHING-MACHINE ATTACHMENT. ALBERT REASON, Pinckney, Mich. Filed April 26, 1892. Serial No. 430,694. (No model.)

Claim.—1. In an attachment for thrashing-machines, a swinging carrier-frame pivotally connected with the machine-body over the delivering end thereof and depending below and under said delivering end, an endless carrier pivotally mounted within said depending frame, and means for swinging said carrier-frame, substantially as set forth.

2. In an attachment for thrashing-machines, the thrashing-machine having an extended rear top deck, a swinging table pivotally

479,156.

mounted upon and working over said deck, a depending frame portion connected with said table and extended under the delivering end of the thrasher, an endless carrier pivotally mounted in said depending frame portion, and means for swinging said table and adjusting said carrier, substantially as set forth.

3. The combination, with a thrashing-machine having a rear top deck, of a swinging table pivotally mounted upon and supported by said deck, opposite supporting-standards depending from the opposite outer ends of said table, opposite parallel pivot-arms projecting from the lower ends of said standards under the delivering end of the thrasher, an endless carrier pivotally mounted between the inner ends of said arms, and means for swinging said table and adjusting said carrier, substantially as set forth.

4. The combination, with a thrashing-machine, of a swinging carrier-frame depending below the delivering end of the thrasher and having a pivot-bolt working in the rear top deck of the thrasher, a horizontal gear-wheel secured to said pivot-bolt under said frame, an adjacent adjusting-shaft having a screw meshing with said gear-wheel to swing the frame, and an endless carrier pivotally mounted in said swinging frame and adapted to be adjusted therein, substantially as set forth.

5. The combination, with a thrashing-machine, of a swinging carrier-frame having a pivot-bolt journaled in the rear top deck of the thrasher, a gear-wheel secured to said pivot-bolt beneath said frame, an inclosing casing surrounding said gear-wheel and secured to the deck of the thrasher to hold the frame thereon, and an adjacent adjusting-shaft provided with a screw end projecting into said inclosing casing and meshing with said gear-wheel, substantially as set forth.

6. In an attachment for thrashing-machines, the thrasher having an extended rear top deck, a swinging table supported by said deck and having an end bolster provided with a pivot-bolt journaled in said deck, supporting-standards depending from the opposite outer ends of said table, rearwardly-inclined pivot-arms projecting from the lower ends of said standards under the delivering end of the thrasher, an endless carrier working between said standards and arms and pivoted at its lower end to said arms, a horizontal gear-wheel secured to said pivot-bolt under the bolster, an adjacent adjusting-shaft having the screw at one end meshing with said gear-wheel, and means for adjusting said carrier, substantially as set forth.

7. In an attachment for thrashing-machines, a swinging carrier-frame pivotally mounted upon the rear end of the thrasher and having a depending frame portion extended under said delivering end, an endless carrier pivotally mounted in said extended frame portion and provided with cord-guides near the outer end thereof, guide-rollers centrally mounted upon the carrier-frame upon the top of the thrasher, opposite cord-guides secured to opposite top sides of the thrasher, a winding-drum located beneath one of said guides, and an adjusting-cord connected fixedly at one end to one side of the thrashing-machine, passing under the outer end of the endless carrier, through the guides thereunder centered between the central top guide rollers, passing around the opposite top guides, and connected at its free end with said winding-drum, substantially as set forth.

8. In an attachment for thrashing-machines, a swinging carrier-frame pivotally mounted upon the rear end of the thrasher and having a depending frame portion extending under the delivering end of the machine, an endless carrier pivotally mounted in said extended frame portion and having a belt-shaft provided with a pulley at one end, upper and lower pairs of guide-pulleys mounted on one side of the depending frame portion, a drive-shaft fixedly journaled upon the frame of the machine, a corresponding adjacent drive-shaft journaled upon the top of the swinging frame and provided with a belt-pulley at one end, a flexible spring-coupling connecting the adjacent ends of said shafts, and a belt passing over said upper and lower pairs of guide-rollers and connected with the belt-shaft pulley and said drive-shaft pulley, substantially as set forth.

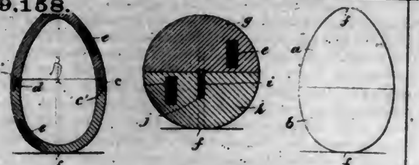
479,157. LANDING-NET FRAME. JAMES REED, Cambridge, Mass. Filed Sept. 24, 1889. Serial No. 324,931. (No model.)

Claim.—1. The side bars of the landing-net frame and the ferrule *g*, combined with the joint composed of two arms pivoted together and having each a threaded shank, said shanks when brought together forming a threaded hub to enter the said ferrule, the said arms receiving and holding the said side bars, substantially as described.

2. A side bar of a landing-net and the joint at its outer end hinged together permanently by the pin *e* and notched, as described, combined with an independently-movable lock to engage notches of the said joint and keep it open, substantially as described.

3. In a landing-net frame, the two arms *A m*, hinged together and provided with shanks, and the side bars inserted in the said sockets, combined with means to hold the said arms in the said sockets, substantially as described.

4. In a landing-net frame, the two arms *A m*, having lips and recessed, as described, and hinged together, combined with two side bars, substantially as described.



5. In a landing-net frame, the socketed arms *c d*, permanently jointed together, and a lock for the same, shanks and two arms *A m*, permanently jointed together and having sockets and threaded shanks, combined with two flexible side bars connected rigidly to the said arms, and with a ferrule to receive the said threaded shanks, substantially as described.

6. A joint composed of two pivoted sections, each section having a side-bar carrier and a semi-cylindrical shank with threads on the outer surface, the threaded shanks of said sections forming, when brought together in the movement of the sections upon their pivot, a threaded hub for engaging with a correspondingly screw-threaded ferrule, and the carriers at the opposite ends of said sections for engaging with the free ends of a net-frame.

479,158. TOY OR PUZZLE. GEORGE T. SMALLWOOD, Washington, D. C., assignor of one-half to Otis Cole, Rochester, N. Y. Filed March 18, 1892. Serial No. 425,473. (No model.)

Claim.—1. In a toy, a shell or body and counterbalancing-weights therefor, said shell or body being constructed to support said weights off the center and said weights being relatively movable with respect to each other, whereby the toy may be poised on end.

479,158.

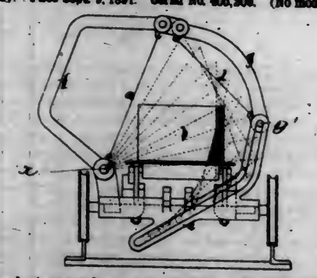
2. In a toy, a sectional shell or body, each section being heavier at one side and being relatively movable to the other, substantially as explained.

3. In a toy, a sectional shell or body, each section having a weight embedded therein at one side, the relative positions of the weights being changeable, substantially as explained.

4. In a toy, a shell or body constructed of rotatable sections, each section being weighted at one side and being relatively movable to the other, substantially as explained.

5. In a toy, a shell or body constructed of rotatable sections, each section having a weight embedded therein at one side, whereby the relative positions of the weights may be changed, substantially as explained.

6. In a toy, a shell or body constructed of separable sections, each section being weighted at one side and being relatively movable to the other, substantially as explained.



7. In a toy, a shell or body constructed of separable rotatable sections, each section being weighted at one side and being relatively movable to the other, substantially as explained.

8. In a toy, a sectional shell or body of plastic material, each section having a weight embedded therein at one side between the inner and outer surfaces, so as to be hidden from view, the relative positions of the weights being changeable, substantially as explained.

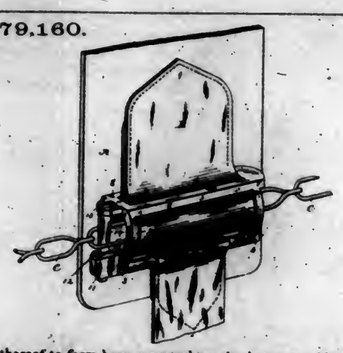
9. In a toy, an egg-shaped shell or body composed of sections, each section being weighted at one side of the longitudinal axis of the shell or body, substantially as explained.

10. In a toy, a shell or body provided with two counterbalancing-weights attached thereto and located off the center and relatively movable with respect to each other, substantially as explained.

479,159. BRICK-CUTTING MACHINE. EUGENE STERN, Helmstedt, Germany. Filed Sept. 9, 1891. Serial No. 405,209. (No model.)

Claim.—1. A cutter for brick-machines, consisting of cutting levices located in the same vertical plane and adapted to engage opposite sides of the stream of clay to be severed, substantially as described.

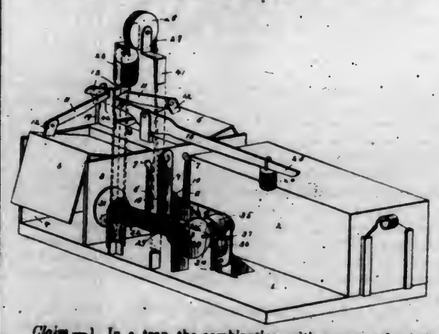
2. A cutter for brick-machines, consisting of two opposing series of cutting-wires, the wires of each series being in the same vertical plane as the wires of the opposing series and said series adapted to engage opposite sides of the stream of clay, and means for moving said opposing series of wires toward each other, substantially as described.



3. In a cutter for brick-machines, a series of cutting-wires and a pivoted support for the same, a second series of wires and a support for the same hinged to said pivoted support, guides for the supports for said second series of wires, adapted to force the same toward those of the second series, and means for supporting a stream of clay intermediate the two series of cutting-wires, substantially as described.

479,160. TRACE-CARRIER. SAMUEL H. WELLBORN, Centre Point, Tex. Filed Apr. 8, 1892. Serial No. 428,361. (No model.)

Claim.—1. In a trace-carrier, the combination of an elongated substantially cylindrical body arranged obliquely to a vertical line and provided with upper and lower supporting-bars and a spring-latch extending across one open end of said body at an angle of inclination to a vertical line, substantially as described.



2. In a trace-carrier, the combination of a cylindrical body of elongated form and obliquely arranged and having slots in the upper

479,160.

part thereof to form bars, a central top slot between said bars, and a lower bar having a recess therein, an obliquely-inclined spring-latch extending across one of the open ends of said body, the back-band having a strap to pass around said body, and a girth-strap connected to said lower recessed bar, substantially as described.

479,161. ANIMAL-TRAP. DAVID WISERT, Greenbush, Ill. Filed Sept. 24, 1891. Serial No. 406,752. (Model.)

Claim.—1. In a trap, the combination, with a cage, of a bait-compartment communicating therewith, L-shaped doors arranged at opposite ends of the bait-compartment and forming the ends and top of the bait-compartment, a lever fulcrumed intermediate its ends, catch-bars pivotally connected to the doors and engaging the lever and adapted to hold the doors in an elevated position, and a bait-holder connected with the lever and adapted to depress the same to release the doors, substantially as described.

2. In a trap, the combination, with a cage, of a bait-compartment communicating therewith, L-shaped doors arranged at opposite ends of the bait-compartment and adapted to close the same, a lever fulcrumed intermediate its ends, catch-bars pivoted to the doors and engaging one end of the lever, a bait-holder connected with that end of the lever, and an adjustable weight mounted on the lever and arranged at the other end thereof, substantially as and for the purpose described.

3. In a trap, the combination of a cage, a bait-compartment communicating therewith, L-shaped doors closing the bait-compartment, rock shafts connected with the doors and carrying the same and provided with depending arms, an oscillating bar arranged between the arms of the rock-shafts and adapted to engage the same to turn the rock-shafts, means for actuating the oscillating bar, an escapement mechanism, a lever, catches connected to the doors and adapted to engage the lever to hold the doors elevated, and a bait-holder connected with the lever and adapted to disengage the same from the catches, substantially as described.

4. In a trap, the combination of a cage, a bait-compartment communicating therewith, doors closing the bait-compartment and provided with catches, a lever fulcrumed intermediate its ends and provided at one end with adjustable weights and having its other end engaged by said catches, a rod depending from the latter end of the lever, and a bait-carrying platform attached to the lower end of the rod, substantially as described.

5. In a trap, the combination of a cage, a bait-compartment communicating therewith, doors closing the bait-compartment and provided with catches, a lever provided at one end with an adjustable weight and having its other end engaged by said catches, a bait-

holder connected with the lever, rock-shafts carrying the doors and provided with depending arms, an oscillating bar arranged between the arms to move the same to lift the doors, a shaft connected with and actuating the oscillating bar, a hinged door arranged within the cage and closing the entrance of the same, escapement mechanism connected with the hinged door and the shaft and operated by the former, and means for rotating the shaft, substantially as described.

6. In a trap, the combination of a cage, a bait-compartment communicating with the same, doors closing the bait-compartment, a lever connected with the doors and holding the same open, a bait-holder connected with the lever and adapted to disengage the same from the doors to close the latter, a shaft connected with the door and adapted to reset the trap and provided at one end with a disk having a projection, a hinged door arranged in the cage and adapted to close the ends thereof, a rock-shaft carrying the hinged door and provided at one end with a weighted bell-crank lever-arm adapted to hold the hinged door closed, and a trip-bar connected with the bell crank lever-arm and provided with a stop to engage the projection of the disk, substantially as described.

7. In a trap, the combination of a cage, a bait-compartment communicating therewith, a door closing the bait-compartment and provided with a catch, a lever arranged to be engaged by the catch, and a bait holder connected with the lever and adapted to disengage the same from the catch, substantially as described.

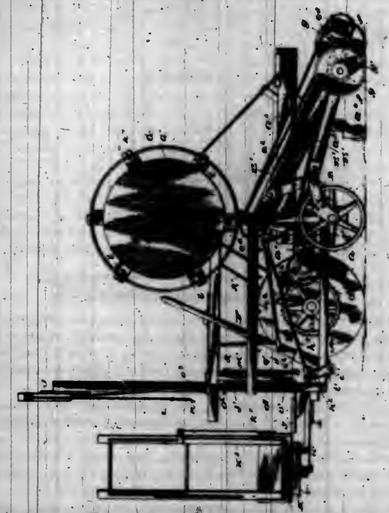
479,162. NUT-LOCK. CHARLES A. BARTLETT, Memphis, Tenn. Filed Sept. 9, 1891. Serial No. 405,187. (No model.)

Claim.—1. The combination, with a bolt and its nut, of the herein-described locking-ring, fitted over the bolt and having its inner periphery provided with a series of oppositely-deflected spring-teeth, one series wedged between the thread on the bolt and nut and the other or outer series sprung under an adjacent outer thread on the bolt, substantially as specified.

2. The herein-described nut-lock, consisting of a ring adapted to fit a bolt and having its inner periphery provided with a series of spring-teeth, each alternate tooth being deflected or disposed in opposite directions and beyond the opposite sides of the ring, substantially as specified.

479,163. GARMENT-FASTENER. GEORGE BRADSHAW, Chicago, Ill., assignor of one-half to George W. Hoyt, same place. Filed Feb. 1, 1892. Serial No. 419,922. (No model.)

Claim.—1. The herein-described pin-fastener, consisting of a wire or wires bent into a heart-shaped configuration, at one end having two points the extremities of which lie adjacent to and in the same plane with each other and at the other end provided with a resilient connection which permits the points to be sprung apart, substantially as described.



2. The herein-described pin-fastener, consisting of a wire or wires bent into a heart-shaped configuration at one end and a hook at the other, said heart-shaped configuration having two points the extremities of which lie adjacent to and in the same plane with each other, and a resilient connection between the ends, which permits the said points to be sprung apart.

479,164. SIGNAL-LIGHT. HENRY COCHRAN, Chester, Pa. Filed Dec. 3, 1891. Serial No. 413,803. (No model.)

Claim.—A signal-light ring or casing having a stationary glass or pane arranged within the same and provided in front of the stationary glass or pane with an L-shaped flange forming a pocket and having in its top a slot to provide a mouth or opening, said pocket being adapted for the reception of a supplemental glass or pane, and the portion S, formed by the slot or opening, being resilient and adapted to clamp the supplemental glass, substantially as described.

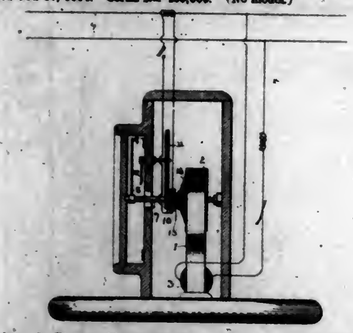
479,165. CORN-HARVESTER. JOSEPH T. HESS, Duffield's, W. Va. Filed Oct. 23, 1891. Serial No. 409,613. (No model.)

Claim.—1. The corn-harvester having the series of knives or cutters arranged in front of the usual cutter-bar and having oblique cutting-edges and adapted to transversely receive through their shanks said cutter-bar, substantially as and for the purpose set forth.

2. The corn-harvester having the corn or stalk elevator comprising the pivoted V-shaped-like frames having secured to their rear ends arms, in combination with the rock-shaft and hand-lever having a slot-and-rod connection with said arms, adapted to have a limited movement independent of said rock-shaft and hand-lever, substantially as specified.

3. The corn-harvester having the crane compromising the axially-pivoted standard, in combination with a slide supporting said standard at its lower end and a bracket supporting said standard a short distance upward from said slide, substantially as set forth.

4. The corn-harvester having the crane and the shock or corn elevating rope or other suitable medium having a stop, in combination with the pulley or drum to which one end of said rope is connected, and the clutch-box adapted to engage said pulley and cause it to revolve with the transporting wheel-axle, and the clutch-box shipping-lever actuated by a supplemental lever, itself actuated by said stop on the elevating-rope, substantially as described.

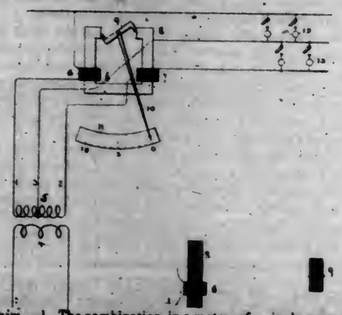


5. The corn-harvester having the shock receiver or stand having secured to its under side a cross-bar v, hinged or pivoted at one edge to a second cross-bar v', centrally pivoted to the outer end of a bar w, pivoted at its inner end to a bracket or support of the framework of the machine, in combination with a segmental bar secured to said bracket and supporting the bar w, substantially as set forth.

479,166. DIE FOR FORMING AXES. JAMES P. KELLY, Louisville, Ky. Filed Oct. 9, 1891. Serial No. 408,278. (No model.)

Claim.—A two-part die for making axes or hatchets, each part having in its working face a cavity corresponding with the general shape of the implement to be formed and having located in such cavity a raised portion C, adapted to produce a label-recess in the finished implement, substantially as hereinbefore described.

479,167. ELECTRICAL METER. ARTHUR E. KENNELLY, Orange, N. J., assignor to the Edison General Electric Company, New York, N. Y. Filed Oct. 17, 1891. Serial No. 408,009. (No model.)



Claim.—1. The combination, with a continuous-current circuit, of a meter comprising an indicating mechanism, an electrical motor for driving it, the armature of said motor having a working coil connected to the circuit, and a closed idle coil or conductor serving to put a load on the motor, substantially as described.

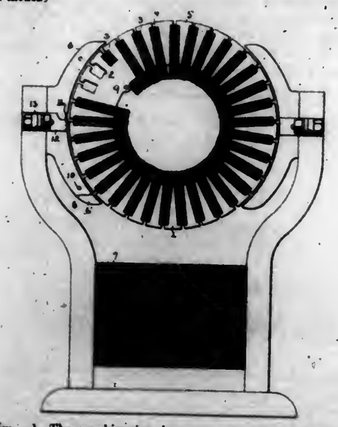
2. The combination, with a continuous-current circuit, of a meter comprising an indicating mechanism, an electrical motor for driving it, the armature of said motor having a working coil connected to the circuit, a closed idle coil or conductor serving to put a load on the motor, and a field-magnet coil connected to the same circuit, substantially as described.

3. The combination of a continuous-current circuit, a meter comprising an indicating mechanism, a motor therefor, the field-magnet coil of which is connected to said circuit, an armature having a coil connected to a commutator, commutator-brushes connected to said continuous current circuit on opposite sides of a resistance, said armature having also a closed idle conductor serving to put a load on the motor, substantially as described.

479,168. ELECTRICAL METER FOR THREE-WIRE SYSTEMS. ARTHUR E. KENNELLY and JOHN F. OTT, Orange, N. J., assignors to the Edison General Electric Company, New York, N. Y. Filed Oct. 21, 1891. Serial No. 409,379. (No model.)

Claim.—1. The combination, in a meter, of a single core, co-operating coils thereon, each coil being connected or adapted to be connected to a separate main, an armature, and an indicating device moved thereby, substantially as described.

2. The combination, in a meter adapted for alternating-current systems, of a laminated core, co-operating coils thereon, each coil being connected or adapted to be connected to a separate main, an armature, and an indicating device moved thereby, substantially as described.



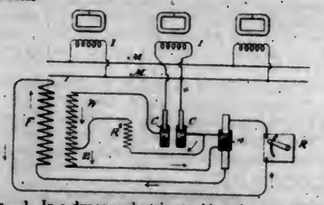
3. The combination, in a meter adapted for alternating-current systems, of a laminated core, co-operating coils thereon, each coil being connected or adapted to be connected to a separate main, a laminated armature, and a pointer or indicating device moved thereby, substantially as described.

4. The combination, in a meter adapted for alternating-current systems, of co-operating coils adapted to be connected to separate mains, laminated pole-pieces therefor, an armature, and an indicator, substantially as described.

5. The combination, in a three-wire system, of the positive, negative, and neutral mains, the source of alternating current connected thereto, and a single meter having two co-operating coils, one connected to a positive and one connected to a negative main, substantially as described.

6. The combination, with positive and negative wires and a source of alternating current connected thereto, of a meter having two co-operating coils, one connected to the positive and one connected to the negative wire, a soft-iron armature therefor, and an indicator or pointer moved thereby, substantially as described.

479,169. ELECTRO-MAGNETIC MACHINE. ARTHUR E. KENNELLY and JOHN F. OTT, Orange, N. J., assignors to the Edison General Electric Company, New York, N. Y. Filed Oct. 21, 1891. Serial No. 409,380. (No model.)



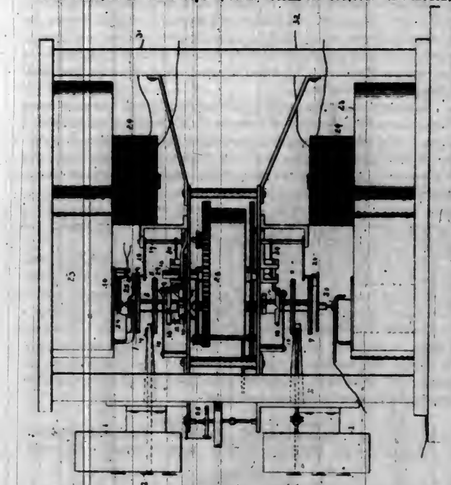
Claim.—1. The combination, in a magnet, of a main body, a separate pole-piece, and a strap securing said body and pole-piece together, substantially as described.

2. The combination, in a magnet, of a main body and a laminated pole-piece, said pole-piece and body being secured together by a strap passing around the pole-piece and fastened to the body, substantially as described.

3. The combination, in a magnet, of a main body and a laminated pole-piece, said pole-piece and body being secured together by a strap passing around the pole-piece and fastened to the body, the pole-piece having a groove across its outer face in which the strap rests, substantially as described.

479,170. COMPOUND-WOUND ALTERNATING-CURRENT DYNAMO. HERMANN LEMP, Lynn, Mass., assignor to the Thomson Electric Welding Company, of Maine. Filed Oct. 17, 1889. Serial No. 327,267. (No model.)

Claim.—1. In a dynamo-electric machine, the combination, with the field-magnet, of two armatures or armature-coils in series with one another, one being the source of current for the work-circuit, and a connection leading across from one side to the other of the series circuit and containing an artificial resistance.



2. In an alternating-current dynamo, the combination, with a field-magnet circuit and an alternating-current work-circuit, of two armatures or armature-coils connected in series through the field-magnet coil, a commutator in such series circuit, a cross connection at an uncommuted portion of the circuit, and a reactive coil or resistance in such connection.

3. The combination, substantially as described, of a field-magnet circuit, two armatures or sections of armature supplying the same in series, a commutator in the series circuit, an uncommuted portion of circuit forming the work-circuit, a connection from one side of the series circuit to the other, made at alternating-current points, and a reactive coil in the said connection.

4. The combination, substantially as described, of two armature coils or sections of coil in series, a field-magnet circuit supplied from the same in series, a commutator in the series connections, a work-circuit in the alternating-current connection to the commutator, a connection across from one side of the series circuit to the other, an artificial resistance in said connection, and a collector-ring for forming such connection.

5. The combination, with the two coils or sections of coil in series, a commutator in the circuit supplied by such coils in series, and an artificial resistance carried by the armature and placed in a connection from a point between the coils to the circuit leading to the commutator.

479,171. ELECTRIC METER. JOHN F. OTT and ARTHUR E. KENNELLY, Orange, N. J., assignors to the Edison General Electric Company, New York, N. Y. Filed Sept. 7, 1891. Serial No. 405,051. (No model.)

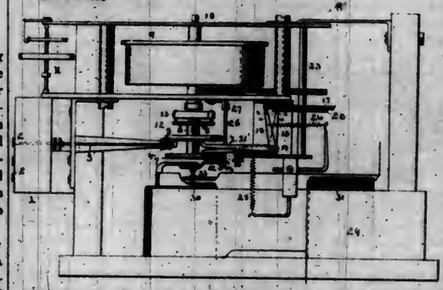
Claim.—1. The combination, in an electrical meter, of a recording device, a regulated motor adapted to advance said recording device when in engagement, mechanism operated by said regulated motor for throwing the motor and recording device into engagement at intervals, and a trip comprising a hand or arm moved in one direction by the current, an engaging wheel or device driven by the motor and operatively connecting the hand and motor when the motor and recorder are in engagement, whereby the hand is carried backward through the same distance by the motor for disengaging said parts when they have moved a distance corresponding to the strength of the current, substantially as described.

2. The combination, in an electrical meter, of a recorder, a motor mechanism adapted to advance said recorder when in engagement, a cam for throwing the same into engagement at intervals, and a tripping device consisting of a pointer moved in one direction by the coil through which the current to be measured passes and moved in the opposite direction by the motor, and a retracting-lever moved by said pointer, substantially as described.

3. The combination, in a meter, of a recorder, a wheel for advancing it, a rotating wheel movable into and out of gear therewith, a motor and mechanism operated thereby for moving said wheels into engagement at regular intervals, a hand or pointer normally free to move, a coil to which said pointer is connected and through which the current to be measured flows, and means for engaging said pointer when the wheel is engaged and moving it, and a trip operated by means of said pointer to disengage the wheels, substantially as described.

4. The combination, in a meter, of a recording or indicating device, a motor and means operated by said motor for periodically throwing it into engagement with the recorder or indicator, a hand or pointer and coil, through which coil the current to be measured passes, said hand being operatively connected to the motor so as to be moved thereby when the motor and recorder are in engagement, the hand not being normally operatively connected to the motor, and a trip operated through said pointer for disengaging the motor from the recorder or indicator, substantially as described.

5. The combination, in a meter, of a recorder, a driving-wheel therefor, a clock work or motor, a gear-wheel driven thereby, mechanism operated by said motor for moving said wheel into and out of engagement with said driving-wheel, a hand or pointer adapted to be moved by the current through a distance exactly corresponding to the strength of the current, the hand being normally disconnected from the motor, a moving part driven by the motor and adapted to connect the hand and motor, said parts being in operative position when the motor and recorder are in engagement, and a tripping device for disengaging the motor from the recorder, said trip being operated through the hand or pointer, substantially as described.



6. The combination of the recorder, the motor, the motor-shaft the gear-wheels and cam movable longitudinally thereon, the bolt co-operating with said cam to move said parts in one direction, and the tripping device comprising a hand or pointer, an operating-coil, and a retractor for the bolt in position to be operated by or through the hand or pointer, substantially as described.

7. The combination of the recorder, the motor, the motor-shaft, the gear-wheels and cam movable thereon, the spring for moving said parts in one direction, the bolt co-operating with said cam to move said parts in the other direction, and the tripping device comprising a hand or pointer, an operating-coil, and a retractor for the bolt in position to be operated by or through the hand or pointer, substantially as described.

8. The combination, in a meter, of a recording device having a driving-wheel, a motor, a wheel driven by the motor, means for moving said wheel into gear with the driving-wheel, consisting of a disk having cam-faces, a sliding bolt pressing against the rim of said disk, but adapted to move lengthwise when a cam-notch is brought in line with it and to move the cam and connected parts forward, and a tripping device comprising a hand or pointer, an operating coil, and a retractor for the bolt in position to be operated by or through the hand or pointer, substantially as described.

9. The combination, in an electrical meter, of two recording devices with driving-wheels therefor, a single clockwork or motor for operating both recorders, gear-wheels movable into and out of gear with the driving-wheels, mechanism operated by the motor for moving the same, and trips the operation of which is dependent on the current used for disengaging the wheels, substantially as described.

479,172. ELECTRIC-CURRENT METER. JOHN F. OTT and ARTHUR E. KENNELLY, Orange, N. J., assignors to the Edison General Electric Company, New York, N. Y. Filed Nov. 30, 1891. Serial No. 413,461. (No model.)

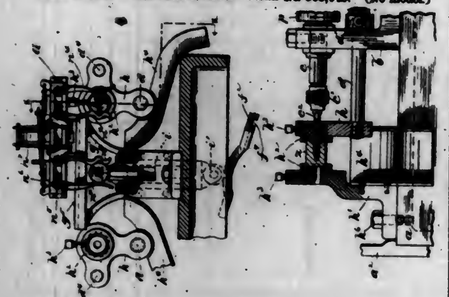
Claim.—1. The combination, in a meter, of a recording device, a motor, intermediate driving connections, a pivoted lever having a retracting-spring for moving said driving connection out of engagement, a regularly-moving cam controlling said lever, and a trip or disengaging device controlled by the force being recorded, substantially as described.

2. The combination, in an electric meter, of a recording device, a regulated motor for advancing said recording device when in engagement, means for throwing the same into engagement at regular intervals, comprising suitable levers, springs adapted to move said levers forward, and regularly-moving cams for putting said springs under tension and then releasing them, and a trip or disengaging device controlled by the current being recorded, substantially as described.

3. The combination, in a meter, of a recording device, a wheel for advancing it, a rotating wheel movable into and out of gear therewith, means for moving said wheels into engagement at regular intervals, a hand or pointer normally free to move, a coil to the axis of which said pointer is connected and through which the current to be measured flows, and means for engaging said pointer when the wheel is en-

gaged and moving it, means for moving said wheels out of engagement, and a detent in position to detain said means from operating, said detent being disengaged at the proper moment by means of said hand or pointer, substantially as described.

4. The combination of a recording device, a regulated motor for advancing it when in engagement, a wheel driven by the motor and movable into and out of gear with the driving-wheel of the recorder, spring-operated levers for moving the first mentioned wheel, regularly-moving cams driven by the motor and in position to act on said levers to put their springs under tension and then to release them, and a trip or disengaging device controlled by the current or force to be recorded, substantially as described.



5. The combination of the recorder driving-wheel, the wheel adapted to gear therewith, and means for engaging and disengaging the same, comprising two pivoted levers with operating-springs, one lever and spring being in position to move the wheel in one direction, the other lever and spring being in position to move the wheel in the opposite direction, and the operating-cams, and a trip or disengaging device controlled by the current or force to be recorded, substantially as described.

6. The combination, in an electric meter, of the recorder driving-wheel, the wheel adapted to gear therewith, and means for engaging and disengaging the same, comprising two pivoted levers with operating-springs, one lever and spring being in position to move the wheel in one direction and the other lever and spring being in position to move the wheel in the opposite direction, the operating-cams, a detent for holding the disengaging lever and spring from operation, and a detent the operation of which is dependent on the current being measured, substantially as described.

7. The combination, in an electrical meter, with a driven wheel of a recorder, of two crown-wheels, one of which is a driving-wheel adapted to gear with the driven wheel of the recorder, two pivoted levers terminating adjacent to said wheels one acting against the same in one direction and the other in the opposite direction, springs connected to said levers, cams acting on the levers, and a trip or disengaging device controlled by the current being recorded, substantially as described.

8. The combination, in a meter, of a coil, an arm or pointer moved thereby, a recording device, a regulated motor adapted to drive the recording device when connected thereto, a movable gear driven by the motor, means comprising pivoted levers with springs of different strength, and cams operating thereon for moving said wheel into or out of engagement, substantially as described.

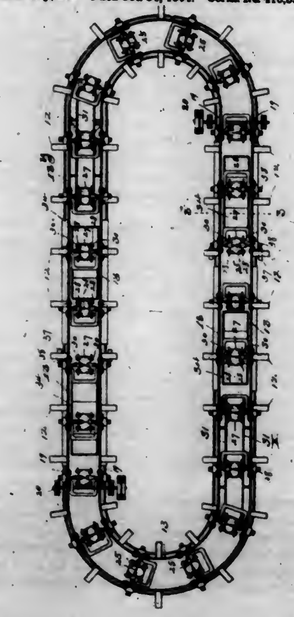
479,173. SPOOL-BORING MECHANISM. JOHN M. PARKER, Pawtucket, R. I. Filed June 9, 1891. Serial No. 395,645. (No model.)

Claim.—1. In a spool-boring machine, the combination, with a blank-holding hopper, a runway or chute leading therefrom, and a vertically-moving plunger, as *i*, communicating with the mouth of the runway, of a pair of horizontally-mounted drills adapted to continuous rotation, a pair of blank-holders arranged in line with and in advance of each drill, a guided carriage provided with yielding fingers adapted to receive and release a spool-blank, mechanism for reciprocating the carriage transversely of the machine to carry blanks alternately from the plunger to the said holders, and mechanism for intermittingly and alternately moving the drills and holders in a longitudinal direction, substantially as hereinbefore described.

2. In a spool-boring machine, the combination, with blank feeding, conveying, and boring mechanisms, of a vertically-movable plunger adapted to receive a spool-blank from the mouth of the runway, and a yielding tongue forming a continuation of the top portion of the runway, substantially as described.

3. In a spool-boring machine, the combination of a blank-guiding runway provided at its mouth with a yielding tongue, as r^{11}, a plunger arranged to travel up and down past the mouth of the runway, a spring-resisted shipper-lever connected with suitable main driving mechanism, and a stop-motion device connected both with the said tongue and shipper-lever, substantially as described.

4. In a spool-boring machine, the combination, with a runway, a pair of revolving laterally-separated longitudinally-movable drills, and a guided blank-carrier traveling back and forth across the machine in advance of the drills, of a vertically-guided plunger arranged to receive a spool-blank from the runway and elevate it into engagement with the carrier, and means for intermittingly reciprocating the plunger in a vertical direction, substantially as described.



5. In a spool-boring machine, the combination, with a guided blank-carrier provided with yielding blank-receiving fingers, all arranged to travel transversely of the machine, of a vertically-guided and automatically-falling plunger, a jointed lever arranged to engage the plunger, provided with an adjustably-secured arm for controlling the plunger's movement, and a revolving cam arranged to engage said arm to effect the vertical travel of the plunger, substantially as described.

6. In a spool-boring machine, the combination of two hollow stationary self-centering blank-holders arranged at the front and the rear sides of the machine, two hollow yielding longitudinally-movable self-centering blank-holders, mechanisms for intermittingly placing spool-blanks in position singly between the adjacent faces of said stationary and movable holders, a pair of continuously-revolving drills mounted in line with the axes of said holders and blanks, springs for forcing the movable holders into frictional engagement with the blanks, and mechanism for feeding the revolving drills endwise through the holders and the retained blanks and returning the parts to their normal positions, substantially as described.

7. In a spool-boring machine, the combination of a blank-holding hopper laterally adjustable to accommodate blanks varying in size, a runway leading therefrom communicating with mechanism for conveying the blanks singly to revolving drills, a guide-wheel revolving in a contrary direction to the path of the column of blanks leading to the runway, an intermittingly-moving pusher, as m^3, located in the front portion of the hopper, and oppositely-arranged reciprocating agitator-plates mounted above the guide-wheel, all arranged and operating substantially as hereinbefore described.

8. In an automatic spool-boring machine, the combination, with an intermittingly moving plunger and a runway arranged to deliver spool-blanks singly thereon, of two suitably-mounted revolving drills, mechanism for alternately and intermittingly moving the drills in a longitudinal direction, yielding self-centering separable holders arranged in line with said drills, and a carriage reciprocating transversely of the machine arranged to remove the blanks from the plunger and place them in position to be acted upon by the said holders and drills, substantially as described.

479,174. CAN-SOLDERING MACHINE. WILLIAM P. QUENTELL, Kansas City, Mo. Filed Oct. 31, 1891. Serial No. 410,529. (No model.)

Claim.—1. In a can-soldering apparatus, the combination of a track having inclined portions therein, solder-wells located along said track, carriers moving thereon, reversible can-supports mounted in said carriers, means for moving said carriers over the track and causing the can to dip into the molten solder without rotating the can, and means for reversing the supports, whereby to present the ends of the can successively to the solder, substantially as described.

2. In a can-soldering apparatus, the combination of a track having inclines therein, solder-wells located along said track, carriers moving on the track, can-supports journaled in the carrier, said can-supports being yieldingly connected, a supplemental track adapted to engage one of the supports, whereby to separate them at proper intervals, means for moving the carriers along the track and inclines, whereby the ends of the can are dipped into and then raised out of the solder without rotation of the cans, and means for reversing the can-supports, whereby the ends of the can are presented successively to the solder, substantially as described.

3. In a can-soldering apparatus, a can-support comprising a hollow cup having a vent in its bottom and a valve carried by a pivoted lever, said valve adapted to seal said vent, and a trip to rock the lever whereby to open the valve, substantially as described.

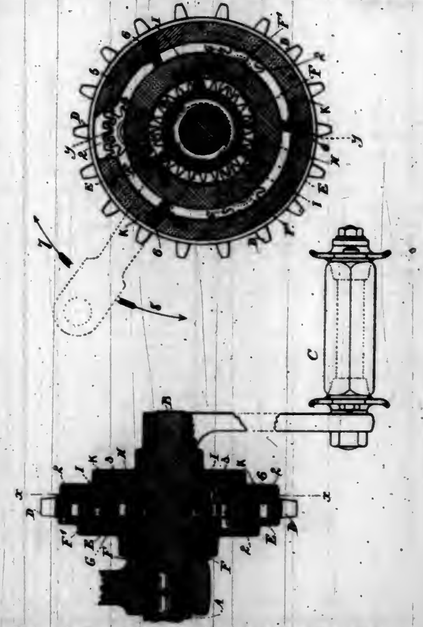
4. In a can-soldering apparatus, the combination of a track having inclines therein, carriers adapted to move upon said track, can-supports journaled in said carriers, a gear upon the journal of the can-support, a rack located between the solder-wells and adapted to engage said gear, whereby to rock the journal and reverse the position of the can, and means for propelling the carriers over said track and inclines, whereby the ends of the can are successively dipped into and then out of the solder without rotation of the cans, substantially as described.

5. In a can-soldering apparatus, can supports consisting of hollow cups yieldingly connected together, said cups being adapted to bear upon the heads of the can inside the flange thereof and their hollow bodies serving to receive superfluous solder, substantially as described.

479,175. WOOD-SCREW AND METHOD OF MAKING THE SAME. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed June 21, 1888. Serial No. 277,776. (No model.) Patented in England Jan. 4, 1889, No. 9,271; in France June 11, 1889, No. 196,947; in Belgium June 15, 1889, No. 86,646; in Italy June 30, 1889, No. 25,639, and in Canada Nov. 8, 1889, No. 32,765.

Claim.—1. The method of forming screws herein described, by forging a finished screw-head, including the slot, upon the end of the wire from which screws are produced, cutting off from the wire and pointing by compression between dies a piece of the required size to form a screw, and forging a thread thereon by rolling it between dies, the ribs of which at the commencement of their operation penetrate the metal to the required depth and then force the metal by lateral compression to expand radially and give the required form to the thread.

2. The wood-screw herein described, having the surfaces of its solid thread, which is raised from the body of the blank by rolling it between dies that compress laterally the metal to form the thread and force it to expand radially from the blank into grooves in the dies having a form transversely the counterpart of that to be given to the thread, of the top and under side of the head, of the slot in said head, and of the portion of the shank adjacent to the head of the thread all composed of compressed metal, substantially as described.



479,176. HANDLE. JOHN B. SCHRODER, Cincinnati, Ohio. Filed Dec. 7, 1891. Serial No. 414,947. (No model.)

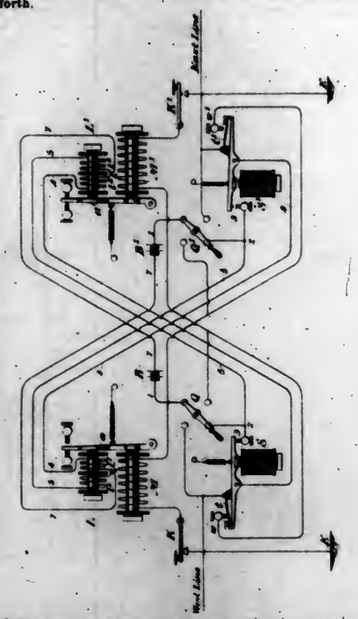
Claim.—1. The detachable handle hereinbefore described, consisting of the handle having locking-shanks, the plate having perforations to receive said shanks, a latch upon the inside of the plate to lock the shanks to the plate, and a handle projecting inwardly from said latch to move it for the purpose of releasing the handle from the plate, the parts combined and arranged substantially as specified.

2. The combination, substantially as hereinbefore set forth, of the plate provided with slotted handle-sockets *a'*, the latch-plate C, fitted to slide in rear of the plate A, portions of said plate C being arranged to pass into the slots in the sockets *a'*, the handle B, having shanks *b* to enter the sockets *a'* and notched at *b'* to register with the slots in said sockets, and the handle projecting inward from the latch-plate for the purpose of sliding it up to release the handle from the inside.

479,177. SPEED-GEAR FOR VELOCIPEDES. CHARLES VOGEL, Fort Lee, N. J. Filed Sept. 24, 1891. Serial No. 406,647. (No model.)

Claim.—1. The combination, with a chain-wheel for a bicycle or similar vehicle, of a crank or pedal shaft, a stationary bearing through which the crank-shaft passes and around which the hub of the chain-wheel is rotated, a central gear-wheel loose upon the crank-shaft, pinions gearing into the same and into the teeth of the gear within the chain-wheel, stationary supports for the intermediate pinions, a disk permanently connected with the crank-shaft, an inclosing face-plate, and pawls acting in opposite directions, whereby the crank-shaft is directly connected with the chain-wheel when revolved in one direction and intermediately connected by the gearing with such chain when revolved in the opposite direction, substantially as set forth.

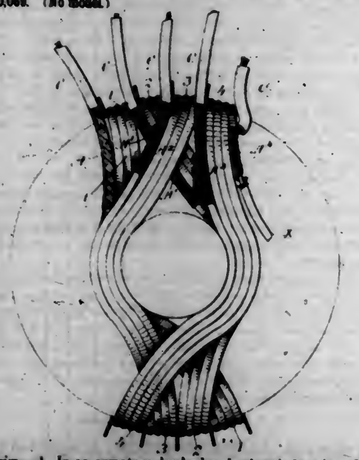
2. The combination, with the crank-shaft and pedals, of a stationary bearing through which the crank-shaft passes, a chain-wheel and hub revolving around the tubular bearing, such chain-wheel having internal gear-teeth, a gear-wheel loose upon the crank-shaft, intermediate gear-wheels between the center gear-wheel and the internal gear of the chain-wheel, fixed bearings supported by the tubular bearing and receiving such intermediate pinions, a disk upon the crank-shaft having a rim, pawls pivoted to such rim and acting at their inner ends upon a cylindrical flange of the center gear-wheel, a recessed face-plate inclosing the gearing and screwed to the chain-wheel, and pawls connected to the rim of the face-plate and acting inwardly against the edge of the disk, substantially as and for the purposes set forth.



3. The combination, with the chain-wheel, the fixed bearing, and the crank-shaft and pedals, of a sun or planet gear between the crank-shaft and chain-wheel, pawls acting in opposite directions, and an inclosing face-plate whereby the entire gear is protected from dust and dirt and the chain-wheel is directly connected to the crank-shaft when the latter is revolved in one direction and intermediately connected to the gearing when the crank-shaft is revolved in the other direction, substantially as set forth.

479,178. TELEGRAPHIC REPEATER. ROSEWELL H. WHITE, New York, N. Y. Filed Feb. 8, 1892. Serial No. 420,710. (No model.)

Claim.—1. In a telegraphic repeater, the combination, with the



armature of the main receiving-magnet, of an independent auxiliary differential magnet, one winding of which is included in a circuit controlled by the armature of the opposite receiving-magnet, substantially as set forth.

2. In a telegraphic repeater, the combination, with the armature of the main receiving-magnet, of an independent differential electro-magnet, a local battery, and a breaking-point included in the circuit of one winding of said differential magnet, which is brought into action before the circuit of the main magnet is broken, substantially as set forth.

3. In a telegraphic repeater, the combination, with the armature-lever of each repeating-sounder, of two independent contact-points, one of which breaks the circuit of the auxiliary magnet of the opposite relay before the other breaks the main circuit of said relay, substantially as set forth.

479,179. ARMATURE FOR DYNAMO-ELECTRIC MACHINES. MERLE J. WIGHTMAN, Scranton, Pa. Filed Oct. 26, 1891. Serial No. 410,069. (No model.)

Claim.—1. In an armature, lead-wires having their point of connection with the armature-wires bound down and clamped against vibration by the wire of a succeeding section wound directly upon it.

2. In an armature, flexible lead-wires attached directly to the armature-winding and bound down or clamped against vibration at the point of attachment by the armature-windings.

3. In an armature, lead-wires connected to the coil-sections beneath the coil-windings, and each bound down at the point of connection by the winding of a succeeding section.

4. In an armature, the combination, with the coil-sections, of a leading-wire connected directly to a coil-winding where it lies upon the armature-head and held in place by another section wound over the point of connection.

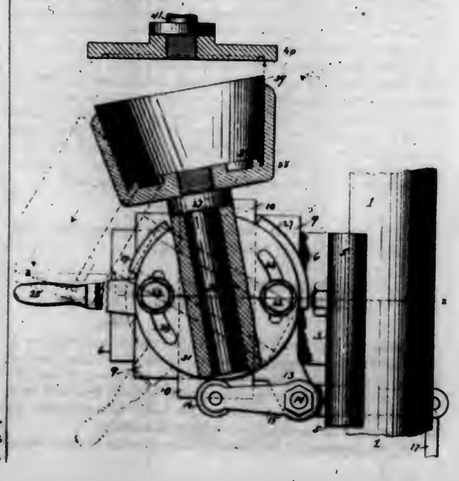
5. The combination, with the armature-coils applied as a continuous winding without projecting loops, of leading-conductors twisted around the wire of said windings at proper points to divide the same into sections, the joints between the leading-wires and sections being each bound by the winding of a succeeding section, as and for the purpose described.

6. In an armature, flexible lead-wires having their points of attachment to the armature-conductors bound down or held against vibration by the armature-winding and their flexible portions only left free to vibrate.

7. In an armature, the combination, substantially as described, with the armature-windings, of flexible lead-wires having their points of attachment to the armature bound down by the armature-winding and having their commutator ends fixed in radial slots in the commutator-segments.

8. The combination, with the flexible lead, of the attached flattened tubular terminal, and a slotted segment or block, in the slot of which the flattened tube is held.

9. The combination, with the flexible lead, of the attached flat sheet-metal terminal, and commutator segments or blocks having radial slots adapted to receive and hold said flat sheet-metal terminal by friction.



479,180. BOX FOR BITS. ISAAC J. BOOTH, Birmingham, Conn. Filed Feb. 25, 1891. Renewed Dec. 21, 1891. Serial No. 415,718. (No model.)

Claim.—1. In a box for packing bits, the combination, with a notched bar adapted to support the bit-shanks and means for holding the bit-points, of a guided and longitudinally-movable locking-bar adapted to engage the squared and tapered rear ends of the bits, substantially as described.

2. In a bit-packing box, the combination of the transverse fixed bar adapted to support the shanks, the longitudinally-movable lock-bar, and an inclined end wall or block having seats for the points of the bits, substantially as and for the purpose set forth.

479,181. METHOD OF AND MACHINE FOR TREATING THE MARGINS OF SHEET-METAL VESSELS. CHARLES M. BROWN and EDWARD P. HOLDEN, Chicago, Ill. Filed Nov. 24, 1891. Serial No. 412,902. (No model.)

Claim.—1. The method of treating sheet-metal articles, which consists in forcing the margin of the article into contact with a tool consisting of a disk having a working surface on one of its flat sides, maintaining the margin of the article and the working surface of the tool in planes that converge so that only a small portion of the circumference of the article has contact with the tool at any one time, and successively bringing all parts of said circumference under the action of the tool, substantially as set forth.

2. The method of treating sheet-metal articles, which consists in presenting the margin of the article to the flat working surface of a revolving tool, maintaining said article in a plane that converges with the plane of the working surface of the tool, so that only a small portion of the circumference of the article has contact with the tool at any one time, forcing them together by pressure applied in a plane parallel with the side of the article that is for the time being in contact with the tool, and successively bringing all parts of the circumference of the article under the action of the tool.

3. The combination of a tool consisting of a disk having a working surface on one of its flat sides, a rotary chuck for holding the article, and means for pressing the margin of the article against the flat face of the tool, the axes of the tool and chuck being inclined with relation to each other, so as to maintain the tool and the margin of the article in converging planes, substantially as set forth.

4. The combination of a rotary chuck for holding the article, a tool consisting of a rotary disk having a working surface on one of its flat sides, the axis of said tool being situated within the circumference of the margin of the article and at an angle to the axis of the chuck, and means for forcing the margin of the article against the face of the tool, substantially as set forth.

5. The combination of a revoluble tool consisting of a disk having a half-round annular groove in one of its flat sides, a chuck for holding the margin of the article in a plane that converges with the plane of the working surface of the tool, and means for forcing the article and tool together, substantially as set forth.

6. The combination, with a tool, of a chuck, a spindle by which it is supported, a plate adjustable about an axis perpendicular to said spindle, a fixed bearing for said spindle carried by said plate, and means for securing said plate so as to hold the parts in the positions to which they are adjusted, substantially as set forth.

7. The combination, with a tool, of a chuck, a spindle by which it is carried, a tilting plate having a socket in which said spindle is journaled and by which it is held against lateral movement relatively thereto, and means for tilting the plate, substantially as set forth.

8. The combination, with a tool, of a chuck, the tilting plate 23, supporting said chuck, a hand-lever for moving said plate, and a dog for locking it in position, substantially as set forth.

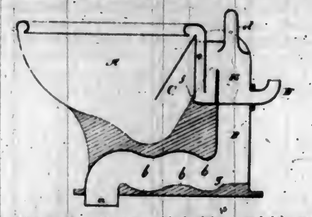
9. The combination, with a tool and a chuck, of a tilting plate 23, a handle for operating it, a plate 31, supporting the chuck, and means adjustably connecting the two plates, substantially as set forth.

10. The combination, with a rotary tool and a chuck having axes inclined with relation to each other, of a slide carrying said chuck and a guide for compelling said slide to move in a plane parallel with the side of the article that is for the time being in contact with the tool, substantially as set forth.

11. The combination, with a rotary tool and a chuck having axes inclined with relation to each other, of a slide carrying said chuck and a guide for said slide adjustable to different angles with respect to the tool, substantially as set forth.

12. The combination, with a tool and a chuck, of a slide, means for adjustably connecting the chuck thereto, and an adjustable guide for said slide, substantially as set forth.

13. The combination, with a tool and a chuck, of the slide 18, the adjustable guide 10, upon which it works, the plate 31, carrying the chuck, and means for adjustably connecting the plate 31 and slide 18, substantially as set forth.

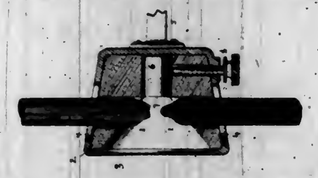


14. The combination of the guide 10, the slide 18, fitting thereon, the plate 23, swiveled to the slide and having the handle 28, the dog 29, the plate 31, secured adjustably to plate 23 and having the socket 35, the spindle 36, occupying said socket, the chuck 38, carried by said spindle, and the tool, all constructed and arranged to operate substantially as set forth.

15. The combination, with the chuck having lugs 48, of the ring 46, surrounding the chuck near its top, the bolts 47, loosely connecting the ring and lugs, and the springs 50, surrounding the bolts and bearing in opposite directions against the lugs and ring, substantially as set forth.

479,182. SIPHON WATER-CLOSET. GEORGE F. BROWN, Philadelphia, Pa. Filed Mar. 2, 1892. Serial No. 423,445. (No model.)

Claim.—1. An improved siphon water-closet in which the longer leg of the siphon is provided in its horizontal portion with a number of projecting surfaces which tend to bank up the water descending through said siphon and render the priming thereof more effectual, substantially as shown and described.



2. A siphon water-closet provided with a receiving and distributing chamber connected with the flushing-tank by a suitable pipe and provided with an outlet to the flushing rim that is normally sealed and with an unsealed outlet to the longer leg of the siphon, substantially as shown, and for the purposes specified.

3. A siphon water-closet provided with a receiving and distributing chamber connected with the flushing-tank by a suitable pipe and provided with an outlet to the flushing-rim that is normally sealed and with outlets into both legs of the siphon, that into the longer leg being unsealed, substantially as shown, and for the purposes specified.

4. A siphon water-closet provided with a receiving and distributing chamber connected with the flushing-tank by a suitable pipe and provided with outlets to the flushing-rim and into both legs of the siphon, the opening into the outlet leading to the longer leg of the siphon being somewhat higher in the chamber than the opening into the outlet leading to the flushing-rim, substantially as described, and for the purposes specified.

479,183. REFLECTOR FOR ARC LIGHTS. ROBERT S. DOBBIE, Brooklyn, assignor to the Edison General Electric Company, New York, N. Y. Filed Apr. 8, 1891. Serial No. 388,104. (No model.)

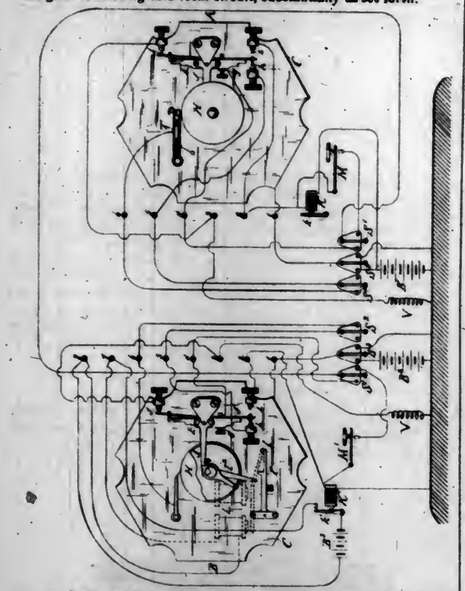
Claim.—1. The combination, with a hollow refractory body, of lamp-carbons forming an arc within said body, a socket therein, and a refractory block adapted to become incandescent supported in said socket, substantially as described.

2. The combination, with a hollow refractory body having a socket, of lamp-carbons forming an arc within said body, a refractory block in the socket and near the arc, adapted to become incandescent, and means for securing said block and for adjusting the same, substantially as described.

479,184. FAC-SIMILE TELEGRAPH. THOMAS A. EDISON, Menlo Park, N. J., and PATRICK KENNY, New York, N. Y. Filed Dec. 6, 1881. Serial No. 47,216. (No model.) Patented in England July 19, 1881, No. 3,140; in Belgium Sept. 15, 1881, No. 56,623; in Canada Oct. 19, 1881, No. 13,577, and in France Nov. 3, 1881, No. 144,646.

Claim.—1. A fac-simile telegraph having transmitting and receiving instruments, the transmitting-circuit being controlled by the depressions produced by marking autographically upon paper or other material, substantially as set forth.

2. In fac-simile telegraphs, the combination of the transmitting and receiving instruments with a transmitting-style having circuit connections and contacts in circuit controlled by the depressions in the surface of the prepared message caused by marking autographically thereon, substantially as set forth.



3. In fac-simile telegraphs, the synchronously-revolving cylinders, one carrying the message prepared by marking autographically upon the transmitting-sheet and the other a chemically-prepared recording-paper, in combination with the transmitting and receiving styles having a movement at right angles to the cylinders, the said transmitting-style having contacts in circuit controlled by the depressions in the surface of the message, substantially as set forth.

4. In fac-simile telegraphs, the combination of the synchronously-revolving cylinders with movable contacts operated by the machines for breaking the circuit when the styles are passing the secured edges of the paper, substantially as set forth.

5. In fac-simile telegraphs, the combination of the two machines having cylinders revolving at slightly-different speeds with a device for checking the faster cylinder and contacts made simultaneously by

the two machines for operating the checking device by completing the circuit through the same, substantially as set forth.

6. In fac-simile telegraphs, the combination of two machines having cylinders revolving at slightly-different speeds with a checking device for the faster cylinder, operated by an electro-magnet in the circuit of a local battery, and contacts made simultaneously by the two machines and completing the main circuit through an electro-magnet controlling said local circuit, substantially as set forth.

7. In fac-simile telegraphs, the combination of the cylinders and the electro-magnetic checking device with sounders for indicating the synchronism of the cylinders, signaling-keys placed in shunts around the machines, and switches for throwing in and out the machines and keys alternately, whereby the sounders will be operated by the machines or keys, according to the position of the switches, substantially as set forth.

8. In fac-simile telegraphs, the combination of the two machines having cylinders and motors revolving the said cylinders at different speeds and an electro-magnetic checking device for one of them with a pivoted lever on each machine connected to line and two contacts between which said lever plays, one connected through the style-circuit to battery or ground and the other through the relay and sounder circuit, such lever being moved once during each revolution of each cylinder to break the style-circuit and make the relay and sounder circuit, substantially as set forth.

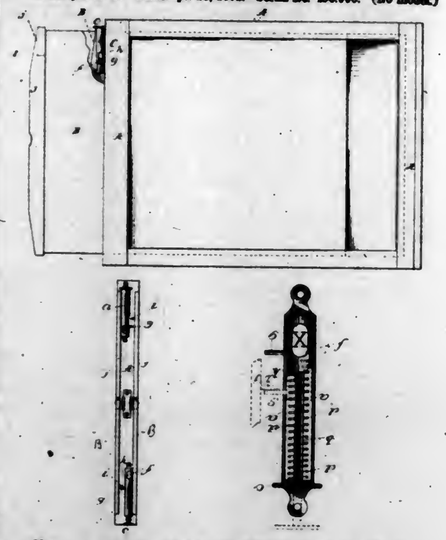
9. In fac-simile telegraphs, the combination, with the synchronously-revolving cylinders and motors and the transmitting and receiving styles, of cams revolving with the cylinders, pivoted levers worked by said cams and connected to line, and making contacts for completing the style, the sounder, and the "compensation" circuits, substantially as set forth.

10. In fac-simile telegraphs, the combination, with the revolving cylinders and the motors working such cylinders, of the revolving cams and the style-carriages controlled by escapements worked by said cams and having a step-by-step movement, substantially as set forth.

11. In fac-simile telegraphs, the combination of the electric motors with weighted centrifugal arms arranged oblique to the motor-shafts, said arms being carried by universal rocking joints and connecting the motors with the driven mechanisms, substantially as set forth.

12. In fac-simile telegraphs, the combination of the horizontal electric motors with the weighted centrifugal arms arranged oblique to the motor-shafts, said arms being carried by universal rocking joints and the slotted cranks, substantially as set forth.

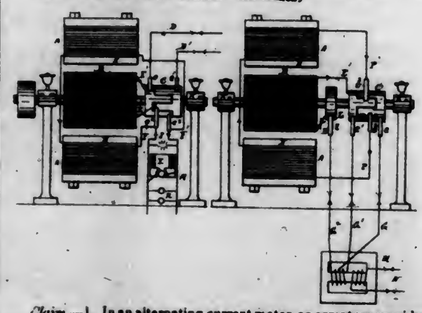
479,185. EAR-MUFF. HARVEY HADDEN, Peekskill, N. Y. Filed Dec. 18, 1889. Serial No. 334,241. (No model.)



Claim.—An ear-muff comprising a wire frame, a covering therefor, and a hanger for securing said frame to a hat, the wire frame

479,185.

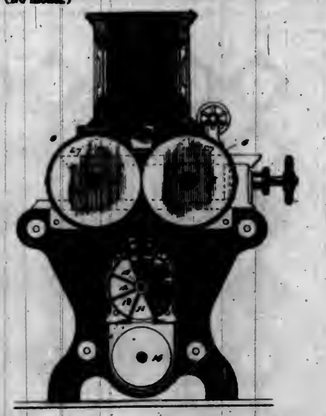
terminating in spirals wound around the shank of the hanger, substantially as herein set forth.



479,186. PHOTOGRAPHIC-PLATE HOLDER. JAMES H. HARE, Brooklyn, N. Y. Filed Apr. 28, 1892. Serial No. 430,990. (No model.)

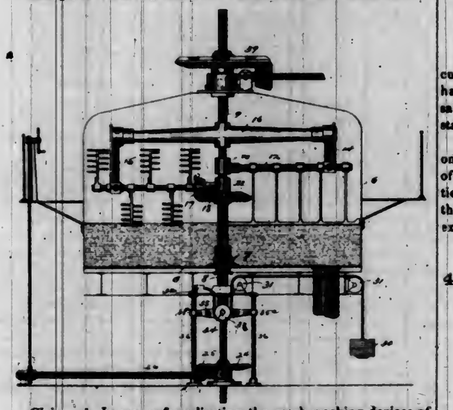
Claim.—1. In a plate-holder, the combination of an indicator, a spring which actuates the indicator, a slide provided with a ledge, and a device upon the indicator adapted to engage with the ledge upon the slide, substantially as set forth.

2. The combination, in a plate-holder, of a tube fastened to the plate-holder, a spindle within the tube, an indicator on the spindle, a spring adapted to move the spindle, a pin for the spindle, a slide, and a ledge on the slide, substantially as set forth.



479,187. ALTERNATING-CURRENT MOTOR. THOMAS H. HICKS, Detroit, Mich., assignor of one-half to H. L. Obetz, same place. Filed Mar. 9, 1891. Serial No. 384,292. (No model.)

Claim.—1. In an alternating-current motor, an armature provided with conductors traversed by alternating currents, said armature rotatable between field-magnet poles, each wound with two distinct conductors, one conductor traversed by current impulses of one direction and the other conductor traversed by current impulses of an opposite direction, and a commutator rotatable with the armature-shaft to separate said current impulses, substantially as described.

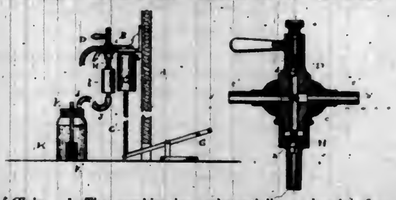


2. The combination, with an alternating-current motor, of a converter having its primary coil in circuit with an alternating current, all its secondary coils in circuit with the armature of the motor, and a part of said secondary coils in circuit with the field-magnet coils of the motor through a commutating or current-shifting device rotatable with said armature, substantially as set forth.

479,188. MEANS FOR PREVENTING EXPLOSIONS IN MILLS. CHARLES KARSTNER, Chicago, Ill. Filed May 13, 1889. Serial No. 310,576. (No model.)

Claim.—In means for preventing explosions in mills, the combination, with the grinding mechanism, of a discharge-passage for the ground material, having hinged wall-sections, and a valve located in the discharge-passage below said movable wall-sections and adapted to discharge the grain therethrough in separated quantities, substantially as described.

479,189. BREWER'S MASHING-MACHINE. CHARLES KARSTNER, Chicago, Ill. Filed Apr. 2, 1891. Serial No. 387,337. (No model.)



Claim.—1. In means for adjusting the mash-working devices of brewers' mashing-machines, the combination of a vertically-movable shaft constructed in two sections, the upper one of which is rotatable upon the lower and carries the mash-working devices, said lower section being hollow and secured against rotation, and an adjusting-screw having a threaded engagement with the lower section and adapted to project into the hollow thereof in adjusting the shaft, substantially as described.

2. In means for elevating the central shaft of brewers' mashing-machines, the combination, with the central shaft, of a screw for raising it, a driving-gear for turning the screw, a support and ball-bearings for the hub of the driving-gear, and a divided coupling engaged with the support and the hub of the driving-gear for maintaining them in alignment, substantially as described.

3. In means for elevating the mash-working devices of brewers' mashing-machines, the combination, with the central shaft, of a screw for raising it, a driving-gear for turning the screw, a support and ball-bearings for the hub of the driving-gear and a divided coupling engaged with the support and driving-gear, a driving-shaft having a pinion enmeshed with the driving-gear, and a bearing for the inner end of said shaft connected with the coupling, whereby the shaft may be adjusted radially, substantially as described.

4. In means for adjusting the central shaft of brewers' mashing-machines, the combination, with a counterbalance, of guide-arms secured with the shaft and having studs carrying sheaves, over which the counterbalance-cables are carried, substantially as described.

479,190. BEER APPARATUS. FRANK M. LA BOITEAUX, Cincinnati, Ohio. Filed Jan. 3, 1887. Serial No. 223,329. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the air-pump, its supporting-bracket, and cock for controlling the passage of air from the pump, the filtering-vessel I, connected to the supply-duct of the pump, and the filtering-vessel K, provided with tube *k*, wire cage *k'*, and tube J to connect the cap of the vessel K to the vessel I.

2. In a beer apparatus, substantially as hereinbefore set forth, the combination of the air-pump C and the cock D for controlling the discharge-duct, said cock being longitudinally perforated, with the spring-loaded valve *d* and plug *d'*, said plug being provided with an alarm, for the purpose set forth.

479,191. BUTTON. FREDERICK H. LARTER, Newark, N. J. Filed Nov. 7, 1891. Serial No. 411,154. (No model.)

Claim.—1. The combination of heads *a a'*, a link permanently secured to one of said heads and separable from the other, the said link having an opening and being provided with a tube formed adjacent to said opening, and a sliding tongue to open or close said opening, substantially as set forth.

2. The combination of heads *a a'*, a link permanently secured to one of said heads and separable from the other, said link consisting of a wire bent at its opposite ends and provided with tubular extremities, and a sliding tongue and spring inserted in one of said extremities, the tongue being adapted to normally close the opening between said extremities, substantially as set forth.

479,192. LAWN-MOWER CLUTCH. GEORGE D. LEEDLE, Springfield, Ohio, assignor to the O. S. Foos Company, same place. Filed May 25, 1891. Serial No. 394,092. (No model.)

Claim.—1. The combination, with a shaft having a rigid collar with ratchet projections and a driving pinion located loosely on said shaft and provided with pockets with inclined bottoms, of an intermediate clutch-collar located between said rigid collar and pinion, ratchet projections on one side of said clutch-collar to engage with the rigid collar, and driving projections on the opposite side thereof adapted to extend into said pockets and engage said inclined bottoms, said driving projections and pockets being provided with engaging faces on opposite sides, substantially as and for the purpose specified.

2. The combination, with a shaft and a rigid collar having ratchet-

teeth, of an intermediate movable collar having similar engaging teeth, and a driving wheel or pinion having cam-faces adapted when revolved in one direction to produce a lateral movement of said intermediate collar, and bearing-faces on the engaging projections of the respective collars, substantially as specified.

3. The combination, with a shaft, a rigid collar having teeth in the face thereof, and a driving-pinion mounted loosely on said shaft, of an intermediate laterally-movable collar provided on one side with ratchet projections to engage with said rigid collar and on the other side with said straight driving edges and inclined bearing-faces adapted to be engaged by similar straight and inclined faces on said pinion, whereby the intermediate collar is caused to be moved laterally and revolved positively by said pinion, substantially as specified.

4. In a clutch, a pinion provided at one end with an inclined and a positive face for exerting an axial and a rotary impulse, respectively, and with a rear face for exerting a rotary impulse.

479,193. PROCESS OF TESTING MILK. HENRY LEFFMANN and WILLIAM BEAM, Philadelphia, Pa., assignors of one-third to John E. Longan, same place. Filed June 3, 1891. Serial No. 394,952. (No specimens.)

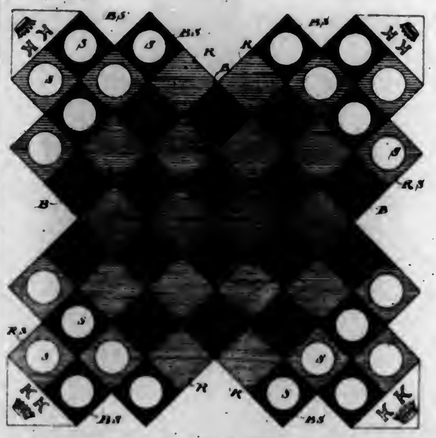
Claim.—1. The process of separating the fatty matter from milk, &c., which consists in adding to such liquid an admixture of alcohol and hydrochloric acid, heating the mixture, and then imparting to the containing-vessel centrifugal motion, substantially in the manner and for the purpose set forth.

2. The process of separating the fatty matter from milk or other similar liquid, which consists in adding to the liquid an admixture of alcohol and hydrochloric acid, then heating the mixture by adding sulphuric acid, and then imparting to the containing-vessel centrifugal motion, substantially as and for the purpose described.

479,194. FISH-HOOK. ALBERT G. MACK, Rochester, N. Y., assignor of one-half to Charles E. Felton, Chicago, Ill. Filed Feb. 18, 1891. Serial No. 381,636. (No model.)

Claim.—1. In combination, a fish-hook or series thereof, an incandescent lamp, and a shield therefor, all arranged in juxtaposition as an artificial bait, substantially as described.

2. In combination, a group of fish-hooks and an incandescent electric lamp supported to extend inside and be shielded by the said group and insulated conductors extending from the lamp for connection with a suitable generator, substantially as described.



3. In combination, a fish-hook having secured to it a tube *r*, an incandescent electric lamp connected with the hook and having insulated conductors passing through the tube for connection with a suitable generator, and a fish-line fastened to the hook, substantially as and for the purpose set forth.

4. In combination, a fish hook having secured to it a tube *r*, an incandescent electric lamp connected with the hook and having insulated conductors passing through the tube for connection with a suitable generator, a fish-line fastened to the book, and a flexible tube D^9, of insulating material, fastened to the tube *r* and enveloping the fish-line and conductors, substantially as and for the purpose set forth.

479,195. GAME APPARATUS. CARRIE N. MAXWELL and NATHANIEL H. MAXWELL, Cincinnati, Ohio. Filed Feb. 18, 1891. Serial No. 381,777. (No model.)

Claim.—1. A game consisting of squares and of the shape of a Greek cross or X, two of the points or corners of the cross being on the line facing the players, each of the arms having the two squares BS and RS standing beyond the rest of said squares BS RS, substantially as and for the purposes specified.

2. In a game-board consisting of squares and in approximately of the shape of an X, part of the squares being of one color or kind, these squares alternating, the end portions of each terminal of the extended corners or ends of the X being provided with similar alternating squares, but these latter squares—viz., BS and RS—being provided with an additional mark or character for distinguishing them from the remainder of the squares, substantially as and for the purposes specified.

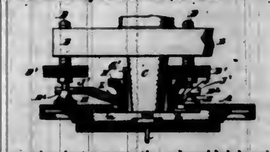
3. In a game-board consisting of squares and in approximately of the shape of an X, part of the squares being of one color or kind, these squares alternating, the end portions of each terminal of the extended corners or ends of the X being provided with similar alternating squares, but these latter squares—viz., BS and RS—being provided with an additional mark or character for distinguishing them from the remainder of the squares, there being a row of four of the last-named squares and an outer row of two thereof, substantially as and for the purposes specified.

4. The game board consisting of alternate squares B and R, differently characterized and arranged in the shape of a Greek cross, and squares BS and RS at the terminal of the cross, having the indicatory disks S, substantially as and for the purposes specified.

5. The game-board having the squares B and R and having its end portions or corners each provided with the squares BS and RS and for the purposes specified.

6. The game-board in the form of a cross, substantially as shown, and having the alternate squares B and R and having its end portions or extended corners provided with a row of four squares BS and RS—viz., two squares BS alternating with two squares RS—and a row of two additional squares, one BS and the other RS, and the outlying spaces K K beyond the last-named row, substantially as and for the purposes specified.

7. The game-board in the form of a Greek cross and provided with squares of two main distinguishing colors, arranged so that all of the squares of one color shall lie in parallel rows, each point or corner of one of these squares touching the adjacent point of an adjacent square, the points or corners of the cross being provided with the spots or spaces K K, respectively located at the ends of the arms and in line with the length of the latter, substantially as and for the purposes specified.



8. A game consisting of squares and of the shape of a Greek cross or X, two of the points or corners of the cross being on the line facing the players, each of the arms having the two squares BS and RS standing beyond the rest of said squares BS RS, a space K K, lying next to and extending out from said two squares BS and RS and forming a narrow or pointed end for the adjacent portion of the cross, substantially as and for the purposes specified.

479,196. TRIPOD-HEAD FOR ENGINEERS' TRANSITS AND ANALOGOUS INSTRUMENTS. JOHN PAOLI, Hoboken, N. J. Filed Nov. 23, 1891. Serial No. 412,712. (No model.)

Claim.—1. In a surveying-instrument, the tripod-plate A, having a central aperture *a*, and the under plate or plane bearing-piece G, applied below and having the threaded tube G', of smaller diameter,

changeable in position in the hole *a*, in combination with each other and with the threaded ring or nut H, and suitable connections to the instrument arranged to tighten and relax the hold of the latter on the tripod-plate by a single central adjustment, substantially as herein described.

2. In a surveying-instrument, the arms B and leveling-screws D, adjustable therein and having spheroidal lower ends D^9, in combination with the shoes E, spider-frame J J', under plate G, having the threaded tube G' and nut H, engaged on the latter, with provisions for communicating pressure at will to the spider-frame, all arranged for joint operation substantially as herein specified.

3. In a surveying-instrument, the spheroidal bearing L, the nut or threaded ring H, acting thereon, and the spider J, with a spheroidal cavity to receive said bearing L, in combination with each other and with the tripod-plate A, having the aperture *a*, and with the under plate G and screw-threaded tube G', carried thereon, all arranged for joint operation substantially as herein specified.

479,197. STOCK-WATERING APPARATUS. ANDREW ROCKFELLOW, South Richland, N. Y. Filed Oct. 12, 1891. Serial No. 408,428. (No model.)

Claim.—1. A stock-watering apparatus consisting of a tank, an elbow communicating with the tank, a supply-pipe, said elbow being adapted to turn on the supply-pipe, the couplings on the supply-pipe, and the elbows leading from the couplings and carrying drink cups or receptacles.

2. A stock-watering apparatus consisting of a tank, an elbow communicating with the tank, a supply-pipe, said elbow being adapted to turn on the supply-pipe, the couplings on the supply-pipe, the elbows leading from the couplings and carrying drink-cups, the flexible discharge-pipe and connections for raising and lowering the same, and the lever connected to the supply-pipe, all substantially as and for the purpose described.

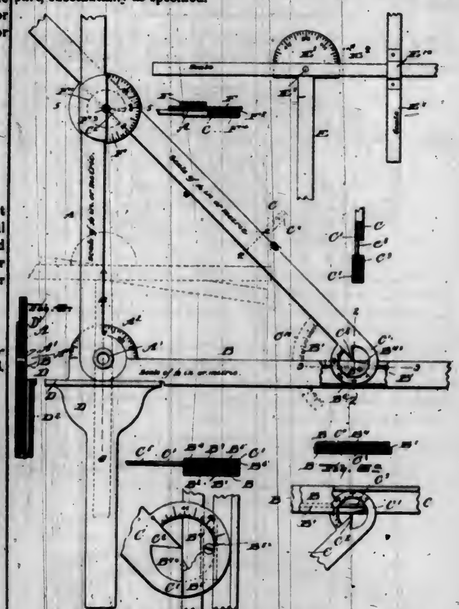
479,198. PLOTTER. LEE P. WATSON, Fairmont, W. Va. Filed Aug. 20, 1891. Serial No. 403,222. (No model.)

Claim.—1. In an instrument of the class described, two arms pivoted upon each other and a third arm mounted pivotally at each end upon each of the two arms, and a protractor located at and movable with each of the pivots of the third arm, substantially as specified.

2. The combination, with a handle, of two arms pivoted to each other and to the handle, and a third arm mounted pivotally and to slide upon the other arms, substantially as specified.

3. The combination, with a handle having a recess, of two arms pivoted to the handle, and a detachable stem having a protractor and a pivoted arm, substantially as specified.

4. The combination, with a handle carrying pivoted arms, of a detachable stem carrying a pivoted arm provided with an arm sliding thereupon and always at a right angle therewith, substantially as specified.



5. The combination of a handle and two arms connected therewith by a hollow eyelet or rivet, substantially as and for the purpose set forth.

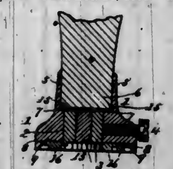
6. The combination, with two arms, as A and C, of a protractor provided with an arm-receiving loop and of a companion plate provided with an arm-receiving loop and a hollow eyelet or rivet for uniting the protractor and plate, substantially as specified.

7. A pivotal and sliding joint comprising a longitudinally movable and rotatable annulus and a plate having a rib and means for connecting the plate movably with an arm, substantially as specified.

8. A pivotal and sliding joint comprising a longitudinally movable and rotatable annulus and a semi-disk arranged within the annulus and means for keeping the parts in operative position, substantially as specified.

9. A pivotal and sliding joint comprising one piece with an annulus formed on or attached thereto, a semi-disk arranged within the annulus and retained in connection with and within a groove in the other part, substantially as specified.

10. A pivotal and sliding joint comprising one piece with an annulus, a semi-disk having a rib, and a slotted arm having a groove in one wall of the slot, substantially as specified.



11. A pivotal and sliding and indicating joint comprising one piece with an annulus having an inwardly-projecting point, a slotted arm, and means for retaining the annulus movably within the slot, substantially as specified.

12. A pivotal, sliding, and indicating joint comprising one piece with an annulus having an inwardly-projecting point and a semi-disk having a recess for the reception of the point, substantially as specified.

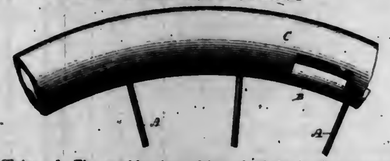
13. The combination of two arms pivoted to each other and a third arm formed in sliding sections and terminating at each end with a pivotal sliding connection with the two first-mentioned arms, substantially as specified.

14. The combination, with two arms pivoted to each other, of a third arm constructed in overlapping sections and terminating at each end in an annulus arranged to embrace a semi-disk mounted to move longitudinally along the two first-mentioned arms, substantially as specified.

479,199. HAND-STAMP. HERMAN RAUNGARTEN, Washington, D. C. Filed Dec. 24, 1891. Serial No. 416,091. (No model.)

Claim.—1. The stamp-body having the socket 5, the mortise 2, and the rim 8, which is made smaller between its outside and inside edges, the plastic printing-form 13, secured in the said rim, as specified, the movable type 3, secured in the mortise, and the plate 7, located between the said socket and mortise, entirely separating them and forming a stationary abutment for the said movable type, substantially as shown and described, and for the purpose set forth.

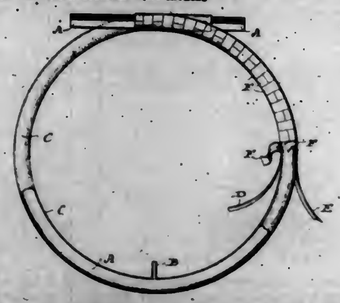
2. The stamp-body having the socket 5, the mortise 2, and the rim 8, which is made smaller between its outside and inside edges, the movable type 3, secured in the mortise, and the plate 7, located between the said socket and mortise, entirely separating them and forming an abutment for the said movable type, in combination with the printing-form 13, adapted to be introduced into the said stamp body by heating it, substantially as shown and described, and for the purpose set forth.



479,200. CARPET-SWEEPER. THOMAS H. BEDELL, Grand Rapids, Mich. Filed March 4, 1892. Serial No. 423,688. (No model.)

Claim.—1. The combination, in a sweeper, of a box, a brush, suitable traction-wheels, and pivoted dust-pans with a series of springs, each engaging at one end with the pans and at the other with the wheel-axles, substantially as described.

2. The combination, in a sweeper, of a box, a brush, traction-wheels, dust-pans, dump-levers pivoted to the dust-pans, and a series of springs engaging at one end with the dump-levers and at the other end with the wheel-axles and having an intermediate bearing upon the box, substantially as described.



479,201. VELOCIPEDE-WHEEL TIRE. FRANK H. BOLTE, Milwaukee, Wis., assignor of one-half to Parker H. Sercombe, same place. Filed Feb. 9, 1891. Serial No. 380,813. (No model.)

Claim.—1. The combination, with a wheel-rim having a concave outer periphery, of an elastic tire in which that portion thereof adjacent to the wheel-rim is in the form of a seat that engages this rim, but is eccentric to the tire itself when the latter is viewed in transverse section, substantially as set forth.

2. The combination, with a wheel-rim having a concave outer periphery, of an elastic tire in which that portion thereof adjacent to the wheel-rim is provided with a seat for the same, this seat being the result of forming circumferential recesses in the body of the tire on opposite sides of its radius eccentric to the center of said tire in transverse section at any point of its circumference, substantially as set forth.

479,202. PNEUMATIC TIRE. FRANK H. BOLTE, Milwaukee, Wis., assignor of one-half to Parker H. Sercombe, same place. Filed Aug. 21, 1891. Serial No. 403,292. (No model.)

Claim.—1. A pneumatic tire comprising an endless tube of caoutchouc vulcanized in one piece with fibrous material so disposed as to present a variable number of layers in cross-section, the greatest number of these layers being on the tread portion of said tube, substantially as set forth.

2. A pneumatic tire comprising an endless tube of caoutchouc vulcanized in one piece with fibrous material so disposed as to present a variable number of layers in cross-section, the greatest number of these layers being on the tread portion of said tube, and an outer protective covering for the tube, substantially as set forth.

3. A pneumatic tire comprising an endless tube of caoutchouc, having a circumferential bracing of fibrous material and a wrapping of like material so disposed as to present a variable number of layers in cross-section, the greatest number of these layers being on the tread portion of the tube, substantially as set forth.

4. A pneumatic tire comprising an endless tube of caoutchouc, having a circumferential bracing of fibrous material and a wrapping of like material, the latter being so disposed as to present a variable number of layers in cross-section, the greatest number of these layers being on the tread portion of the tube, and an outer protective covering for the tube, substantially as set forth.

5. A pneumatic tire comprising an endless tubular base of caoutchouc, wound with a series of fibrous reinforcing-strips so disposed as to present a variable number of layers in cross-section, the greatest number of these layers being on the tread portion of said tubular base, substantially as set forth.

6. A pneumatic tire comprising an endless tubular base of caoutchouc, wound with a series of fibrous reinforcing-strips so disposed as to present a variable number of layers in cross-section, the greatest number of these layers being on the tread portion of said tubular base, and an outer protective covering on the fibrous material, substantially as set forth.

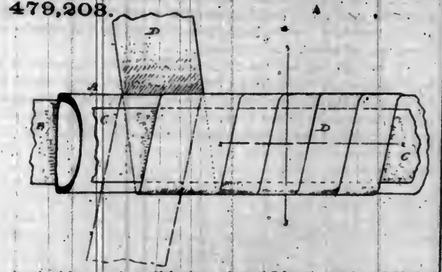
7. A pneumatic tire comprising an endless tubular base of caoutchouc, having one or more circumferential bracing-strips of fibrous material and a series of fibrous reinforcing-strips wound on the base and bracing-strips at right angles to the latter in such a manner as to present a variable number of layers in cross-section, the greatest number of these layers being on the tread portion of said base, substantially as set forth.

8. A pneumatic tire comprising an endless tubular base of caoutchouc, having one or more circumferential bracing-strips of fibrous material and a series of fibrous reinforcing-strips wound on the base and bracing-strips at right angles to the latter in such a manner as to present a variable number of layers in cross-section, the greatest number of these layers being on the tread portion of said base, and an outer protective covering on the fibrous material, substantially as set forth.

9. A method of manufacturing pneumatic-tire tubes, that consists in shaping a previously-formed tube of caoutchouc upon a ring-like mandrel, enveloping this tube with a reinforce of fibrous material previously stretched and treated with caoutchouc, withdrawing the tube from the mandrel and joining its ends, injecting the tube with a material expansible under heat, and then vulcanizing in a suitable mold, substantially as set forth.

10. A method of manufacturing pneumatic-tire tubes, that consists in shaping a previously-formed tube of caoutchouc upon a ring-like mandrel, wrapping the tube with previously-stretched and caoutchouc-coated strips of fibrous material so disposed as to present a variable number of layers at different points, withdrawing the tube from the mandrel and joining its ends, injecting the tube with a material expansible under heat, and then vulcanizing in a suitable mold, substantially as set forth.

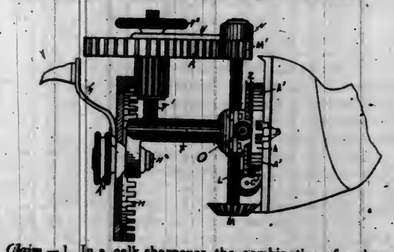
11. A method of manufacturing pneumatic-tire tubes, that consists in shaping a previously-formed tube of caoutchouc upon a ring-like mandrel, bracing the tube with one or more strips of fibrous material previously stretched and treated with caoutchouc, wrapping the tube and bracing-strips with other fibrous strips, also previously stretched and treated with caoutchouc, whereby a variable number of layers are had at different points, withdrawing the tube from the mandrel and joining its ends, injecting the tube with a material expansible under heat, and then vulcanizing in a suitable mold, substantially as set forth.



12. A method of manufacturing pneumatic-tire tubes, that consists in shaping a previously-formed tube of caoutchouc upon a ring-like mandrel, enveloping the tube in a reinforce of fibrous material previously stretched and treated with caoutchouc, withdrawing the tube from the mandrel, and joining its ends, injecting the tube with a material expansible under heat, then vulcanizing in a suitable mold, and afterward securing a protective covering on the vulcanized product, substantially as set forth.

479,203. PNEUMATIC TIRE. FRANK H. BOLTE, Milwaukee, Wis., assignor of one-half to Parker H. Sercombe, same place. Filed Aug. 31, 1891. Serial No. 404,248. (No model.)

Claim.—1. A pneumatic tire comprising an endless tube of caoutchouc vulcanized in one piece with a practically-continuous strip of fibrous material that is spirally disposed and so wound as to overlap about one-half of itself throughout its length, and thus form two thicknesses at all points, substantially as set forth.



2. A pneumatic tire comprising an endless tube of caoutchouc

479,203.

vulcanized in one piece with circumferential bracing-strips of fibrous material and a practically-continuous strip of like material spirally disposed and so wound as to overlap about one-half of itself throughout its length, substantially as set forth.

479,204. CALK-SHARPENER. JAMES H. R. CLARK, Council Bluffs, Iowa. Filed Feb. 16, 1892. Serial No. 421,761. (No model.)

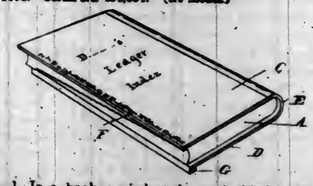
Claim.—1. In a calk sharpener, the combination of a clamping base-bar, a worm attached to said bar, a pinion-stock pivotally secured to said base-bar, provided with a worm-gear meshing with said worm, a cutter-shaft within said stock, and gears for operating said cutter-shaft, substantially as and for the purpose set forth.

2. In a calk-sharpener, the combination of a clamping base-bar, a pinion-stock pivoted to said bar, provided with a stub-shaft and adjustable upon said bar by means of a worm and gear, a cutter-shaft within said stock, provided with a pinion, an adjustable gear upon said stub-shaft, meshing with said pinion, and means for operating said gear, all substantially as and for the purpose set forth.

3. In a calk-sharpener, the combination of a clamping base-bar, a pinion-stock pivotally secured to said bar and provided near its upper end with a threaded stub-shaft, a cutter-shaft free within said stock, provided with a pinion, a threaded sleeve adjustable upon said threaded stub-shaft, provided with a gear meshing with said pinion, and means for operating said gear, substantially as set forth.

4. In a calk sharpener, the combination of the following instrumentalities, to wit: a clamping base-bar provided with a worm, a pivoted pinion-stock secured to said bar, having a threaded stub-shaft near its upper end, and a worm-gear meshing with said worm at its lower end, a cutter-shaft free within said stock, provided with a pinion, a threaded sleeve upon said stub-shaft, having a gear meshing with said pinion, a tie-bar connecting said cutter-shaft to said sleeve, and means for operating said gear, all substantially as and for the purpose set forth.

5. In a calk-sharpener, the combination of the following instrumentalities, to wit: a clamping base-bar, a worm connected to said bar, a pivoted pinion-stock secured to said bar, provided at the upper end with a shaft opening centrally with a threaded stub-shaft and at the lower end with a worm-gear, a cutter-shaft free within said stock, provided with a pinion, and a compound gear and pinion adjustable upon said stub-shaft, said gear meshing with the pinion upon the cutter-shaft, a crown-gear secured to the upper end of the stock, said crown-gear meshing with the pinion of said compound gear, a tie-bar revolubly securing said cutter-shaft to said compound gear, and means for actuating said crown-gear to operate said cutter-shaft, said cutter-shaft having a radial and circumferential adjustment within one plane, all substantially as and for the purpose set forth.



479,205. TUBE FOR BEER-COOLERS. CHARLES A. COTTER, Waterbury, Conn., assignor to Randolph & Clowes, same place. Filed Feb. 29, 1892. Serial No. 423,170. (No model.)

Claim.—A tube for beer-coolers and similar uses, having a longitudinally outwardly-projecting flange extending from the body of the tube, said flange being integral with and formed upon one side only of the metallic strip from which the tube is made, the curved end of the blank being secured to the base of the flange, the tube and its flange thus consisting of one piece of metal.

479,205.

479,206. INDEX. FRANKLIN S. DEWEY, Alpena, Mich. Filed May 2, 1892. Serial No. 431,551. (No model.)

Claim.—1. In a book, an indented marginal index, the covers, one projecting to or beyond the outer edge of the leaves of the book, and the other cut off at the inner edge of the indentations, a flange at or near the margin of the narrow cover, and an index on the outer face of the wide cover, corresponding to the indented index, substantially as described.

2. In a book, an indented marginal index, the covers, one projecting to or beyond the outer edge of the leaves and the other cut off at the inner edge of the indentations, a metal binding for the narrow cover, a flange or bend formed in said binding to raise the outer edge of the book, and an index on the outer face of the wide cover, corresponding to the indented index, substantially as described.

479,207. SHADE FOR INCANDESCENT ELECTRIC LAMPS. WILLIAM J. EDMOND and THOMAS J. KEON, Philadelphia, Pa. Filed Feb. 29, 1892. Serial No. 423,234. (No model.)

Claim.—1. A shade comprising a series of sections pivoted to a base, a tongue or tongues projecting from each of said sections, a grooved operating-ring engaging with said tongue, and means for effecting the vertical movement of such grooved ring, substantially as specified.

2. A shade comprising a base ring, a series of sections pivoted thereto, tongues projecting from said sections, a grooved operating-ring encircling said base-ring and adapted to engage with said tongues, and means for effecting the vertical movement of said grooved operating-ring, substantially as specified.

3. A shade comprising a base-ring, a series of sections pivoted thereto, tongues *l l* on each of said sections, an operating-ring, a flange thereon adapted to fit between said tongues, and means for effecting the vertical movement of said operating-ring, substantially as specified.

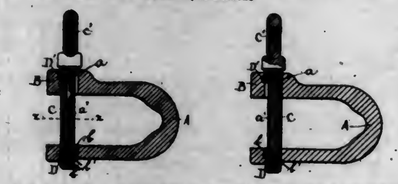
4. A shade comprising a base-ring, an internal flange *h* thereon, and having a peripheral groove *i*, a series of sections, pivot-blocks thereon, a pivot pin or ring passing through each of said blocks and adapted to said groove *i*, tongues projecting from said pivot-blocks, and a grooved operating-ring, to which said tongues are adapted, with means for effecting the vertical movement of said ring, substantially as specified.

5. A shade comprising a base-ring, an internal flange thereon, and having a peripheral groove *i*, a series of overlapping sections, pivot-blocks thereon, a pivot pin or ring passing through each of said blocks and adapted to said groove *i*, tongues *l l*, projecting from each of said sections, an operating-ring, a flange thereon adapted to fit between said tongues, and means for effecting the vertical movement of said operating-ring, substantially as specified.

6. A shade comprising a base-ring, an internal flange thereon, and

having a peripheral groove *i*, a series of overlapping sections, pivot-blocks thereon, a pivot pin or ring passing through each of said blocks and adapted to said groove *i*, tongues *l l'*, projecting from each of said blocks, an operating-ring, a flange thereon adapted to fit between said tongues, and a pin projecting from said operating-ring and adapted to a cam-groove in the base-ring, substantially as specified.

7. A shade comprising a base-ring B, having an inclined cam-groove *r*, a series of overlapping shade-sections pivoted to said base-ring, tongues projecting from each of said sections, a grooved operating-ring engaging with said tongue, and a pin carried by said grooved operating-ring and adapted to the cam-groove of the base-ring B, substantially as specified.



8. A shade comprising a series of sections, each of said sections having one of its edges so arranged as to overlap the edge of the next adjoining section and its opposite edge being overlapped by another of said sections, substantially as specified.

9. The combination of the base-ring, a series of overlapping sections pivoted thereto means for operating said sections, and a holding-ring comprising an upper clamp-ring *c* and a lower ring *d*, and catches carried by said lower ring and adapted to engage with said base-ring, substantially as specified.

10. The combination of the base-ring, the shade carried thereby, openings in said ring, a holding-ring A, secured to the lamp-socket, and tongues *f*, projecting from said holding-ring and adapted to engage with the openings in the base-ring, substantially as specified.

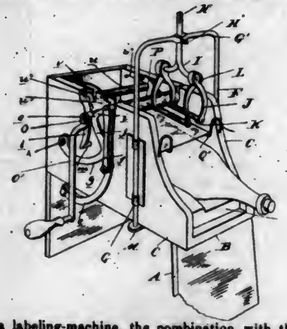
11. The combination of the base-ring B, having openings, the shade carried by said base-ring, the holding-ring A, comprising an upper split ring *c*, a clamping-screw for holding said ring in position on the socket, and catches carried by said holding-ring and adapted to engage with the openings in the base-ring, substantially as specified.

479,208. CLEVIS. JAMES M. RESCHEN, Crete, Nebr. Filed Mar. 21, 1892. Serial No. 425,944. (No model.)

Claim.—1. As a new article of manufacture, a clevis the stubs of which are provided with registering pin-openings, in combination with a draft-pin working within said pin-openings, provided with an upper groove and a flat or mutilated portion extending from said groove, and a pin passing through the side of the upper stub and resting partly within the groove of the draft-pin, substantially as described.

2. As a new article of manufacture, a clevis the stubs of which are provided with registering openings adapted to contain a draft-pin, the lower stub being provided with a lip projecting into its pin-opening, in combination with a draft-pin working within said opening provided with an upper circumferential groove, a mutilated portion extending a suitable distance from said groove, and a lower circumferential groove leading into a mutilated portion below, said lower groove being adapted to accommodate said projecting lip and the upper groove a non-removable pin, all substantially as and for the purpose set forth.

3. As a new article of manufacture, the clevis A, the stubs of which are provided with pin-openings, the lower stub having the lip D, in combination with the pin C, having the groove *a*, the mutilated portion *a'*, the lower groove *b'*, and the mutilated portion *b''*, all substantially as and for the purpose set forth.



479,209. MACHINE FOR PASTING LABELS ON BOTTLES. ANDREW STEER, Saginaw, Mich. Filed Nov. 16, 1891. Serial No. 411,968. (No model.)

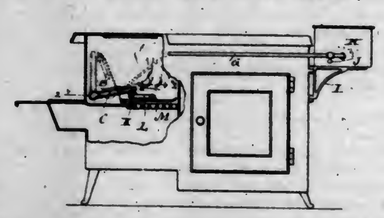
Claim.—1. In a labeling-machine, the combination, with sides and holder, of a vertically-disposed frame movably secured on the sides, consisting of two side bars and a top cross-bar having an aperture therein, a vertical standard passing through the aperture, a set-screw carried by the cross-bar engaging the standard, a horizontal head on the standard, spring-arms on the opposite ends of the heads, and means for actuating the frame, substantially as described.

2. In a labeling-machine, the combination, with a frame having a label-receptacle therein, of a feed-roll, gumming-rolls, guide-arms between the feed and gumming rolls, pressing-rolls, and means for actuating the feed and gumming rolls and pressing-rolls, substantially as described.

3. In a labeling-machine, the combination, with the frame and means for pressing the labels on the articles, of a label-receptacle in the frame, a spring for normally forcing the bottom of the receptacle up, and means for holding the bottom down against the pressure of the spring, substantially as described.

4. In a labeling-machine, the combination, with the frame, of a label-receptacle therein having a movable bottom, a spring below the bottom engaging the same, means for holding the bottom in a lowered position against the tension of the spring, a feed-roll, gumming-rolls, and reciprocating presser-rolls, substantially as described.

5. In a labeling-machine, the combination, with the actuating mechanism, of the feed-roller *u*, the table *v'*, and the rolls P P², of the guides *v*, extending above the table *v'* and beyond the roller P, passing through grooves formed in said roller, substantially as and for the purpose described.

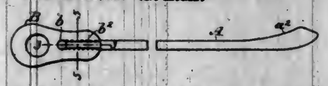


6. In a labeling-machine, the combination, with the label-receptacle, of the bottom board *q*, the spring *q'* for raising the same, the rod *r'*, lever *s*, shaft *t*, notched crank-arm *t'*, and the pawl *t²*, engaging therewith, substantially as and for the purpose described.

7. In a labeling-machine, the combination, with the feed-roller and its drive-pinion, the delivery and gumming rollers, and a drive-pinion therefor, of a main drive-shaft between said pinions and a segmental gear thereon adapted to successively engage with said pinions to intermittently actuate the same, substantially as described.

8. In a labeling-machine, the combination, with a frame, of a reciprocating label-attaching device, a label-receptacle formed in the frame, a feed mechanism for moving the labels from the label-receptacle, a single driving-shaft and actuating connection between said shaft, feed mechanism, and attaching device, substantially as described.

9. In a labeling-machine, the combination, with the label-attaching mechanism, of means for reciprocating the same intermittently, consisting of the crank-shaft O, crank-arm *l* thereon, the actuating-lever *g*, having the portions *i j* separated by a shoulder *o*, the lever *c*, linked to said actuating-lever at one end, the shaft *d*, to which the other end of the lever is secured, the lever *a*, secured to the shaft *d*, and links to the reciprocating frame, and the spring *c*, the parts arranged and operating substantially as described.



479,210. STOVE. JOHN FISCHER and EMIL PREISER, Milwaukee, Wis. Filed Feb. 13, 1892. Serial No. 421,435. (No model.)

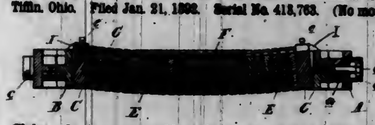
Claim.—1. The combination, with a stove, of a wick-case trunnioned therein to connect with a source of liquid fuel and a pivotal plate linked to the back of the wick-case to move therewith, whereby this plate serves as a grate-cover when said wick-case is swung down and a fire-box wall when the same is raised, substantially as set forth.

2. The combination of a stove, a wick-case trunnioned therein, one trunnion of the wick-case made hollow for a portion of its length and provided with jet-openings, a socket provided with a fluid-tight bushing for the hollow trunnion, a turning plug fitted in the socket, a pipe leading from said socket to a source of liquid fuel, a handle rigid on one of the trunnions, and a pivotal plate linked to the back of the wick-case to move therewith, substantially as set forth.

479,211. PILE-WIRE. CHARLES FORD, Lowell, Mass. Filed June 4, 1891. Serial No. 395,056. (No model.)

Claim.—1. The combination of a flat metallic pile-wire head provided in one of its sides with a groove or slot cut to a depth less than the thickness of said head and a pile-wire secured in said slot, substantially as described.

2. The combination of the flat metallic head provided with a groove or slot of less depth than the thickness of said head, said slot being narrowest at its open side, and the pile-wire inserted in said slot and secured therein, as and for the purpose specified.



3. The combination of the flat metallic head provided with a hole and provided in one of its sides with a groove or slot extending nearly to the opposite side of said head and from said hole to the end of said head and the pile-wire inserted in said slot and bent into said hole, as and for the purpose specified.

4. The combination of the head provided with a hole and with a slot or groove of less depth than the thickness of said head and extending from said hole to the end of said head, said slot being narrower at its open side, and the pile-wire inserted in said slot and bent into said hole; as and for the purpose specified.

5. The combination of the flat metallic head provided with a hole and with a slot or groove extending nearly to the opposite side of said head and from said hole to the end of said head and the pile-wire inserted in said slot and bent into said hole and secured to said head by sweating or soldering with soft solder, as and for the purpose specified.

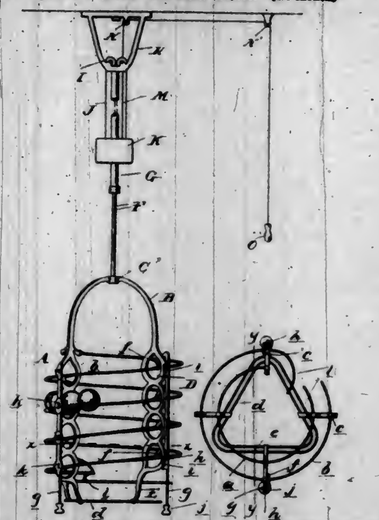
6. The combination of the head provided with a hole and with a slot or groove of less depth than the thickness of said head and extending from said hole to the end of said head, said slot being narrower at its open side, and the pile-wire inserted in said slot and bent into said hole and secured to said head by sweating or soldering with soft solder, as and for the purpose specified.

479,212. CRAYON-MOLDING MACHINE. ARTHUR A. FUOSS, Tiffin, Ohio. Filed Jan. 21, 1892. Serial No. 418,763. (No model.)

Claim.—1. A crayon-mold consisting of a series of sectional mold-strips wedge-shaped in cross-section and a flexible transverse support which connects said mold-strips together on the back to form a mold-plate adapted to open and close the molds by its flexion, substantially as described.

2. A crayon-mold consisting of a frame, two sliding heads supported within said frame, and a series of sectional molds transversely connected at the back to one or more flexible supporting-bars and suspended by said bars between the sliding heads, to which the ends of the supporting-bars are connected, substantially as described.

3. The combination of the frame reversibly suspended on trunnions within an outer stationary supporting-frame, two sliding heads supported within said frame, a series of sectional molds between the heads, and a flexible support secured to the under side of the heads and sectional molds and adapted to clamp the same together by the weight of said molds, substantially as described.



4. The combination of a frame, reversibly supported on trunnions, two sliding heads supported within said frame, and a series of sectional mold-strips secured upon and supported by a flexible bar or bars between the sliding heads and shoulders on rests on the reversible frame to limit the deflection of said bars, substantially as described.

5. The combination, in a crayon-mold, of a series of sectional molds, a flexible bar or bars to which said molds are secured on the back and upon which they are suspended, two heads between which said series of molds is adapted to be clamped and to which the ends of the flexible bars are secured, a frame within which said heads are slidingly supported, and trunnions by means of which said frame is reversibly suspended within an outer frame, said trunnions being slidingly secured in one frame and having a screw-thread engagement in the other frame and adapted to clamp the sliding heads and sectional molds together, substantially as described.

6. The combination, in a crayon-mold, of an outer stationary supporting-frame, an inner frame reversibly suspended therein by trunnions sliding in the outer frame and having a screw-thread engagement through the inner frame, sliding heads supported within said inner frame, and a series of sectional molds supported between said heads by a flexible bar or bars, substantially as described.

7. The combination of the stationary outer frame, the inner frame reversibly secured therein, the sliding trunnions *a*, having a screw-thread engagement with said inner frame, and the adjustable caps *c* on the heads of said trunnions, substantially as described.

479,218. POOL RACK AND SPOTTER. CHARLES H. FUOSS, Tiffin, Ohio. Filed Mar. 31, 1892. Serial No. 427,179. (No model.)

Claim.—1. A pool-rack consisting of a series of standards having a series of loops thereon, a spiral way passing through the loops, a series of movable stops normally in the way, means for moving the stops, and a spotter at the base of the way, formed of different-sized frames, substantially as described.

2. The combination of a rack, standards having a series of loops therein, a spiral runway connecting said loops and ending at the base in an inwardly-extending spout, a series of movable stops dividing it into sections, a series of inwardly-extending fingers at the base of the standard, and a spotter-frame secured to said fingers, substantially as described.

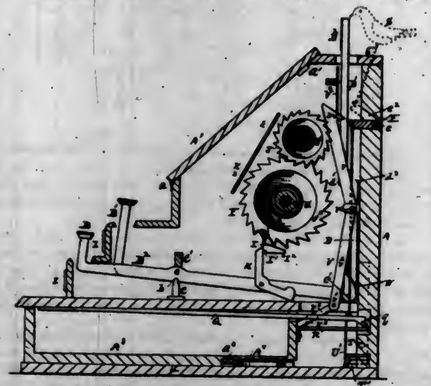
3. The combination of a rack formed of four standards having a vertical series of radially-arranged loops formed therein, a spiral runway formed through said loops by wire secured on opposite sides thereof, and a series of movable stops in said runway dividing it into sections, substantially as described.

4. The combination of a track formed of standards having a vertical series of radially-arranged loops formed therein, a spiral runway formed through said loops and discharging inwardly at the base, a series of movable stops dividing said runway into sections, and a spotter-frame within said track at the base, composed of two separated wire triangles, the upper one being of the greater area, substantially as described.

479,214. INJECTOR. OTTO L. HALLBERG, West Salem, Ill. Filed June 4, 1891. Serial No. 395,140. (No model.)

Claim.—1. An automatic drip cock or valve having a series of vertical grooves and a depending stem having a bore or hole extending throughout the valve and stem, substantially as shown and described, and for the purpose set forth.

2. The combination, with an injector having the seats *b*, of a valve



having vertical grooves and located in the cap of the injector and a coil-spring surrounding the stem of the valve and situated in the chamber of the cap, whereby the injector is drained after it is stopped, substantially as described.

3. An automatic drip-cock operated by a current of water, steam, or fluid, having a grooved valve, and a stem having a central bore which extends through the valve, said stem being provided with a conical lower end having apertures formed at right angles to said central bore, in combination with the injector-cap and the coil-spring surrounding the valve-stem, having its bearing upon the valve and bottom of the said cap, substantially as shown and described, and for the purpose set forth.

4. The combination, with an injector having a delivery-tube provided with prongs or projections G, of a valve having vertical grooves and located in the cap of the injector, the valve-stem having a conical end provided with a series of apertures which open into a central opening in the valve-stem, a coil-spring surrounding the stem, whereby the valve is forced up against the said prongs or projections, and the screw-threaded extension having the lock-nut, substantially as and for the purpose set forth.

5. A drip-valve for injectors, &c., having vertical grooves and the valve-stem having a conical end provided with a series of apertures, in combination with the coil-spring and a regulating device therefor consisting of the screw-threaded extension L and its lock-nut *l*, substantially as set forth.

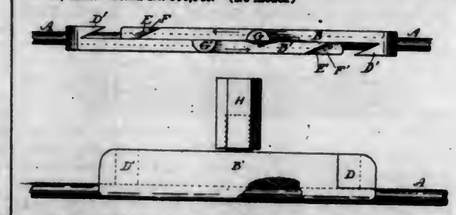
479,215. CASH REGISTER AND INDICATOR. MICHEL HERPE, Detroit, Mich. Filed Nov. 2, 1891. Serial No. 410,627. (No model.)

Claim.—1. In a cash register and indicator, a series of primary registering-wheels F, each provided with a pin *f*, a series of secondary registering-wheels operated at each revolution of the primary wheels, respectively, operating-levers B^3, provided with operating-keys, a pawl engaged with each of said levers extending adjacent to the corresponding primary wheel to operate the wheel, a tilting guide-bar I, extending transverse said wheels and levers, provided with fingers *i*, extending adjacent to the faces of the primary wheels, respectively, and a stop I^2 to limit the movement of the guide-bar in one direction, the construction and arrangement being such that the finger and guide-bar will be tripped by the pin *f* as the adjacent wheel F rotates in one direction and will limit the reverse rotation of said wheel, substantially as described.

2. In a cash register and indicator, a series of registering-wheels mounted loosely upon a shaft, means for operating said wheels, stationary collars located upon said shaft between adjacent wheels, and springs located between pairs of adjacent wheels, each spring exerting its tension upon one of said wheels, substantially as and for the purpose described.

3. In a cash register and indicator, the combination, with a case provided with a recess c^3, of operating-levers B^3, upright bars D, jointedly engaged with the levers B^3, respectively, and a rocking cross-piece E, having one edge thereof extending into the recess of the case, said upright bars each provided with a device to engage the cross-piece when projected upward thereabove, the edge of the recess in the case below the cross-piece forming a stop and a normal support for the cross-piece, substantially as described.

4. In a cash register and indicator, the combination, with a case provided with a recess c^3, of operating-levers B^3, upright bars D, jointedly engaged with the levers, respectively, each provided with a hook *d* and indicator D^4, and a rocking cross-piece E to engage said hooks when projected upward, said cross-piece having one edge thereof extending into the recess of the case, the edge of the case below the cross-piece forming a stop and normally supporting said cross-bar, substantially as described.



5. In a cash register and indicator, the combination, with a case provided with a recess c^3, of operating-levers B^3, upright bars D, jointedly connected with said levers, respectively, each provided with a hook *d* and indicator D^4, a rocking cross-piece E to engage said hooks when projected upward, said cross-piece having one edge thereof extending into the recess of the case and common to all said upright bars, the construction and arrangement being such that the cross-piece will hold the last indicator manipulated exposed and drop it at the next subsequent manipulation of the operating-levers, substantially as described.

6. In a cash register and indicator, the combination, with an inclosing case, of a drawer, registering mechanism, operating-levers B^3, upright bars D, a lever V, provided with a foot v^3, a rocking cross-piece to engage said upright bars and the lever V, and a pivoted stop V^4 to bear upon the lever V and to be moved out of the way thereof when desired, substantially as and for the purpose described.

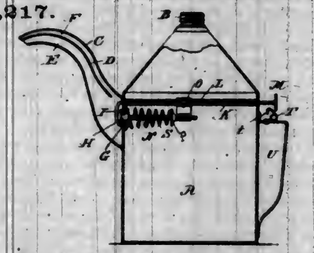
7. In a cash register and indicator, the combination of an operating-lever B^3, an upright bar D, jointedly connected with the lever and having a hook *d*, a rocking cross-piece E, operated by said bar, a cuckoo figure connected with the cross-piece, a pipe for each key to sound cuckoo notes, and a bellows to actuate said pipes, said bellows connected with said cross-piece, substantially as set forth.

8. In a cash register and indicator, the combination, with a case provided with a recess c^3, of an operating-lever B^3, an upright actuating-bar D, and rocking cross-piece E, having one edge engaged in said recess, said bar D provided with a hook *d*, projecting rearward of the adjacent portion of the bar, said bar at a little distance below the hook projecting rearwardly of the rear face of the hook, the edge of the recess underlying the cross-piece forming a stop and normal support for said cross-piece, substantially as set forth.

479,216. CLAMP FOR ELECTRIC CONDUCTORS. JOHN INGMANSON and RUDOLPH LORANG, Chicago, Ill., assignors to said Lorang, John A. Ingmanson, and Emil H. Ingmanson, all of same place. Filed July 13, 1891. Serial No. 399,340. (No model.)

Claim.—1. In a clamp for electrical conductors, the combination of a pair of jaws, a tongue projecting laterally from one of said jaws and having a cam-face for engaging the other, and means for locking the jaws against relative longitudinal movement, substantially as set forth.

2. In a clamp for electrical conductors, the combination of a pair of jaws, a tongue projecting laterally from each, said tongues being presented in opposite directions, and means for locking the jaws against relative longitudinal movement, substantially as set forth.



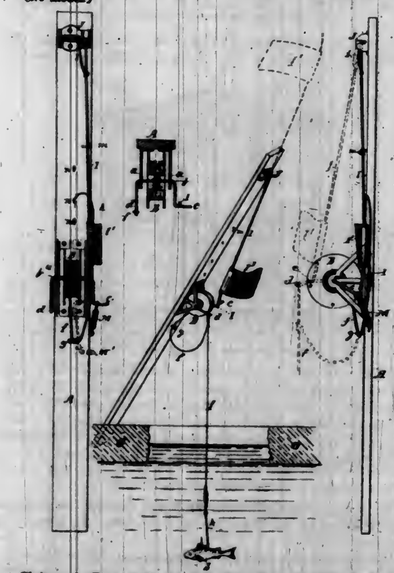
3. In a clamp for conductors, the combination of a pair of jaws, a tongue projecting laterally from each, said tongues being presented in opposite directions and having cam-faces, and means for locking the jaws against relative longitudinal movement, substantially as set forth.

4. In a clamp for electrical conductors, the combination of a pair of jaws, a tongue projecting laterally from one and engaging the other, a shoulder engaging said tongue, and means for locking the jaws against relative longitudinal movement, substantially as set forth.

5. In a clamp for electrical conductors, the combination, with the jaw B, having at one end the cam-faced tongue D and having its other end beveled, as at E, of the jaw B', similar and complementary to the jaw B, and means for locking the jaws against relative longitudinal movement, substantially as set forth.

6. In a clamp for electrical conductors, the combination, with the jaw B, having at one end the cam-faced tongue D and having its other end beveled off at E, forming shoulder F, of the jaw B', similar and complementary to the jaw B, and means for holding the jaws against relative longitudinal movement, substantially as set forth.

479,217. SAFETY OIL-CAN. HIRSH KAPLAN, New York, N. Y. Filed Apr. 18, 1892. Serial No. 429,099. (No model.)

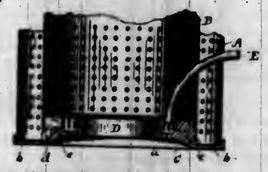


Claim.—The combination with the can A, having cap B, double spout C, and thumb-spring T, of the valve H, secured to one end of the rod K, the other end of which terminates in a push-button M, which is adapted to be engaged by the said thumb-spring T, substantially as shown and described.

479,218. FASTENING FOR SHOES, GLOVES, &c., AND LACE THEREFOR. PHILIPP KOPPENHÖFER, Speyer, Germany. Filed Aug. 26, 1891. Serial No. 404,091. (No model.) Patented in Germany Aug. 22, 1890, No. 55,815.

Claim.—In combination with the outer metal disks *a a'*, the flexible disks *b b'*, held within the metal disks by the flanges of the latter disks with their faces in contact, the two sets of disks being connected by a headed post, the heads of which are interposed between the metal disk and the flexible disk, substantially as described.

479,219. APPARATUS FOR FISHING THROUGH ICE. GEORGE H. LANE, Worcester, Mass. Filed Mar. 24, 1892. Serial No. 426,257. (No model.)

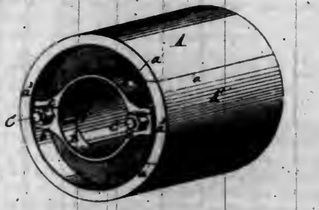


Claim.—1. The combination, substantially as described, of the support-bar, the revolable reel, its axis supported in bearings on said bar, with its ends forming the crank *c* and line-supporting finger *d*, as shown, and the swinging tilt or flag-wire hinged at one end to said bar and provided with a spring, and its other end disposed for engagement with the reel-crank, for the purpose set forth.

2. The reel formed of two oppositely-disposed disks having offset centers secured together and the wire axial shaft passing through and rigidly fixed therein and having one of its ends bent to form the crank *c* and the other bent to form the line-holding finger *d*, in combination with the bar, the axle-bearings fixed to said bar, the spring-pressed tilt, and the line, all substantially as and for the purposes set forth.

3. The combination, with the bar, the revolable reel mounted in bearings thereon, and the reel-operating crank, of the spring M, having one of its ends attached to the bar and its free end formed into a loop adapted to pass over said crank, substantially as and for the purposes set forth.

4. The combination of the bar having an eye or holes *n* formed in its front side for engaging the fish-hook, as shown, the revolable line-reel mounted in bearings on said bar, the line-guide *g*, fixed in the front of the bar below the reel, and a holding device or hook adjacent thereto attached to the bar by eye-staples, wherein said hook can be turned forward for engaging the reel-plate, substantially as described, for retaining said reel stationary when the line is wound up and the apparatus not in use.



479,220. VAPOR-BURNER. JOHN A. LANNERT and WILLIAM B. JEAVONS, Cleveland, Ohio. Filed Mar. 9, 1892. Serial No. 424,337. (No model.)

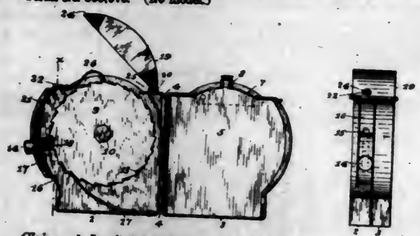
Claim.—1. A vapor-burner provided with a vapor and combustion chamber and a vapor-distributing chamber and channels to convey the vapor from the distributing-chamber to the vapor and combustion chamber, substantially as described.

2. A vapor-burner having a vapor and combustion chamber closed at its bottom against admission of air and having air-inlets in its sides, a vapor-distributing chamber, and channels or ducts leading from said distributing-chamber to the said vapor and combustion chamber, substantially as described.

479,221. PULLEY. EBER A. LONG, South Bend, Ind., assignor to the South Bend Pulley Company, same place. Filed Apr. 9, 1892. Serial No. 428,472. (No model.)

Claim.—1. The combination of the pulley proper and clamping devices comprising clamp-sections movable axially toward and from the pulley and radially relatively thereto and having interlocking flanges and bolts longitudinal to the axis of the pulley for uniting the clamp-sections and applying them to the shaft.

2. The combination of the pulley proper and clamping devices comprising clamp-sections movable axially toward and from the pulley and radially relatively thereto and having flanges formed with inclined abutting surfaces and bolts longitudinal to the axis of the pulley for uniting the clamp-sections and applying them to the shaft.



3. The combination of the pulley and clamping devices comprising separable clamp-sections movable radially independently of the pulley proper and having arms formed with interlocking flanges with inclined abutting surfaces and bolts longitudinal to the axis of the pulley, which constitute the sole means for connecting the clamp-sections to the pulley and which also unite the clamp-sections and apply them to the shaft.

4. The combination of the pulley and clamping devices at each end thereof, comprising a pair of half-rings movable radially relatively to the pulley and formed with arms having interlocking flanges and longitudinally-arranged bolts for applying the ring-sections to the shaft and for connecting them to the pulley.

5. The combination of the pulley and clamping devices, comprising clamp sections movable radially relatively to the pulley and longitudinally-arranged bolts passing through the body of the pulley and through the clamp-sections for uniting them and moving the clamp-sections radially.

6. The combination, with the pulley formed with recesses at each end, of a pair of clamp-sections or half-rings within each of said recesses and movable radially relatively to the pulley, and bolts extending longitudinally through the body of the pulley and through the clamp-sections and having adjusting-nuts for firmly uniting the clamp-sections to the pulley and for moving them radially relatively to the pulley.

479,222. POCKET-LAMP OR LIGHTING DEVICE. NATHAN F. MATTHEWS, Providence, R. I., assignor, by mesne assignments, to the Little Gem Manufacturing Company, of New Jersey. Filed May 18, 1891. Serial No. 393,078. (No model.)

Claim.—1. In a lighting device, a revolubly-mounted drum adapted to receive and hold secured upon its periphery, so as to be rotated therewith, a tape provided with drops or bits of fulminating material, substantially as shown and described.

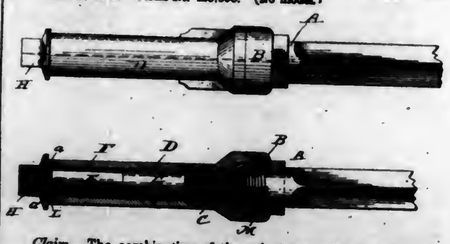
2. In a lighting device, the combination, with a drum adapted to receive and hold secured upon its periphery, so as to be rotated therewith, a tape provided with drops or bits of fulminating material, of means for rotating the drum and for exploding the bits of fulminating material one by one as the drum is rotated, substantially as shown and described.

3. In a pocket-lamp or lighting device, the combination, with a drum adapted to receive upon its periphery a tape provided with drops or bits of fulminating material, of means for securing the fulminating-tape to the drum, so that the same may be rotated therewith, and means for rotating the drum and exploding the bits of fulminating material one by one as the same is rotated, substantially as shown and described.

4. In a pocket-lighting device, the combination, with a drum adapted to receive upon its periphery a tape provided with drops or bits of fulminating material, of means for securing the tape to the drum, so that the same may be rotated therewith, a spring scratcher adapted to press upon the tape on the drum and explode the bits of fulminating material one by one as the tape is carried beneath it, and means for rotating the drum step by step, substantially as shown and described.

5. In a lighting device, the combination, with a drum adapted to receive and hold secured upon its periphery, so as to be rotated therewith, a tape provided with drops or bits of fulminating material, of a holder for an ignitible wick adjacent to the periphery of the drum, means for exploding the drops or bits of fulminating material one by one at a point adjacent to the wick as the drum is rotated, and means for rotating the drum step by step, substantially as shown and described.

6. In a lighting device or pocket-lamp, the combination, with a drum adapted to receive and hold secured upon its periphery, so as to be rotated therewith, a tape provided with drops or bits of fulminating material, of a reservoir adapted to receive an absorbent material, and a wick, one end of which protrudes therefrom, means for exploding the drops or bits of fulminating material one by one at a point adjacent to the protruding portion of the wick as the drum is rotated, and means for rotating the drum step by step, substantially as shown and described.



7. In a pocket-lamp or lighting device, a revoluble disk having a flange secured thereto forming a drum, said flange being provided with a slot, as 28, by which a tape provided with drops or bits of fulminating material may be secured upon the periphery of the drum formed by the flange in such manner as to be rotated with the drum, and means by which the ends of the tape may be secured within said slot, substantially as shown and described.

8. In a pocket-lamp or lighting device, the combination, with a revoluble disk, of a flange forming a drum secured thereto and adapted to receive upon its periphery a tape provided with drops or bits of fulminating material, said flange having a slot through which the ends of the tape pass, of means located within the drum formed by the flange for drawing the expended tape upon the flange within the same and coiling it and at the same time drawing a fresh portion of unexploded tape from the interior of said drum upon the periphery thereof, substantially as shown and described.

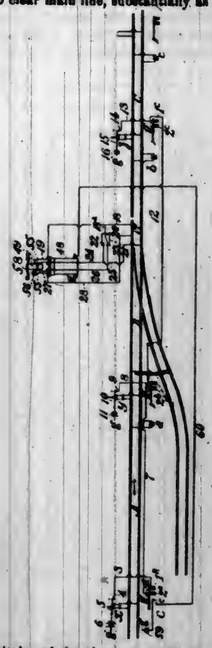
9. In a pocket-lamp or lighting device, the combination, with a revoluble disk, of a flange forming a drum secured thereto, having a slot, as 28, and adapted to receive and hold upon its peripheral surface a tape provided with drops or bits of fulminating material, of means located within the drum formed by the flange for holding a coil of unexpended tape, and a stud also located within the drum and adapted to be rotated, whereon the expended tape upon the periphery of the drum may be wound after being drawn through the slot 28, the expended tape as it is drawn within the drum drawing from the interior thereof through the slot sufficient unexpended tape to cover the periphery of the drum, substantially as shown and described.

10. In a pocket-lamp or lighting device, the combination, with a revoluble disk provided with a flange forming a drum adapted to receive upon its peripheral surface a tape provided with drops or bits of fulminating material and having a passage or slot through which the ends of such tape pass to the interior of the drum formed by such flange, of two studs located within such drum, one of which is adapted to hold a coil of unexpended tape and the other of which is adapted to rewind upon itself as it is rotated the expended tape upon the peripheral surface of the flange, and thus draw from the other stud out upon such flange sufficient unexpended tape to cover the same, substantially as shown and described.

479,223. AXLE. WILLIAM H. MATTHEWS, Zanesville, Ohio. Filed Mar. 22, 1892. Serial No. 425,893. (No model.)

Claim.—The combination of the axle A, provided with a screw-threaded portion, the shouldered sleeve B C, adapted to engage the said screw-threaded portion and be adjusted thereon, and a sleeve or bushing F, adapted to fit the reduced portion E of said axle, substantially as described.

479,224. SANITARY VENTILATOR. WILSON I. POTTER, Hartford, Conn. Filed Nov. 4, 1891. Serial No. 410,859. (No model.)



Claim.—In a sanitary ventilator, the combination of a vertical draft-tube passing from the interior to the exterior of a building, a burner located in said tube near the top, the leading-tube swiveled to the draft-tube below the burner and capable of complete rotation thereabout, and valve-controlled draft-openings in said draft-tube, located beneath the leading-tube, substantially as set forth.

479,225. SWITCH AND SIGNAL APPARATUS. JESS G. SCHREUDER, Edgewood, Pa. Filed Jan. 20, 1892. Serial No. 418,690. (No model.)

Claim.—1. In a switch and signal apparatus, the combination of movable switch-rails, a fluid-pressure mechanism for locking such rails in position for clear main line, electrically-operated valves controlling the flow of fluid-pressure to and from such mechanism, a normally-closed circuit controlling said valves and provided with a circuit-breaker, and a signal controlling a track-section adjacent to the switch and adapted when shifted to "danger" to open the valve-controlling circuit, and thereby so shifting the valves as to effect a locking of the switch rails to clear main line, substantially as set forth.

2. In a switch and signal apparatus, the combination of movable switch-rails, electrically-controlled mechanism for locking the rails in position for clear main line, a normally-closed circuit controlling the lock mechanism and provided with a circuit-breaker, a signal controlling a track-section adjacent to the switch, means operated by said signal when shifted to "danger" to open the circuit controlling the switch-lock, thereby locking the switch-rails to clear main line, and a hand-operated device for unlocking the switch-rails and simultaneously breaking the normally-closed circuit, whereby the signal controlling the adjacent section is shifted to "danger," substantially as set forth.

3. In a switch and signal apparatus, the combination of movable switch-rails, electrically-controlled mechanism for locking such rails in position for clear main line, a normally-closed circuit controlling such mechanism and provided with a circuit-breaker, a home signal controlling a track-section adjacent to said switch, and a distant signal controlling the track-section containing the switch and controlled by the home-signal and adapted when shifted to "danger" to open the circuit controlling the switch-locking mechanism, and thereby lock the switch-rails to clear main line, substantially as set forth.

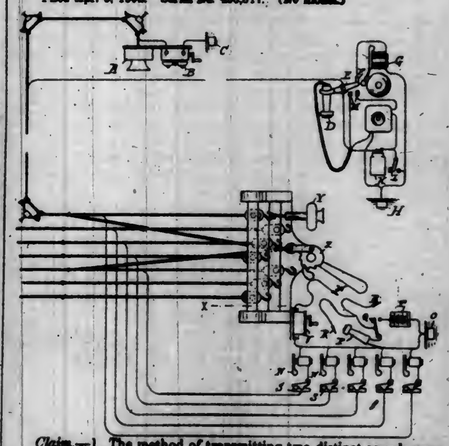
4. In a switch and signal apparatus, the combination of movable switch-rails, electrically-controlled mechanism for locking such rails in position for clear main line, a normally-closed circuit controlling such mechanism and provided with a circuit-breaker, a home-signal controlling a track-section adjacent to said switch, a distant signal controlling the track-section containing the switch and controlled by said home-signal and adapted when shifted to "danger" to open the circuit controlling the switch-locking mechanism, and thereby lock the switch-rails to clear main line, and a home-signal controlling the track-section containing the switch and adapted when at "danger" to hold the distant signal at "danger," substantially as set forth.

5. In a switch and signal apparatus, the combination of a track-circuit formed in part by the rails of a section of track and in part by contact-plates, a movable plug or other suitable hand device for holding said spring-plates in contact, thereby completing the track-circuit, a switch extending from said track-section, fluid-pressure mechanism for locking the switch to clear main line and controlled by the movable plug, and a normally-closed circuit controlling the signals protecting the track-section and controlled by the track-circuit, whereby a movement of the plug to unlock the switch will break the track-circuit, thereby causing the protecting-signals to go to "danger," substantially as set forth.

6. In a switch and signal apparatus, the combination of a track-section forming a part of a circuit, contact-plates, also forming a part of said circuit, a movable plug or other suitable hand device normally holding the contact-plates together, thereby completing the track-circuit, a switch extending from the track-section, fluid-pressure mechanism for locking the switch to clear main line and controlled by the movable plug, a normally-closed circuit controlling the signals protecting the track-section and controlled by the track-circuit, and a normally-open shunt-circuit from the track-circuit adapted to be closed by the movement of the plug to open the track-circuit and operate the switch-locking mechanism, substantially as set forth.

7. In a switch and signal apparatus, the combination of a track-section forming part of a track-circuit, contact-plates, also forming a part of said circuit, a movable plug or other suitable hand device, normally holding the plates together, thereby completing the track-circuit, a switch extending from said track-section, fluid-pressure mechanism for locking the switch to clear main line and controlled by the movable plug, a normally-closed circuit controlling the signals protecting the track-section and controlled by the track-section, and an electric switch included in the track-circuit and operated by the movable rails of the track-switch to break the track-circuit when the movable rails are shifted to siding, substantially as set forth.

8. In a switch apparatus, the combination of a locking-bar provided with a notch and connected to the movable switch-rails, a movable bar adapted to engage the notch in said locking-bar, a spring for pressing said movable bar in one direction, and a fluid-pressure cylinder provided with a piston for shifting the bar in the opposite direction, substantially as set forth.

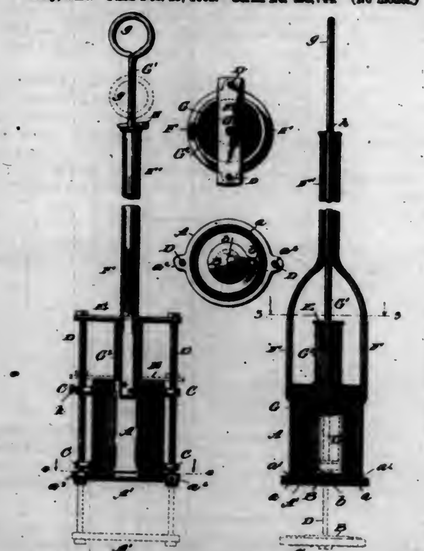


9. In a switch and signal apparatus, the combination of movable rails, a locking mechanism therefor, a fluid-pressure mechanism for operating the locking mechanism, a spring-actuated plug for shifting the valves of the fluid-pressure mechanism, spring-plates adapted to form parts of a track-circuit and normally held in contact by the plug in certain position thereof, and a locking device for holding the plug in such position as to keep the spring-plates in contact, substantially as set forth.

479,226. TELEPHONE. GEORGE F. SHAVER, Yonkers, N. Y., assignor of one-half to Stephen F. Sherman, New York, N. Y. Filed Mar. 2, 1892. Serial No. 423,511. (No model.)

Claim.—In a telephone-receiver, the combination of one or more magnets, each forming an incomplete ring and having pole-pieces extending into the ring, the magnets being reversed and laid one upon the other with a diaphragm adjacent to the pole-pieces, substantially as described.

479,227. TELEPHONY. GEORGE F. SHAVER, Yonkers, N. Y. Filed Apr. 8, 1892. Serial No. 428,317. (No model.)



Claim.—1. The method of transmitting two distinct sounds over a single conductor simultaneously, as herein described, by causing electrical undulations similar in form to the vibrations of the air accompanying one of said sounds and mechanical vibrations similar in form to the vibrations of the air accompanying the other of said sounds, substantially as described.

2. A duplex telephone-exchange system comprising mechanical-telephone subscribers' stations, magnetic-telephone subscribers' stations, a central station, lines connecting the central station with the subscribers' stations, there being at least one mechanical and one magnetic

telephone subscriber's station on each line, means for connecting any pair of lines for transmission of mechanical vibrations, and means for connecting any pair of lines for transmission of electrical currents, substantially as described.

3. A duplex telephone-exchange system comprising mechanical-telephone subscribers' stations, magnetic-telephone subscribers' stations, a central station, lines connecting the central station with the subscribers' stations, there being at least one mechanical and one magnetic telephone subscriber's station on each line, means for connecting any pair of lines for transmission of vibrations mechanically, means for connecting any pair of lines for transmission of vibrations electrically, and an annunciator connected with said lines, substantially as described.

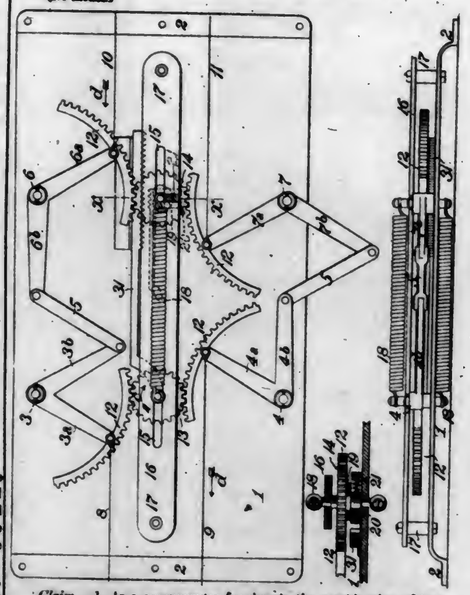
479,228. CISTERN OR WELL CLEANER. JESSE SHILLING, Jr., Troy, Ohio. Filed Feb. 25, 1892. Serial No. 422,744. (No model.)

Claim.—1. The combination, with the cylinder and its movable bottom, of a plunger fitted within the cylinder, a cross-bar connected with the bottom, guides and rods carrying said bottom, and a rod connected with the plunger, and a block on the upper end of the plunger beneath the cross-bar, substantially as and for the purpose specified.

2. The combination, with the cylinder and its movable bottom, of a plunger fitted within the cylinder, rods connected with the bottom and working in guides on the cylinder, a cross-bar carried by the upper ends of said rods, a plunger-rod passed through said cross-bar, and a block on the rod and above the plunger and below the cross-bar, as and for the purpose specified.

3. The combination, with the cylinder and its movable bottom with opening and inwardly-opening valve, of a plunger in the cylinder, rods connected with the bottom and carrying a cross-bar at their upper ends, a plunger-rod, a block between the plunger and cross-bar, and a tubular handle to the cylinder through which the plunger-rod passes, as shown and described.

479,229. TROUSERS-GUARD. CHARLES SULZNER, Philadelphia, Pa. Filed Feb. 27, 1892. Serial No. 423,010. (No model.)



Claim.—1. A trousers-guard having a body with shoulders at one end and spurs laterally projecting from said shoulders and a prong and a hook projecting from the other end of the body, said prong and hook projecting in opposite direction to said spurs, and the parts being combined substantially as described.

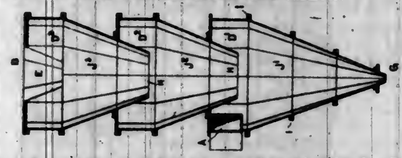
2. A trousers-guard formed of wire and having a body with shoulders at one end with spurs and provided at the other end with a prong and hook and spurs intermediate of said end spurs and hook, the end spurs projecting in an opposite direction to said prong and hook, and said parts being combined substantially as described.

3. A trousers-guard consisting of a body with the shoulders E and laterally-projecting spurs B on one end thereof, the hook C and laterally-projecting prong D at the other end of the body, and the inwardly-projecting spurs F, secured to the body near said prong and hook, said parts being combined substantially as described.

479,230. COMPENSATOR FOR SIGNALS. JAMES J. TURNER, Pittsburg, Pa. Original application filed Feb. 6, 1892, Serial No. 421,165. Divided and this application filed May 25, 1892. Serial No. 434,345. (No model.)

Claim.—1. In a compensator for signals, the combination of two pairs of connected bell-crank levers, one member of each pair being connected to an operating-lever and the other member of each pair to a signal, rack-bars secured to one arm of a member of each pair of bell-cranks, and a pinion intermeshing with said rack-bars, substantially as set forth.

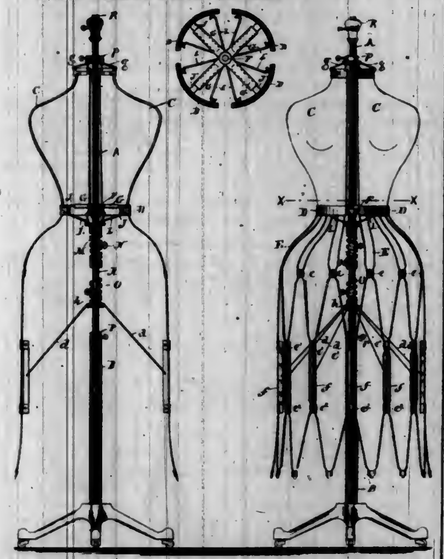
2. In a compensator for signals, the combination of two pairs of connected bell-crank levers, one member of each pair being connected to an operating-lever and the other member of each pair to a signal, rack-bars secured to one arm of a member of each pair of bell-cranks, a laterally-movable pinion engaging said rack-bars, and a spring for shifting the pinion, substantially as set forth.



3. In a compensator for signals, the combination of two pairs of connected bell-crank levers, one member of each pair being connected to an operating-lever and the other member of each pair to a signal, rack-bars secured to one arm of a member of each pair of bell-cranks, a movable pinion engaging said rack-bars, a spring for shifting the pinion, and a lock for holding the pinion as against movement, substantially as set forth.

479,231. DUST-COLLECTOR. PIETER VAN GELDER, Sowerby Bridge, England. Filed Dec. 19, 1891. Serial No. 415,592. (No model.)

Claim.—1. In a dust-collector, a polygonal portion D', having a tangential air-inlet and a top air-outlet and having a very obtuse angle at the junction of the sides or plates which form the polygon or polygonal chamber, in combination with a tapering discharge-chamber.

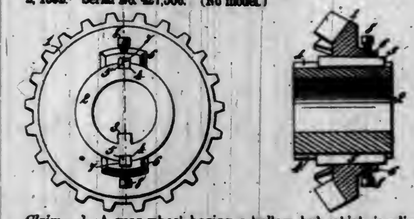


2. In a dust-collector, a polygonal portion D', having a tangential air-inlet and a top air-outlet, in combination with a tapering dust-discharge chamber, also polygonal in cross-section.

3. In combination with a tapering-chamber D' J', into which the air enters tangentially, a second tapering chamber extending down into the top of the first-mentioned chamber and having an outlet at the top, all substantially as shown and described, whereby the rotary action of the lower air-current is continued in the upper chamber and a further amount of dust separated by centrifugal force in the upper chamber and caused to descend into the lower chamber.

4. In combination with the polygonal tapering chamber D' J', having a tangential air-inlet and a top air-outlet, the second tapering chamber D^2 J^2, polygonal in cross-section, provided at its top with an air-outlet and having its lower portion J^2 extending down through the top of the lower chamber.

479,232. DRESS-FORM. WILLIAM VOGLER, Somerville, assignor to Charles A. Morse, Boston, Mass. Filed Oct. 25, 1888. Renewed Jan. 16, 1892. Serial No. 418,260. (No model.)



Claim.—1. An adjustable skirt-form provided with means for expanding and contracting it and supported upon a central standard, said skirt-form being composed of waistband-sections D D and a series of longitudinal wires or strips E E, arranged in pairs and rigidly secured to said sections at their upper ends, the wires of each pair being secured to each other at or near the hip portion by clips *e e* and also at their lower ends, each wire being also connected to the nearest wire of the pair next to it at one or more points between the clips *e e* and the lower connected ends of the wires, substantially as set forth.

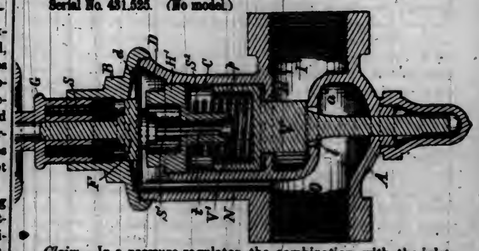
2. An adjustable skirt-form provided with means for expanding and contracting it and supported upon a central standard, said skirt-form being composed of waistband-sections D D and a series of longitudinal wires E E, arranged in pairs and rigidly secured to said sections at their upper ends, said wires being also secured to each other at or near the hip portion and at their lower ends, and the adjacent wires of the pairs being secured at two intermediate points, as *d' e'*, and provided with vertical strips *f f*, secured at *d' e'*, all substantially as described.

3. In an adjustable dress-form, a central standard A, having the waistband-sections D D and a collar F, free to revolve on the standard, said collar being held against vertical movement and provided with a series of horizontal sleeves G G, in combination with a series of horizontal arms or slide-bars J J, rigidly secured to the band-sections and sliding in said sleeves revolving with the collar, and a series of braces L L, pivotally connected at their outer ends to said dress-form sections and at their inner ends to a collar adjustable upon the standard, substantially as described.

4. In an adjustable dress-form, a central standard A, having the waistband-sections D D and a collar free to revolve on said standard, said collar being held against vertical movement and provided with a series of horizontal sleeves G G, in combination with a series of horizontal arms or slide-bars J J, fixed to the band-sections and sliding in said sleeves, and a series of braces L L, pivotally connected at their outer ends to said dress-form sections and at their inner ends to a worm M, engaging with the stud or screw N, fixed to the standard, and a series of braces *d d*, pivotally connected to the dress-form sections at their outer ends and at their inner ends to the reversely-threaded worm O, which engages with the stud or screw A, fixed in the standard, the inner ends of the braces being higher than their outer ends, substantially as described.

479,233. GEAR-WHEEL. ALEXANDER WALKER, West Chester, Iowa, assignor of one-half to William Thompson, same place. Filed Apr. 2, 1892. Serial No. 427,506. (No model.)

Claim.—1. A gear-wheel having a hollow hub which is adjustable lengthwise through the wheel, independent of the latter, substantially as described.



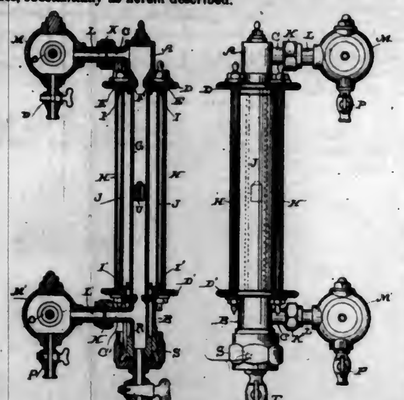
2. A gear-wheel having a hollow hub which is adjustable lengthwise through the wheel independent thereof, combined with means for rigidly locking the wheel and hub together after the desired adjustment is effected, substantially as described.

3. A gear-wheel having a hollow hub which is adjustable lengthwise through the wheel, combined with set-screws carried by the wheel for rigidly connecting the wheel and hub together after the desired adjustment is effected, substantially as described.

4. A gear-wheel having a hollow hub provided interiorly with a key or feather and adjustable lengthwise through the wheel, combined with devices carried by the wheel for rigidly connecting the latter to the hub after the desired adjustment of the parts is effected, substantially as described.

5. A gear-wheel having a hollow hub provided exteriorly with a key-seat, a key or wedge engaging the key-seat and a part of the gear-wheel, and a set-screw carried by the gear-wheel and acting against the key or wedge, whereby the hub can be adjusted lengthwise through the wheel and then rigidly connected therewith, substantially as described.

479,234. FLUID-PRESSURE REGULATOR. EDWARD WIRE, Reading, assignor to Nelson Curtis, Boston, Mass. Filed May 2, 1892. Serial No. 431,525. (No model.)



Claim.—In a pressure-regulator, the combination, with the inlet and outlet arms I and O, partition *a*, provided with port *l* and piston-valve V, of the cylinder C, provided with the two cylinder-heads H and H', cap B, diaphragm *d*, passage-way N, and valve V', having its seat in said cylinder-head H', and a suitable regulating device located in said cap B, the said piston-valve V having its piston between said cylinder-heads H and H', substantially as described.

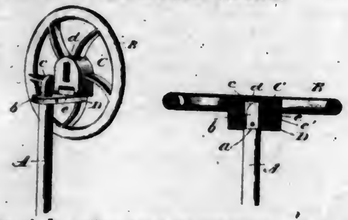
479,235. WATER-GAGE. WILLIAM A. WOODS, San Francisco, Cal. Filed Nov. 9, 1891. Serial No. 411,401. (No model.)

Claim.—1. In a water-gage, the top and bottom chambers having grooved seats on their inner faces, in combination with concentric glass tubes having their opposite ends seated in the grooved seats of the chambers to form tight joints, substantially as herein described.

2. In a water-gage, the top and bottom chambers facing each other, an annular groove in the face of the upper chamber, and a supplemental removable chamber fitting the lower chamber below its face, having an annular groove in its upper edge, packing-washers fitting said grooves, adapted to receive the ends of the tube, and a screw-cap by which the lower supplemental chamber is pressed against the end of the tube, so as to form tight joints at both ends without the use of stuffing-boxes, substantially as herein described.

3. In a water-gage, the chambers A and B, disks formed upon the adjacent faces of these chambers, an annular groove with packing-collar in the lower face of the upper disk, a removable tubular chamber having a corresponding annular groove and packing-washer to receive the lower end of the tube, a slot formed in the side of the chamber B, through which the horizontal tubular passage C projects, and a cap screwing upon the bottom of the chamber B to retain the inner supplemental tubular chamber in place and force it against the bottom of the gage-tube, said inner chamber and tube being removable when the cap has been removed, substantially as herein described.

4. In a water-gage, the chambers A and B, having the confronting faces, an annular groove and packing-collar formed in the face of the upper chamber, a supplemental tubular chamber movable in the chamber B beneath the lower face, having an annular groove and packing-collar, a glass gage-tube the ends of which abut against the packing-collars in the upper and lower grooves, annular grooved disks surrounding the upper and lower ends of the glass gage-tube and abutting upon the faces of the chambers A and B, and an exterior glass tube concentric with the inner one, having its ends fitting the annular movable disks with washers, whereby tight joints are made at the ends, substantially as herein described.



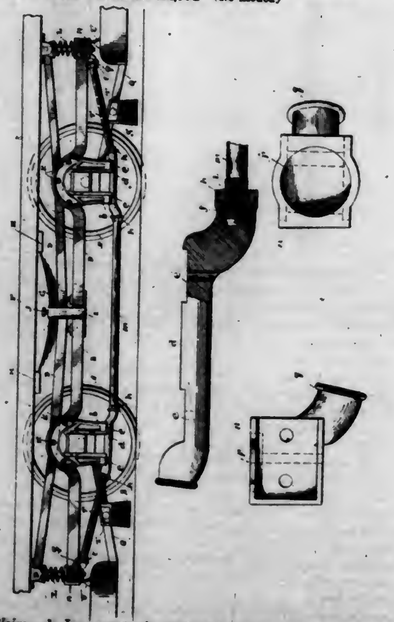
5. A water-gage consisting of the inner and outer concentric glass tubes, chambers with annular grooves and packing-collars, a means for pressing the ends of the tubes against the packing-collars to prevent leakage, a supplemental tubular chamber having an annular groove at the upper end in which the lower end of the inner gage-tube is supported and a cap by which it is held in position from below, and a passage and a cock connecting with the interior of said supplemental chamber, whereby the tube may be blown out and cleaned, substantially as herein described.

6. In a water-gage, the inner and outer glass tubes, the chambers at the upper and lower ends connected with the boiler and facing each other, with annular grooves and packing-collars to receive the ends of the tubes, a means for forcing them into contact with the packing-collars to prevent leakage, a blow-off cock and passage connecting with the inner tube, and an exterior passage connecting the outer tube with the lower exterior chamber, substantially as herein described.

7. In a water-gage, the tubular concentric glasses, the chambered heads with annular grooves, packing-collars between which the ends of the tubes are retained and a tight joint made without stuffing-boxes, horizontally-projecting tubes and couplings whereby the chambered heads are connected with valve-chambers, which in turn are connected with the boiler, blow-off cocks at the lower sides of said valve-chambers, and corresponding screw-threaded caps fitted to the opposite sides, said caps and cocks being interchangeable, whereby the position of the valve may be reversed and the gage used either as a left or right hand gage, substantially as herein described.

8. In a water-gage, the interior and exterior concentric glass tubes, chambered metallic heads with annular grooved channels and packing collars against which the ends of the tubes abut, and means for clamping the tubes against the collars to make tight joints without stuffing-boxes, and an annular chambered float fitting the inner tube and the discharge passes vertically through its center, substantially as herein described.

479,286. CAR-BRAKE. CHARLES H. ALLEN, Stroudsburg, Pa. Filed Apr. 7, 1892. Serial No. 428,213. (No model.)



Claim.—1. In a railway-brake, the combination, with the brake-shaft, of a plate rigidly secured thereto and a brake-wheel hinged to said plate to one side of the shaft, said brake-wheel when turned to a horizontal position being adapted to engage with the upper end of the shaft, substantially as shown, and for the purpose set forth.

2. In a railway-brake, the combination, with the brake-shaft, of a plate rigidly attached to said shaft and having a projecting portion, to which a brake-wheel is hinged, said brake-wheel having a socket within which the upper end of the brake-shaft lies when the plate and hub of the brake-wheel contact with each other, substantially as shown, and for the purpose set forth.

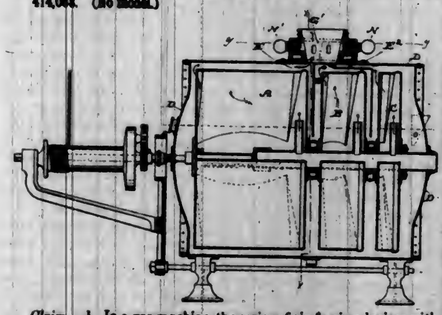
3. In a railway-brake, the combination of a brake shaft having a squared or reduced upper end, one side being curved or cut away, as shown, a plate D, rigidly secured to the brake-shaft and provided with an upwardly-projecting lug *c*, a brake-wheel B, having a hub with a cut-away portion at one end, to which the lug of the plate D is secured by a pintle, and a recess *d* to one side of the hinged connection, said recess being adapted to receive the upper portion of the brake-shaft, substantially as shown, and for the purpose set forth.

479,287. CAR-TRUCK. JOHN E. ANGER, Green Island, N. Y. Filed Mar. 11, 1892. Serial No. 424,564. (No model.)

Claim.—1. In a car-truck, castings *b*, having curved upper ends, bars B, supported on said castings, bars D, adapted to rock on the said curved upper ends of the castings, a guide in which the inner

ends of the bars D move vertically, and a spring confined within the said guide, the parts being combined to operate substantially as shown and described.

2. In a car-truck, the castings *b*, having forked upper ends, bars B and D, confined within the said forks, springs interposed between the outer ends of the said bars, a guide in which the inner ends of the bars D move vertically, and a spring secured in the guide, the parts being combined to operate substantially as shown and described.



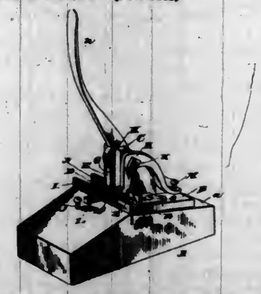
3. In a car-truck, the castings *b*, bars B and D, springs interposed between the outer ends of the bars, a guide for the inner ends of the bars D, which move vertically between the bars B, a spring secured in the upper end of the said guide, and a set-screw J, the parts being combined to operate substantially as shown and described.

4. In a truck, a suitable frame, the wheels journaled therein, equalizing-bars pivoted between their ends substantially over the axles and extending inward to substantially the center of the truck, combined with the car-body, which has its ends resting upon the outer ends of the equalizing-bars, and a spring between the center of the body and the inner ends of the said bars, substantially as set forth.

5. In a car-truck, forked castings *b*, arranged over the journal-boxes of the trucks, bottom stays *d*, secured to the lower ends of said castings and having their adjacent ends bent downward and recessed, screw-threaded nuts fitting the recesses thus formed, and a screw-threaded truss-brace which connects the said stays, substantially as shown and described.

6. In a car-truck, wheels, axles, and axle-boxes, depending castings supported by the latter, a longitudinal bar supported on the upper end of the castings, castings secured to the ends of said bar, socket portions *q*, projecting from said castings, and a truss-brace secured at its respective ends to the said sockets, substantially as shown and described.

479,288. AIR-SUPPLYING DEVICE FOR GAS-MACHINES. EDGAR B. BADLAM, San Francisco, Cal. Filed Dec. 4, 1891. Serial No. 414,064. (No model.)



Claim.—1. In a gas-machine, the series of air-forcing devices with separate and independent casings, passages leading therefrom, a valve having interior and exterior chambers, a valve-casing consisting of exterior and interior cylindrical walls forming an annular chamber, diaphragms whereby this chamber is divided, openings through the inner cylindrical wall of the casing and openings connecting the interior space, in which the valve turns with the pipes N' and N, which lead, respectively, to an evaporating-chamber and an air-mixing chamber, means for turning the valve-plug so as to unite the various chambers and connect them with the air-forcing mechanisms, and a dial-plate whereby each connection is indicated, substantially as herein described.

2. In a gas-machine, a series of air-forcing devices with passages leading therefrom, a valve-casing consisting of concentric walls, openings through the inner wall communicating with the interior space, radial diaphragms by which the space between the walls is subdivided, passages connecting each subdivision with one of the air-forcing devices, a hollow valve-plug fitting and turning in the central compartment having a central passage communicating with the other air-forcing device, chambers around the exterior of the plug with which the openings in the inner wall of the valve-casing connect, a passage Q from one of these chambers to the interior of the plug and an opening P through the opposite wall of the plug to connect with the openings in the casing, and openings N N' through the inner wall of the casing connecting with pipes leading to a mixing and drying compartment and to an evaporating compartment, substantially as herein described.

3. In a gas-machine, a series of air-forcing devices, independent evaporating and drying compartments, a valve interposed between these compartments and the air-forcing devices, with communicating passages through which varying proportions of air are delivered to the two compartments, a handle by which the valve is turned, a disk having holes or stops corresponding with the different positions of the valve, and a spring-actuated pin passing through the handle so as to engage either of the stops and hold the valve-plug in either position, substantially as herein described.

4. In a gas-machine, a series of air-forcing devices, independent evaporating and drying compartments, a valve interposed between the compartments and the air-forcing mechanisms with passages by which the proportions of air delivered to either compartment are varied by changing the position of the valve-plug, a handle by which the plug is turned, a disk with stops corresponding with the different positions of the plug, a spring-actuated pin carried by the handle so as to engage either of the stops and hold the valve in place, and a projection upon the pin by which it is withdrawn when desired to move the plug, substantially as herein described.

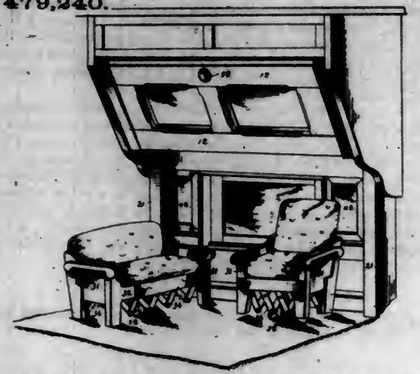
479,289. SAW-SET. CLARK BAKER, Greenville, Ohio. Filed Apr. 22, 1892. Serial No. 430,346. (No model.)

Claim.—1. In a saw-set, the oppositely-beveled base, a base-plate secured to one face of said base and provided with an anvil, a die working over the anvil and provided with a spring-shank secured to the base and normally holding the die above the anvil, a lever having an eccentric head pivotally mounted upon said base and working over said die, a transverse saw-rest secured to the base in front of the base-plate and the anvil thereon, a gage-screw adjustably working in the opposite face of said base, and adjustable gage-plates mounted upon opposite sides of said base-plate adjacent to the saw-rest, substantially as set forth.

2. In a saw-set, the oppositely-beveled base, a base-plate secured to one face of said base and provided with an anvil, a spring-die working upon said base over the anvil, an eccentric lever pivoted upon the base over said die, a transverse rest-plate located in front of the base-plate and the anvil thereon, a gage-screw, and an adjustable retaining-lever adjustably mounted upon said base-plate and projecting over the rest-plate and adjacent to the gage-screw, substantially as set forth.

3. In a saw-set, the combination, with the base-plate, setting devices mounted upon said plate, a transverse rest-plate, and an adjacent gage-screw, of a retaining-lever centrally pivoted over the base-plate and provided with a forwardly-extending retaining-arm projecting over the rest-plate over one side of the gage-screw, and an opposite threaded end, and an adjusting-screw engaging said threaded end and bearing upon the base-plate, substantially as set forth.

479,240. PARLOR SLEEPING-CAR. DE WITT C. BREED, Medina, N. Y. Filed June 19, 1890. Renewed June 23, 1892. Serial No. 437,780. (No model.)



Claim.—1. The combination, with a car having an overhanging rail or bar and a hinged swinging berth, of leaves or plates hinged at their lower edges to the ends of the berth and provided at their upper ends with notches, forming abutments to engage the rail or bar for sustaining the berth in its horizontal position and rigidly locking it against accidentally collapsing, substantially as described.

2. The combination, with a hinged berth adapted to swing down to a horizontal position, of a drop-berth connected with the hinged swinging berth, substantially as described.

3. The combination, with a hinged swinging berth, of a leaf or plate hinged to each end thereof, adapted to turn to a vertical position and having means to engage a fixed part of the car to lock the hinged berth stationary when opened, and a drop-berth connected with the hinged berth and adapted to rise and fall and when raised to turn or swing with the hinged berth, substantially as described.

4. The combination, with a hinged swinging berth, of a drop-berth connected with the hinged berth and adapted to rise and fall independent of the latter and when raised to turn and swing with the hinged berth, substantially as described.

479,240.

5. The combination, with a hinged swinging berth, of a drop-berth having extensible and collapsible end walls connecting it with the hinged berth, substantially as described.

6. The combination, with a hinged berth adapted to swing down to a horizontal position and means for rigidly locking the berth against movement in any direction when lowered, of a drop-berth connected with and carried by the hinged berth and folding or turning upward therewith, substantially as described.

7. The combination, with an upper berth, of a drop-berth capable of being lowered to make up a lower berth and balancing mechanism for the drop-berth, which assists in elevating the drop-frame, substantially as described.

8. The combination, with an upper berth, of a drop-berth having expansible and collapsible end walls which suspend it from the upper berth and when perpendicular are rigidly locked and thereby brace the drop-berth in its lowered position, and balancing mechanism which assists in elevating the drop berth, substantially as described.

9. The combination, with a movable upper berth, of a drop-berth carried thereby and adapted to be lowered to make up a lower berth, and balancing mechanism which assists in lifting the drop-berth against the upper berth and then aids in moving both berths into position for storage, substantially as described.

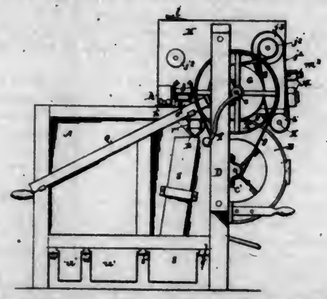
10. The combination, with a movable upper berth, of a drop-berth adapted to be lowered to make up a lower berth, cables connected with the drop-berth and a spring-drum mechanism, and balancing mechanism for keeping the cables taut and assisting in the elevation of the drop-berth, substantially as described.

11. The combination, with a hinged berth having end pulleys or sheaves, of a drop-berth connected with the hinged berth, turning therewith and adapted to be lowered to make up a lower berth, cables connected with the drop-berth and passing over the pulleys or sheaves on the hinged berth, and means for automatically keeping the cables taut and assisting in the elevation of the drop-berth, substantially as described.

12. The combination, with a movable upper berth having end pulleys or sheaves, of a drop-frame connected with the upper berth and adapted to be lowered into the position required for use, cables connected with the drop berth and passing over the pulleys or sheaves on the upper berth, and spring-drum mechanism for keeping the cables taut and assisting in the elevation of the drop-berth, substantially as described.

13. The combination, with an upper berth, of a drop-berth having end walls each composed of two bars hinged to the drop-berth, and an intermediate plate hinged to the upper berth and pivotally connected between its extremities to the hinged bars to constitute collapsible and extensible ends to the drop-berth, substantially as described.

14. The combination, with a hinged swinging berth and vertical guideways below the latter, of a drop-berth connected with the hinged berth and having end brackets or arms in sliding engagement with the vertical guideways, substantially as described.



15. In a parlor-car for railroads, the combination, with a berth-frame, of rotating single-seat chairs, each extensible and collapsible rectilinearly to change its width for receiving and sustaining one end of the berth-frame to make up a berth, substantially as described.

16. In a parlor-car for railroads, the combination, with a drop-frame adapted to rise and fall, of single-seat chairs, each extensible and collapsible to convert it from a single seat into a support for one end of the drop-berth frame, substantially as described.

17. In a parlor-car for railroads, the combination, with a berth-frame, of a rotating single-seat chair which is extensible and collapsible rectilinearly and when extended lowers itself to the car-floor for standing stationary to support the berth-frame, substantially as described.

18. The combination, with a berth-frame, of a single-seat parlor-car chair journaled to rotate axially on a stationary pedestal and comprising two independent arm and seat sections, and an extensible connection between the two arm-sections for simultaneously adjusting the same to rigidly support the berth-frame, substantially as described.

479,241. FANNING-MILL. HENRY BUSH, Holgate, Ohio. Filed Dec. 12, 1891. Serial No. 414,814. (No model.)

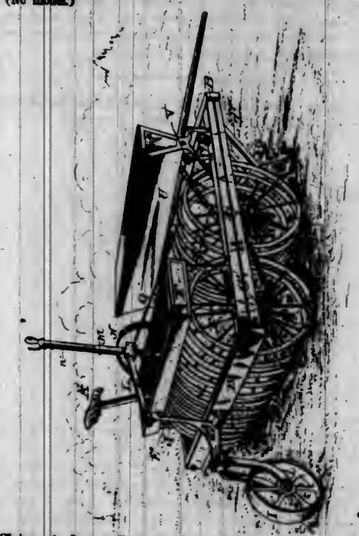
Claim.—1. In a grain-separator, the combination, with the casing and the fan located therein, of a feed-hopper located above the fan and having an inclined bottom, opposite vertical grooves and slanting grooves cutting or crossing said vertical grooves, located in opposite inner edges of the hopper, a corrugated feed-roller journaled in said blocks, a guard-board removably secured in said slanting grooves directly above said feed-roller, and removable regulating and cut-off gates working in said vertical grooves and in front of the guard-board to secure the same in place, substantially as set forth.

2. In a grain-separator, the combination, with the casing and the fan located therein, of a double-hopper frame detachably secured upon said casing and having opposite hoppers provided with centrally-meeting inclined bottoms, opposite vertical and crossing slanting grooves at the front edges of the hoppers, a corrugated feed-roller journaled at the front lower edges of the hoppers, a guard-board removably secured in said slanting grooves directly above said feed-roller, removable regulating and cut-off gates working in said vertical grooves in front of the guard-boards, a division cover or lid hinged at the apex or meeting point of the inclined bottoms and adapted to be thrown over either of the hoppers, reciprocating screens within said hopper-frame, and means for operating the same, substantially as set forth.

3. In a grain-separator, the combination, with the casing and a fan located at one end thereof, of a detachable double-hopper frame mounted upon said casing directly over the fan, opposite pairs of oscillating levers secured to opposite inner sides of said hopper-frame, upper and lower screen-frames secured pivotally to the upper and lower ends, respectively, of said levers, and means for oscillating said levers, substantially as set forth.

4. In a grain-separator, the combination, with the casing and a fan located at one end thereof, of a detachable frame mounted upon said casing, opposite pairs of oscillating levers secured to opposite inner sides of said frame, upper and lower screen-frames pivotally secured to the upper and lower ends, respectively, of said levers, vibrating conducting-spouts mounted transversely beneath the front ends of each screen-frame, and means for simultaneously oscillating said levers and vibrating said spouts, substantially as set forth.

5. In a grain-separator, the combination, with the casing and a fan located at one end thereof, of a double-hopper frame detachably mounted upon said casing, oscillating levers secured to inner opposite sides of said frame, the rear levers having lower projecting ends, upper and lower screen-frames pivotally secured to the upper and lower ends, respectively, of said levers, curved operating-plates secured to the rear ends of the lower screen-frames, a square operating-shaft journaled beneath the screen-frames and adapted to alternately strike the lower projecting ends of said levers and said curved plates, and means for simultaneously operating said shaft with the fan, substantially as set forth.



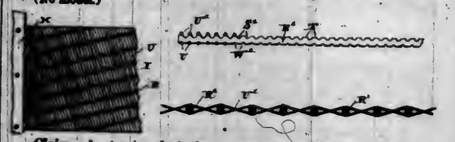
6. In a grain-separator, the combination, with the casing and a fan located in one end thereof, of a double-hopper frame detachably mounted upon said casing, oscillating levers secured to inner opposite sides of said frame, the rear levers having lower projecting ends, upper and lower screen-frames secured to the upper and lower ends, respectively, of said levers, curved operating plates secured to the lower ends of the lower screen-frame, a square or rectangular operating shaft journaled beneath the screen-frame, opposite strike-plates

secured to opposite sides at each end of said shaft and adapted to alternately strike the lower projecting ends of said levers and said curved plates, and means for simultaneously operating said shaft with the fan, substantially as set forth.

7. In a grain-separator, the combination, with the casing and a fan located at one end thereof, of a detachable frame mounted upon said casing, upper and lower reciprocating screen-frames working within said frame, parallel angle-plates secured to the inner ends of said screen-frames and having the ends thereof turned at an angle to the length of said frames, vibrating conducting-spouts located transversely beneath the front ends of the screen-frame and provided with supporting and sliding pins secured to one end thereof and adapted to slide in the sides of said frame and casing, respectively, and with upwardly-projecting studs adapted to engage between said angle-plates, swinging links supporting the outer ends of said spouts, and means for operating said screen-frame simultaneously with the fan, substantially as set forth.

8. In a grain-separator, the combination, with the casing of a fan located at one end thereof, of a series of vertical dividing-receptacles in front of said fan, a detachable double-hopper frame mounted upon said casing directly over the fan, upper and lower reciprocating screen-frames working within said hopper-frame, swinging and vibrating spouts located transversely beneath the front ends of said screen-frames and connected with and operated thereby, conducting chutes and spouts under the discharging ends of each vibrating spout, a series of boxes or drawers beneath each receptacle, and means for operating said screen-frames simultaneously with the fan, substantially as set forth.

479,242. SEEDER, ROLLER, AND PULVERIZER. HARDY W. CAMPBELL, Putney, S. D. Filed Mar. 24, 1892. Serial No. 426,248. (No model.)

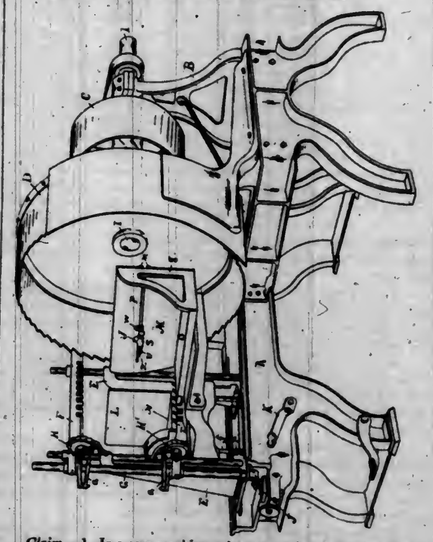


Claim.—1. In a combined roller, soil packer and pulverizer, the combination of a suitably-constructed frame having the bed F, the axles C and C', secured near the center and rear portions of said frame, the series of wheels mounted upon said axles, the caster-wheel secured to the center of the rear cross-bar of the frame, and the mechanism whereby the weight of said machine is thrown upon said caster-wheel and the front series of wheels D, substantially as described, and for the purpose set forth.

2. In a combined seeder, roller, soil packer and pulverizer, &c., the combination of a suitably-constructed frame provided with the bed F, the axles C and C', secured near the center and rear portions of said frame, the series of wheels D and D', mounted upon said axles, the caster-wheel secured to the center of the rear cross-bar of the frame, the drag-bars pivoted to the cross-bar B, the seed-box located in front of the bed F and upon the ends of the longitudinal pieces A and A' and provided with a suitable feed mechanism, the seed-tubes secured to the cross-bar 1 of the machine and the bottom of the seed-box, and the mechanism whereby the caster-wheel I, the drag-bars, and the feeding mechanism are operated, substantially as described, and for the purpose set forth.

3. In a combined seeder, roller, soil packer and pulverizer, &c., the combination of a suitably-constructed frame with the axle-bars secured near the front and rear portions of said frame, the series of wheels mounted upon said axle-bars, the caster-wheel secured to the center of the rear cross-bar of the frame, the seed-box located upon the front ends of the longitudinal pieces A and A' and provided with a suitable feed mechanism, and the mechanism whereby the caster-wheel I and feeding mechanism are operated, substantially as described, and for the purpose set forth.

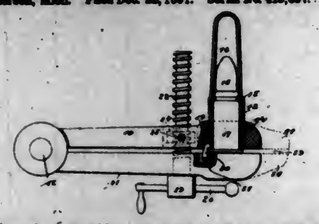
479,243. APPARATUS FOR MANUFACTURING PAPER-PULP. JOHN R. CARTER, Kokomo, Ind. Filed June 18, 1891. Serial No. 396,756. (No model.)



Claim.—1. A wire-cloth for wood-pulp-reducing machines, consisting of large wires having transverse water-ways on their upper sides and small wires which cross the large wires and are placed between the said grooves, substantially as described.

2. In a pulp-reducing machine, a reciprocating frame, a wire-cloth secured thereto having large wires, and small wires passed over and under the said large wires, and tightening devices which are connected with one or more of the large wires for the purpose of stretching the said cloth, substantially as described.

3. In a pulp-reducing machine, a vat, a reciprocating wire-cloth over the vat, a feed-box supported over the wire-cloth, perforated water-pipes under the said cloth, and water-supply pipes extending over the feed-box, the parts combined substantially as specified.

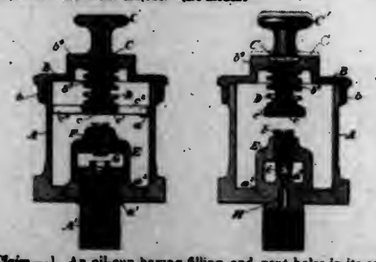


479,244. SAWING-MACHINE. DENNIS CHASE, Orange, Mass. Filed May 26, 1891. Serial No. 394,218. (No model.)

Claim.—1. In a saw-machine, a box to receive the chair-backs or other articles as they are cut from the block, in combination with a sliding piece S, forming a bearing for a rod V, provided with a sharpened point and being normally thrust forward by a coiled spring U, said piece S sliding in a horizontal slot P in the back of said box and receding under pressure from the block as it is fed forward, substantially as described.

2. In a saw-machine, a box to receive chair-backs or other articles as they are cut from the block, in combination with a sliding piece S, forming a bearing for a rod V, provided with a sharpened point and being normally thrust forward by a coiled spring U, said piece S sliding in a horizontal slot P in the back of said box and having rolls W W bearing upon the inside of said box, and a spring X, bearing upon the outside thereof to sustain the sliding piece S in position, substantially as described.

479,245. CARTRIDGE-RELOADER. FREMONT R. CRAWFORDSON, Emerson, Mich. Filed Dec. 22, 1891. Serial No. 415,827. (No model.)



Claim.—1. A cartridge-reloader comprising oppositely-arranged jaws, a tapering tube held in one of the jaws and shaped to fit a cartridge, and a screw extending transversely through the jaws, one of the jaws carrying a pivoted nut to receive the screw, substantially as described.

2. A cartridge-reloader comprising oppositely-arranged jaws, a detachable cartridge-receiving tube carried by one of the jaws and adapted to fit a cartridge, a nut pivoted in one of the jaws, a screw extending through one of the jaws and through the nut of the opposite jaw, and an extractor for the cartridge, substantially as described.

3. The combination, with the movable jaws, one of which is provided with a cartridge-receiving tube and has a recess adjacent to the tube, of a hook pivoted on one of the jaws and adapted to engage the flange of the cartridge, substantially as described.

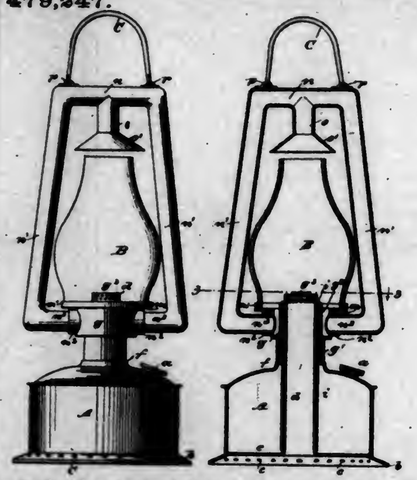
479,246. OIL-CUP. JOSEPH M. COALE, Baltimore, Md. Filed Feb. 24, 1892. Serial No. 422,621. (No model.)

Claim.—1. An oil-cup having filling and vent holes in its cap, a cover adapted to open and close said holes by a partial rotation, and a spring holding said cover upon the cap, substantially as described.

2. An oil-cup having filling and vent holes in its cap, a cover for said holes, consisting of a plate mounted upon a stem, on which it has both a rotatory and an axial sliding movement, and a spring holding said plate against the cap, substantially as described.

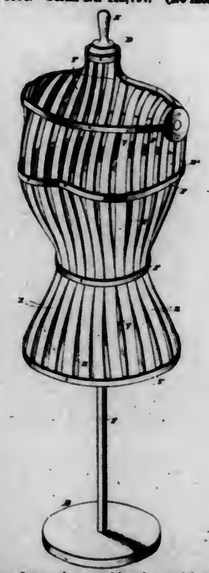
3. An oil-cup having filling and vent holes and an oblong groove in its cap, a cover for said holes, consisting of a plate adapted to be received in said recess, and means for holding said plate yieldingly in the recess, substantially as described.

4. An oil-cup having filling and vent holes and a transverse groove in its cap, a cover for said holes, consisting of a plate adapted to be received in said groove, said plate being rotatable and also axially movable, and having a spring holding it in said groove, substantially as described.



5. The combination, with the oil-cup A, of the cap B, provided with a transverse groove and having the holes b' b^2 opening into said groove, the plate C, having a spindle c midway between said holes, the collar c' on said spindle, and the spring E, compressed between said collar and the cap B, substantially as described.

6. The combination, with the oil-cup A, having the lugs a, and the cap B, having the filling and vent holes and the groove, of a plate C, having a spindle c, provided with the collar c' and arms c^2, and the spring D, substantially as described.

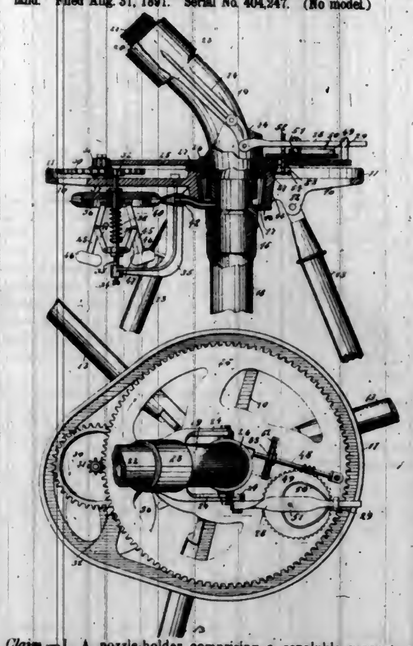


7. The combination, with an oil-cup A, of a tubular wrought-iron stem screwed into the bottom of said cup, a yoke E, screwed upon the inner end of the stem, and a screw working in the yoke above and in line with the bore of the stem to regulate the feed, substantially as described.

479,247. LANTERN. DANIEL W. CROSBY, Little Rock, Ark. Filed Feb. 16, 1892. Serial No. 421,770. (No model.)

Claim.—As an improved article of manufacture, a central-draft lantern consisting in the annular reservoir A, having an apertured supporting-flange b, a central draft-tube d, closed at its upper laterally-foraminated end, and a collar f, concentric with and of greater diameter than the tube, the shell g, secured upon said neck at g' and having an upward extension g^2, extending adjacent to the upper end of the tube d to form the wick-space, the opposite apertured globe-supporting flange or plate m on the upper end of the shell, and the tubular frame having inward-bent lower ends n^2, connected with the opposite sides of the said shell, and the hood o' within the upper end of the tubular frame, substantially as set forth.

479,248. CLOTHING-FORM. HERBERT H. CUMMER, Cadillac, Mich. Filed Nov. 23, 1891. Serial No. 412,797. (No model.)



Claim.—1. In a form, the combination, with a base, an upright rising therefrom and a downwardly-facing spring-catch on the upright, and a pin in the upper end of said upright, of the form proper comprising horizontal blocks connected by an exterior covering, the lowermost two blocks having a hole to receive said upright, the next block having a socket to receive said pin and to permit the face of the catch at that time to stand above the lowermost block, and the latter having a hole through which said catch may be reached, as set forth.

2. The herein-described form, the same comprising horizontal blocks at the hip, waist, bust, and shoulder lines, an upright top block on the uppermost horizontal block, a horizontal disk supported by the top block, a vertical bar connecting said blocks, an exterior covering therefor, and a support, as set forth.

3. The herein-described form, the same comprising a number of blocks cut to the proper size, a bar connecting them, upright veneer strips secured to the edges of the blocks to make the general contour approximate the human figure, and fabric strips secured over said veneer strips opposite the edges of all said blocks, as hereinbefore set forth.

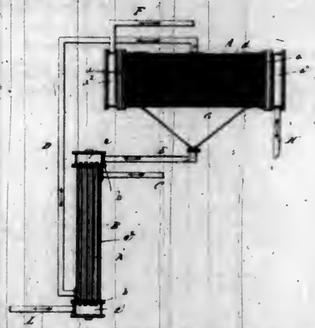
4. The herein-described form, comprising horizontal blocks at the hip, waist, bust, and shoulder lines and arranged one above the other, a vertical bar rigidly connecting said blocks, an exterior covering therefor consisting of veneer strips secured to the edges of the said blocks and bent into shape to assume the general contour of the human figure, an upright support, and a vertically-disposed spring secured to one of said blocks and engaging the said support, substantially as described.

479,249. NOZZLE-HOLDER. ARTHUR CUTHBERT, London, England. Filed Aug. 31, 1891. Serial No. 404,247. (No model.)

Claim.—1. A nozzle-holder comprising a revoluble support, a pivoted deflector in which a nozzle is loosely held, carried by the said support, and means for swinging the deflector on its pivots as a support is revolved, substantially as described.

2. A nozzle-holder comprising a frame having a hose-coupling in an opening therein, a horizontal revoluble wheel mounted on the frame, a nozzle-holding deflector pivoted to the said wheel, and means for swinging the deflector on its pivot as the wheel is revolved, substantially as described.

3. A nozzle-holder comprising a frame having a central opening therein, a hose-coupling secured in the opening and provided with a side jet-pipe, a revoluble deflector mounted above the hose-coupling and adapted to support a nozzle, a water-motor mounted on the frame and having its wheel in the path of the jet-pipe, a gear mechanism connecting the deflector with the motor, and a cam-operated lever mechanism for changing the angle of the deflector, substantially as described.



4. A nozzle-holder comprising a frame having a central opening therein, a hose-coupling secured in the opening, a deflector mounted above the coupling and adapted to support a nozzle, a centrally-apertured wheel mounted horizontally upon the frame, a lever held to slide on the wheel and connected with the deflector, a cam mechanism for operating the lever, and a motor for revolving the wheel, substantially as described.

5. The combination, with the frame having a central opening therein to receive a pipe, the revoluble wheel held to turn horizontally around the central opening, the nozzle-holding deflector pivoted on the wheel, and the lever pivoted to the deflector and held to slide on the wheel, of a cam-wheel mounted on the main wheel and adapted to engage a roller on the lever, a worm-shaft for operating the cam-wheel, and a star-wheel secured to the worm-shaft and adapted to engage fixed projections on the main frame, substantially as described.

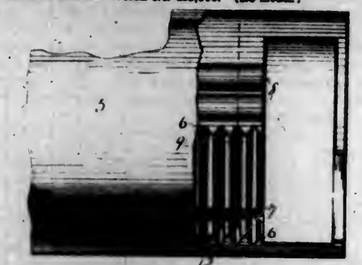
6. The combination, with the motor-shaft and the motor-wheel held to slide thereon, of a spring arranged to support the wheel and weights adapted to balance the spring, said weights being pivoted to the under side of the wheel and having a link connection with the shaft, substantially as described.

7. In a nozzle-holder, the combination, with the revoluble wheel held to turn horizontally, as described, of a deflector comprising a sleeve having depending legs pivoted to the central portion of the wheel, and a lever mechanism for changing the position of the deflector in relation to the wheel, substantially as described.

479,250. APPARATUS FOR CLARIFYING SUGAR SOLUTIONS. EUGENE W. DEMING, New Orleans, La. Filed Nov. 18, 1891. Serial No. 412,321. (No model.)

Claim.—The apparatus, substantially as and for the purpose set forth, comprising the heater or defecator having the chamber a', the chambers a^3, and the pipes connecting the chambers a^3, the steam-feed pipe connected with one of the chambers a^3, the steam-discharge pipe connected with the other chamber a^3, the stand-pipe having the chamber c^3, the chambers cc', and the pipes connecting said chambers cc', a pipe connecting the chamber c^3 of the stand-pipe and the chamber a' or the heater or defecator, a pipe connecting the chamber a' of the heater or defecator and the chamber c of the stand-pipe, and a pipe leading from the chamber c' of said stand-pipe, all adapted to operate substantially as and for the purpose set forth.

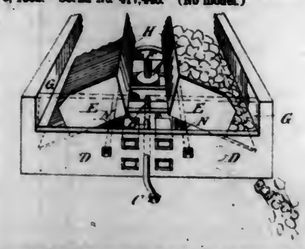
479,251. WOOLEN BOOT. WALLACE H. DODGE and ROBERT D. O. SMITH, Mishawaka, Ind. Filed Oct. 13, 1887. Serial No. 252,266. (No model.)



Claim.—1. A woolen all-knit boot whereof the leg portion of loosely-twisted yarn is, after fulling and finishing, hard and stiff and the foot portion of hard-twisted yarn is flexible, as set forth.

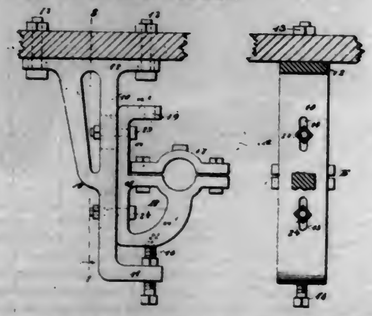
2. A boot whereof the leg and foot portions constitute one continuous or interwoven fabric, the former portion being composed of soft loosely-twisted yarn felted together thoroughly and the latter portion being composed of hard-twisted yarn relatively unfelted and flexible, as set forth.

3. An all-knit boot whereof the leg and foot portions are one continuous knit fabric, the former extending down and including the heel, being composed of soft loosely-twisted yarn felted together thoroughly and the latter being composed of hard-twisted yarn unfelted and flexible, as set forth.



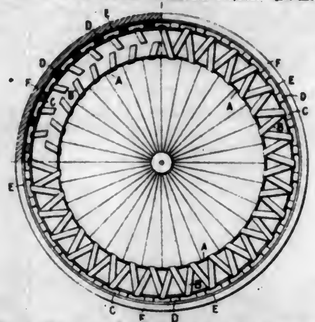
4. An all-knit boot consisting of a stiff felted or fulled leg and a flexible or unfelted foot portion, substantially as set forth.

479,252. STEAM-BOILER. DANIEL DOSAHUE, New York, N. Y. Filed Mar. 5, 1892. Serial No. 423,860. (No model.)



Claim.—The combination, in a steam-boiler, of a corrugated shell and water-pipes located between the corrugations and connected with the boiler, substantially as described.

479,253. AIR DUMP-CAR. CHARLES H. DOW, Ellensburg, assignor of one-sixth to James Garvey and Harry L. Smith, Tacoma, Wash. Filed Jan. 8, 1892. Serial No. 417,440. (No model.)

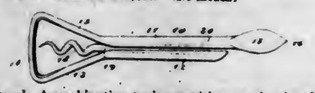


Claim.—A dumping car and means for dumping the same, comprising in its construction a car having stationary sides and ends and formed with two dumping-sections E E, which are inclosed by the stationary sides of the car and pivoted to the frame of the car near their outer edges, said sections being provided with inclined inner sides H H, which meet at a point when the sections are in a normally-adjusted position, thereby preventing coal, stone, or debris getting in between the two sections and preventing the sections operating, an air or steam conducting pipe B, a cylinder A, and piston F, which works against the under side of the inner ends of the sections and raises the same, said sections being so pivoted that when the load is dumped they automatically return to their lowered condition, substantially as described.

479,254. HANGER. JAMES G. DUKE, Memphis, Tenn. Filed Mar. 16, 1892. Serial No. 425,162. (No model.)

Claim.—The combination, with a hanger capable of attachment to an overhead, to a vertical, or to a low horizontal support, the said hanger comprising, essentially, a body-section and an arm extending at an angle therefrom at one end, the body-section of the hanger being provided with elongated slots located one above the other, of a box consisting of a bracket comprising a body-section having an elongated transverse slot therein near one end and an aperture near the opposite end, an arm projected from one end of the body and having an elongated opening formed therein, a second arm extending from the body and supporting a bearing, the latter arm being provided with a recess, adjusting-bolts passed through the upper body-slot of the bracket and the lower aperture therein and through the elongated slots in the body of the hanger, and an adjusting-screw carried by the arm of the hanger, adapted to enter the recess in one arm of the box or pass through the slot in the opposite arm of said box, as and for the purpose specified.

479,255. WHEEL FOR VELOCIPEDES. JOHN B. DUNLOP, Belfast, Ireland. Filed Feb. 10, 1892. Serial No. 421,012. (No model.)



Claim.—1. In a wheel for velocipedes or other vehicles, the combination, with a rigid rim, of a flexible or elastic covered ring or hoop larger than and concentric with the said rim and bands of cloth or other pliable and non-elastic textile material connecting the said rim with the elastic ring, substantially as and for the purpose specified.

2. In a wheel for a velocipede or other vehicle, the combination, with a rigid rim, of flexible rings or hoops larger than and concentric with the said rim, said rings or hoops being firmly secured together by blocks of india-rubber interposed between and cemented to them, and bands or strips of pliable cloth connecting the said rings to the rigid rim, substantially as described.

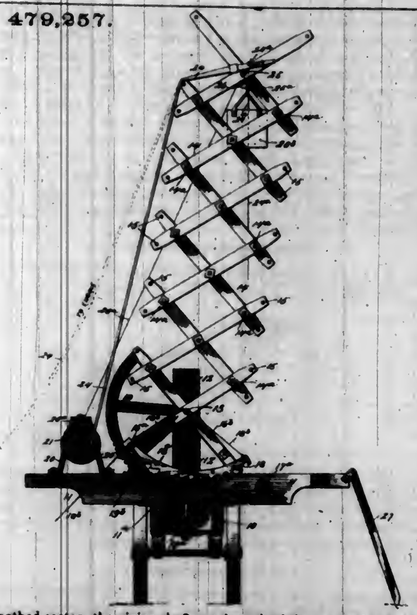
3. In a wheel for velocipedes or other vehicles, the combination, with a rigid rim, of a covered flexible compound ring made up of a series of convolutions larger than and concentric with the said rim and bands or strips of cloth or other pliable material connecting the said compound ring to the rigid rim, substantially as described.

479,256. CAN-OPENER. SMITH ERENGER, Park City, Utah. Filed Feb. 5, 1892. Serial No. 420,436. (No model.)

Claim.—1. A combination tool comprising a spring-handle having longitudinally-separable members of unequal lengths, the longer member terminating in cutting-blades, and a corkscrew adapted to fold longitudinally between the members and having a pivot connection with one member of the handle, substantially as described.

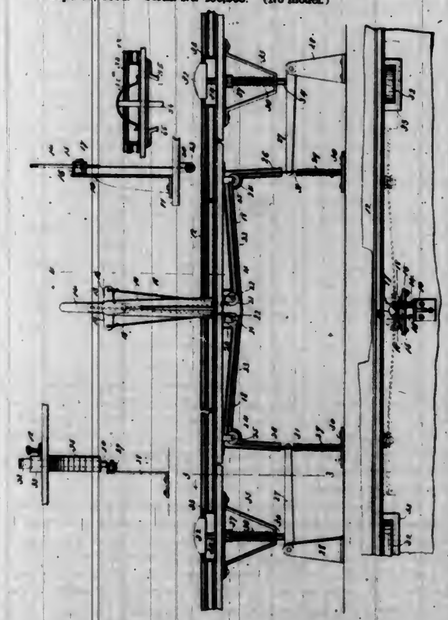
2. A combination tool comprising a longitudinal separable handle having an enlarged outer end formed into a scraper and adapted to exert a spring action on the handle members and having one of the said members provided at one end with cutting-blades, and a corkscrew adapted to extend longitudinally between the members, said corkscrew being pivoted to one member of the handle, substantially as described.

3. A combination-tool comprising a longitudinally-separable handle having an enlarged outer end formed into a scraper and adapted to exert a spring action on the members of the handle, and a corkscrew having its shank pivoted between the members of the handle, substantially as described.



479,257. FIRE-ESCAPE. CARL F. ZEMAN, Marshalltown, Iowa. Filed Feb. 9, 1892. Serial No. 420,929. (No model.)

Claim.—1. In a fire-escape, the combination, with the lazy-tongs the links or levers of which are extended beyond the outer joints of the rounds or bars connecting the ends of the said links or levers, substantially as shown and described.

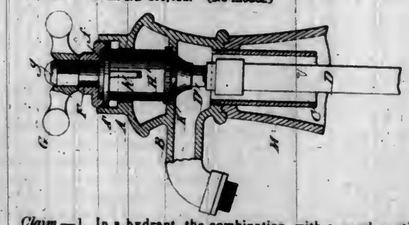


2. The combination, with the frame, of the upright standards, the lazy-tong extension-ladder journaled between the same, the elevating-strap, the winding-drum, the locking-bar, the toothed swinging frame connected with the ladder and adapted to engage the locking-bar, the toothed sector, the pinion-shaft, ratchet-wheel thereon, and engaging pawl, all arranged substantially as shown and described.

3. In a fire-escape, the combination of a lazy-tong extension-ladder, a toothed semicircular segment secured to one of the lower members, an elevating-strap attached to the other lower member, the pinion and shaft for operating the toothed sector, and the pawl for locking the same, whereby the ladder can be adjusted at any suitable angle, and the winding-drum for operating the elevating-strap, substantially as shown and described.

479,257.

479,258. RAILWAY-SIGNAL. SAMUEL ENRICH, Reno, Nev. Filed Sept. 19, 1891. Serial No. 406,303. (No model.)



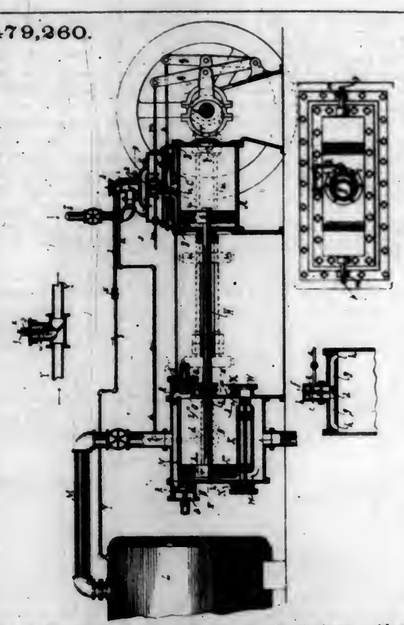
Claim.—1. A railway-signal comprising a pivoted signal-arm, pivoted and spring-pressed levers, cables connected to opposite sides of the signal-arm and to the free ends of the said levers, and vertically movable and spring-pressed contact-blocks adjacent to the rails and having depending shanks adapted to engage the pivoted levers, substantially as described.

2. A railway-signal comprising a signal-post, a swinging signal-arm mounted thereon, a casing arranged adjacent to and parallel with the track, swinging spring-pressed levers mounted beneath the open ends of the casing, cables having an operative connection with the signal-arm and extending over guide-pulleys in the casing to connect with the free ends of the levers, and spring-pressed contact-blocks arranged adjacent to the track, said blocks having depending shanks adapted to contact with the levers, substantially as described.

3. A railway-signal comprising a post arranged adjacent to the track, a signal-arm pivoted on the post and provided with oppositely-extending arms at its base, a casing arranged parallel with the track and extending beneath the foot of the post, vertically-swinging spring-pressed levers mounted beneath the open ends of the casing, cables secured to the free ends of the levers and to the outer ends of the base-arms of the signal-arm, said cables extending over suitable guide-pulleys in the casing, and spring-pressed contact-blocks arranged adjacent to the track-rail, said blocks having depending shanks adapted to strike the upper sides of the swinging levers, substantially as described.

479,259. HYDRANT. CHARLES G. BYRD, St. Louis, Mo. Filed Oct. 24, 1891. Serial No. 409,732. (No model.)

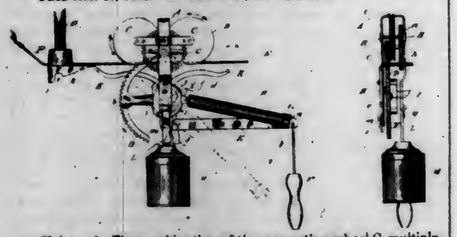
Claim.—1. In a hydrant, the combination, with a nozzle-section having an integral nozzle, of the stem which connects with the valve in the water-way, a conical perforated rubber packing-ring on said stem and seated upon the seat in the nozzle-section, the cylinder bearing upon said packing-ring and located non-rotatively within the nozzle-section, an adjusting-ring screwed in the upper end of the nozzle-section, and a metallic block within said ring, provided with a screw-threaded projection engaging the head of the valve stem, all arranged substantially as described.



2. In a hydrant, the combination of a nozzle-section having an integral nozzle, a circular seat and the internal screw-threaded upwardly-projecting cylindrical extension, the stem which is connected to the valve in the water-way, a single conical perforated rubber packing-ring on said stem and seated on the aforesaid circular seat, a cylinder located within the nozzle-section so as to be adjustable vertically, but non-rotative, said cylinder bearing at its lower end upon the packing-ring, an adjusting-ring screwed into the aforesaid screw-threaded extension, a block inside of said ring, having a downward screw-threaded projection engaging the head of the valve-stem, and a handle device secured to the aforesaid block, so as to rotate the same, and thus open or close the valve, substantially as described.

479,260. AIR-COMPRESSOR. THOMAS F. FARRELL, Paterson, N. J. Filed July 9, 1891. Serial No. 398,944. (No model.)

Claim.—1. The combination, with a receiver and a cylinder K, having a housing *b*, of a valve-chamber F, a pipe Y, leading from the receiver to the valve-chamber, a pipe *a*, leading from the valve-chamber to the housing *b*, a valve Z, located in the valve-chamber F and actuated by the pressure in the pipe Y to open the pipe *a*, and a piston located in the housing of said cylinder, said cylinder being provided with a channel having mouths *h*, leading into the cylinder at opposite sides of the piston, and a stopper or valve *d* for said channel, said stopper or valve being actuated by the pressure in the pipe *a*, substantially as described.



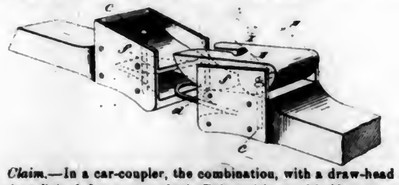
2. The combination, with a receiver, of a cylinder made to communicate with said receiver, said cylinder being provided with a piston I and with a channel having mouths *h*, leading into the cylinder at opposite sides of the piston, a stopper or valve *d* for said channel, an actuating-piston B, a cylinder A for said actuating-piston, stoppers or valves *l* for intercepting the steam-supply to said cylinder, a supply-pipe Y, and pipes or channels *a i* for conveying pressure from the re-

479,260.

ceiver to the valves *d l*, respectively, for actuating the latter, said supply-pipe being provided with a valve and a spring or weight for holding said valve closed until a certain pressure is attained and said pipe Y being made to communicate with the pipes or channels *a i*, leading, respectively, to the valves *d l*, and a valve Z, actuated by the pressure in the pipe Y for opening the pipes or channels *a i*, substantially as described.

479,261. CASH-CARRIER. FAY O. FARWELL, Dubuque, Iowa. Filed Mar. 10, 1891. Serial No. 384,460. (Model.)

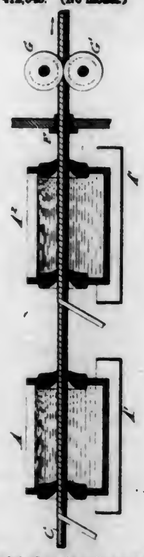
Claim.—1. The combination of the supporting-wheel C, multiplying-gearing connected therewith, a toothed segment D, engaging with said multiplying-gearing, a lever-arm E, pivoted to the frame of the cash-carrier, a cylinder or tube G, pivoted to said lever-arm, and a spring within said cylinder connected with the toothed segment, substantially as set forth.



2. The combination of the supporting-wheels C C, multiplying-gearing connected therewith, a toothed segment D, adapted to engage with said multiplying-gearing, having a hub provided with a smooth segment I, a lever-arm E, pivotally connected to the frame of the carrier, a tube or cylinder pivoted to said lever-arm, and a spring within said tube or cylinder attached to the smooth segment, substantially as set forth.

3. The combination of the supporting-wheels C C, multiplying-gearing connected therewith, a toothed segment D, adapted to engage with said multiplying-gearing, a smooth segment connected with said toothed segment, a lever-arm E, pivoted to the frame of the carrier, a cylinder or tube E, pivoted to said lever-arm, a spring within said cylinder or tube connecting with said smooth segment, and retaining-arms K K, secured to the frame of the carrier, for the purposes set forth.

4. The combination of the supporting-wheels C C, multiplying-gearing connected therewith, a toothed segment adapted to engage with said multiplying-gearing, a smooth segment connected to said toothed segment, a lever-arm pivoted to the frame of the carrier, a cylinder or tube G, pivoted to said lever-arm, a spring within said tube or cylinder connecting with said smooth segment, deflecting-arms K K, pivoted to the frame of the carrier for the purposes set forth and having notches *e e* at their lower ends, and the cross-piece *f* on said lever-arm adapted to engage with one or the other of said notches.



5. The combination of the supporting-wheel C, multiplying-gearing connected therewith, a toothed segment adapted to engage with said multiplying-gearing, a smooth segment connected to said toothed segment, a lever-arm E, pivoted to the frame of the carrier, a cylinder or tube G, pivoted to said lever-arm, a spring within the tube or cylinder connected with the toothed segment, and the arm L, hinged to the main frame of the cash-carrier and carrying a cash-holder, substantially as set forth.

479,262. CAR-COUPLING. JOHN FAUBION, Sr., Leander, Tex. Filed Sept. 5, 1891. Serial No. 404,911. (No model.)

Claim.—In a car-coupler, the combination, with a draw-head A, the pin *c*, link *d*, flanges *f*, and trip B for raising and holding in position the draw-pin *c* until it shall automatically fall into the hole provided in the opposite draw-head, engaging the link, thereby completing the coupling, substantially as and for the purpose described.

479,268. ART OF AND APPARATUS FOR MAKING PARCHMENTIZED-FIBER TUBES. ROBERT P. FRIST, Wilmington, Del., assignor to the Delaware Hard Fibre Company, same place. Filed Nov. 23, 1891. Serial No. 412,843. (No model.)

Claim.—1. The hereinbefore-described improvement in the art of making parchmentized-fiber tubes, which improvement consists in winding a strip of dry or untreated paper spirally into tubular form, with closely adjacent edges, converting the tube into parchmentized fiber by passing it as fast as formed through a transforming-bath, and then consolidating the tube thus formed and treated into a homogeneous fabric by pressure.

2. The hereinbefore-described improvement in the art of making parchmentized-fiber tubes, which improvement consists in winding a strip of dry or untreated paper spirally into tubular form, with closely abutting or overlapping edges, immersing the tube thus formed in a transforming-bath, winding a second strip of dry or untreated paper on the treated tube, and passing both the treated and untreated layers or convolutions through a second transforming-bath.

3. The combination, substantially as hereinbefore set forth, of a tank for containing a transforming-bath, a mandrel, means for revolving it below the surface of the transforming-bath, for traversing it endwise therethrough, for winding a strip of dry or untreated paper thereon, and for carrying its convolutions through the bath to be acted upon thereby as fast as formed, and means for consolidating the transformed fabric into a homogeneous structure.

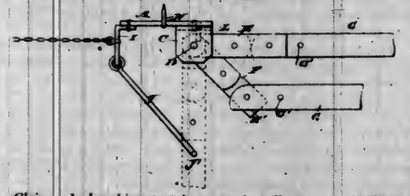
4. The combination, substantially as hereinbefore set forth, of a series of transforming-baths, a mandrel, means for rotating and traversing it endwise through the baths and for winding a strip of dry or untreated paper thereon and for passing it through one of the baths, and means for winding a second strip upon the first after passing through the first bath and for passing both strips through the succeeding bath, for the purposes described.

5. The combination, substantially as hereinbefore set forth, of a transforming tank or bath, a mandrel, means for rotating it, for winding a strip thereon, and for moving both the mandrel and strip endwise through the bath, and gates or valves through which the shaft, with the strip wound thereon, passes to subject it to the action of the bath.

6. The combination, substantially as hereinbefore set forth, of a transforming tank or bath, a rotating mandrel movable endwise therethrough, elastic or yielding gates in the tank, through which the mandrel passes, together with the paper wound thereon, and means, such as eyes or grooved rollers, for consolidating the tube as it emerges from the bath.

7. The combination, substantially as hereinbefore set forth, of a series of transforming tanks or baths, a rotating mandrel movable endwise therethrough, elastic or yielding gates in the tanks through which the mandrel passes, together with the paper wound thereon, and means, such as eyes or grooved rollers, for consolidating the tube as it emerges from the bath, whereby a strip of dry or untreated paper may be wound upon the mandrel, passed through the bath, successive strips or layers of untreated paper wound thereon, and the whole passed through another bath and consolidated after emerging therefrom.

479,264. ART OF AND APPARATUS FOR MAKING PARCHMENTIZED-FIBER TUBES. ROBERT P. FRIST and CHARLES G. RUPERT, Wilmington, Del., assignors to the Delaware Hard Fibre Company, same place. Filed Nov. 23, 1891. Serial No. 412,855. (No model.)

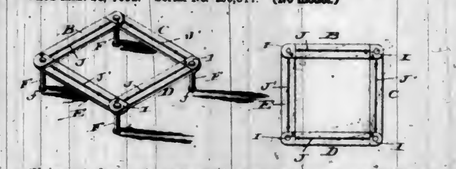


Claim.—1. The hereinbefore-described improvement in the art of making parchmentized-fiber tubes, which improvement consists in winding a strip of dry or untreated paper spirally into tubular form and conveying to the tube an acid or transforming-fluid to convert the paper into parchmentized fiber as fast as wound into tubular form.

2. The hereinbefore-described improvement in the art of making parchmentized-fiber tubes, which improvement consists in successively winding strips of dry or untreated paper spirally into tubular form one upon the other, conveying to each layer of the tube as formed an acid or transforming-fluid to convert it into parchmentized fiber, and then consolidating the transformed layers, as described.

3. The combination, substantially as hereinbefore set forth, of a series of saturating-rolls, means for applying a transforming-fluid thereto, a mandrel rotating and moving endwise past these rolls to wind the paper spirally into a tube and feed it past them, balancing or pressure rolls on the opposite side of the mandrel to that of the saturating-rolls, and means, such as eyes or rollers, through or between which the mandrel passes endwise with the saturated tube thereon.

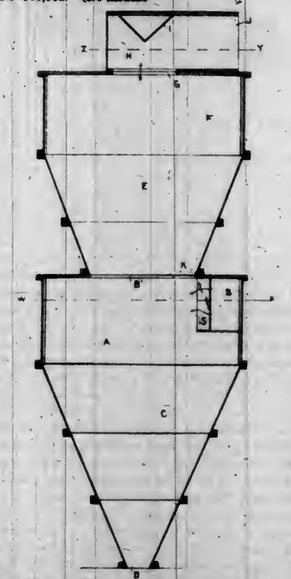
479,265. WIRE-STRETCHER. WILLIAM D. FULBRIGHT, Nichols, Mo., assignor to himself and Harry E. Patton, same place. Filed Oct. 29, 1891. Serial No. 410,187. (No model.)



Claim.—1. In a wire-stretcher, two pivotally-supported independent arms, having each a complementary lever, which serves, in connection with its arm, to grip the wire and movable alternately by said levers for exerting tension on the wire, and a locking device for the levers, the one arm with its lever serving when locked to maintain the wire under tension until gripped by the other arm and lever, substantially as described.

2. In a wire-stretcher, the combination, with a plate adapted to be temporarily attached to a fence-post, of two arms pivoted on the said plate one above the other, gripping-jaws attached to the opposite faces of the said pivoted arms, and levers pivoted on the said arms in line with the respective gripping-jaws, substantially as shown and described.

3. In a wire-stretcher, the combination, with a plate provided with a pin and a chain for holding the plate in position, of two arms pivoted on the said plate one above the other, gripping-jaws attached to opposite faces of the said pivoted arms, levers pivoted on the said arms in line with the respective gripping-jaws, and a locking device, substantially as described, for locking the said lever and pivoted arm in place for stretching the wire, as set forth.

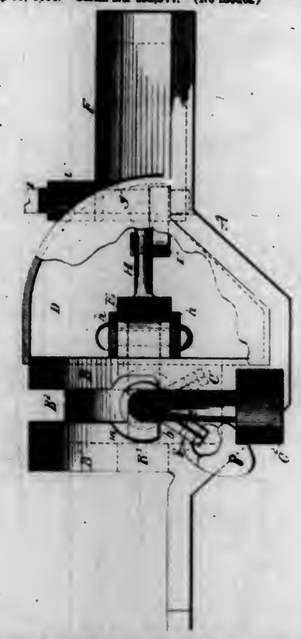


479,266. GAME APPARATUS. WILLIAM FULD, Baltimore, Md. Filed Mar. 28, 1892. Serial No. 426,817. (No model.)

Claim.—1. In a parlor game of the described type, a pointer-frame composed of four sides jointed loosely together at their ends and provided at their jointed ends or corners with legs of suitable height, substantially as and for the purpose set forth.

2. The jointed pointer-frame for parlor-games of the type described, consisting of the four side bars having metallic plates I I, the reinforcing-wires J and J', the legs or fingers F, metallic rods G, inserted through said legs, and the caps H, all constructed and combined to operate substantially as and for the purpose shown and set forth.

479,267. APPARATUS FOR SEPARATING DUST FROM AIR. PIETER VAN GELDER, Sowerby Bridge, England. Filed Nov. 4, 1890. Serial No. 370,302. (No model.)



Claim.—1. In an apparatus for separating dust from air, a cylindrical casing having a central air-exit in its upper end and peripheral embayments, as described, a tangential air-inlet device adapted to cause the incoming dusty air to whirl around said casing, a downward

conical extension of said casing having a dust-discharge orifice at its lower end, a smaller casing communicating directly with said air-exit and having a discharge-pipe tangential to the exit spout of the smaller casing, and a conical deflector depending from the upper wall of the last-named casing directly above the last-named air-exit, substantially as described.

2. The combination of the cylindrical corrugated casing F, having central air-exit G, the conical extension E, the superposed casing H, having tangential air-exit J and communicating with exit G, the deflecting-cone I above exit G, and an air-inlet opening into the lower end of the casing F, substantially as described.

3. The combination of the cylindrical corrugated casing A, having tangential air-inlet B and central air-outlet B', conical extension C, having dust-discharge opening D, second cylindrical corrugated casing F above casing A, conical casing E, connecting casings F and A, additional casing H, having tangential exit J and communicating with the air-exit G of casing F, and deflecting-cone I above exit G, substantially as described.

479,268. SWITCH-STAND. VICTOR J. GOETZ, Hillburn, N. Y., assignor of one-half to W. C. Kidd and J. B. Suffern, same place. Filed Aug. 13, 1891. Serial No. 402,577. (No model.)

Claim.—1. In a switch-stand, the combination, with a hub mounted therein, of a grooved lever carried by said hub, a weighted arm projecting from said grooved lever, and a moving rod having a pin adapted to enter the grooves of said lever, substantially as set forth.

2. In a switch-stand, the combination, with a hub mounted therein, of a grooved operating-lever carried by said hub, a weighted arm projecting from said grooved lever, a projection on said lever, a projection on the stand, and means for locking said projections together to lock the stand, a moving rod, and a pin carried by said moving rod and adapted to enter the grooves in the operating-lever, substantially as set forth.

3. In a switch-stand, the combination, with a hub mounted therein, of a lever carried by said hub and made with grooves therein, a moving rod, a pin projecting from said moving rod and adapted to enter the grooved lever, and rollers carried by said moving rod and adapted to run on one side of the hub, substantially as set forth.

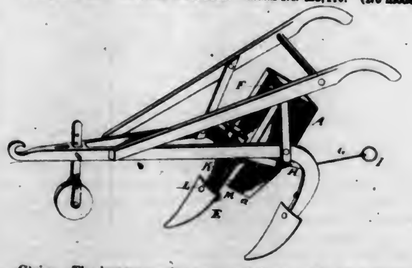
4. In a switch-stand, the combination, with a hub mounted therein, of a grooved lever mounted in said hub, a moving rod, a pin carried by said moving rod and adapted to enter the grooved lever, a spring, and a link or toggle connecting said moving rod with the spring, the connection of said toggle or link with the moving rod being diametrically opposite the pin in said rod, substantially as set forth.

5. In a switch-stand, the combination, with a hub mounted therein, of a lever mounted in said hub and provided with grooves, a moving rod, a pin carried by said moving rod and adapted to enter said grooved lever, rollers carried by said rod at opposite sides of the pin, a spring, and a link connecting said moving rod and spring, the connection of said link with the moving rod being at a point diametrically opposite the pin and rollers, substantially as set forth.

6. In a switch-stand, the combination, with suitable bearings, of a hub mounted therein, said hub being provided with an elongated slot or groove, a grooved lever mounted in said hub, a moving rod, and a pin carried by said moving rod and adapted to enter said grooved lever, substantially as set forth.

7. In a switch-stand, the combination, with a hub mounted therein, of a lever located in said hub, said lever having elongated slots, a moving rod, and a pin projecting from said moving rod and adapted to enter one of said elongated slots when the device is operated automatically, substantially as set forth.

8. In a switch-stand, the combination, with a hub mounted therein, of a lever located in said hub, said lever being provided with annular grooves, a sliding rod, and a pin projecting from said sliding rod and adapted to enter one of said annular grooves when the device is operated by hand, substantially as set forth.



9. In a switch-stand, the combination, with a hub mounted therein, of a lever located in said hub, said lever being provided with annular grooves near the ends of its body portion, and elongated slots or grooves in its body portion, a moving rod, and a pin carried by said moving rod and adapted to enter said grooves, substantially as set forth.

10. In a switch-stand, the combination, with a revoluble operating-lever, of a projection thereon, said projection being adapted to be secured to the stand at an angle, substantially as set forth.

11. In a switch-stand, the combination, with a revoluble operating-lever, of a projection thereon, a projection on the stand, said projections being so arranged that they may be secured together at an angle to the axis of the lever, substantially as set forth.

12. In a switch-stand, the combination, with a hub mounted therein of a weighted operating-lever having an elongated slot or groove, a moving rod, and a pin projecting from said rod and adapted to enter said elongated slot or groove, substantially as set forth.

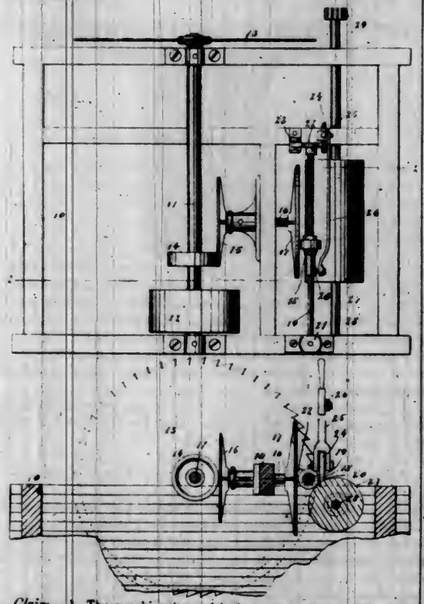
479,269. CORN-PLANTING ATTACHMENT. WILLIAM P. GOINS, Paragould, Ark. Filed Mar. 18, 1892. Serial No. 425,419. (No model.)

Claim.—The hopper, spring-retracted dropper-slide, roller-spring held on the slide, clip-carrying roller, and a cord attached to slide, all combined and arranged as shown and described.

479,270. DRAWING-PEN. OSCAR F. GRANT, Pittsburg, Pa. Filed Apr. 29, 1892. Serial No. 431,145. (No model.)

Claim.—1. A drawing-pen having two blades, one of said blades being hinged to the other and having an ink-reservoir on its lower end, whereby ink may be taken from a receptacle and conveyed to the stationary blade, substantially as described.

2. A drawing-pen provided with an auxiliary blade hinged to one of the blades of the pen, said auxiliary blade having an ink-receptacle on its lower end, whereby ink may be carried from a receptacle to the point of the pen, substantially as described.

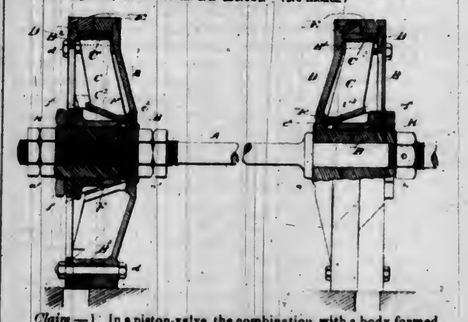


3. A drawing-pen provided with an auxiliary blade having an ink-reservoir on its lower end, one of the blades of the pen being formed with an orifice adjacent to its point, whereby ink from the reservoir is conveyed to the point of the pen, substantially as described.

479,271. STEAM-CONDENSER. CHARLES GROSMAN, Lincolnville, N. Y. Filed Mar. 3, 1892. Serial No. 423,967. (No model.)

Claim.—A condenser comprising the main case 20, provided with a top inlet and a bottom outlet, upper and lower series of tubes 33 33ª, extending through the case and its heads, opposite inner lower chambers 34 32, connected by the lower series of tubes 33, and outer lower inlet chamber 29, separate from chamber 34 and connected with an opposite lower outer chamber 31 by a series of tubes 30, passing through the tubes 33 and chambers 34 32, a passage 32ᵇ, connecting the chambers 31 32, opposite upper inner chambers 34ª 32ª, separate from the lower chambers and connected by the upper series of tubes 33ª, the chamber 34ª, having an outlet 37, an upper outer chamber 36, having a passage 35, connecting it with the lower inner chamber 34, an upper outer opposite chamber 31ª, having a passage 32ª, leading into upper inner chamber 32ª, and the upper inner series of tubes 30ª, extending through the tubes 33ª and connecting chambers 31ª and 36, substantially as set forth.

479,272. VARIABLE FEED FOR SAWMILLS. CALVIN HARBAUGH, Pleasant Home, Ohio. Filed Aug. 25, 1891. Serial No. 403,684. (No model.)



Claim.—1. The combination, with the saw-mandrel and the feed-shaft arranged parallel therewith and provided with a friction-drum, of friction-disks driven by the mandrel, a movable shaft, a friction-pulley mounted on said shaft and engaging one of the friction-disks and the friction-drum, and a lever mechanism for moving the said shaft and the friction-pulley thereon, substantially as described.

2. The combination, with the saw-mandrel having a friction-pulley thereon and the feed-shaft arranged parallel therewith and provided with a friction-drum, of a shaft mounted transversely between the feed-shaft and mandrel, friction-disks secured to the transverse shaft, one disk contacting with the friction-pulley on the mandrel and the other being arranged adjacent to the friction drum, a swinging shaft mounted between one of the friction-disks and the friction-drum, a friction-pulley held to slide on the shaft and adapted to contact with a friction-disk and the friction-drum, and a lever mechanism for moving the friction-pulley, substantially as described.

3. The combination, with the saw-mandrel and the feed-shaft arranged parallel therewith and provided with a friction-drum, of a friction-disk arranged adjacent to the friction-drum and driven by the saw-mandrel, a vertically-swinging shaft mounted between the friction-disk and the friction-drum, a loose pulley held to slide on the shaft and to contact with the friction-disk and the friction-drum, and a lever mechanism for moving the pulley and shaft, substantially as described.

479,273. PISTON-VALVE. MARTIN E. HERSHEY, Harrisburg, Pa. Filed Apr. 11, 1892. Serial No. 428,681. (No model.)

Claim.—1. In a piston-valve, the combination, with a body formed by the disk having the annular peripheral channel on one side and the central hub projecting on the same side as the peripheral channel, of the packing-rings in the channel, the sectional spider underlying the rings, the expander surrounding the hub within the valve and co-operating with the sectional spider, and the set-nuts working on the end of the hub to adjust the expander, substantially as described.

2. In a piston-valve, the combination, with the body having the annular peripheral channel and central hub and the packing-rings in said channel, of the sectional spider having the segmental plates underlying said rings, the central inclined plates, and the radial arms uniting said plates, the conical expander working in the hub and co-operating with the inclined plates, and the set-nuts on the hub for holding the expander in adjusted position, substantially as described.

3. In a piston-valve, the combination, with the body formed by the disk, having the central hub and slotted flange near its periphery, the face-plate or ring secured to the flange, and the packing surrounding the flange between the disk and the face plate or ring, of the segmental plates underlying the packing-rings, the radial arms carrying said plates passing through the slots in the flange, and the conical expander working on the hub for moving the segmental plates outward to tighten the packing, substantially as described.

4. In a piston-valve, the combination, with the disk having the central hub and flange near the periphery, having slots or openings therein, the face-plate or ring secured to said flange, and the packing-rings between said plate and disk, of the sectional spider consisting of the segmental plates underlying the packing-rings, the central inclined plates, and the radial arms passing through the flange and uniting the said plates, the expander working on the hub and having the inclined ribs or projections engaging the inclined plates, and the set-nuts for holding the expander in adjusted position, substantially as described.

5. In a piston valve for steam-engines, the combination, with the piston-rod, of the two independent heads mounted on said rod and adjustable toward and from each other, substantially as described.

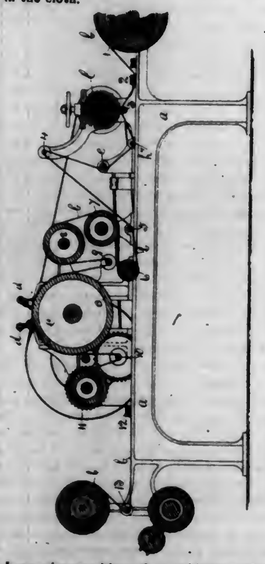
6. In a piston-valve, the combination, with the valve-rod and the head secured permanently thereon, of the opposite head mounted on said rod and having set-nuts on both sides of the same, whereby it may be adjusted longitudinally of the shaft, substantially as described.

7. In a piston-valve, the combination, with the rod, of the oppositely-arranged heads secured thereon and having the outwardly-projecting hubs and peripheral chambers, the packing-rings, the sectional spiders, the expanders, the set-nuts for adjusting said expanders screwing on the outer ends of the hubs, whereby the heads may be adjusted while in the valve-chest and without dismembering the valve, and the nuts on the rod engaging the hub to hold the valve in place irrespective of the adjustment of the expanders, substantially as described.

8. A piston-valve for steam-engines, having the support for the packing-rings formed of metal having a greater range of expansibility than the valve-chest under the influence of variations in temperature, substantially as described.

9. In a piston-valve for steam-engines, the combination, with the packing-rings, of the relatively thin radial arms for supporting the same, formed of metal having a greater range of expansibility than the cylinder under the influence of variations in temperature, substantially as described.

10. In a piston-valve for steam-engines, the combination, with the body portion, of the packing-rings and the spider supporting said rings, formed of metal having a greater range of expansibility than the body portion under the influence of variations in temperature, substantially as described.

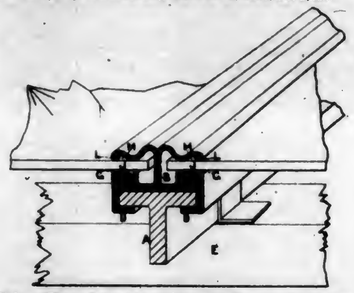


11. In a piston-valve for steam-engines, the combination, with the iron or steel body portion and the packing-rings, of the supporting-spider for said rings, formed of brass, substantially as described.

12. In a piston valve for steam-engines, the combination, with the body portion formed of metal having a small range of expansibility and the packing-rings, of the sectional spider supporting said rings, having its radial arms formed of metal having a greater range of expansibility than said body portion, substantially as described.

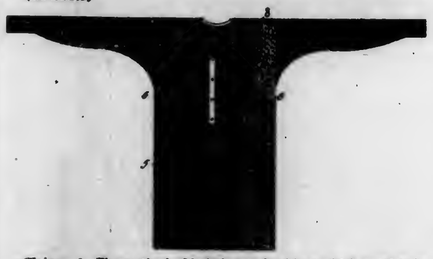
13. In a piston-valve for steam-engines, the combination, with the body portion formed of metal having a small range of expansibility and the packing-rings, of the sectional spider supporting said rings, having relatively thin radial arms formed of metal having a greater range of expansibility than said body portion, and an expander co-operating with the sectional spider to adjust the same for wear, substantially as described.

479,274. PEGGING-MACHINE FOR PILE FABRICS. HARVEY HEYWOOD and JOHN HOLLAND, Middleton, near Manchester, England. Filed Sept. 3, 1891. Serial No. 404,639. (No model.) Patented in England Feb. 2, 1891. No. 1,854.



Brief.—The cloth is "pegged" between a rotating cylinder and stationary peg-bars, means being provided whereby the peg-bars may be raised at intervals to allow them to be cleaned of any fluff or to prevent creases in the cloth.

Claim.—1. In pegging-machines, the combination of apparatus for temporary releasement of the pegs, formed by the revolving cams *f*, with recesses f^3, the bowls *h h'*, periodically received by such recesses, the bowl-levers h^2 h^3, moving with the bowls, the short levers h^3 h^4, attached to the axis of the pegs, and the connecting-links *k k'*, receiving motion from the bowl-levers, and the hand-lever *g'*, attached to the eccentric bush *g* of the cams *f*, which lever when moved over on its center forces such cams *f* against the projecting arms on the bowl-levers h^2 h^3, moving forward the same and their aforementioned connections *k k'* h^2 h^3, all substantially as set forth.



2. In pegging-machines, the combination of stationary pegs or presser-bars *d* and the revolving bed *c*, over which the cloth travels, with apparatus for temporary releasement of the pegs, formed by the revolving cams *f*, with recesses f^3, the bowls *h h'*, periodically received by such recesses, the bowl-levers h^2 h^3, moving with the bowls, the short levers h^3 h^4, attached to the axis of the pegs, and the connecting-links *k k'*, receiving motion from the bowl-levers, and the hand-lever *g'*, attached to the eccentric bush *g* of the cams *f*, which lever when moved over on its center forces such cams *f* against the projecting arms on the bowl-levers h^2 h^3, moving forward the same and their aforementioned connections *k k'* h^2 h^3, all substantially as set forth.

479,275. GLAZING-BAR FOR SKYLIGHTS. WILLIAM H. HEYWOOD, Huddersfield, England. Filed Dec. 22, 1891. Serial No. 415,945. (No model.) Patented in England Feb. 12, 1890, No. 2,263.

Claim.—The combination, with the T-iron A, of a glazing-bar B, resting upon the table of said T-iron, and having wings D D at its lower part to embrace said T-iron and secure said bar thereto, grooves H H, formed in that portion of said bar which rests upon the table of said T-iron, wings K K, provided at their outer ends with beads L L, and packing G G in the grooves H H, substantially as described.

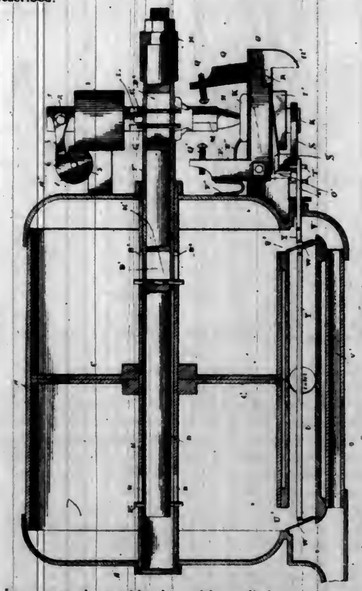
479,276. UNDERSHIRT AND METHOD OF MAKING THE SAME. JAMES HOLROYD, Albany, N. Y. Filed Mar. 23, 1892. Serial No. 426,139. (No model.)

Claim.—1. The method of knitting undershirts, which consists in producing an initial strip of flat ribbed fabric, then producing a tubular web of plain knitting integral with said strip, and finally producing a further strip of flat ribbed fabric, and then folding the resulting fabric and uniting the edges where necessary.

2. In an undershirt, the body portion thereof consisting in part of ribbed fabric of single thickness and in part of tubular plain fabric, substantially as described.

3. In an undershirt, the body portion thereof consisting in part of one-and-one-ribbed fabric of single thickness and in part of tubular plain fabric, substantially as described.

4. In an undershirt, the body portion thereof consisting in part of fabric of single thickness and in part of a tubular web, substantially as described.



5. In an undershirt, the body portion thereof consisting in part of fabric of single thickness and in part of double fabric, the combined thickness of the walls of the double fabric being substantially equal to the thickness of the single fabric, substantially as described.

479,277. FLUID-METER. FREDERIC W. HOLT, St. George, Canada. Filed Jan. 25, 1892. Serial No. 419,214. (No model.)

Claim.—1. In a meter, the combination, with a cylinder, a slotted hollow guide therein, and a piston moving on said guide, of a projecting rod, which reciprocates in the guide, a stop secured to the inner end of the rod, an adjustable sleeve on said rod, a stop secured to the sleeve, both of said stops being engaged by the piston, and a registering and a valve-throwing mechanism, which are operated by the rod, substantially as shown and described.

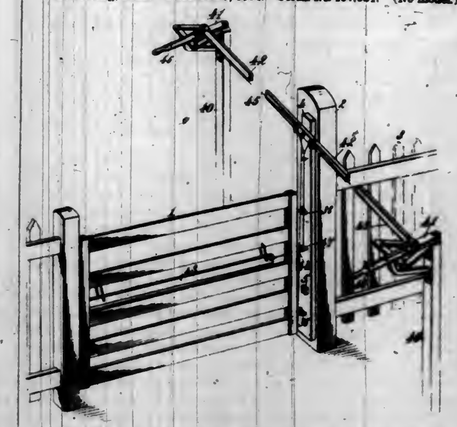
2. In a meter, the combination, with a cylinder, a slotted hollow guide therein, and a piston moving on said guide, of a projecting rod which reciprocates in the guide, a stop secured to the inner end of the rod, a sleeve on said rod, a stop secured to the sleeve, both of said stops being engaged by the piston, an interiorly-screw-threaded cap swiveled to the outer end of the rod and which engages the outer end of the sleeve, whereby the latter is made adjustable in relation to the rod, and a registering and a valve-throwing mechanism, which are operated by the rod, substantially as shown and described.

3. In a meter, the combination, with a cylinder, a reciprocating rod, and a piston, of a shaft journaled to one side of the rod, an arm secured to said shaft, which is loosely connected to the rod, a registering mechanism, which is actuated by the shaft, and a valve-throwing mechanism which is also operated by the shaft, substantially as shown and described.

4. In a meter, the combination, with a cylinder, a reciprocating rod, a piston, and a partially-revolving shaft which is operated by the rod, of a laterally-projecting pin in the upper end of the shaft, arms loosely connected to the opposite ends of the said pin, a worm-shaft, heads secured thereon which are engaged alternately by the said arms, a registering mechanism which is operated by the worm-shaft, and a valve-throwing mechanism, substantially as shown and described.

5. In a meter, the combination, with a cylinder, a reciprocating rod, and a piston, of a shaft which is partially rotated by the rod, a second shaft adjacent to the first-named shaft, a spring which is clamped at its opposite ends to the adjacent ends of the shafts, a valve-throwing mechanism which is operated by the said shafts, and a registering mechanism, substantially as shown and described.

6. In a meter, the combination, with a cylinder, a reciprocating rod, and a piston, of a shaft J, which is partially rotated by said rod, arm M on said shaft, a shaft K, a spring which connects the adjacent ends of the shafts, arm S, secured to shaft K, a valve-throwing rod which is reciprocated by the arm S, a locking mechanism for said rod, which is operated by the arm M, and a registering mechanism, substantially as shown and described.

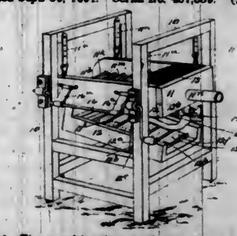


7. In a meter, the combination, with a cylinder, a reciprocating rod, and a piston, of a shaft J, which is partially rotated by the said rod, arm M, shaft K, a spring connecting the adjacent ends of the shafts J K, arm S, a valve throwing rod reciprocated by the arm S, pivoted latches which lock the said rod at the ends of its stroke and which are engaged by the arm S, and a registering mechanism, substantially as shown and described.

8. In a meter, the combination, with a cylinder, a reciprocating rod, and a piston, of a shaft J, which is partially rotated by said rod, arm M, shaft K, a spring which connects the said shafts, arm S, a valve-throwing rod which is operated by said arm, pivoted latches having notched ends which engage the arm S at the end of its throw, inwardly-projecting set screws on the opposite ends of the latches and which are engaged by the arm M, and a registering mechanism, substantially as shown and described.

9. In a meter, the combination, with a cylinder, a reciprocating rod, and a piston, of a shaft J, which is partially rotated by said rod, arm M, shaft K, a spring connecting said shafts, arm S, a valve-throwing rod operated by said arm, support O, having projections O', L-shaped latches pivoted to said support and having notched lower ends which engage and hold the arm S at the ends of its throw, set-screws in the upper ends of the latches, which are engaged by the arm M, and a registering mechanism, substantially as shown and described.

10. In a meter, the combination, with a cylinder provided with ports at its opposite ends and an inlet and outlet chamber arranged beneath the cylinder, which are in communication with said ports, of valves pivoted to the bottom of said inlet-chamber directly beneath the ports and which are adapted to close either the inlet or outlet chamber, a link extending through the inlet-chamber and pivotally connected at its ends to the valves, an outwardly-extending valve-operating rod, a piston, a reciprocating rod, and a registering mechanism actuated by said rod, substantially as shown and described.



479,278. GATE-ACTUATING MECHANISM. JAMES F. HOUSTON, Lewisburg, Tenn. Filed Oct. 6, 1891. Serial No. 407,921. (No model.)

Claim.—1. The combination, with a gate-post, of a gate-carrying beam pivoted between its extremities to the post and adapted to swing thereon in a vertical plane, a gate having its end bar hinged to the gate-carrying beam, a pair of posts or standards arranged at opposite sides of the gate-post, a pair of swinging hand-levers pivoted, respectively, at one end to the upper portions of the posts or standards, and a rigid rod connection between the pair of levers and the upper end of the gate-carrying beam, substantially as described.

2. The combination, with a gate-post, of a gate-carrying beam pivoted between its extremities to the gate-post and adapted to swing thereon in a vertical plane, a gate having its end bar hinged to the gate-carrying beam, a pair of posts or standards arranged at opposite sides of the gate-post, a pair of horizontally-swinging levers pivoted, respectively, to the upper ends of the posts or standards, a rigid rod connection pivoted to the levers and to the gate-carrying beam, and cords running from the hand-levers to the gate-latch for operating the latter, substantially as and for the purposes described.

479,279. ORE-CONCENTRATOR. GOTTLIEB D. HUSEMANN, St. Louis, Mo. Filed Sept. 30, 1891. Serial No. 407,359. (No model.)

Claim.—1. The combination, with the frame, of the upper box adjustably and pivotally suspended therefrom, the lower box hinged to the upper box and adjustably suspended therefrom, the horizontal crank-shaft journaled to the side of the frame, and the pitmen connecting said shaft and the upper box, whereby as said shaft is revolved the boxes will be reciprocated horizontally, substantially as and for the purposes described.

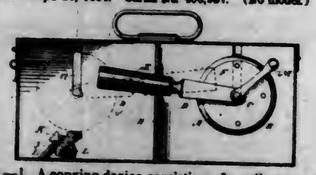
2. The combination, with the upper box suspended in an inclined position, of the lower box hinged to the lower end of the upper box and inclined in an opposite direction, the tube or conduit arranged centrally and longitudinally upon the bottom of the upper box, having inlet-apertures in its upper side and a discharge-pipe attached to its lower end, discharging into the lower box, and a similar tube or conduit arranged upon the bottom of the lower box in a similar manner and provided with a discharge-pipe at its lower end, substantially as shown and described.

3. The combination, with a box having a solid bottom, of a perforated riffle-plate arranged above the bottom, thereby providing a water-space beneath the said riffle-plate, a conduit having openings in its upper side communicating with the upper surface of the riffle-plate, and a water-supply pipe connected with the box, substantially as shown and described.

4. The combination, with an inclined box carrying a riffle-plate, of the hopper-shaped sieve arranged at the upper end thereof and an apron arranged between the sieve and riffle-plate, substantially as and for the purpose described.

5. The combination, with an inclined box having a solid bottom, of a riffle-plate arranged above the bottom, said plate sloping toward the longitudinal center of the box, a conduit arranged beneath the lowest portion of the plate, said plate and conduit being provided with perforations at the points of contact, a water-supply pipe entering the box between the bottom and plate, the bottoms of the riffles being perforated, and the hoods or covers adapted to protect the conduit-openings, substantially as shown and described.

6. The combination, with the frame of the upper and lower inclined boxes having solid bottoms, of the tubes or conduits arranged upon the said bottoms and perforated at their upper sides, the sloping riffle-plates perforated as described, the water-supply pipe entering each box between the bottom and plate thereof and its respective riffle-plate, the hoods or covers arranged to protect the conduit-openings, the sieve, the bail-suspending straps, and means for reciprocating the boxes, all arranged substantially as shown and described.

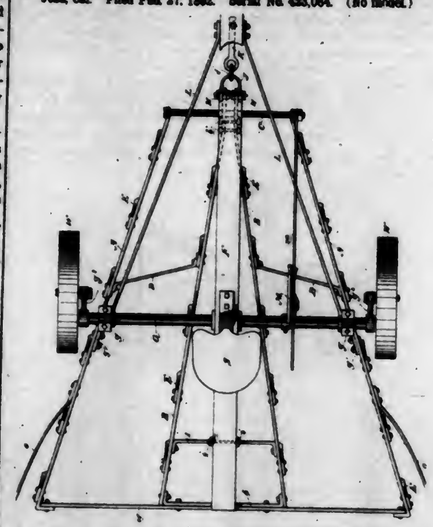


7. The combination, with a frame, of the upper box having a centrally-sloping perforated riffle-plate arranged above the bottom of said box, a water-supply pipe entering the box between the bottom and plate, the lower box hinged to the upper box and having a similarly-arranged riffle-plate, the water supply pipe attached to said lower box, the discharge-pipe leading from the upper box to the lower one, and the lower discharge-pipe, arranged substantially as shown and described.

8. In an ore-washer, the combination, with a riffle-plate having transverse partitions and apertures produced in said plate between the partitions, of the hood arranged between said partitions and adapted to cover the said apertures, substantially as shown and described.

9. In an ore-washer, the combination, with a riffle-plate having partitions and apertures between said partitions, of the hoods adapted to cover the said apertures and the yokes or connecting-plates adapted to connect the hoods and straddle the partitions, substantially as shown and described.

10. The combination with an inclined box, of a centrally-sloping riffle-plate arranged above the bottom of the same, said riffle-plate having a transverse row of perforations extending across the face of the same and a series of perforations produced along the center of said plate, and a tube or conduit arranged beneath the center of said plate and communicating with the central perforations, substantially as shown and described.



479,280. COPYING DEVICE. JOSEPH C. INGRAM, San Francisco, Cal. Filed Sept. 26, 1891. Serial No. 406,927. (No model.)

Claim.—1. A copying device consisting of a roller mounted upon a shaft and journaled in a frame, a box having vertical slots made in its sides, into which the projecting ends of the roller-shaft lie, a cleansing-sponge fixed in the bottom of the box, and a crank fixed to the roller-shaft, whereby it may be rotated in contact with the sponge, substantially as herein described.

2. A copying device consisting of a roller having its shaft journaled in a frame and a crank upon the outer end of the shaft, a box having vertical slots formed in its sides to receive the roller-shaft with the crank exterior to the sides of the box, a cleansing-sponge, clamps between which said sponge is secured, and inclined slotted guides in the bottom of the box, into which said clamps are fitted, substantially as herein described.

479,281. CULTIVATOR. CHARLES JOHNSON and OTTO OLSON, San José, Cal. Filed Feb. 27, 1892. Serial No. 423,064. (No model.)

Claim.—1. In a cultivator, the convertible frame thereof consisting of the outer bars A, the inner bars B, the main back bar *a*, connecting the rear ends of said bars A and B, the back bar *b*, connecting the rear ends of the bars B, and the removable tie-bolt C, connecting the front ends of the bars A and B, substantially as herein described.

2. A cultivator consisting of the convertible tooth-carrying frame composed of the outer bars A, the inner bars B, the main back bar *a*, connecting the rear ends of said bars A and B, the back bar *b*, connecting the rear ends of the bars B, and the removable tie-bolt C, connecting the front ends of the bars A and B, and the pole or tongue F, secured to and carried by the inner bars B of the frame, substantially as herein described.

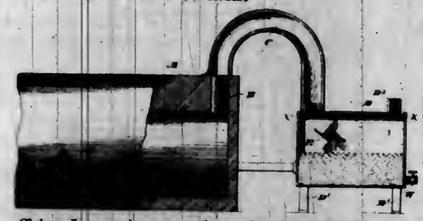
3. A cultivator consisting of the convertible tooth-carrying frame composed of the outer bars A, the inner bars B, the main back bar *a*, connecting the rear ends of said bars A and B, the back bar *b*, connecting the rear ends of the bars B, and the removable tie-bolt C, connecting the front ends of the bars A and B, the pole or tongue F, secured to and carried by the inner bars B of the frame, and the wheeled axle G, carried by the outer bars A of said frame, substantially as herein described.

4. A cultivator consisting of the convertible tooth-carrying frame composed of the outer bars A, inner bars B, back bar *a*, connecting the rear ends of bars A and B, back bar *b*, connecting the rear ends of the bars B, and the removable tie-bolt C, connecting the forward ends of said bars A and B, the wheeled axle carried by the outer bars A of the frame, the tongue or pole F, carried by the inner bars B of said frame, and the draft connection between said inner bars and pole consisting of the pivoted bail and the link-rod K, substantially as herein described.

5. A cultivator consisting of the convertible tooth-carrying frame composed of the outer bars A, the inner bars B, the main back bar *a*, connecting the rear ends of said bars A and B, the back bar *b*, connecting the rear ends of the bars B, and the removable tie-bolt C, connecting the front ends of the bars A and B, the pole or tongue F, secured to and carried by the inner bars B of the frame, the wheeled crank-axle G, carried by the outer bars A of said frame, the lever for operating the crank-axle, and the rack-bar carried by the tie-bolt C for engaging the lever, substantially as herein described.

6. In a cultivator, the combination of the forwardly-converging frame-bars B, the tongue or pole carried thereby and adapted to be vertically adjusted, and the draft connection between said bars and pole consisting of the bail pivoted in the forward ends of the bars, and the link-rod connecting said bail and pole, substantially as herein described.

7. In a cultivator, the forwardly-converging frame-bars B, having the parallel forward ends bolted together and the vertical perforated standards rising from said forward ends, in combination with the tongue or pole fitted between said standards and vertically adjustable therein, and the draft connection between said forward ends, and the pole consisting of the pivoted bail and link-rod, substantially as herein described



8. A cultivator having an inner frame consisting of the converging bars B, secured together at their ends, an outer frame consisting of the converging bars A, removably secured at their ends to the ends of the bars B, the wheeled crank-axle, the adjusting lever and rack, and guard-springs carried by said outer frame, and the tongue or pole carried by the inner frame, substantially as herein described.

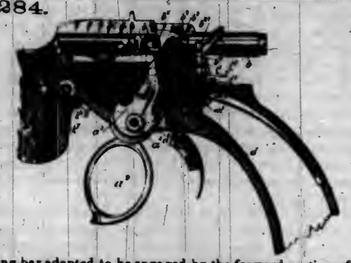
479,282. ELECTRIC ALARM. ROBERT L. KEITH, Brazil, Ind. Filed May 26, 1892. Serial No. 434,484. (No model.)

Claim.—In an electric alarm for the detection of poisons, the combination, in a circuit, of a battery, an alarm, and a wire connecting the battery and alarm with a shelf, a metal rod constituting part of the circuit and carrying one or more spring-levers, each lever provided with a projection extending through said shelf, and one or more bottles, each adapted to rest upon one of said projections, whereby on the removal of a bottle from one of the said projections the circuit is closed by the action of said lever and the alarm sounded, substantially as and for the purpose described.

479,283. SPARK-ARRESTER. JOHN F. LANDRETH, Eliaville, Ga., assignor of one-half to Stephen A. Sellars, same place. Filed Mar. 14, 1892. Serial No. 424,890. (No model.)

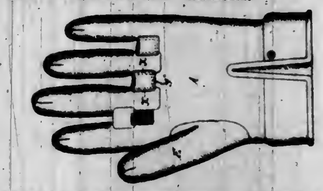
Claim.—In a spark-arrester, the combination, with a furnace, of a semicircular curved pipe or stack hinged thereto and adapted to be raised and lowered in a vertical plane only, an arrester removably attached to the opposite end of said pipe or stack and consisting of a tank or box to contain water and having a bladed wheel therein revolving above the water by means of the current of the products of combustion, substantially as described.

479,284. REPEATING FIREARM. JOSEF LAUBAEK, Vienna, Austria-Hungary, assignor to the Ludw. Loewe & Company Commandit-Gesellschaft auf Actien, Berlin, Germany. Filed May 12, 1890. Serial No. 351,558. (No model.)



Claim.—1. A cartridge-magazine having a pair of vertical or nearly vertical slots in the opposite sides thereof, the slots in one side of the magazine being respectively opposite to those in the other side of the same, and convex corrugations extending from one slot to its fellow slot in the same side, the convex corrugations in one side being respectively opposite to the convex corrugations in the other side, and a convex corrugation with the corresponding one opposite to it forming a seat for one cartridge, as set forth.

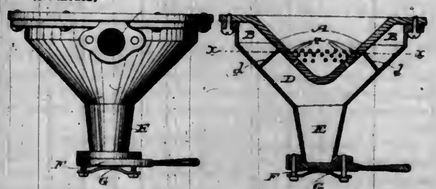
2. The combination, with the cartridge-magazine, of a stop on the back thereof, having one of its bottom corners cut away, thereby producing an incline, a bolt working in a transverse socket in the side and back of the magazine-chamber, the head of which bolt projects through the said side and presents itself at the side of the arm, a notch cut in the front face of the said bolt, having one of its sides inclined and adapted in respect of its position to be engaged by the above-mentioned incline on the stop on the back of the magazine, an internal spiral spring adapted to keep the head of the said bolt projected through the said side of the magazine-chamber, and a plane-horizontal face in the under side of the said bolt communicating with the inclined side of the said notch in the face of the said bolt and adapted to be locked above the said stop on the back of the magazine-chamber by the resilient action of the said spring, as set forth.



3. The combination of a breech-bolt, a locking-bar pivoted on the side thereof, a notch in the breech-bolt cylinder adapted in respect of contour and position to receive the operative nose of the said locking-bar when the breech-bolt is in the firing position, a front stud on the said locking-bar adapted to be engaged by the forward motion of the trigger top and to pull the operative nose of the locking-bar into the said notch, and a back stud on the said locking-bar adapted to be engaged by the cocking motion of the trigger top and to raise the said nose out of the said notch, as set forth.

4. The combination of a lever in the vertical plane and having its fulcrum in the end plate of the arm, a horizontal locking-bolt within the chamber of the breech mechanism, the rear end of which bolt projects through an arc-shaped slot in the said end plate and also through a second slot in the said lever, a lateral extension on the internal end of the said bolt adapted to be moved out of the path of the trigger by the engagement of the arc-shaped slot in the lever with the rear end of the locking-bolt when the said lever is moved about its fulcrum in one direction and to stand just in front of the trigger, the latter being in the cocked position and just behind it if in the firing position when the said lever is moved about its fulcrum in the opposite direction, as set forth.

479,284.



479,285. GLOVE. PRESTON B. LEE, Philadelphia, Pa. Filed July 14, 1891. Serial No. 399,507. (No model.)

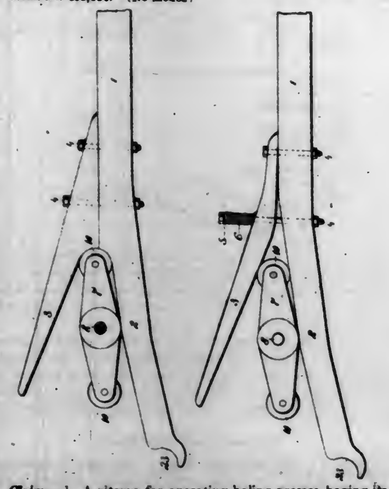
Claim.—1. A glove having its adjacent finger-stalls separated at the base and the openings thus formed closed by bridge-pieces completely spanning the opening from front to rear and stitched at their side edges to the lower edges of the adjacent sides of the finger-stalls, substantially as described.

2. A glove having the adjacent finger-stalls separated at the base and the openings so formed closed by bridge-pieces D, each formed by an extension of the palm extending from front to back between two of the finger-stalls and each stitched at its side edges to the lower edges of the adjacent sides of the finger-stalls, substantially as set forth.

479,286. BLACKSMITH'S FORGE. THEODORE W. LESSEN and LOUIS HECKENROTH, San José, Cal. Filed Nov. 4, 1891. Serial No. 410,849. (No model.)

Claim.—1. In a blacksmith's forge, a fire-receptacle of inverted-cone shape having a closed bottom and a series of holes in its inclined sides, in combination with a surrounding air-chamber having a partition dividing said chamber into upper and lower passages which communicate with each other through an opening formed in said partition, said lower passage communicating with the fire receptacle, substantially as herein described.

2. In a blacksmith's forge, a fire-receptacle, an air chamber or passage communicating with the bellows and encircling the upper portion of the fire-receptacle, and a partition *d* in said passage, forming a second passage or chamber separated from the first and surrounding



the lower portion of the fire-receptacle, said second chamber communicating with the first and also communicating with the fire-receptacle, substantially as and for the purpose herein described.

3. A blacksmith's forge having a fire-receptacle of an inverted conical shape, an annular air passage or chamber surrounding its upper portion and communicating with the bellows and having a partition in said passage, forming a second air passage or chamber surrounding its lower portion and separated from the first passage or chamber, a communication between the two passages or chambers, and a series of upwardly-inclined communicating apertures between the second passage or chamber and the fire-receptacle, substantially as herein described.

4. A blacksmith's forge having the inverted conical fire-receptacle A, the encircling communicating air passages or chambers B D, having a partition separating one from the other, said chamber D communicating through the holes *a* with the fire-receptacle, the discharge-neck E and the laterally-swinging pivoted lock or gate F, and the spring G below the same, controlling said neck, substantially as herein described.

5. A blacksmith's forge consisting of the inverted-conical-shaped casting forming the fire-receptacle A, provided with the series of inwardly and upwardly inclined holes *a*, the surrounding shell with apertured partition forming the air passages or chambers B and D and neck E, the controlling-gate at the bottom of the neck, having a booked end, the bolts upon one of which the hook end of the gate engages to lock said gate, and a spring below the gate and held in place by the bolts, substantially as herein described.

479,287. BALING-PRESS. WINFIELD S. LIVINGOOD, Kansas City, Mo., assignor to Ephraim C. Scoy, same place. Filed Sept. 14, 1891. Serial No. 405,639. (No model.)

Claim.—1. A pitman for operating baling-presses, having its forward end forked, and means, in connection with the arms of said forked end, for operating said pitman, substantially as described, and for the purpose set forth.

2. In a baling-press, the combination of the pitman forked at one end, the trip-lever working in said forked end and adapted to engage the sides of the arms of said forked end, and means for moving said trip-lever upon its fulcrum, substantially as and for the purpose set forth.

3. In a baling-press, the combination of a pitman having its forward end forked, a trip-lever for engaging the arms of said forked end, one of said arms having its face constructed on an angle of greater degree than the angle of the other arm, substantially as described, and for the purpose set forth.

4. In a baling-press, the combination of a pitman having its forward end forked, one arm of said fork having its face constructed on an angle of greater degree than the other arm and having said arms formed of unequal lengths, substantially as described, and for the purpose set forth.

5. The combination, with a baling-press, of a pitman provided with suitable bearings and having a forked head whose arms are of unequal lengths and have their faces constructed at angles of different degrees and the longer one of which arms has a curved end, and the trip-lever adapted to work in said forked end and engage the respective faces of the arms and to engage said curved end of the longer arm, substantially as and for the purpose set forth.

6. In a baling-press, the combination of a pitman having its forward end forked and a trip-lever for engaging the same, one arm being removably connected with the pitman and the other arm.

7. In a baling-press, a pitman having its forward end forked, one arm of said fork being an integral part of the pitman and the other being secured thereto by bolts having a spring for permitting lateral movement of the latter arm.

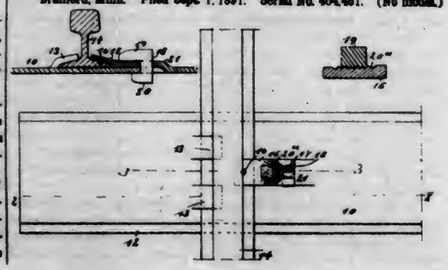
8. In a baling-press, the combination of a pitman having forked arms 2 3 pivoted thereto, a trip-lever for engaging said forked arms, one of said arms having its face formed on an angle of greater degree than the other arm, substantially as described, and for the purpose set forth.

9. In a baling-press, the combination of a pitman having forked arms 2 3 pivoted thereto, a trip-lever for operating the same, and spring connection between the different arms of the fork for giving elasticity to the same, substantially as described, and for the purpose set forth.

10. In a baling-press, the combination of a pitman, forked arms pivoted thereto, a shoulder 21 for limiting the backward movement of the arm 2, a pin 22 for limiting the forward movement of said arm, substantially as described, and for the purpose set forth.

11. In a baling-press, the combination of a pitman, forked arms 2 3, pivoted thereto, an extension 13 on the arm 3, a bolt 15 for connecting the same with the arm 2, and a spring on said bolt, substantially as described, and for the purpose set forth.

12. In a baling-press, the combination of a pitman, forked arms pivoted thereto, an extension 13 on the arm 3, a lug 19 on the arm 2, a bolt 15 for connecting said extension with said lug, a spring 17 on said bolt, a collar 18 on said bolt, and set-nuts 20 for adjusting said bolt, substantially as described, and for the purpose set forth.

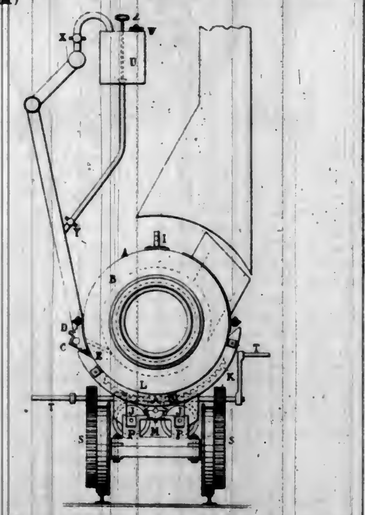


479,288. BOILER. JAMES R. LUTGEN, Winlock, assignor of one half to Charles A. Sturm, Castle Rock, Wash. Filed Feb. 9, 1892. Serial No. 420,897. (No model.)

Claim.—1. In a boiler, a sectional water-pipe comprising a circular base-pipe, vertical pipes extending from the said base-pipe, a second circular pipe arranged above the base-pipe and connected with the said vertical pipes, and a concentric circular pipe arranged within the said second circular pipe, and a series of hollow radial arms which connect with two circular pipes, substantially as shown and described.

2. In a boiler, a sectional water-pipe comprising a circular base-pipe, concentric pipes arranged above the said base-pipe and connected with each other, upright pipes set in the said concentric pipes, top concentric pipes connected with the said upright pipes, and short vertical pipes connecting the said base-pipe with the first set of concentric pipes, substantially as shown and described.

479,289. RAILROAD-RAIL FASTENING. HENRY A. LYDDON, Brainerd, Minn. Filed Sept. 1, 1891. Serial No. 404,461. (No model.)



Claim.—1. In a device of the class specified, a lever pivoted at its center and movable in a vertical plane on said pivotal point carrying a bucket on each of its ends, each bucket having an aperture in its bottom and a ball seated over said aperture when the bottom of said bucket is substantially horizontal and adapted to roll from or over said aperture upon the departure of said bucket from said horizontal position, and means for guiding said ball in its movements, in combination with a water-supply adapted to fill said buckets on their elevation, for the purpose specified.

2. In a device of the class specified, a lever pivoted near its middle and movable in a vertical plane on its pivot and carrying a bucket on each end, each bucket having an aperture in its bottom, a ball normally seated over said aperture and adapted to roll from or over said aperture on the tilting of the lever, and guides for said ball in its movements, consisting of wires inclosing the same, in combination with a water-supply adapted to fill said buckets on their elevation, substantially as and for the purpose specified.

Claim.—A rail-fastening comprising lugs formed on the top surface of a railroad-tie and shaped to fit the flange of a rail, a lug produced on the tie, so as to be opposite the other flange of the rail, a clamping-plate adapted to fit between the lug and the rail, said plate having a recessed outer end, a spur at its inner end to fit a socket in the flange and a corrugated upper surface, and a locking-key adapted to enter the recess of the clamping-plate and a hole in the tie, said key having end arms, the upper of which is corrugated to fit the corrugated surface of the clamping-plate, substantially as shown and described.

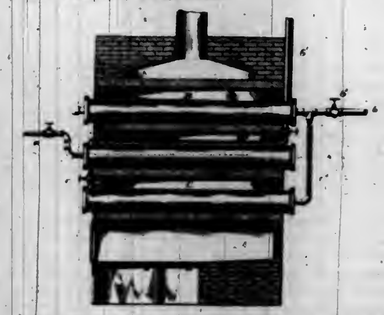
479,290. PROCESS OF TREATING NICKEL-MATTE. PIERRE MANHES, Lyons, France. Filed Dec. 19, 1888. Serial No. 294,112. (No specimens.)

Claim.—The process of reducing ores of nickel or cobalt, which consists in melting the ore to concentrate the metallic elements, removing the melted ore to a highly-heated converter that has been previously rotated or inclined from a vertical position to a nearly horizontal position, then blowing air through the molten metal while in the converter, and gradually turning back the converter to a vertical position, so that the air will pass upward from the bottom of the converter and traverse the entire metallic mass, then gradually inclining the converter to admit air at successively higher levels as the principal combustible elements disappear, whereby the nickel or cobalt will collect below the line where the air is admitted, and thus escape oxidation, then casting the metal product, and subsequently remelting the metal to refine it, substantially as described.

479,291. HYDRAULIC MOTOR. SPENCER S. MARSH, Atlanta, Ga. Filed Nov. 24, 1891. Serial No. 413,019. (No model.)

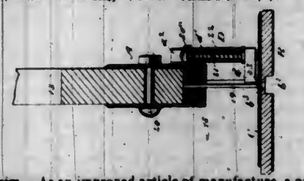
Claim.—1. In a device of the class specified, a lever pivoted at its center and movable in a vertical plane on said pivotal point carrying a bucket on each of its ends, each bucket having an aperture in its bottom and a ball seated over said aperture when the bottom of said bucket is substantially horizontal and adapted to roll from or over said aperture upon the departure of said bucket from said horizontal position, and means for guiding said ball in its movements, in combination with a water-supply adapted to fill said buckets on their elevation, for the purpose specified.

2. In a device of the class specified, a lever pivoted near its middle and movable in a vertical plane on its pivot and carrying a bucket on each end, each bucket having an aperture in its bottom, a ball normally seated over said aperture and adapted to roll from or over said aperture on the tilting of the lever, and guides for said ball in its movements, consisting of wires inclosing the same, in combination with a water-supply adapted to fill said buckets on their elevation, substantially as and for the purpose specified.



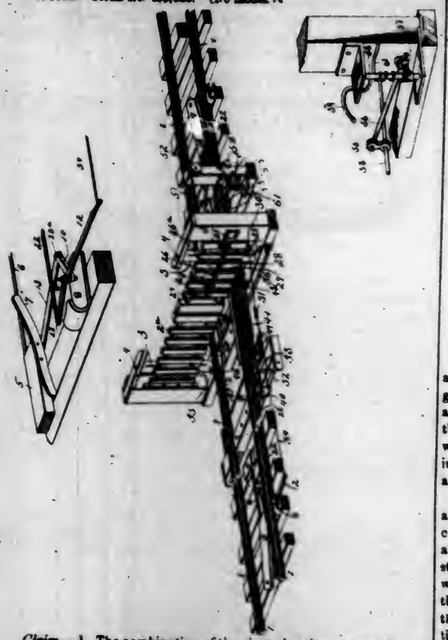
479,292. WATCH-CASE SPRING. JULES MENDOAT and ARMAND MENDOAT, Brooklyn, N. Y. Filed Mar. 5, 1892. Serial No. 423,895. (No model.)

Claim.—1. A spring for watch-cases, consisting of the arc-shaped metal strip having the blade and head, the movable or slidable holder resting upon said strip, having a groove running from end to end and provided with holes to receive a retaining-screw, and the securing-strip resting in said groove and having its ends secured to said spring, substantially as described.



2. The combination, with a watch-case, of the movable or slidable holder having a groove running from end to end and a series of screw-holes, the retaining-screws by which the holder is fastened to the case, the spring upon which the holder rests, and the securing-strip resting in said groove in the holder and having its ends secured to the spring, substantially as described.

479,293. PROCESS OF MANUFACTURING GAS. FRANK D. MOSES, Chicago, Ill., assignor, by direct and mesne assignments, to the Universal Gas Construction Company, same place. Filed Feb. 13, 1892. Serial No. 421,406. (No specimens.)



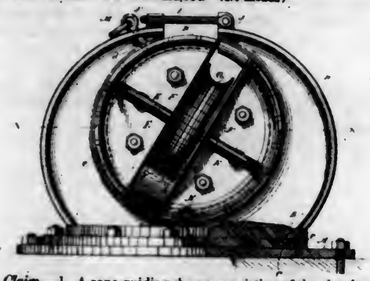
Claim.—The process of manufacturing a gaseous product, which consists in first vaporizing any suitable hydrocarbonaceous matter at a proper heat, then fixing the resulting vaporous product at a higher heat, and then mixing atmospheric air in suitable quantity with the resulting gas, while both the air and the gas are subjected to a strong heat of a temperature below that of ignition of the mixture or of injurious decomposition of the gas, substantially as and for the purpose described.

479,294. PERFORATING-MACHINE. CHARLES O. MORGAN, Morton, Minn. Filed Aug. 7, 1891. Serial No. 402,018. (No model.)

Claim.—As an improved article of manufacture, a punch-bar consisting of a hard-metal casing comprising a horizontal member and vertical members extending upward from the sides of the horizontal member, punches projected upward through the horizontal member within the casing, a soft-metal bed resting upon the horizontal member of the casing and surrounding the punches, and a locking device whereby the bar is attached above the soft-metal bed to the sliding frame of the perforating-machine, substantially as shown and described.

479,295. AUTOMATIC RAILWAY-GATE. EDWARD A. MORROW and JOHN WILSON, Chester, Ark. Filed July 11, 1891. Renewed June 6, 1892. Serial No. 436,620. (No model.)

Claim.—1. The combination of the pivoted spring-actuated levers 5 14, arranged at suitable distances on both sides of the crossing and provided at their free ends with the metal shoes 7 16, and adapted to be engaged by the flanges of the car-wheels, the vertical shafts 9 18, having the projecting arms pivotally connected to the free ends of said levers, the connecting-rod 22, arranged as specified, the swinging gates 2 2^a, connected by the coupling-rod so that they will move simultaneously, and a connection between one of the arms of the shaft 9 and the pivoted gate 2, substantially as set forth.

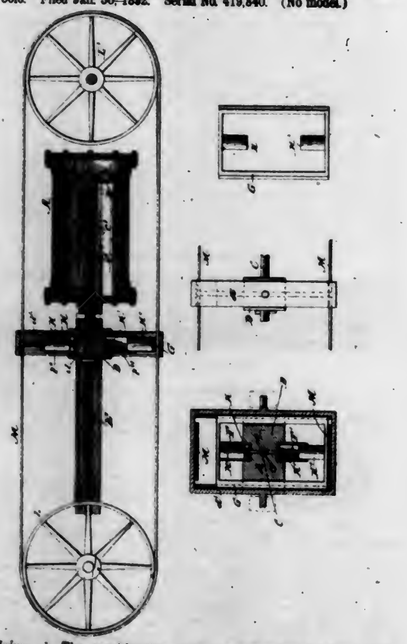


2. The combination of the pivoted spring-actuated levers 5 14, arranged between the rails on both sides of the crossing and having at their free ends the metal shoes 7 and 16, adapted to be engaged by the flanges of the car-wheels, the swinging gates 2 2^a, the vertical shafts 9 18, arranged as specified and having the projecting arms, the bars pivotally connecting the free ends of the levers with the arms of said vertical shafts, the connecting-rod 22, the sliding spring-actuated locking-bolt 24, the shaft 27, pivotally mounted on the gate 2 and having the upper arm 28, which engages with the pin 29 on the locking-bolt, the lower shaft-arm 30, the coiled spring 31, connected to the said arm, and a connection between said spring and an arm of the vertical shaft 9, substantially as set forth.

3. The combination, with the swinging gates 2 2^a, connected by the coupling-rods so that they will act simultaneously, of the spring-actuated locking-bar 37, adapted to automatically lock the gates in their opened position, the unlocking device adapted to be operated by the wheels of the train, and the curved guard-arms 59 60, adapted to be actuated by the wheels of a passing train to hold the gates open until the last car has passed entirely through the gateway, substantially as set forth.

4. The combination, with the swinging gates 2 2^a and the automatic device for locking and releasing the same, of the spring-actuated shaft 58, having the short arm 57, the curved guard-arm 59, secured to the upper part of the said vertical shaft, the longitudinal shaft 53, having the arm 54, extending beneath the rail and curving upward at its free end, the connecting-rod 56, arranged as specified, the spring-arms 45, and the flat longitudinal bar 46, secured on the free ends of the spring-arms, so that it will be actuated by the wheel-flanges of a passing train, substantially as set forth.

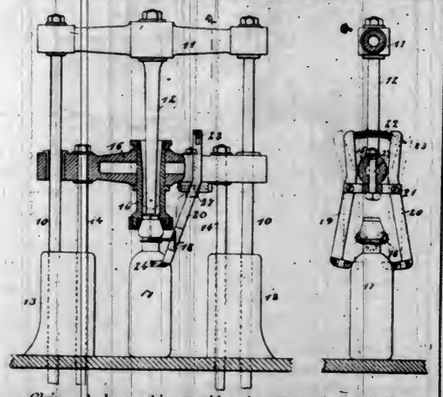
5. The combination, with the swinging gates 2 2^a, connected by the coupling-rods, so that they will act simultaneously, of the spring-actuated locking-bar 37, the pivoted shaft 42, the lever 41, secured to said shaft, and the arm 43, extending from said shaft and connected at its free end with the locking-bar 37, the spring-actuated shaft 47, extending beneath the rails and having the upwardly-extending arms 48 and 49 at its ends, and the spring-supported bar 46, adapted to be operated by the wheels of a passing train, substantially as set forth.



479,296. ROPE-GUIDING SHEAVE. SAMUEL MURRAY, San Francisco, Cal., assignor of one-half to William F. Murray, same place. Filed Mar. 21, 1892. Serial No. 425,514. (No model.)

Claim.—1. A rope-guiding sheave consisting of the circular block, a pulley journaled within the block, a standard having a circular groove made in it within which the block may be rotated, said standard having an opening through which the rope may be introduced to the sheave or removed therefrom, a pin by which the block is locked when the pulley stands at the desired angle, and a closing and locking yoke by which the opening in the standard is closed, substantially as herein described.

2. A rope-guiding sheave consisting of the circular block having a grooved periphery, a standard having a correspondingly-shaped circular opening to receive the block, a pulley journaled within the block at right angles with its face, a means for locking the block in the standard with the pulley at any desired angle, a flanged disk upon which the standards are supported, a corresponding base within which the disk may be rotated at right angles with the plane of rotation of the pulley-block, and a means for locking this disk in any desired position, substantially as herein described.



479,297. POWER-TRANSMITTER. DANIEL MCCARTHY, Earle, Colo. Filed Jan. 30, 1892. Serial No. 419,840. (No model.)

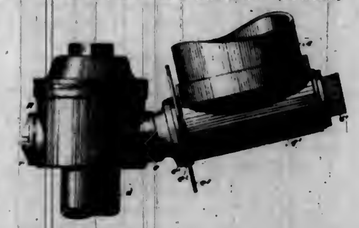
Claim.—1. The combination, with a steam-cylinder, piston, and rod, of an endless belt, a cross-head carried by the end of rod and having steam communication with the steam-cylinder, the outer frame carried upon said cross-head, the cylinders, inner frame, and plungers all arranged substantially as described.

2. The combination, with cross-head, cylinders, and outer frame of the inner frame and plungers, the endless belt, the ranges of which pass between the inner and outer frames, the piston-rod having steam-passages which communicate with the cylinders carried by the cross-head, and the piston and main cylinder, all arranged substantially as shown and described.

479,298. BOTTLE-FILLING APPARATUS. MICHAEL J. MCHUGH, Jersey City, N. J. Filed July 27, 1891. Serial No. 400,803. (No model.)

Claim.—1. In a corking-machine, the combination, with the cross-head carrying the cork-tube, of pivoted levers depending from cross-head and having feet at their lower ends to engage the bail and seat it over the cork when the cross-head is moved away from the bottle, the said feet projecting inwardly under the lower end of the cork-tube to be pressed apart by the bottle in the descent of the cross-head, substantially as set forth.

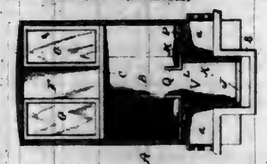
2. In a corking-machine, the combination, with the cross-head carrying the cork-tube, of a bail-seater comprising two depending levers at opposite sides of the cross-head and provided with inward-projecting feet and a spring pressing the lower ends of the levers toward each other, substantially as set forth.



3. In a corking-machine, the combination, with the cross-head carrying the cork-tube, of a bail-seater depending from the cross-head and comprising two levers having inward-projecting feet provided with inclined upper faces, substantially as set forth.

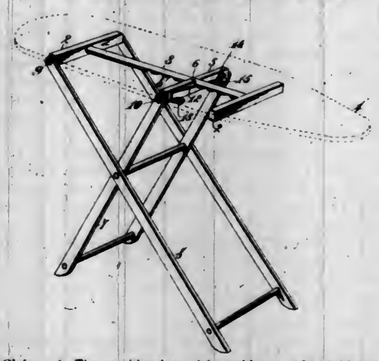
4. In a corking-machine, the combination, with the cross-head carrying the cork-tube and provided with a vertical bolt-aperture, of the bail-seater comprising a cross-bar having a bolt extending up through said aperture, levers depending from the ends of the bar and having inward-projecting feet at their lower ends, and a spring throwing said lower ends toward each other, substantially as set forth.

5. A bail-seating attachment for corking-machines, comprising two levers provided at their lower ends with inward-projecting feet inclined on their upper faces, a spring pressing the lower ends toward each other, and an attaching bar connecting the said levers, substantially as set forth.



6. A bail-seating attachment for corking-machines, comprising an attaching cross-bar, two levers pivoted between their ends to the ends of said bar and inclined outward from their pivotal points, feet formed on the lower ends of the levers, and a spring between and forcing the upper ends of the levers apart, substantially as set forth.

479,299. PUMP VALVE AND CASE. JOHN NEUMANN, Brooklyn, N. Y. Filed Nov. 21, 1891. Serial No. 412,635. (No model.)



Claim.—The combination, with the pump-barrel provided with a chamber at its lower end, said chamber having diametrically-opposite openings, of a valve-casing provided with a flanged trough-shaped limb projecting into the openings of the chamber and having its end internally screw-threaded and a screw-plug screwed into the said limb, substantially as herein shown and described.

479,300. CAB. DAVID J. O'DONNELL, Grafton, Nebr. Filed Mar 15, 1892. Serial No. 424,996. (No model.)

Claim.—In a cab or two-wheeled vehicle, the combination, with the angular walls A L K, the bottom I, with reduced portion J, and the entrance V, of the sectional hinged seats M T, having ledges Q, the section P, secured to the wall L, with the movable section M, with its ledge extending over the sides of the entrance V, and the said ledges being adapted to engage the inner surfaces of the side walls A when thrown upward, substantially as and for the purposes specified.

479,301. IRONING-TABLE. WILBUR F. PARMELEE, Middletown, Conn. Filed Aug. 8, 1891. Serial No. 402,118. (No model.)

Claim.—1. The combination, with a table-top, of a rigid ratchet-bar immovably attached to the under side of the table-top, the pivoted leg-frames, one of which is pivoted to a cross-bar in interlocked sliding engagement with the immovable ratchet-bar, and a spring-arm attached to the sliding, cross-bar and directly engaging the ratchet-teeth of the ratchet-bar, substantially as described.

2. A folding table consisting of a table-top having cleats secured to its under side, a rigid ratchet-bar having its extremities immovably fixed to the cleats, a cross-bar in interlocked sliding engagement with the ratchet-bar and provided with a spring-arm directly engaging the ratchet-teeth of the ratchet-bar, and pivoted leg-frames pivoted, respectively, to one of the cleats and to the sliding cross-bar, substantially as described.

3. A folding table consisting of a table-top having cleats secured to its under side, a rigid cylindrical ratchet-bar immovably fixed to the cleats, a cross-bar having an approximately circular orifice between its extremities and in interlocked sliding engagement with the cylindrical ratchet-bar, a wire arm directly engaging the ratchet-teeth of the ratchet-bar, having at one extremity a finger-piece and at the opposite extremity provided with a series of spirals or coils secured directly to the cross-bar, and pivoted leg-frames pivoted, respectively, to one of the cleats and to the sliding cross-bar, substantially as described.

479,302. PAPER-CUTTING MACHINE. BENJAMIN J. PAYNE and THOMAS BURNS, St. Louis, Mo., assignors to James G. Payne, same place. Filed Feb. 20, 1892. Serial No. 423,273. (No model.)

Claim.—1. The combination, with the paper-clamp member 9, of the hinged member 16, adapted to be raised and lowered on the paper-clamp member, substantially as described.

2. In a paper-cutting machine, a paper-clamp consisting of a member 9, sliding in fixed ways, and a member 16, hinged to the

member 9 and having a broad base 16ª, adapted to extend below the lower edge of the member 9, substantially as set forth.

3. The combination, in a paper-cutting machine, of the clamp having a sliding member 9 and a member 16, having slots 19 and orifices 20 and hinged to fixed pins 15 of the member 9, carrying set-screws 18, all constructed and adapted to operate substantially as set forth.

4. The combination, in a paper-cutting machine, of the clamp having a sliding member 9 and a member 16, hinged to the member 9, so as to be raised and lowered, the knife 3, and the gage 14, the clamp being constructed and adapted to operate substantially as set forth.

479,303. PENCIL-SHARPENER. WILLIAM G. PRICE, New Orleans, La. Filed Mar. 22, 1892. Serial No. 425,939. (No model.)

Claim.—1. The combination of a rotary grinder for sharpening the lead points of pencils with a tubular pencil-sharpener provided with a side blade for cutting the wood of the pencil preparatory to the grinding of its lead point, whereby the wood is first cut to a conical point and the lead of the pencil immediately thereafter, without removal of the pencil from the sharpener, ground to a point, substantially as described.

2. The combination of the wood-cutting portion and the lead-cutting portion of the sharpener and gearing and means for operating the grinder and insuring the cutting away of the wood and the lead successively without removing the pencil from the sharpener, substantially as described.

3. The combination of the spring and adjusting-screw with the grinder and the wood cutting portion of the sharpener, the combined sharpener and grinder being adapted for cutting away the wood and the lead successively without removing the pencil from the sharpener, substantially as described.

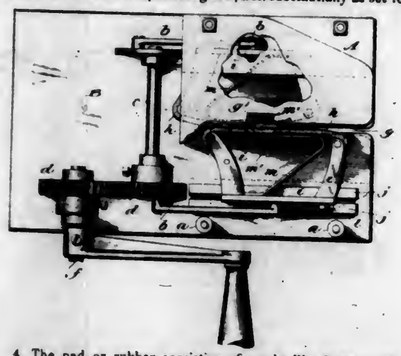
4. A rotary emery grinder applied at the conical end of the tubular wood-cutting portion of the sharpener, the combined sharpener and grinder being adapted for cutting the wood and lead successively without removing the pencil from the sharpener, substantially as described.

5. The combination of the tubular wood-cutting portion of the sharpener, the shaft of the grinder, the plug, and the confining-lug, substantially as described.

6. The plug provided with a milled head, in combination with the wood-cutting portion of the sharpener and the rotary grinder, substantially as described.

7. The combination of the shaft of the rotary grinder provided with the toothed wheel, the plug provided with a toothed wheel, the rotary grinder, and the wood-cutting portion of the sharpener, substantially as described.

8. The rotary hollow grinding-wheel for a tubular pencil-sharpener, having a beveled emery-covered internal surface, a shaft, suitable bearings, and a wheel for insuring the revolution of the grinder when the pencil is revolved within the wood-cutting portion of the sharpener, substantially as described.



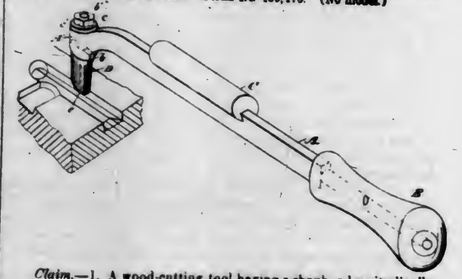
9. A rotary yielding grinder applied at the end of the wood-cutting portion of the tubular pencil-sharpener and means for revolving the grinder when the pencil is revolved, said grinder pointing the lead of the pencil immediately after the wood is cut away and the pointing being effected without removing the pencil from the tubular wood-cutting portion of the sharpener, substantially as described.

479,304. MACHINE FOR CLEANING AND POLISHING KNIVES. JOHN PLETCHER, Baltimore, Md. Filed Mar. 17, 1892. Serial No. 425,330. (No model.)

Claim.—1. The combination of the front and back plates A B, provided with slits for the insertion of the knife, the two pads arranged between and mounted to reciprocate in said plates and having spring-pressed meeting faces, and means for simultaneously reciprocating the pads in opposite directions to each other, as and for the purposes shown and described.

2. The friction pads having each a pliable face and a backing consisting of a plate-spring m of approximate V form, in combination with the frame, in which said parts are mounted to reciprocate, and means for reciprocating the pads simultaneously in directions opposite to each other, as herein shown and described.

3. The pads consisting each of a frame, a pliable strap stretched between the arms of said frame, and a plate-spring of approximate V shape interposed between the back plate of the frame and the strap, in combination with the guides, in which said pads are supported and move, and means for reciprocating the pads, substantially as set forth.

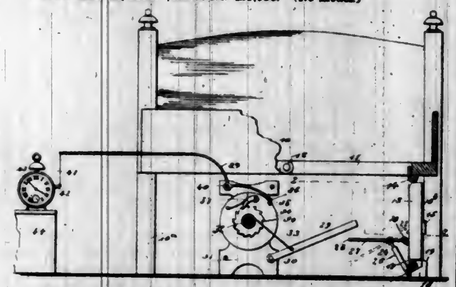


4. The pad or rubber consisting of a yoke-like frame, a pliable strap extending between the arms of the yoke, means for adjusting the tension of the strap, and a plate-spring of approximate V form interposed between the strap and the back plate of the yoke, substantially as herein set forth.

479,305. MANUFACTURE OF PHOTOGRAPHIC FILMS. HENRY M. REICHENBACH, Rochester, N. Y., assignor, by mesne assignments, to the Eastman Kodak Company, same place. Original application filed Apr. 9, 1889, Serial No. 306,375. Divided and this application filed Nov. 18, 1889. Serial No. 330,638. (No specimens.)

Claim.—The hereinbefore described improvement in the art of forming flexible photographic films, the same consisting in depositing and spreading a fluid solution of nitro cellulose and camphor upon a supporting-surface in the form of a thin layer or film and drying the same, then washing the face of the dried film-support with a binding solution, such as a solution of silicate of potash, then spreading upon the surface of said film-support a film of fluid gelatino-argentic emulsion and drying the same, and finally stripping the photographic film from its support.

479,306. WOOD-CUTTING TOOL. ROBERT ROBERTS, Brooklyn, N. Y. Filed Oct. 22, 1891. Serial No. 409,473. (No model.)

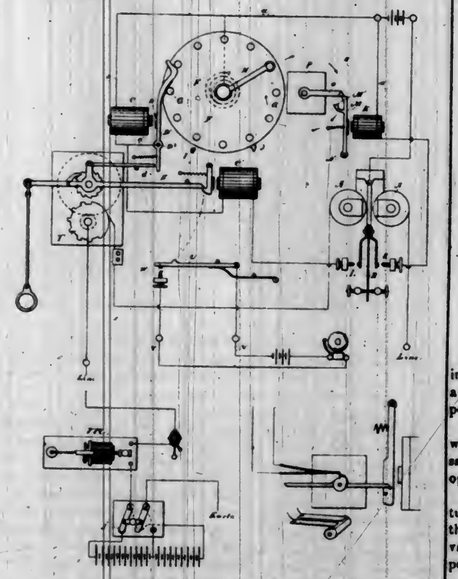


Claim.—1. A wood-cutting tool having a shank, a longitudinally-extending handle on one end of said shank, a rest-block on the normally-upper edge of the shank, a hub on the other downwardly-curved end of the shank, that is axially perforated to receive the stem of the cutter-blade, and a cutter-blade adapted to cut with its side edges and free end and securable in the shank-hub by its stem, and a nut on the threaded end of the said stem, substantially as described.

2. A wood-cutting tool comprising an elongated shank having a longitudinally-extending handle at one end, a rest C, extending longitudinally along the upper edge of the shank between its ends, and a downwardly-extending two-edged cutting-blade on the forward end of the shank and in the plane thereof, substantially as set forth.

3. The combination, with the shank having a hub on one end provided on its lower end with a transverse groove in the plane of the shank, of the two-edged cutting-blade D, engaging at its upper edge said groove and having a shank extending up through the hub and provided with a securing device, substantially as described.

479,307. TIME-ALARM BED. GEORGE O. SEAMAN, Brooklyn, N. Y. Filed Mar. 22, 1892. Serial No. 425,938. (No model.)



Claim.—1. The combination, with the bed, the swinging bottom, the loose legs for supporting the bottom, and the lever mechanism for fastening the legs, of a clock-work mechanism adapted to release the lever mechanism and trip the legs, substantially as described.

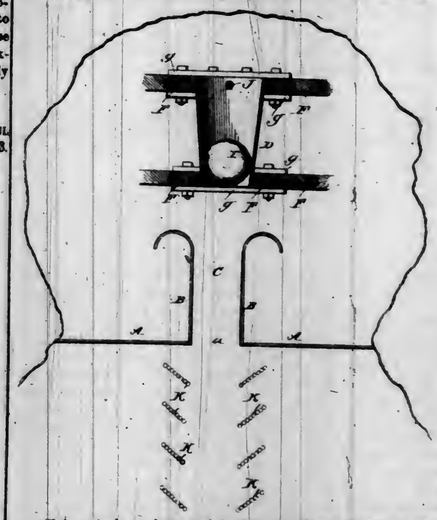
2. The combination, with the swinging bed-bottom and its supporting legs, of an inclined cleat forming a rest for the legs, a swinging leaf hinged to the cleat, a crank-rod carried by the leaf and adapted to be fastened to the legs, and a clock-work-operated tripping-lever adapted to swing against the crank, substantially as described.

3. The combination, with the swinging bed-bottom and its supporting-legs, of an inclined support for the legs, a rod connecting the two legs, a swinging leaf hinged to the inclined support, a crank-rod journaled on the leaf and having a hook to engage the leg-rod, a swinging lever adapted to strike on the crank of the crank-rod, and a clock-work mechanism for releasing the lever, substantially as described.

4. The combination, with the swinging bed-bottom and its supporting-legs, of an inclined support for the legs, a fastening device to hold the legs to the support, a swinging crank-arm adapted to release the fastening device, a swinging lever adapted to strike the crank-arm, and a clock-work mechanism for releasing the lever, substantially as described.

479,308. INDIVIDUAL ALARM SIGNAL APPARATUS. PAUL SEILER, San Francisco, Cal. Filed Aug. 1, 1891. Serial No. 401,403. (No model.)

Claim.—1. The rotary disk with projecting pins, a lever and clock-train, an escapement and controlling electro-magnet by which the disk is advanced one interval at each movement of the armature, a second magnet with an armature which actuates a stop engaging the pins at each movement, and a connection from the circuit wires through one of the pins, whereby a short circuit is established through this pin and the stop when they are in contact and the magnet is thrown out of action, substantially as herein described.



2. The magnet C and its armature, the rotating disk and a pin by which the electrical current is diverted from the magnet, a return-signal mechanism, and a second magnet by which it is actuated when the current is diverted from the first magnet to pass through the second, substantially as herein described.

3. The magnet C with its armature, the rotating disk and a pin by which the electrical current is diverted from the magnet, a return-signal mechanism, and a second magnet by which it is actuated when the current is diverted from the first magnet to pass through the second, a contact maker and breaker, and a releasing device to free the first armature, substantially as herein described.

4. A return-call mechanism consisting of two magnets of different resistances within the same circuit, a mechanism operated when the call is made, whereby the magnet if of higher resistance is short-circuited and the second magnet is thrown into action, a return-signal, and a device to return the armature of the first magnet, actuated by the second magnet when it is thrown into action, substantially as herein described.

5. A return-call mechanism consisting of a polarized relay in the main circuit, contact-points L and R, to one or the other of which the armature is attracted by a reversal of the current, and a spring by which it is returned to a central position when the current is cut off, a mechanism actuated when the call is made, whereby one of two magnets of different resistances is short-circuited and the other is thrown into action, a contact-maker operated by the second magnet to produce a return-signal, and a device whereby the armature of the first magnet is released, substantially as herein described.

479,309. HARBOR. ROBERT H. F. SEWALL and NICHOLAS H. SEWALL, Bessemer, Ala. Filed July 6, 1891. Serial No. 398,491. (No model.)

Claim.—1. In an improved harbor, a wall provided with openings made circular in cross-sections and the check-valve consisting of a ball movable within said opening, all substantially as and for the purposes set forth.

2. An improved harbor having main wall portions and channel-wings or portions extended from the adjacent ends of said wings, the said main wall portions being provided with flumes and with inwardly-opening check-valves, all substantially as and for the purposes set forth.

3. In a harbor, a wall composed of a plurality of rows of piles, tubular flumes extending through the wall, a filling of concrete between the rows of piles and around the flumes, and inwardly-opening check-valves controlling the said flumes, all substantially as and for the purposes set forth.

4. An improved harbor comprising the main wall portions provided with flumes and with check-valves controlling the same and the wings extended in parallel lines and projected from the adjacent ends of the main portions, all substantially as and for the purposes set forth.

5. An improved harbor comprising the main wall portions having flumes and check-valves, channel-wings extended from the adjacent ends of the main wall portions, and dikes arranged in rows on oppo-

site sides of the channel-line and inclined with respect to said line, substantially as described, and for the purposes set forth.

6. An improved harbor comprising the main wall portions provided with flumes and check-valves and the channel-wings extended from the adjacent ends of the main portions inwardly toward the land, substantially as set forth.

7. In a harbor, a wall composed of a plurality of rows of piles, the rows being separated by an intervening space, tapering tubular flumes extended between said rows of piles and opening at their opposite ends through the same; ball-valves movable within said tapering flumes, whereby they may operate as check-valves, and retaining devices whereby the said balls are held from escaping from the large ends of the flumes, all substantially as and for the purposes set forth.

8. In an improved harbor, the combination, with the main wall portions, of the channel-wings extended from the adjacent ends of the main portions inwardly toward the land, the said main portions being provided with flumes and with check-valves controlling the same, substantially as set forth.

9. In a harbor, a wall formed of side piles, a metal flume-casing extending from side to side thereof, a ball-valve in said casing, and concrete filled in between the side piles and around the flume-casing, substantially as set forth.

10. In a harbor, substantially as described, the combination, with the main wall portions having side piles, flumes, and concrete filling and provided with inwardly-opening check-valves controlling the said flumes, of the channel-wings extended from the adjacent ends of the main wall portions, all substantially as and for the purposes set forth.

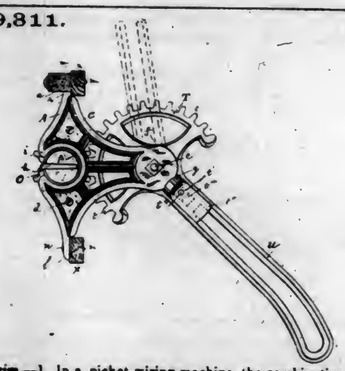
11. In a harbor, the combination, substantially as described, with the main wall portions having openings and inwardly-opening check-valves controlling the same, of the channel-wings extending from the adjacent ends of the main wall portion, said channel-wings being also provided with openings and inwardly-opening check-valves controlling the same, substantially as and for the purposes set forth.

12. In a harbor, substantially as described, the combination of the main wall portion, the channel-wings extended from the adjacent ends of the main wall portions, and the spur dikes arranged outside the main wall and extended in rows on opposite sides of the line of the channel and at an angle to such line, all substantially as and for the purposes set forth.

479,310. FOLDING UMBRELLA. GEORGE H. SEYMOUR, Stanton, Tex., assignor to himself and William H. Tersch, same place. Filed Nov. 18, 1891. Serial No. 412,265. (No model.)

Claim.—1. In a folding umbrella, the combination, with a folding stick, of ribs formed of two sections, the upper sections being pivoted to the upper portion of the stick and sliding in the lower section, and braces pivoted to the runner of the stick and to the lower rib-sections and with their ends projecting into the paths of the upper sections, substantially as and for the purpose set forth.

2. The combination, with the folding stick and the runner held to slide thereon, of ribs pivoted to the upper portion of the stick, each rib comprising a tubular outer section having a longitudinal slot therein and a solid upper section having at its lower end a lug to slide in the slot, sleeves fixed on the upper end of the lower or outer section of the rib, and braces pivoted on the sleeves with their ends projecting into the paths of the lugs on the upper rib-sections and extending to the runner, substantially as shown and described.



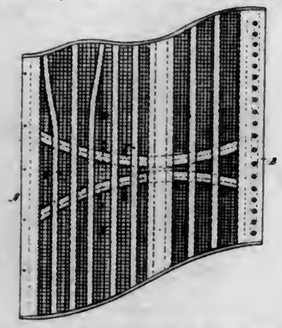
3. In a folding umbrella, the combination, with the folding stick and the ribs pivoted thereon, of a runner held to slide on the stick and provided with notched springs at its upper end, a ring held to slide on the runner, and braces pivoted on the runner and to the telescoping ribs, substantially as described.

4. In a folding umbrella, the combination, with the upper and lower stick-sections, of a link pivoted to each section and provided with a slit forming a spring, and a sleeve sliding on the sections, substantially as described.

5. A folding umbrella comprising a stick formed of three sections, the two lower sections being hinged together and the uppermost section sliding in the upper hinged section, ribs formed of two sections, one sliding in the other, a runner provided with springs, braces hinged to the runner and to the outer rib-sections and projecting into the paths of the upper rib-sections, and a ring sliding on the runner over the braces, substantially as described.

479,311. PICKET-WIRING MACHINE. JAMES R. SHAFFER, Huntington, Ind.; Jane Shaffer administratrix of said James R. Shaffer, deceased. Filed Mar. 2, 1892. Serial No. 423,590. (No model.)

479,311.

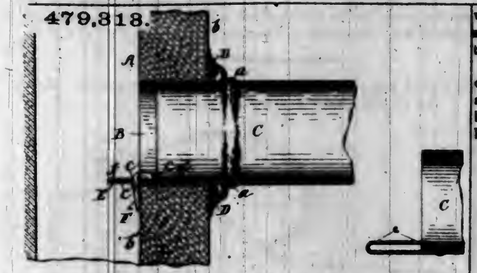


Claim.—1. In a picket-wiring machine, the combination, with a suitable frame, of a gear-wheel having a radial slot and side journals, as described, a segmental rack adapted to engage the gear-wheel, and a lever connected with the rack for operating the same, substantially as set forth.

2. In a picket-wiring machine, the combination of a frame composed of two triangular plates having perforated inner projections and securing-bolts, as described, the forward part of the frame having a slotted bearing and a radially-slotted gear-wheel journaled therein, an operating-lever with segmental rack pivoted in the rear part of the frame, indentures at the rear of the frame-plates, and the spring-actuated catches of the operating-lever, substantially as described.

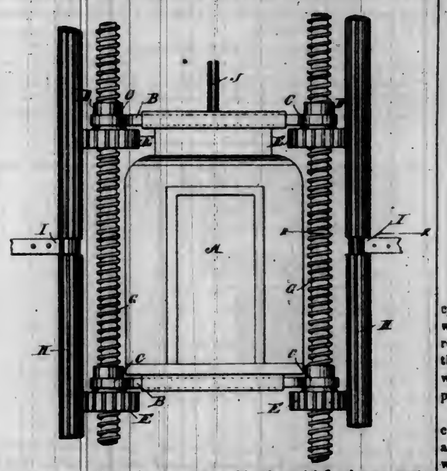
3. The combination, in a picket-wiring machine, of a triangular frame having a slotted bearing and a radially-slotted gear-wheel journaled therein, an operating-lever with segmental rack pivoted in the rear of the frame, a pair of bearing-plates at the forward part of the frame, and a gage-block secured to one of the bearing-plates, substantially as and for the purpose described.

479,312. CORSET. MYRON W. SHERMAN, West Brookfield, Mass. Filed Sept. 7, 1891. Serial No. 404,959. (No model.)



Claim.—A corset having each half composed of a front or busk strip and a rear or eyelet strip, combined with segment-shaped sections F G, extending transversely from front to rear, the said sections being of substantially equal width from front to rear, the section F curved downward and the section G curved upward, said sections being of two thicknesses of material, the zone-shaped section C, extending from front to rear, with its upper edge secured to the lower edge of the section F and between the two thicknesses of that section F, the lower edge of said zone-shaped section C secured to the upper edge of the section G and between its two thicknesses, the upper section D having its lower edge secured to the upper edge of the section F and between its two thicknesses, and the lower section E having its upper edge secured to the lower edge of the section G and between its two thicknesses, the sections C, D, and E being reversely curved at their respective edges, substantially as described.

479,313. STOVEPIPE-HOLDING DEVICE. CHARLES F. SPENCER, Rochester, N. Y., assignor to William Horcheler, same place. Filed Feb 29, 1892. Serial No. 423,208. (No model.)



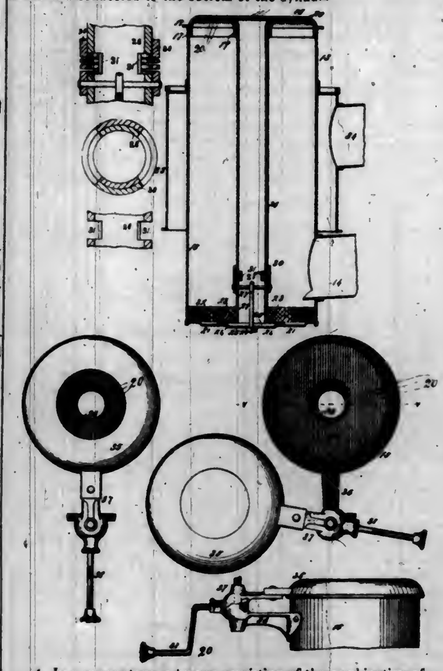
Claim.—1. The terminating section of a stovepipe provided with a narrow perforated extension projecting beyond its forward end and adapted for receiving into one or the other of its perforations an angular or headed pin or nail, said pin or nail bearing against the unexposed surface of the flue-wall of the chimney or other structure, substantially as described.

2. The combination of the terminating end section of a stovepipe, the perforated extension projecting into the chimney-flue, the fastening pin or nail, and the collar abutting against the head or corrugation of the pipe-section and against the flue-wall, substantially as described.

479,313.

479,314. ELEVATOR. COLLINS M. STEARNS, Milwaukee, Wis., assignor to himself, Emil John Field, and Thomas Field, same place. Filed Dec. 18, 1891. Serial No. 415,533. (No model.)

Claim.—1. In an elevator, the combination, with fixed screw-posts, of gear-wheel nuts mounted to turn on the said posts and adapted to support the cage and revoluble shafts fluted to form long pinions in mesh with the said gear-wheel nuts, substantially as shown and described.



2. In an elevator, the combination, with a cage provided with bars having eyes, of gear-wheel nuts engaged at their hubs by the eyes of the said bars, fixed screw-posts on which said nuts turn, and revoluble shafts fluted to form long pinions in mesh with the said gear-wheel nuts, substantially as shown and described.

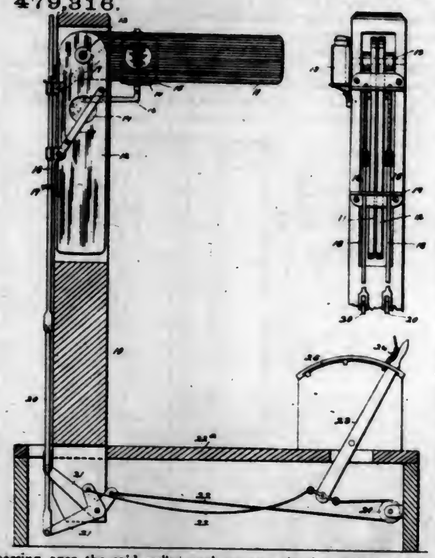
479,315. VAPOR-STOVE. LOUIS STOCKSTROM, St. Louis, Mo., assignor of one-half to Charles A. Stockstrom, same place. Filed May 9, 1891. Serial No. 392,175. (No model.)

Claim.—1. The combination of a gravity-carburetor, a main burner arranged below the level of the carburetor, having a cylinder provided with a cap, a pipe by which the carburetor is connected with the cylinder, a pipe passing through the cylinder, having openings located near its lower end, and a collar sleeved or fitted onto the pipe, having holes adapted to register with the openings in the pipe, substantially as and for the purpose set forth.

2. In a vapor-stove, a burner consisting of the combination of a cylinder having a bottom 21, a burner-cap fitting on the cylinder and having a central flared neck, a pipe located within the cylinder and having a flared upper end fitting in the neck of the burner-cap, a washer fitting against the bottom of the cylinder, a pin passing transversely through the pipe, and a bolt extending from the pin through said washer and having a nut on its lower end, substantially as and for the purpose set forth.

3. In a vapor-stove, a burner consisting of the combination of a cylinder having a bottom, a burner-cap fitting on top of the cylinder and having a flared neck, and a pipe located within the cylinder and having a flared upper end fitting in the neck of the burner-cap and its lower end connected to the bottom of the cylinder

4. In a vapor-stove, a burner consisting of the combination of a cylinder, a burner-cap fitting on top of the cylinder, a pipe located within the cylinder and secured to the cap at the upper end, a washer resting against the bottom of the cylinder, a pin passing transversely through the pipe, and a bolt extending from the pin through said washer and having a nut at its lower end, substantially as and for the purpose described.

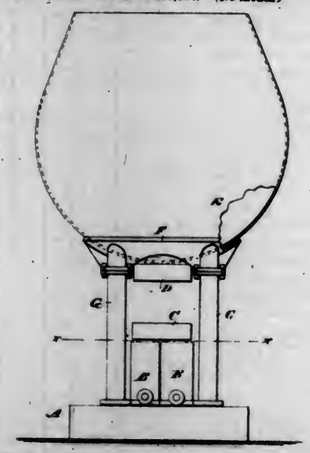


5. The combination of the cylinder, the burner-cap formed with a central opening, with a vertical flange fitting within the cylinder, with a horizontal flange resting on the top of the cylinder, and with an outwardly-flared and downwardly-extending neck, a bottom to the cylinder, formed with a central opening, with a neck around the opening and with a raised portion, a central pipe formed with a flared upper end fitting the flared neck of the cap and its lower end fitting the neck of the bottom, a perforated disk fitting the raised portion of the bottom, a pin extending transversely of the pipe near its lower end, and an eye-pin and nut by which the disk is secured to the transverse pin, substantially as and for the purpose set forth.

6. The combination of the cylinder, the burner-cap formed with a central opening, with a vertical flange fitting within the opening, with a horizontal flange resting on the top of the cylinder, and with a downwardly-extending neck, a bottom to the cylinder, formed with a central opening and with a neck around the opening, a central pipe fitting the neck of the cap and the neck of the bottom, having small holes near its lower end, a perforated disk, a pin extending transversely of the pipe near its lower end, and an eye-pin and nut by which the disk is secured to the transverse pin, substantially as and for the purpose set forth.

479,316. SEMAPHORE-SIGNAL. PERRY G. STUART, Fitchburg, assignor of one-half to H. Prentice Kendall, Sterling, Mass. Filed July 30, 1891. Serial No. 401,172. (No model.)

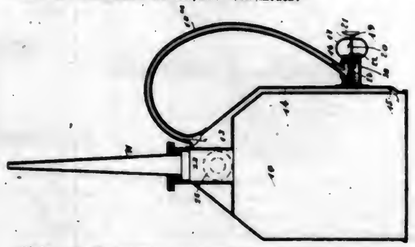
Claim.—1. In a signal, the combination, with a standard and semaphore-arms pivoted thereto, of vertically-sliding rods at one side of the standard, links pivoted to the semaphore-arms and to the rods, bell-crank levers to which the lower ends of the sliding rods are pivoted, a pulley, a cord or wire secured to the bell-crank levers and



479,316.

passing over the said pulley, and an operating-lever connected directly to the said cord or wire, substantially as described.

2. A semaphore-signal comprising a chambered standard, a lantern secured to the standard, two apertured semaphore-arms pivoted in the chamber of the standard, vertically-sliding rods on one side of the standard, links pivoted to the semaphore-arms and to the rods, bell-crank levers to the longer arms of which the sliding rods are pivoted, a pulley, a cord or wire secured to the short arms of the bell-crank levers and passing over the pulley, and an operating-lever secured directly to the cord or wire, substantially as herein shown and described.

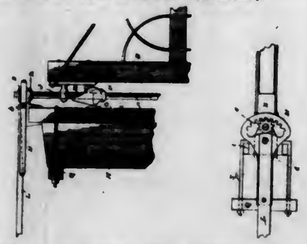


479,317. HYDRAULIC PRESS. JOHN F. TAYLOR, West Park, N. Y. Filed Oct. 17, 1891. Serial No. 409,077. (No model.)

Claim.—1. A compress comprising vertical supports, a weight mounted on said supports and carrying the upper platen on its under side, and the vertically-movable piston having a platen on its upper end, the said weight being sufficient to wholly withstand any pressure that the piston may exert, thereby relieving said supports from tensile strain, substantially as described.

2. The herein-described compress, comprising vertical supports, a weight-receiving receptacle mounted on said supports and adapted to contain a sufficient weight to withstand any pressure that the piston may exert without exerting any tensile strain on said supports, an upper platen on the bottom of the vessel between the supports, and a hydraulic piston on the base between the supports and carrying the lower piston, substantially as described.

479,318. OIL-CAN. HANS H. THIELLESEN, Custer City, S. D. Filed Nov. 12, 1891. Serial No. 411,677. (No model.)

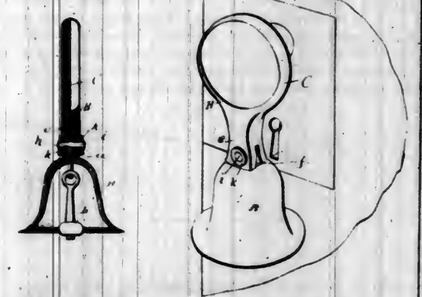


Claim.—1. The combination, with an oil-can having an air-chamber in the upper part thereof, of a hollow handle opening into the air-chamber, an air-compressor connected with the handle, and a channel leading from the air-chamber to the lower portion of the can, substantially as shown and described.

2. The combination, with an oil-can having an air-chamber in the upper part thereof, of a hollow handle connected with the chamber, a case supported on the can and connected with the handle, an apertured collapsible ball secured to the case, a spring-pressed plug mounted in an opening of the case and extending into the ball, and a thumb-piston secured to the plug and extending through the ball, substantially as shown and described.

3. The combination, with an oil-can having the usual discharge-nozzle, of an air-chamber arranged in the top of the can, near the base of the nozzle, a channel leading from the air chamber to the bottom portion of the can, and an air-compressor mounted exteriorly upon the can and adapted to force air into the channel, substantially as described.

479,319. DRIVE-GATE. JAMES M. THOMAS, Chillicothe, Ohio. Filed Jan. 16, 1892. Serial No. 418,347. (No model.)



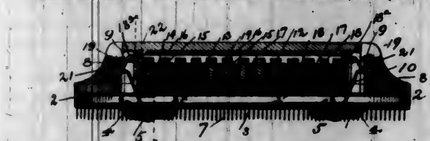
Claim.—1. In a swinging gate, the combination, with the main upright, of an adjustable hinge-plank secured thereto, provided with a cap-plate at its upper end, a cogged rim pivoted to said cap-plate, a cogged pinion meshing therewith, secured rigidly to the upper end of the hinge-rod, a hinge-rod journaled on the hinge-plank, a roller-cam, constructed substantially as described, supported on said rod, a swinging gate provided with a roller near its upper inner end, adapted to run upon the roller cam, and means for opening and closing said gate and holding it in a closed and supported position, substantially as described.

2. In a swinging gate, the combination of the main upright E, the adjustable hinge-plank C, attached thereto, carrying at its upper end the cap-plate K, the cogged rim M, pivoted to the cap-plate, the hinge-rod D, suitably journaled to the adjustable hinge plank C, roller-cam P, constructed substantially as described, supported on said hinge-rod, the gate suitably secured to said hinge-rod, roller R, carried by the gate, the pins W, secured at the front ends of said gate, the supports U for the front end of the gate, secured to a suitable upright, latches T T, and stop V, together with means for opening and closing said gate, substantially as described.

479,320. BURGLAR-ALARM. PIERRE G. TROUE, New Orleans, La., assignor of one-half to Hermann Levi, same place. Filed Apr. 21, 1891. Renewed May 26, 1892. Serial No. 434,394. (No model.)

Claim.—1. As an improved article of manufacture, the burglar-alarm described, comprising the bell having its shank or stem provided with a hole and the attaching device formed wholly from rubber or elastic material and having the band or ring of concavo-convex form

479,320.



in cross section and the solid branch slitted and the slitted branches perforated to receive a bolt or rivet for securing the bell-shank thereto, substantially as specified.

2. The combination, with a bell, of a rubber band adapted to embrace a door-knob and having an integral branch secured to the shank or stem of the bell, substantially as specified.

3. In a burglar-alarm, the combination, with a bell and a door-knob, of a band of rubber or elastic material adapted to snugly embrace the knob and having an integral solid branch slitted and the slitted branches perforated for the attachment of a sounding device, substantially as specified.

479,321. ELECTRIC BRUSH. ROBERT R. WILLIAMS, Dallas, Tex., assignor of two-thirds to Val. E. Winston, same place, and Drew Ferguson, Homer, La. Filed Jan. 2, 1892. Serial No. 416,876. (No model.)

Claim.—1. In an electric brush, the combination, with the metal plate having an upwardly and downwardly extending rim, the non-conducting plate upon the under side thereof, the electrodes, the conducting-strips connected with the electrodes and secured to blocks upon the upper side of said metal plate, and the pivoted conductors electrically connected with said strips, of the battery adapted to rest upon the metal plate, having conducting-loops at each end, with which the pivoted conductors engage, substantially as and for the purpose set forth.

2. A galvanic battery for an electric brush, comprising a trough divided into a series of cells by transverse partitions having notches in their upper edges, the bent metal plates seated in said notches, the battery elements contacting with said plates, and the conductors in the ends of the trough, substantially as described.

3. A galvanic battery for electric brushes, comprising a series of cells and the positive and negative plates located in said cells, having holes or apertures near their upper edges, substantially as and for the purpose described.

479,322. CONNECTOR FOR ELECTRIC CIRCUITS. JOHN F. WOLLENSAK, Chicago, Ill. Filed Apr. 26, 1892. Serial No. 430,749. (No model.)

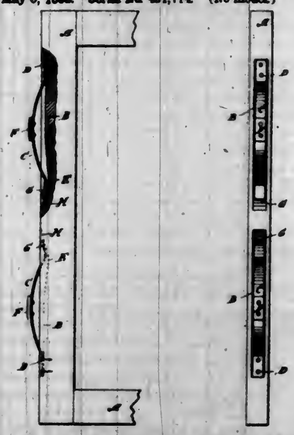
Claim.—1. In electric-circuit connectors, the combination of an insulating-piece secured to a face-plate and provided with two sockets, said plate having holes registering with the sockets, contact-springs secured to said insulated piece and communicating with said sockets through openings in the sides thereof, substantially as described.

2. In electric-circuit connectors, the combination of an insulating-piece provided with two sockets and secured to a face-plate, means whereby said piece may be prevented from turning out of position on said plate, holes in said plate registering with said sockets, contact-springs secured to the insulating-piece and communicating with the sockets through openings in the sides thereof, whereby as the plugs of a portable terminal are inserted in the sockets the springs will contact therewith to complete the circuit, substantially as described.

3. In electric-circuit connectors, the combination of an insulating-piece secured to a face-plate and provided with sockets, openings in the insulating-piece, contact-springs communicating at one of their ends with the sockets through said openings and having their other ends bent between the free end of said insulating-piece and an insulating-disk, and a screw passing through said disk and insulating-piece and screwing into the face-plate, whereby the said parts are secured to the face-plate and the contact-springs are secured to the insulating-piece, substantially as described.

4. In electric-circuit connectors, the combination of an insulating-piece secured to a face-plate, a lug upon said plate, and a notch arranged in the insulating-piece, whereby the said insulating-piece is prevented from turning upon the face-plate, substantially as described.

479,323. DULCIMER. IGNATIUS D. BAGDASARIAN, Cambridge, Mass. Filed Apr. 19, 1892. Serial No. 429,711. (No model.)



Claim.—1. In a dulcimer, the combination, with the end bridges of the sounding board and the stringing of the instrument, of two separate rows of bridge-posts unattached to and at a greater height from the sounding-board than the height of said end bridges and converging from the front to the rear of the dulcimer and having the strings at a bearing thereon, but alternately as to those of each row, substantially as described, for the purpose specified.

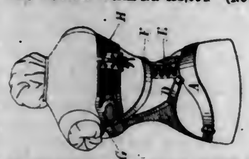
2. In a dulcimer, blocks to receive the hitch and tuning pins, located at opposite ends of the instrument, and each made with a downward and outward incline from the corresponding end bridge, substantially as described, for the purpose specified.

3. In a dulcimer, the combination, with the end bridges of the sounding-board and the stringing of the instrument, of two separate rows of bridge-posts unattached to and at a greater height from the sounding board than the height of said end bridges and converging from the front to the rear of the dulcimer and having the strings at a bearing thereon, but alternately as to those of each row, and skeleton brace-bars for the sounding board, a pair for each row of the bridge-posts and severally attached to the body, and those of each pair converging from the rear to the front of the instrument and along the opposite sides of the row of said bridge-posts to which they belong, substantially as described, for the purposes specified.

479,324. SASH-HOLDER. EMIL BROCKELWIRTH, Brooklyn, N. Y. Filed May 3, 1892. Serial No. 431,714. (No model.)

Claim.—The combination, with a shutter or blind A, having grooves B in one of its sides, of springs C, secured at one end in the groove and provided centrally between their ends with friction-pads of elastic material for deadening noise and increasing frictional contact with a frame in which the shutter or blind slides, substantially as described.

479,325. CONNECTOR FOR ELECTRIC CIRCUITS. WILLIAM H. GILL, Chicago, Ill., assignor to John F. Wollensak, same place. Filed Apr. 26, 1892. Serial No. 430,735. (No model.)



Claim.—1. In electric-circuit connectors, the combination of a plate provided with a hole therethrough, a stationary block of insulating material attached to the plate and provided with a hole registering with the hole in the plate, and springs of unequal lengths projecting beyond the end of the block and forming stationary terminals for the ends of the circuit-wires, substantially as described.

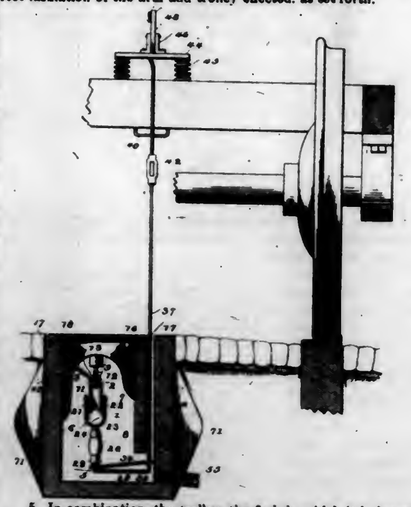
2. In electric-circuit connectors, the combination of a portable block into which the ends of circuit-wires are led, and stems, one within the other, fastening the ends of the circuit-wires in the block, with the inner stem projecting beyond the outer and forming portable terminals, substantially as described.

3. In electric-circuit connectors, the combination of a plate provided with a hole therethrough, a stationary block of insulating material attached to the plate and provided with a hole registering with the hole in the plate, springs of unequal lengths projecting beyond the end of the block and forming stationary terminals for the ends of circuit-wires, a portable block into which the ends of circuit-wires are led, and stems, one within the other, fastening the ends of the circuit-wires in the block, with the inner stem projecting beyond the outer and forming portable terminals contacting with the stationary terminals when the stems are inserted in the plate and stationary block, substantially as described.

479,326. SPINAL BRACE. CHARLES G. GÜMPEL, London, England. Filed May 11, 1892. Serial No. 432,604. (No model.)

Claim.—1. In apparatus for supporting the spine, the combination of a supporting-band, such as A, adapted to be secured around the body, the spring E, having its lower end secured to the central portion of said band A and adapted to fit into the hollow of the back, the metal band or rod F, centrally secured to the upper end of said spring and having its ends curved upward to the armpits, and crutches G G, attached to the ends of the band or rod F and adapted to fit under the arms of the wearer, substantially as and for the purpose described.

2. In apparatus for supporting the spine, the combination of the supporting-band A, the adjustable belt B, the corset-front C, attached to said belt and provided with straps D for attachment to the band A, the spring E, having its lower end secured to the central portion of said band and adapted to fit into the hollow of the back, the metal band or rod F, centrally secured to the upper end of said spring and having its ends curved upward to the armpits, crutches G G, attached to the ends of the band or rod F and adapted to fit under the arms of the wearer, and an adjustable belt or band H, connecting said crutches, as and for the purpose described.



479,327. CONDUIT-TROLLEY FOR STREET-CARS. ARTHUR H. HEATHMAN, Baltimore, Md., assignor of one-half to Harry D. Heatzman, same place. Filed Mar. 24, 1891. Serial No. 386,196. (No model.)

Claim.—1. The conductor-support herein described, consisting of a stem and two downwardly-inclined plates forming an inverted-V-shaped or angle iron, the stem being secured to or formed on the apex of this iron and the plates being provided with openings to receive the securing-screws, as set forth.

2. In combination, the housing having brackets, the insulators secured to said brackets, the inverted-V-shaped conductor-support secured to the insulators, and the conductor secured to the supports, substantially as set forth.

3. In combination, the housing provided with side plates, connecting bottom plate, downward partition, with clear space below it to accommodate foot of trolley-arm, brackets secured to upper inner parts of one side plate and the partition and forming top cross-bars, two sets of insulators carried by said brackets, and a conductor and auxiliary conductor carried by said sets of insulators, as set forth.

4. A trolley-support consisting of a hollow rubber structure, through which the wires pass, formed at one end for connection with the trolley-bearing and at the other for connection with the toe of the trolley-arm, whereby a yielding support is given to the trolley and perfect insulation of the arm and trolley effected, as set forth.

5. In combination, the trolley, the fork in which it is journaled, the toe of the trolley-arm, and the rubber trolley-support embracing the fork at one end and the toe at the other, as set forth.

6. In combination, a trolley-arm, a trolley, a bearing for the trolley, and an insulating-support connected to the arm at its lower end and by a swivel-joint to the trolley-bearing at its upper end, as set forth.

7. The trolley-support consisting of the arm having horizontal foot and vertical toe at the end thereof, in combination with the inclined brace connecting the arm and toe, as set forth.

8. The trolley-arm formed as a conduit for insulated wires from the trolley, in combination with the trolley and an insulating-support connecting the trolley-arm and trolley, as set forth.

9. The combination of the trolley-arm and toe with a connecting-brace secured to each of them by means of an embracing eye or socket, as set forth.

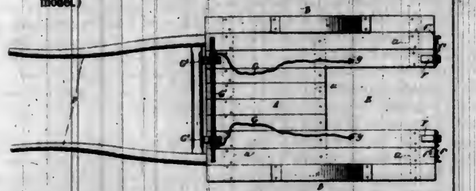
10. The trolley-arm and car, in combination with a brace secured at the top to the car and at the bottom to the arm and traveling in the slot, as set forth.

11. The trolley-arm and car, in combination with a brace secured at the top to the car and having a vertically-sliding connection with the arm at the bottom, as and for the purpose set forth.

12. The trolley-arm and car, in combination with a brace connected at its upper end with the car by a horizontally-sliding connection and at its lower end with the trolley-arm, as set forth.

13. The trolley-arm and car, in combination with a brace having a horizontal sliding connection with the car at its upper end and a vertically-sliding connection with the trolley-arm at its lower end, as set forth.

14. The combination, with the car and the trolley-supporting arm having foot and toe, as described, of a brace connecting the toe and arm by means of sliding connections and a second brace secured at its lower end to the first brace at the arm and at its upper end to the car by a horizontally-sliding connection, as and for the purpose set forth.



15. In combination, the car, the hand-lever, the pivoted cam, the trolley-arm connected thereto, and the spring-platform upon which the cam is supported, as set forth.

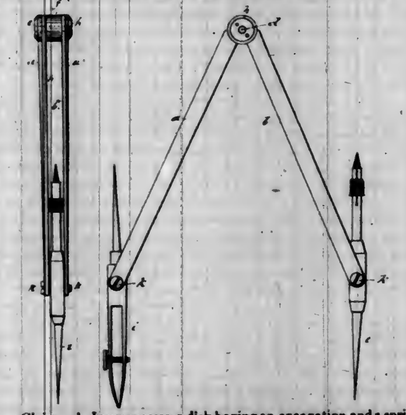
16. A trolley-arm provided with a horizontal foot and vertical toe, in combination with the trolley and an elastic connection between it and the toe, as set forth.

17. In combination, the trolley, the fork in which it is journaled, the toe of the trolley-arm, and the elastic insulating trolley-support embracing the fork at one end and the toe at the other, as set forth.

18. In combination, a trolley-arm, a trolley, a bearing for the trolley, and an elastic insulating-support connected to the arm at its lower end and by a swivel-joint to the trolley-bearing at its upper end, as set forth.

479,328. VEHICLE FOR CARRYING GRAIN. RICHARD W. JOSH, Rock Hall, Md. Filed Apr. 12, 1892. Serial No. 428,832. (No model.)

Claim.—1. A vehicle for use in carrying cut grain, having a platform flat on its upper surface and provided in its rear with a cut-away portion or opening, and means located at either end of the platform for retaining the grain in place, substantially as described.



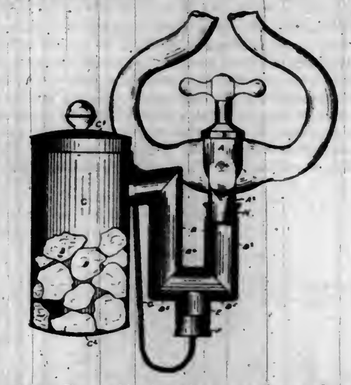
2. A vehicle for use in carrying cut grain, having a platform flat on its upper surface and provided in its rear with a cut-away portion or opening, and means, such as described, located on the platform, whereby the contents of the vehicle may be drawn toward the operator, substantially as described.

3. In a vehicle of the class described, a device for use in unloading, comprising ropes, each having one of its ends secured to the platform of the vehicle and its other end attached to a bar, and rests provided in the front of the platform for receiving said bar, substantially as described.

4. In a vehicle of the class described, the combination of the platform having the rearward opening, tail-gates hinged to the rear portion of said platform and having the described notches therein, and the locking-bolts operating with said notches, in the manner and for the purpose set forth.

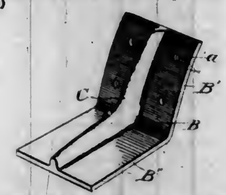
5. In a vehicle of the class described, the combination of the platform having the rearward opening, tail-gates hinged to the rear of the platform, having the notches therein as described, locking-bolts, means, such as described, for drawing the contents toward said opening, comprising two cords secured at one end to the rear portion of the platform and at their forward end to a bar, uprights on the forward end of the platform having rests for said bar, and guards on the sides of said platform to protect the contents of the vehicle from the wheels, the combination being and operating substantially as set forth.

479,329. COMPASSES. ADOLPH KOLESCH, Brooklyn, N. Y. Filed Apr. 29, 1891. Serial No. 390,995. (No model.)



Claim.—1. In compasses, a disk having an excavation and a spring-acting dished or conical washer in said excavation placed on the pivot-pin of the head of the compasses, so that the washer acts as a spring against one of the legs of the compasses, substantially as set forth.

2. Compasses having its legs consisting each of two blades cut or stamped out of sheet metal and secured to the pivot-pin of the head outside of an interposed disk, substantially as set forth.



3. In a pair of compasses, the combination of a disk having in an excavation of the same a spring-acting dished or conical washer, with two blades cut out or stamped out of sheet metal placed on each side of the disk and forming the legs of the compasses and a pivot-pin passing through the head ends of the blades and the disk and washer and secured to the same by means of a knob and a screw-cap, substantially as set forth.

479,330. SOAP-HOLDER ATTACHMENT FOR WATER-FAUCETS. ABRAHAM B. MIRANDA, Boston, Mass. Filed Mar. 26, 1892. Serial No. 426,573. (No model.)

Claim.—The combination, with a water-faucet, of a vertical receptacle located at one side of said faucet and at its upper portion adapted to be charged with soap and having a perforated bottom, and a U-pipe in communication at one end with the upper portion of said receptacle and at the other end with said faucet and between the faucet and receptacle and at its lower portion having a discharge-orifice adapted to be opened and closed, all as described, for the purposes specified.

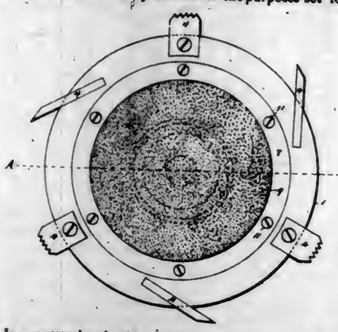
479,331. BOILER-LUG AND METHOD OF MAKING THE SAME. GEORGE I. MCGREGOR, Chicago, Ill. Filed Dec. 14, 1891. Serial No. 414,989. (No model.)

Claim.—1. The improvement in the art of manufacturing boiler lugs or brackets, which consists in forming a metal blank, rolling such blank to form a web, and bending the blank to form the completed lug, substantially as described.

2. The improvement in the art of manufacturing boiler lugs or brackets, which consists in forming a metal blank, rolling the blank to form a web along the middle thereof, cutting the blank to the desired lengths, and bending the pieces so formed to make the completed lugs, substantially as described.

3. The improvement in the art of manufacturing boiler lugs or brackets, which consists in taking a metal blank provided with a web, cutting such blank to the proper lengths and shapes, and drilling and bending the pieces so formed to make the completed lugs, substantially as described.

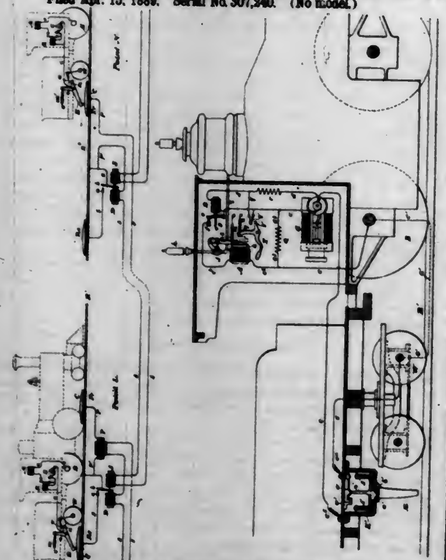
4. A boiler lug or bracket made out of a continuous metal blank by rolling the same to form a web and bending it to form a curved member to be attached to the boiler and a flat member to rest upon the boiler-support, substantially as described.



479,332. COMBINED CUTTING AND SCOURING DEVICE. EDWARD K. PATTEN, Whitesborough, N. Y., assignor to the Seaman Drawer Fitting Machine Company, Milwaukee, Wis. Filed Jan. 14, 1892. Serial No. 418,085. (No model.)

Claim.—1. A rotating cutter-head having cutting-spurs in the face of the head, extending substantially parallel therewith and projecting beyond the periphery, and clearing-spurs set substantially at right angles to the cutting-spurs, extending beyond the periphery of the head, in combination with a scouring-surface upon the face of the head within the cutters substantially flush with the face of the cutters, substantially as and for the purposes set forth.

2. A rotating cutter-head having serrated cutting-spurs in the face of the head, extending substantially parallel therewith and projecting beyond the periphery, and clearing-spurs set substantially at right angles to the cutting-spurs, extending beyond the periphery of the head,



in combination with a scouring-surface upon the face of the head within the cutting-spurs and substantially flush with the face thereof and held to the face by rings and screws, substantially as and for the purposes set forth.

3. The combination, with a rotating disk mounted upon the end of a shaft, of one or more cutters secured in the face of the disk at right angles with the shaft extending beyond the periphery of the disk, and one or more clearers at right angles with the cutters, extending beyond the periphery of the disk, and sand-paper or other scouring material upon the face of the disk within the cutters, and clearers substantially flush with the plane of the cutters and adapted to cut and scour a width equal to the diameter of the scouring material upon the face of the disk, substantially as and for the purposes set forth.

4. In a cutter-head, the combination, with a rotating planer-head, of one or more clearers attached to the head at right angles thereto and projecting beyond its periphery, and one or more cutters attached to the head with their cutting-edges substantially at right angles to the cutting-edges of the clearers, constructed to move simultaneously for the cutting and crosscutting and clearing the material and adapted to plane a width equal to the diameter of the head and cutters, in combination with sand-paper or other scouring material upon the face of the head within the cutters, and ring and screws for securing the sand-paper or scouring-surface to the face of the head, substantially as and for the purposes set forth.

479,333. ELECTRIC RAILWAY-SIGNAL. THEODORE A. B. PUTNAM, New York, N. Y., assignor to Ella Sarah Webster, same place. Filed Apr. 15, 1889. Serial No. 307,240. (No model.)

Claim.—1. The combination, with a locomotive, of a partial electric circuit thereon, a current-generator in said circuit, and two conducting-terminals for said circuit in contact with the rail, whereby normally said circuit is closed through the rail between said terminals, and a mechanical circuit-manipulator carried by the locomotive and adapted when displaced by contact with some provision on the track to break or vary the resistance of said circuit.

2. The combination, with a locomotive, of a partial electric circuit thereon, a current-generator in said circuit, and two conducting-terminals for said circuit in contact with the rail, whereby normally said circuit is closed through the rail between said terminals, and a circuit-breaking lever carried by the locomotive and adapted when displaced by contact with some provision on the track to break or increase the resistance of said circuit.

3. The combination, with a locomotive, of a normally-closed electric circuit thereon, a current-generator carried by the locomotive, feeding said circuit, a circuit connection between one terminal of said generator and the rail, and a contact-lever carried by the locomotive, adapted to make electrical contact with some provision along the track and in electrical connection with the other terminal of said generator.

4. A locomotive, a partial circuit thereon terminating in connections with one of the track-rails and normally closed therethrough, a current-generator upon the locomotive, feeding said circuit, and a contact device carried thereby and in electrical connection with said circuit, in combination with a track having a practically continuous or uninsulated track rail or rails with a contact plate or rail along the track, insulated from the track-rails and arranged to be touched by said contact device in its passage, and a partial track-circuit with one terminal connected to said contact-plate and the other to one of said continuous track-rails.

5. The combination of a railway-track having a contact plate or rail insulated from the track-rails and a partial circuit with one terminal connected to said plate and the other to one of the track-rails, with a locomotive, a partial circuit thereon terminating in connections with the rail, whereby it is normally closed through the rail, a current-generator on the locomotive, feeding said partial circuit, and a contact lever or device carried by the locomotive, connected with said partial circuit and arranged to make contact with said contact-plate in passing it, and thereby to connect the partial track-circuit momentarily to said partial locomotive-circuit.

6. The combination of a railway-track having a contact plate or rail insulated from the track-rails and a partial circuit with one terminal connected to said plate and the other to one of the track-rails, with a locomotive, a partial circuit thereon terminating in connections with the rail, whereby it is normally closed through the rail, a current-generator on the locomotive, feeding said partial circuit, a contact lever or device carried by the locomotive, connected with said partial circuit and arranged to make contact with said contact-plate in passing it, and thereby to connect the partial track-circuit momentarily to said partial locomotive-circuit, and a circuit-breaker operated by the contact of said lever with the contact-plate and adapted to break the partial locomotive-circuit between the connection of said contact-lever and the rail connections, whereby a greater proportion of the current from said generator is diverted through said partial track-circuit.

7. The combination of a railway-track having a contact plate or rail insulated from the track-rails and a partial circuit with one terminal connected to said plate and the other to one of the track-rails, with a locomotive, a partial circuit thereon terminating in connections with the rail, whereby it is normally closed through the rail, a current-generator on the locomotive feeding said partial circuit, a contact lever or device carried by the locomotive, connected with said partial circuit and arranged to make contact with said contact-plate in passing it, and thereby to connect the partial track-circuit momentarily to said partial locomotive-circuit, and an alarm-magnet in operative connection with said partial locomotive-circuit and adapted to give an alarm upon a certain change in the volume of current from the normal.

8. The combination of a railway-track having a contact plate or rail insulated from the track-rails and a partial circuit terminating at said plate and one of the track-rails, with a locomotive, a current-generator and contact-lever carried thereby, said lever arranged to make contact with and be displaced by said contact-plate in passing it, a partial circuit on the locomotive terminating in connections with the rail, whereby it is normally closed through the rail, and a circuit-breaker in said partial locomotive-circuit operated to break it or increase its resistance by the displacement of said contact-lever.

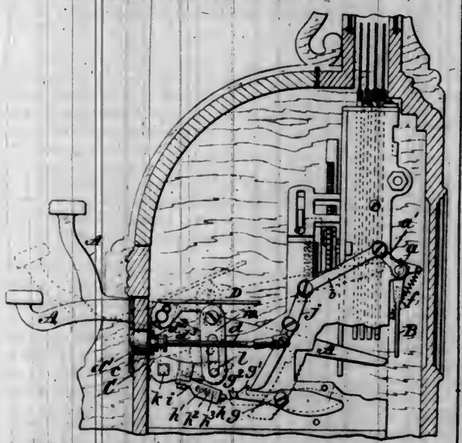
9. The combination, with a railway-track, a contact plate or rail consisting of plates or bars laid longitudinally side by side, spread apart or flared laterally at their ends, and movable relatively toward or from each other, and a spring for pressing said plates together, of a locomotive carrying a contact-lever adapted to enter between said plates in passing, a partial circuit connected to said lever, and a current-generator on the locomotive feeding said partial circuit.

10. The combination, with a railway-track, of a plate f', mounted on the ties, a plate f^2, arranged against said plate and movable toward and from it, a lever j', on which said plate f^2 is fixed, and a spring k', arranged to exert its tension against said lever to press the two plates together.

11. The combination, with a locomotive, of a circuit-breaking lever carried thereby, a ball-and-socket connection between said lever and its bearing, springs for holding said lever in its normal position, a contact-arm on said lever, and a contact-spring arranged to be touched by said arm in the normal position of the lever and to break contact therewith on the deflection of the lever.

12. The combination, with a locomotive, of a circuit-breaking lever carried thereby, a half-ball formed on said lever, a hemispherical socket in which said ball is held, a movable plate lying against the flat side of said ball, and springs pressing against said plate to return the plate to its normal position when displaced.

13. The combination, with a locomotive, of a box or casing U', having a hemispherical socket b', a contact-lever E, having a half-ball d' movable in said socket, a plate d', lying against the flat side of said ball, and springs s' s', pressing said plate against said ball, whereby the lever E may be deflected in any direction and will be restored to its normal position by the tension of said springs.



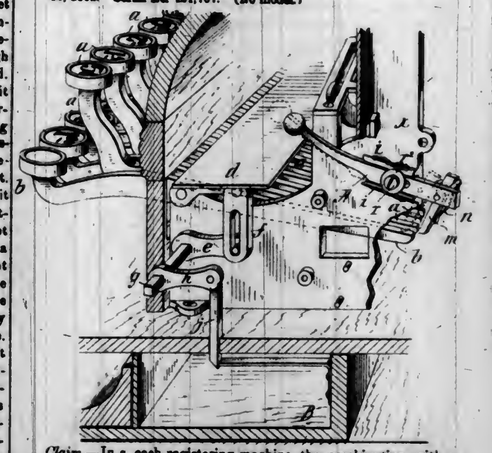
14. The combination, with a locomotive, of a partial electric circuit thereon terminating in connections with the rail and normally closed therethrough, a current-generator in said circuit, an electro-magnet and circuit-breaking contacts in said circuit, a relay-magnet for operating said contacts, and a short circuit cutting out said alarm-magnet and contacts, but not said rail connection, and including a resistance, whereby the absolute breaking of the partial circuit through the rail connections by the separation of the relay-contacts is prevented.

15. The combination, with a locomotive, of a partial circuit thereon, a current-generator and an alarm-magnet in said circuit, circuit-breaking contacts in said circuit, a relay-magnet for operating said contacts to break said circuit, and a switch for manually decreasing or discontinuing the current through said relay to cause it to release its armature and restore the current through said alarm-magnet.

16. The combination, with a locomotive, of a partial circuit thereon, a current-generator in said circuit, an alarm-magnet operating to give an alarm upon the release of its armature, a relay-magnet for governing the operation of said alarm-magnet, connected in a shunt of said partial circuit, a switch for manually varying the current through said relay to cause it to restore the normal current to the alarm-magnet, and a restoring-lever arranged when vibrated to restore its armature to said alarm-magnet and to operate said switch, whereby the alarm-magnet is caused to reattract and hold its restored armature.

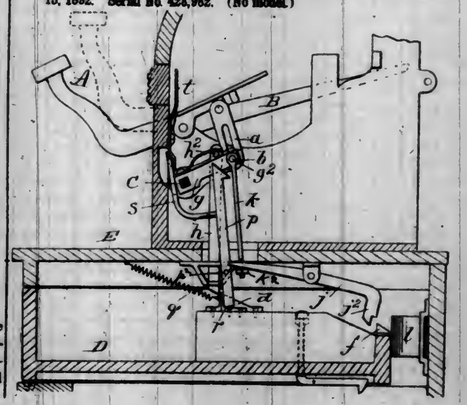
17. The combination, with a locomotive, of a partial circuit thereon, a current-generator and alarm-magnet in said circuit, circuit-breaking contacts for breaking said circuit, a relay-magnet for operating said contacts, the circuit of said relay, short-circuiting contacts in said relay-circuit, adapted to cut out said relay, and a restoring-lever arranged when vibrated to restore its armature to said alarm-magnet and to close said short-circuit, whereby the relay-magnet is caused to release its armature and the normal circuit through the alarm-magnet is restored.

479,334. CASH-REGISTER. JOHN J. RANGE, Northampton, Mass., assignor to the Boston Cash Register Company, same place. Filed Feb. 16, 1892. Serial No. 421,766. (No model.)



Claim.—1. In a cash-register, the combination, with one or more operating key-levers, of a key-lever-engaging member mounted to normally engage the levers and movable to disengage a device for temporarily holding the locking member in its disengaging position, and means actuated by either of the key-levers on a registering movement thereof to terminate the engagement between said temporary holding device and said locking member, for the purpose set forth.

2. In a cash-register, the combination, with a series of key-levers, of the movable locking-bar, the lever j, intermediately pivoted and a medium of connection between said lever and the locking-bar, a pawl or trigger for engaging said lever, and a dog movable in conjunction with the operation of the key-levers to release said pawl, substantially as and for the purposes set forth.

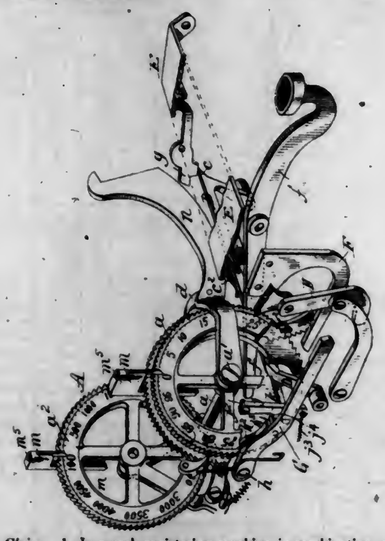


3. In a cash-register, the combination, with a series of key-levers, of the common tilting plate, the swinging dog-carrier linked to said plate, and the spring-pressed dog, the pivoted lever j, the pawl g for engaging said lever and having its nose in proximity to the course of movement of said dog, a medium of connection between the said lever and said locking-bar, and the push-rod d, all arranged for operation substantially as described.

479,335. CASH-REGISTER. JOHN J. RANGE, Northampton, Mass., assignor to the Boston Cash Register Company, same place. Filed Feb. 16, 1892. Serial No. 421,767. (No model.)

Claim.—In a cash-registering machine, the combination, with a cash-drawer and a locking device therefor, of a series of key-levers having an operative connection with the register and a blank-key lever, which, together with the register-key levers, is in operative connection with the cash-drawer-locking device, and a handle-bar mounted for a sliding movement forward and back on a stationary support which is adjacent the blank key, and said handle-bar having thereon a pivoted pawl located in a plane coincident with the course of movement of the blank-key lever, which is held normally forwardly spring-pressed and which has an upward and rearward inclination, substantially as and for the purposes set forth.

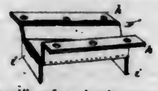
479,336. CASH-REGISTER. JOHN J. RANGE, Northampton, Mass., assignor to the Boston Cash Register Company, same place. Filed Apr. 13, 1892. Serial No. 428,962. (No model.)



Claim.—1. In a cash-registering machine, the combination, with a key-lever and a cash-drawer, of a catch for holding the drawer closed, and a medium of connection between the key-lever and the drawer-catch, arranged and adapted to permit of the maintenance of the locked relations of the catch and drawer on the working movement of the key-lever and to be operated for the release of the drawer only on a return movement of the key-lever, for the purpose set forth.

2. In a cash-registering machine, the combination, with one or more key levers and a movable cash-drawer having two catch-abutments, of a catch adapted to engage each of said abutments, and mechanism of connection between each of said catches and the key-levers, whereby one of the catches will disengage its abutment on the working movement of a key-lever and the other catch will disengage its abutment on the return movement of the key-lever, substantially as described.

3. In a cash-registering machine, the combination, with the key-lever and the rocking bar C, movable therewith and having the arm *g*, of the cash-drawer having the catch-abutment *d* and the catch-abutment *f*, the bolt A, having the stud A^3, projected to be engaged by said arm *g*, the intermediately-pivoted catch-lever *j* and a connection between one arm thereof and said arm *g*, and the spring for forwardly forcing the drawer, all substantially as described.

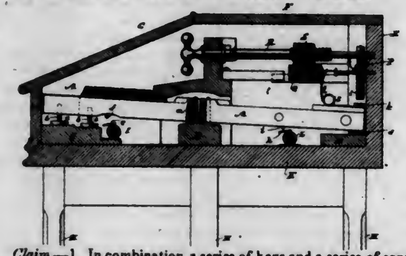


479,337. CASH-REGISTER. WILLIAM H. SAUNDERS, JOHN J. RANGE, and EDWARD M. FOOTE, Northampton, Mass., assignors to the Boston Cash Register Company, same place. Filed Feb. 16, 1892. Serial No. 421,769. (No model.)

Claim.—1. In a cash-registering machine, in combination, a register-wheel having a series of teeth, operating key-levers, and mechanism between the key-levers and register-wheel for imparting on the working movement of the lever a registering movement of the wheel, and a rocker-plate movable with the key-levers and having the member H connected thereto, a detent-arm movable to engage and disengage the teeth of the ratchet-wheel and having its engaging movement imparted by the said rocker-plate member H on the completion of the working movement of the key, a trigger for engaging and retaining the detent-arm in its engagement with the register-wheel, and a movable device adapted to be released on the completion of the return movement of the rocker-plate to force the trigger out of engagement with the detent-arm, substantially as described.

2. In a cash-registering machine, in combination, a registering-wheel, and a series of operating key-levers therefor, the rocking plate E, having the arm F and the member H, the swinging member D, having an engagement member, as *e*, and the trigger *g* for engaging the latter, the pivotally-mounted detent-arm G, having the catch member A^3, and the pivotally-mounted and spring-constrained trigger *j* for engaging said catch member, all for conjoint operation, substantially as described.

479,338. DERAILING-FROG. OWEN J. TRAVIS, Marshalltown, Iowa, assignor of one-half to Albert E. Shorthill, same place. Filed Nov. 23, 1891. Serial No. 413,391. (No model.)



Claim.—1. A derailing-frog having a recess in its under side to receive the ball or head of a railway-rail and having an oblique recess or guide on its upper side, said frog being hinged so as to turn laterally, substantially as specified.

2. The derailing-frog comprising the block having the transverse recess in its under side to bridge a rail and the oblique recess in its upper side, the straps secured to the said block, the wear-plate or shoe secured in said oblique recess, and the bolt for pivotally connecting one end of the straps to a tie, substantially as specified.

3. The combination, with a railway-rail and cross-tie, of a stand-bolt rising from one end of said tie, the two straps pivoted at one end to the head of the bolt, the block secured to said straps and having the groove or recess in its under side to straddle a rail-head, and the oblique groove on its upper side to receive a car-wheel and the angular plate secured in the upper groove, substantially as specified.

479,339. EXERCISING-KEYBOARD. ALSON K. VIRGIL, New York, N. Y. Filed Mar. 9, 1889. Serial No. 302,635. (No model.)

Claim.—1. In combination, a series of keys and a series of sound-producing devices adapted to produce a short quick sound, (not a musical tone,) arranged in position to be operated when the depression of the key is substantially completed, whereby a distinct sound commences and occurs at the moment when the key is down, substantially as described.

2. In combination, a series of keys and a series of sound-producing devices adapted to produce a short quick sound, (not a musical tone,) arranged in position to be operated when the ascent of the key is substantially completed, whereby a distinct sound commences and occurs at the moment when the key is up, substantially as described.

3. In combination, a series of keys, a series of sound-producing devices adapted to produce a short quick sound, (not a musical tone,) arranged in position to be operated when the depression of the key is substantially completed, whereby a distinct sound commences and occurs at the moment when the key is down, and a series of cushions arranged under the forward ends of the keys in such position as to be in contact with the key when the sound-producer is struck, substantially as described.

4. In combination, a series of keys, a series of sound-producing devices adapted to produce a short quick sound, (not a musical tone,) arranged in position to be operated when the ascent of the key is substantially completed, whereby a distinct sound commences and occurs at the moment when the key is up, and a series of cushions arranged under the rear of the keys in such position as to be in contact with the key when the sound-producer is struck, substantially as described.

5. In combination, a series of keys, a series of cushions for said keys, and a series of sound-producing devices adapted to produce a short quick sound, (not a musical tone,) arranged in position to be operated when the key is in contact with said cushion, substantially as described.

6. In combination, a series of keys and two series of sound-producing devices adapted to give a short quick sound, (not a musical tone,) one series arranged in position to be operated when the depression of the key is substantially completed and the other series arranged in position to be operated when the ascent of the key is substantially completed, whereby one distinct sound commences and occurs at the moment when the key is down and another distinct sound commences and occurs at the moment when the key is up, substantially as described.

7. In combination, a series of keys, two series of sound-producing devices adapted to produce a short quick sound, (not a musical tone,) and a separate means for adjustment for each series of sound-producing devices, whereby the same may be thrown out of operation independently of the other, substantially as described.

8. In combination, a series of keys and a series of sound-producing devices adapted to produce a short quick sound, (not a musical tone,) one member of each sound-producing device consisting of a rigid projection from the key and the other member consisting of a rigid piece in position to be struck by the projection when the key has completed its movement, substantially as described.

9. In a key-exercising apparatus containing a series of keys, in combination with each key, two independent click-producing devices constructed and arranged to be operated by said key, one of the same producing said click upon the upward movement of said key, the other of the same producing said click upon the downward movement thereof, and each of the same provided with independent means of adjustment, whereby either may be disconnected from the operation of said key, substantially as described.

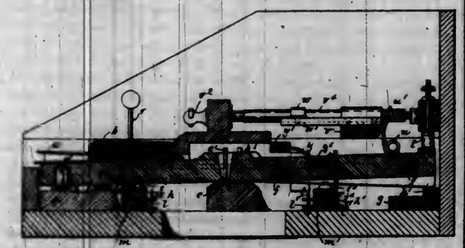
10. In a keyboard-exercising apparatus having a series of keys, the combination, with said series of keys, of a hard or metal plate extending continuously adjacent to the various keys of said series, whereby it may be struck by mechanism connected with each of said keys to produce a short quick click, substantially as described.

11. In a keyboard-exercising apparatus having a series of keys, the combination, with said series of keys, of a hard or metal plate extending continuously adjacent to each of said keys, secured substantially as described, whereby it has an overhanging portion to be struck by mechanism connected with each of said keys to produce a short quick click, substantially as described.

12. In a key-exercising apparatus, the combination, with a series of keys, of a hard or metal plate extending continuously adjacent to said keys and secured by one of its edges to an adjustable bar, whereby it may be adjusted into or out of position to be struck by mechanism connected to said keys, substantially as described.

13. The combination, in a key-exercising apparatus, of a series of keys, a continuous hard or metal plate extending beneath the forward end of said keys, and a hard or metal spur secured to each of said keys in position to strike said plate upon the descent of its key and thereby produce a sharp quick click, substantially as described.

14. In a key-exercising apparatus, the combination, with a series of keys having counterbalance extensions, of a hard or metal plate extending continuously transversely to said extensions, and a hard or metal spur connected with each of said keys and arranged in position to impinge upon said plate upon the upward movement of its key and thereby produce a quick sharp click, substantially as described.



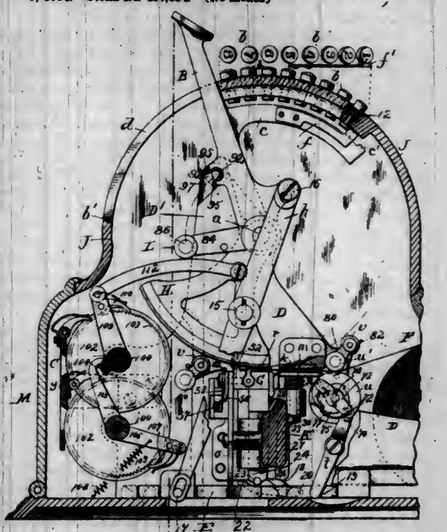
15. In combination, a series of keys, an adjustable bar, mechanism whereby the same may be adjusted, a spring-arm interposed between said bar and each key and extending approximately in the direction of motion of said key, whereby as said key moves the friction produced by the sliding contact of said spring-arm is in a direction opposed to the action or reaction of said spring, substantially as described.

16. In combination, a series of keys, the coil-springs *s*, the extensions *f* of the same, and the adjustable bar Q, bearing against said extensions, whereby the strain of the springs upon the keys is regulated, substantially as described.

17. In combination, a series of keys, an adjustable bar arranged behind the name board, a screw-shaft extending through the name-board and connecting with said adjustable bar, and a spring interposed between said adjustable bar and each of the keys, substantially as described.

18. In combination, a series of keys, the name-board running transversely above the same, a scale on said name-board, a vibrating finger, a shaft extending through said name-board and connected with said finger, an adjustable bar connected with said shaft, and a spring interposed between said bar and each key, all substantially as described, whereby the pressure exerted by said springs will be indicated.

479,340. EXERCISING-KEYBOARD FOR MUSICIANS. ALSON K. VIRGIL, New York, N. Y. Filed Apr. 15, 1891. Serial No. 389,021. (No model.)



Claim.—1. In a key-exercising apparatus containing click-producing devices adapted to be operated by the keys, in combination with such devices, a sliding bar having an inclined surface, whereby as the bar slides one member of the click-producing device is raised, substantially as described.

2. In a key-exercising apparatus containing a series of keys and a series of springs connected therewith operated upon by a compressing-bar, in combination with such bar, a screw-shaft, a supplemental bearing for said screw-shaft, and braces connecting said supplemental bearing with said bar, whereby the said bar is compelled to move squarely to and from said springs, substantially as described.

3. In a key-exercising apparatus containing a series of keys, in combination with said keys, a series of springs extending into approximately-vertical spring-arms, a bar adapted to bear against said spring-arms in an approximately-horizontal direction, and another series of springs adapted to press downward upon said keys, substantially as described.

4. In combination with the click-producing devices, the bar *k*, supporting one member of the same, the slide *l*, and the inverse inclines *o* and *p*, substantially as described.

479,341. CASH-REGISTERING AND CHECK-MAKING MACHINE. JEROME J. WEBSTER and WILLIAM H. SAUNDERS, Northampton, Mass., assignors to the Boston Cash Register Company, same place. Filed Oct. 3, 1891. Serial No. 407,634. (No model.)

Claim.—1. In a cash-registering machine, in combination, a register-disk and a pivoted part comprising a type-segment and a key-lever and a medium of connection between the register and the key-lever part, whereby the movement in any extent of the latter will positively impart a corresponding degree of movement to the register-disk, a platen located adjacent and movable against and away from the type-segment, and means for effecting the printing impact between the platen and type-segment, substantially as described.

2. In a cash-register, the combination, with one or more key-levers and corresponding type-segments movable therewith, of a slide having a cam which is movable therewith and a platen having a member thereof which is extended across the course of the cam and means for moving the slide, substantially as described.

3. The combination, with the side uprights D D, having the block K supported between them above their bases, which is provided with the vertical socket or way 25, of the platen supported upon said block and having the pending rod or member 24 passed through said socket with the stud 23, extended laterally from its lower extremity, and the slide E, constrained for a horizontal movement below said block and having the cam-coded arm *i* pivoted thereon, and means for imparting forward and backward movements to the slide, substantially as described.

4. In a cash-register, the combination of one or more key-levers and type-bearing portions movable therewith, of a platen, a feed device for supplying strip material between the platen and the type-bearing portions, a cutter for severing portions of the strip, means for effecting the printing impact of the platen and type-bearing portions, a pusher mounted on the platen and means for moving it to push the printed check along the platen, and a register movable through suit-

able connections in unison and in extent corresponding to the movement of the key-lever, substantially as described.

5. In a cash-register, the combination, with one or more key-levers and corresponding type-bearing portions movable therewith and a slide having a cam and means for imparting a reciprocatory movement to the slide, of a platen supported adjacent the said type-bearing portion and having a member which is extended across the course of the cam and a shear adjacent the platen, a movable member thereof being provided with a rod which is extended across the course of the slide, and paper-supply devices and an operating member therefor, which is extended into engagement with said slide, substantially as described.

6. The combination, with key-levers having type-bearing portions movable in conjunction therewith, of a platen having at one side one or more abutments 21, means for feeding sheet material to constitute the check onto said platen up to the abutment, means for securing the printing impact, and a pusher for forcing the check along the platen in a direction at right angles to its direction of infeed, substantially as described.

7. The combination, with key-levers having type-bearing portions movable in conjunction therewith, of a platen and means for securing the printing impact, delivery-rolls mounted adjacent the platen, a pusher and means for moving it to force the check along the platen to the nipping action of the delivery-rolls, and devices for rotating said rolls, substantially as described.

8. The combination, with key-levers having type-bearing portions movable in conjunction therewith, of a platen and means for securing the printing impact, delivery-rolls mounted adjacent the platen and the one spring-pressed with relation to the other and separable therefrom, a part movable to secure the separation of the rolls for a slight period, a pusher for forcing the check along the platen and between the rolls, and means for then rotating said rolls, substantially as described.

9. In a cash-registering machine, the combination, with the part having the type and a platen movably supported and guided and means for moving the type with relation to the platen for the presentation for printing of the desired character, and a slide having thereon a pivoted member which is provided with a cam-forcing portion which on the forward movement of the slide impinges upon an extension of the platen, forcing same to printing impact, and all so that on the return movement of the slide the pivoted forcing member will pass without action by the part of the platen previously forced thereby, substantially as described.

10. In a cash-registering machine, the combination, with the movable type-bearing portions, and a platen movably supported and guided and means for moving the type-bearing portions with relation to the platen for the presentation for printing of the desired character, means for feeding to the platen portions of a continuous supply-strip of sheet material, a stationary cutter-bar and a reciprocating knife coacting therewith at the rear of the platen and normally located lower than the platen-surface, a slide having thereon a pivoted member which is provided with a cam-forcing portion which on the forward movement of the slide successively impinges upon an extension of the platen, forcing same to printing impact, and on an extension of the movable cutter forcing the latter to sever the check portion which is upon the platen, and all so that on the return movement of the slide the pivoted forcing member will pass without action by the parts of the platen and cutter previously forced thereby, substantially as described.

11. In a cash-registering machine, the combination, with frame parts, as D D, and the key-levers and type-segments pivotally supported thereon and the block K, supported on the frame above the bottom of the machine, but under the segments, and having a vertical guideway therein, the platen G, having the pending member 24, movable in said vertical way and provided with a stud 23, the stationary cutter-bar *k*, the slide 27, playing in a vertical way in said support K and having at its bottom the lateral extension 26 and at its upper part the cutter *j*, a slide horizontally movable under said block K and having the pivoted member *i*, with the lateral cam-formed portion 22, and means for securing a reciprocatory movement of the slide, all substantially as described, for the purposes set forth.

12. In a cash-registering machine, the combination, with the key-lever and printing-segment having types "0" to "9," successively, and the casing having the slot *d*, through which the key-lever plays, the arm rearwardly extended from the key-lever and having an abutment portion *c'*, and said key-lever and type-segment being pivotally mounted and standing normally to present a type at its one end in the printing position, a series of eight movable stop buttons for limiting the movement of the segment for the eight intermediate segment characters, and the end *b'* of said casing-slot being located to constitute the stop for the proper presentation of the last character, substantially as described.

13. In a cash-register, in combination, the key-lever with the type-segment thereon pivotally mounted, a series of movable stops for limiting the key-lever having an extension which is adapted as the lever is positively moved to click over substantially a corrugated surface which is provided near the course of movement of said spring-finger and the finger exercising, while the lever is to remain in its set position, and a spring-retaining bind for the lever, substantially as described.

14. The combination, with a pivotally-mounted device comprising a key lever or arm and a pivotally-mounted segment with type successively arranged in the course of its swinging movement and a platen adjacent and movable against and away from said type-segment, of a register-disk having a ratcheted portion, a pawl which engages said register-disk ratchet, a pivotally-mounted carrier for said pawl, and a link between the key-lever segment and pawl-carrier, substantially as and for the purposes described.

15. In a cash-register, in combination, the support or casing having a series of socket-holes and the key-lever and type-segment pivotally mounted and said lever provided with the spring-finger with a lateral projection, as *f'*, the series of stop-buttons comprising the spindle portions playing through said socket-holes and having enlargements above and below said holes, and the springs 12, all arranged for the operations set forth.

16. In a cash-registering and check-printing machine, the combination, with a register, a series of key-levers and conjoint type-segments pivotally mounted, and a medium of connection secured to each key-lever and also having an engagement with the register for imparting on a movement of a key-lever a corresponding recording action of the register, and a platen movable toward and away from the type-segments, of a slide having a cam thereon which is adapted for an operating impingement upon a member of the platen which is suitably extended relative to the course of said cam and a lever connected to and for operating the slide, substantially as described.

17. In a cash-registering machine, the combination, with the support for a supply roll or strip of paper, a movable type-bearing portion and platen, and means for securing the printing adjustment of the type-bearing portion over the platen, of a pair of feed-in rolls *u u'*, located near the platen, one thereof having therein a ratchet-wheel, a pawl-carrier mounted to oscillate adjacent said ratchet and having the pawl, the slide, and a lever intermediately pivotally mounted and having its one arm connected to said pawl-carrier and its other projected to be rocked in opposite directions on the forward and backward movements of the slide, for the purposes set forth.

18. In a cash-register, the combination, with the type segment, the platen, the supply roll support, and the feed-in rolls and operating device for one thereof, which comprises the intermediately-pivoted lever *t*, of the slide having the separated abutments 18 and 19, adapted to alternately engage said lever at separate intervals, in the manner and for the purpose set forth.

19. In a cash-registering and printing machine, the combination, with one or more key-levers, each having a type-segment and a platen adjacent thereto and means for feeding strip material onto the platen and for effecting the contact of the platen against the type-segment, of a stationary cutter-bar *k*, supported adjacent the rear edge of the platen relative to the direction of infeed of the paper, the movable knife or cutter *j* for coaction with the said cutter-bar *k*, and means for effecting the movement of the movable cutter-bar, all whereby the printed portion of the check while remaining on the platen will be severed from the main strip, substantially as described.

20. In a cash-registering and check-printing machine, the combination, with a movable type-bearing part and an adjacent platen and means for effecting the printing contact between the type and platen, of a pusher supported and guided for movement on the platen, the slide E, having a cam-surface, a lever suitably mounted and having one end subject to impingement by said cam-surface and having its other end connected to said pusher, and a lever for operating the said slide E, substantially as described.

21. In a cash-register, the combination, with a movable type-bearing part and adjacent platen having therein the socket 44, with the shaft 45, and a pusher carried thereon and movable as the shaft is moved over the top of the platen, the slot through the side of the platen leading to said passage and the stud 52, extended through the slot and connected to said shaft 45, the slide E, having a cam-surface *n*, the lever *o*, intermediately pivoted and having its one end in connection with the said shaft and its other end extended to be engaged by said slide-cam, and a lever for imparting the movements to the cam-provided slide, substantially as described.

22. The combination, with the platen and a pusher supported and guided for movement relative to the platen, the delivery-rolls *p q*, the one thereof mounted upon a spring-pressed and yielding bearing-support which is provided therefor, a slide having the cam or forcing portion and the lever adapted to be engaged thereby and connected to the pusher for securing its movement, and a separator device movable in conjunction with the pusher and adapted to engage and pass out of engagement from said movable roll-support, substantially as described.

23. The combination, with the platen and a reciprocatory pusher,

of a pair of delivery-rolls adjacent the platen having on its axis a ratchet-wheel, an oscillating pawl-carrier and pinion loosely mounted on said axis, and a pawl on the carrier in engagement with the teeth of the ratchet, a rack-bar meshing with said pinion and means for imparting thereto forward and backward movements, all whereby the pinion may be thereby turned in one direction without effect to rotate the delivery-roll, but to secure on the reverse rotation of the pinion a delivery rotation of said roll.

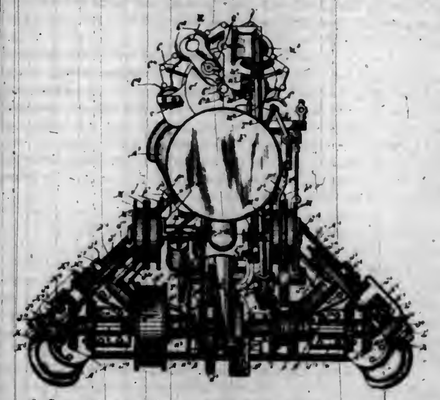
24. In a cash-register, the combination, with a movable type-bearing portion and adjacent platen having therein the socket 44 and the spring 40 and provided with the upper longitudinal slot 48 and the lateral slot 50, of the shaft 45, having thereon the angular pusher *r* and the stud 52, the delivery-rolls at the end of the platen, a socketed guide and a spindle 39, movable therein, and the spring 40, against which said spindle moves, and the spindle having the members 38 38, in which the upper one of said delivery-rolls is supported, the lower roll having fixed on its arbor the ratchet 60 and the loose pinion and pawl-carrier 59 and 62, which latter carries the pawl 64, the separator device mounted on said stud 52 and adapted to operate upon the portion of one of said ear-pieces 38, the rack-bar 57, also supported on said stud and meshing with the pinion, the slide E, having the cam *n*, and the intermediately-pivoted lever *o*, having one end subject to the action of said cam and having its other end connected to the said stud 52, substantially as described.

25. In a cash-register, the combination, with the key-levers and segments pivotally mounted, of the block K, supported below said segments, but above the bottom of the machine and having the vertical way 25, and another vertical way and a horizontal way 58, and the ear-pieces 37, the platen having a pending number movably guided in said way 25, and the cutter-slide with the knife *j*, which slide is movably guided in said second-named vertical way, one of the pair of delivery-rolls supported in said ear-pieces 37, and located at the end of the platen and a rack-bar guided for movement in the said horizontal way in said block, and adapted to have a co-operative action with appliances on one of the said delivery-rolls, and the cam-slide for imparting vertical movements to the platen and cutter and through suitable medium of connection which is provided to secure the movement of the said rack-bar, substantially as described.

26. In a cash-register, the combination, with the series of key-levers, of a bar and supporting-arms therefor which are pivotally mounted and said bar being normally free to be swung in a direction corresponding to and in advance of the key-levers, and a general lever pivotally mounted and adapted to be swung down to the lower position of said bar and said bar and general lever being constructed for an interlocking engagement the one with the other, and means for effecting the disengagement of the general lever and bar on the replacement of the parts, substantially as described.

27. In a cash-register, the combination, with the series of key-levers, of the bar L and one or more supporting-arms pivotally mounted and said bar having a longitudinal opening or passage with the rod *w*, axially movable therein, and having at one end the head 86, and the spring for normally maintaining the rod with said head toward its end and for securing normally the projection of the other end of the rod beyond the proximate end of the bar, the general lever pivotally mounted and having the depression 92 within its side and the contracted recess through the thickness of the lever and leading from its edge to said depression and having the members of the lever at either side of said recess cam-inclined, and the cam 97 for forcing the rod endwise against the spring through the bar as the latter is swung into its uppermost position, substantially as described.

479,842. BOTTLE-WIRING MACHINE. SOL WILE and HENRY LA CASSE, Rochester, N. Y., assignors to the Bottlers' Specialty Company, same place. Filed Dec. 24, 1890. Serial No. 375,735. (No model.)



Claim.—1. In a wiring machine, the combination of a spindle for receiving strands of wire, rotating mechanism for revolving said spindle to wind thereon and unwind the desired amount of wire, and means operatively connected therewith, substantially as described, for securing these strands of wire to the bottle, substantially as and for the purpose set forth.

2. In a wiring-machine, the combination of a spindle for receiving strands of wire, rotating mechanism for revolving said spindle to wind thereon and unwind the desired amount of wire, and movable wire-securing jaws for securing the strands of wire to the bottle, substantially as and for the purpose set forth.

3. In a wiring-machine, the combination of a tapering spindle for receiving strands of wire, rotary mechanism for revolving said spindle to wind spirally thereon and to unwind the desired amount of wire, and a pair of wire-securing jaws supported by said spindle for receiving the wire from the spindle and securing it to the bottle, substantially as set forth.

4. In a wiring-machine, the combination of a reversely-revolving spindle for receiving the strands of wire, a head at the forward extremity of the spindle, and a pair of jaws hinged to said head for receiving the wire from the spindle and feeding it to the bottle, substantially as described.

5. In a wiring-machine, the combination of a reversely-revoluble tapering spindle for receiving the strands of wire, a head at the forward extremity of the spindle, having a recess, and a pair of spring-actuated jaws mounted in said recess for receiving the wire from the spindle and securing it to the bottle, substantially as specified.

6. In a wiring-machine using two strands of wire, the combination of a guide for separating the strands, a spindle for receiving the strands, rotating mechanism for reversely revolving said spindle, and means, substantially as described, for securing the wire to the bottle, substantially as described.

7. In a wiring-machine, the combination of a reversely-revoluble shaft, a spindle carried by said shaft and constructed for winding thereon and unwinding the desired amount of wire, and movable wire-securing jaws also carried by said shaft in advance of the spindle for applying the wire to the bottles, substantially as and for the purpose described.

8. In a wiring-machine using two strands of wire, the combination of a guide for separating the strands, a spindle in proximity to the guide, rotary mechanism for revolving said spindle to wind spirally thereon and to unwind the desired amount of wire, and a pair of wire-securing jaws supported by the spindle, substantially as specified.

9. In a wiring-machine, the combination, with a reversely-revoluble shaft, of a wire-shuttle on the shaft and yielding jaws on said shuttle for securing strands of wire to the bottle, substantially as set forth.

10. In a wiring-machine using strands of wire, the combination of a guide for separating the wire, a reversely-revoluble spindle constructed for winding thereon and unwinding the desired amount of wire, and movable wire-securing jaws in proximity to said spindle for applying the wire to the bottles, substantially as and for the purpose specified.

11. In a wiring-machine, the combination, with a reversely-revoluble shaft, of a wire-shuttle on the shaft for securing strands of wire to the bottle and means, substantially as described, for moving said shuttle toward and away from the bottle, substantially as and for the purpose described.

12. In a wiring-machine, the combination, with a reversely-revoluble shaft, of a wire-shuttle on the shaft for securing strands of wire to the bottle, means, substantially as described, for moving said shuttle toward and away from the bottle and for raising and lowering the shuttle, and connected mechanism between the foregoing parts, substantially as specified.

13. In a wiring-machine, the combination, with a reversely-revoluble shaft, of a wire-shuttle on the shaft for securing strands of wire to the bottle, means, substantially as described, for moving said shuttle toward and away from the bottle and for raising and lowering the shuttle, a stop for stopping the rotation of the shaft when the shuttle is in its horizontal position, and connected mechanism between the foregoing parts, substantially as and for the purpose set forth.

14. In a wiring-machine, the combination of a reversely-revoluble shaft, a shuttle on the shaft for securing strands of wire to the bottle, and means, substantially as described, for reciprocating the shuttle toward and away from the bottle, said reciprocating mechanism being adapted to move with varying rapidity in relation to the rotation of the shaft for varying the tightness of the wire-twists, substantially as specified.

15. In a wiring-machine, the combination of a reversely-revoluble shaft, a spindle carried by said shaft and constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws also carried by said shaft for applying the wire to the bottles, and means, substantially as described, for moving said shaft toward and away from

the bottle, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose set forth.

16. In a wiring-machine, the combination of a reversely-revoluble shaft, a spindle carried by said shaft and constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws also carried by said shaft for applying the wire to the bottles, means, substantially as described, for moving said shaft toward and away from the bottle and for raising and lowering the shaft, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose specified.

17. In a wiring-machine, the combination of a reversely-revoluble shaft, a spindle carried by said shaft and constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws also carried by said shaft for applying the wire to the bottles, means, substantially as described, for moving said shaft toward and away from the bottle and for rotating said shaft at unequal speed during its movement toward and away from the bottle, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose described.

18. In a wiring-machine, the combination of a reversely-revoluble shaft, a spindle carried by said shaft and constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws also carried by said shaft for applying the wire to the bottle, means, substantially as described, for moving said shaft toward and away from the bottle and for raising and lowering the shaft, a stop for stopping the rotation of the shaft when the jaws are in their horizontal position, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose specified.

19. In a wiring-machine, the combination of a reversely-revoluble shaft, a tapering spindle carried by said shaft and constructed for winding thereon and unwinding the desired amount of wire, yielding wire-securing jaws also carried by said shaft in advance of the spindle for applying the wire to the bottle, means, substantially as described, for moving said shaft toward and away from the bottle for raising and lowering the shaft, and a stop for stopping the rotation of the shaft when the jaws are in their horizontal position, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose described.

20. In a wiring-machine, the combination of a reversely-revoluble shaft, a spindle carried by said shaft and constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws also carried by said shaft for applying the wire to the bottle, means, substantially as described, for moving said shaft toward and away from the bottle and for rotating said shaft at unequal speed during its movement toward and away from the bottle, a stop for stopping the rotation of the shaft when the jaws are in their horizontal position and for raising and lowering the shaft, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose set forth.

21. In a wiring-machine, the combination of a reversely-revoluble shaft, a shuttle supported by the shaft, a pair of gears on the shaft, and a pair of movable clutches adapted to engage said gears, substantially as and for the purpose specified.

22. In a wiring-machine, the combination of a reversely-revoluble shaft, a shuttle supported by the shaft, a pair of gears on the shaft, and a pair of movable clutches adapted to engage said gears, said clutches being so arranged in relation to the gears that both clutches may be simultaneously out of operation, substantially as and for the purpose set forth.

23. In a wiring-machine, the combination of a reversely-revoluble shaft, a shuttle supported by the shaft, a pair of gears on the shaft, a pair of movable clutches adapted to engage said gears, and a lock adapted to intermittently prevent the shaft from rotation, substantially as described.

24. In a wiring-machine, the combination of a reversely-revoluble shaft, a spindle carried by the shaft and constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws also carried by the shaft for applying the wire to the bottle, a pair of gears on the shaft, and a pair of movable clutches adapted to engage said gears, substantially as and for the purpose specified.

25. In a wiring-machine, the combination of a reversely-revoluble shaft, a spindle carried by the shaft and constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws also carried by the shaft for applying the wire to the bottle, a pair of gears on the shaft, and a pair of movable clutches adapted to engage said gears, said clutches being so arranged in relation to the gears that both clutches may be simultaneously out of operation, substantially as set forth.

26. In a wiring-machine, the combination of a reversely-revoluble shaft, a spindle carried by the shaft and constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws also carried by the shaft for applying the wire to the bottle, a pair of gears on the shaft, a pair of movable clutches adapted to engage said gears, and a lock adapted to intermittently prevent the shaft from rotation, substantially as described.

27. In a wiring-machine, the combination of a pair of spindles arranged at an angle with each other and constructed for winding the wire upon and unwinding it from their peripheries, wire-securing means, substantially as described, for receiving the strands of wire from the spindles and securing them to the bottle, and connected mechanism between the foregoing parts, substantially as described.

28. In a wiring-machine, the combination of a pair of reversely-revoluble spindles arranged at an angle with each other and constructed for winding the wire upon and unwinding it from their peripheries, wire-securing means, substantially as described, for receiving the strands of wire from the spindles and securing them to the bottle with their extremities projecting therefrom at an angle with each other, and connected mechanism between the foregoing parts, substantially as set forth.

29. In a wiring-machine, the combination of a pair of reversely-revoluble spindles arranged at an angle with each other and constructed for winding the wire upon and unwinding it from their peripheries, wire-securing means, substantially as described, for receiving the strands of wire from the spindles and securing them to the bottle, and means, substantially as described, for moving the spindles toward and away from the bottles, substantially as described.

30. In a wiring-machine, the combination of a pair of spindles arranged at an angle with each other and constructed for winding the wire upon and unwinding it from their peripheries, wire-securing means, substantially as described, for receiving the strands of wire from the spindles and securing them to the bottle, for passing the wire over the top of the bottle and the inserted cork, and for securing the wire in said position, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose set forth.

31. In a wiring-machine, the combination of a pair of reversely-revoluble shafts arranged at an angle with each other, a spindle on each shaft constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws on said shafts for receiving the wire from the spindles and applying the same to the bottle, and connected mechanism between the foregoing parts for operating them in due order, substantially as described.

32. In a wiring-machine, the combination of a pair of reversely-revoluble shafts arranged at an angle with each other, a spindle on each shaft constructed for winding thereon and unwinding the desired amount of wire, wire securing jaws on said shafts for receiving the wire from the spindles and applying the same to the bottle, means for moving the shafts toward and away from the bottles, and connected mechanism between the foregoing parts for operating them in due order, substantially as set forth.

33. In a wiring-machine, the combination of a pair of reversely-revoluble shafts arranged at an angle with each other, a spindle on each shaft constructed for winding thereon and unwinding the desired amount of wire, heads on the spindles, yielding jaws mounted on said heads for receiving the wire, wire-securing jaws on said shafts for receiving the wire from the spindles and applying the same to the bottles, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose described.

34. In a wiring-machine, the combination of a pair of reversely-revoluble shafts arranged at an angle with each other, a spindle on each shaft constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws on said shafts for receiving the wire from the spindles and applying the same to the bottle, means for raising and lowering said shafts and for preventing the same from rotation, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose set forth.

35. In a wiring-machine, the combination, with a wire-feeder, of a tapering spindle for receiving the strands of wire and unwinding the same therefrom, means, substantially as described, for securing the wire to the bottle, and connected mechanism between the foregoing parts, substantially as set forth.

36. In a wiring-machine, the combination, with a wire-feeder, of a reversely-revoluble spindle for receiving the strands of wire and unwinding the same therefrom, means, substantially as described, for securing the wire to the bottle, and connected mechanism between the foregoing parts, substantially as specified.

37. In a wiring-machine, the combination, with a wire-feeder, of a reversely-revoluble spindle for receiving the strands of wire and unwinding the same therefrom, means, substantially as described, for securing the wire to the bottle, and a take-up for preventing slack of the wire, and connected mechanism between the foregoing parts, substantially as set forth.

38. In a wiring-machine, the combination, with a wire-feeder, of a tapering spindle for receiving the strands of wire and unwinding the same therefrom, means, substantially as described, for securing the wire to the bottle, a guide for separating the strands of wire, and connected mechanism between the foregoing parts, substantially as set forth.

39. In a wiring-machine, the combination, with a wire-feeder, of a spindle for receiving strands of wire, mechanism for rotating the spindle to wind thereon and unwind the desired amount of wire for stopping the rotation of the spindle and for securing the wire to the bottle, and connected mechanism between the foregoing parts for operating them in due order, substantially as set forth.

40. The combination, with a wire-feeder, of a pair of spindles arranged at an angle with each other and constructed for winding the wire upon and unwinding it from their peripheries, wire-securing means, substantially as described, for receiving the strands of wire from the spindles and securing them to the bottle, and connected mechanism between the foregoing parts, substantially as described.

41. The combination, with a wire-feeder, of a pair of reversely-revoluble shafts arranged at an angle with each other, a spindle on each shaft constructed for winding thereon and unwinding the desired amount of wire, wire-securing jaws supported on said shafts for receiving the wire from the spindles and applying the same to the bottle, and connected mechanism between the foregoing parts for operating them in due order, substantially as set forth.

42. In a wiring-machine, the combination of a pair of reversely-revoluble spindles arranged at an angle with each other and constructed for winding the wire and unwinding it from their peripheries, a pair of wire-feeders for feeding wire to the respective spindles, movable jaws for receiving the wire from the spindles and securing the same to the bottle, and connected mechanism between the foregoing parts for operating them in due order, substantially as specified.

43. In a wiring-machine, the combination of a wire-feeder, wire-securing jaws for securing the wire and applying it to the bottle, mechanism for moving the wire securing jaws toward and away from the bottle, a take-up for preventing the slack of the wire, connecting mechanism between the wire-feeder and take-up for operating both conjointly, and connected mechanism between the foregoing parts for operating them in due order, substantially as described.

44. In a wiring-machine, the combination of a wire-feeder, wire-securing jaws for securing the wire and applying it to the bottle, mechanism for removing the wire-securing jaws toward and away from the bottle, a take-up for preventing the slack of the wire, connecting mechanism between the wire-feeder and take-up for operating both conjointly, a guide on the take-up lever for separating the wires, and connected mechanism between the foregoing parts for operating them in due order, substantially as specified.

45. In a wiring-machine, the combination of a wire-feeder, a spindle for receiving the strands of wire and unwinding the same therefrom, means, substantially as described, for securing the wire to the bottle, a take-up for preventing slack of the wire, connected mechanism between the wire-feeder and take-up for operating both conjointly, and connected mechanism between the foregoing parts for operating them in due order, substantially as set forth.

46. In a wiring-machine, the combination of a wire-feeder, a spindle for receiving the strands of wire and unwinding the same therefrom, a guide in proximity to the spindle for separating the strands, jaws for receiving the wire from the spindle and applying it to the bottle, a take-up preventing slack of the wire, and a guide in proximity to the take-up lever for separating the strands, substantially as and for the purpose described.

47. In a wiring-machine, the combination of a continuously-operating feeder, a reciprocating spindle for receiving the strands of wire and unwinding the same therefrom, wire-securing mechanism substantially as described, for securing the wire to the bottle, and connected mechanism between the foregoing parts, substantially as specified.

48. In a wiring-machine, the combination of a continuously-operating feeder, a reciprocating spindle for receiving the strands of wire and unwinding the same therefrom, wire-securing mechanism, substantially as described, for securing the wire to the bottle, a take-up for preventing slack of the wire, and connected mechanism between the foregoing parts, substantially as described.

49. In a wiring-machine, the combination of a continuously-operating feeder, a reciprocating reversely-revoluble spindle for receiving the strands of wire and unwinding the same therefrom, wire-securing mechanism, substantially as described, for securing the wire to the bottle, a take-up for preventing slack of the wire, a guide between the feeder and spindle, and connected mechanism between the foregoing parts, substantially as and for the purpose set forth.

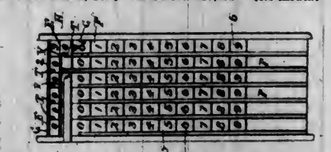
50. In a wiring-machine, the combination of a feeder for feeding two strands of wire, a reciprocating spindle for receiving strands of wire and unwinding the same therefrom, a guide for separating the wire, wire-securing means for securing the strands of wire to the bottle, and connected mechanism between the foregoing parts, substantially as and for the purpose described.

51. In a wiring-machine, the combination, with a wire-feeder, of a pair of reversely-revoluble spindles arranged at an angle with each other for winding the wire upon and unwinding it from their peripheries, wire-securing means, substantially as described, for receiving the strands of wire from the spindles and securing them to the bottle, and connected mechanism between the foregoing parts, substantially as set forth.

52. In a wiring-machine, the combination, with a wire-feeder, of a pair of reversely-revoluble spindles arranged at an angle with each other for winding the wire upon and unwinding it from their peripheries, take-ups for preventing slack of the wire, wire-securing means, substantially as described, for receiving the strands of wire from the spindles and securing them to the bottle, and connected mechanism between the foregoing parts, substantially as specified.

53. In a wiring-machine, the combination, with a wire-feeder, of a pair of spindles arranged at an angle with each other for receiving the strands of wire and unwinding the same therefrom, jaws for receiving the wire from the spindles and applying it to the bottles, a pair of movable levers having their extremities interposed between the feeder and the spindles for supporting the wire and taking up the slack thereof, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose specified.

54. In a wiring-machine, the combination of a wire-feeder, a revoluble spindle for receiving the strands of wire and unwinding the same therefrom, a take-up lever having one end mounted at one side of the spindle and engaged with the wire between said spindle and feeder, means for reciprocating the lever toward the spindle, and connected mechanism between the foregoing parts for operating them in due order, substantially as and for the purpose set forth.



55. The combination, with mechanism for receiving and applying the wire to the bottle, of a feeding-roller having a conical peripheral face for engaging the wire, means, substantially as described, for positively driving the feeding-roller, a spring-guide movable toward said roller for yieldingly forcing the wire against the same, and an adjuster for varying the position of the positively-driven roller to regulate the feed of the wire, substantially as and for the purpose specified.

56. The combination, with mechanism for receiving and applying the wire, of a revoluble shaft, a conical feeding-roller for the wire mounted on said shaft and movable lengthwise thereon, and an adjuster for moving the roller lengthwise on the shaft and regulating the feed of the wire, substantially as and for the purpose set forth.

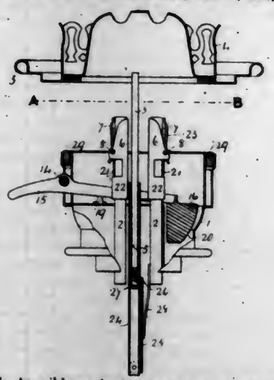
57. The combination, with mechanism for receiving and applying the wire, of a longitudinally-movable tapering feeding-roller, a spring-guide bearing against said roller, and an adjuster for varying the position of the roller for regulating the feed of the wire, substantially as and for the purpose described.

58. The combination, with mechanism for receiving and applying the wire, of a revoluble shaft, a tapering feeding roller for the wire mounted on said shaft, an adjuster for varying the position of the roller on the shaft and regulating the feed of the roller, and a guide for conducting the wire to the feeding-roller, substantially as and for the purpose set forth.

479,343. ADDING-MACHINE. WILLIAM H. WILSON, Moline, assignor of one-half to John V. Emmitt and Robert L. Kimbro, Sterling, Ill. Filed Dec. 2, 1891. Serial No. 413,759. (No model.)

Claim.—1. A series of separately-pivoted wheels E, provided with peripheral notches G, serially numbered, and bars F, provided with the double series of notches 4 and 5, the notches 5 being serially numbered and the bars being adapted to be separately moved longitudinally to engage and actuate, respectively, the wheels E, substantially as shown, and for the purpose described.

2. The combination of a transverse series of wheels E, provided with serially-numbered peripheral notches G, bars F, having lower engaging and upper serially-numbered notches and adapted to be carried upon and actuate, respectively, said wheels E, and a retaining-spring 18 for each bar, substantially as shown, and for the purpose specified.



3. The combination, with a frame, of a series of notched wheels journaled therein, each notch being provided with a number, a series of longitudinally-movable notched bars engaging with said wheels, the outer notches of said bars being provided each with a number, and a cross-bar secured to the frame outside of and near the upper ends of the bars when the latter are in their normal position, whereby the movement of each bar upwardly until the desired notch in the bar is

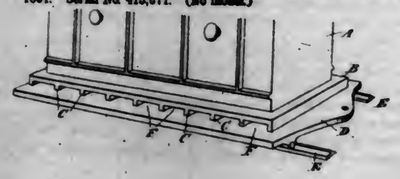
adjacent to the lower edge of the cross-bar the wheel will have been rotated the distance, substantially as set forth.

4. The combination, with a frame, of a series of notched wheels journaled therein, each of the notches being provided with a number and one of them with a radially-projecting pin, a notched bar for each wheel, the upper end of each bar being provided with a laterally-projecting lug upon the right-hand edge, whereby it may be engaged by the pin upon the next adjacent wheel to the right, substantially as set forth.

5. The combination of a series of separately-rotating wheels E, having a common axis of rotation and being peripherally notched and numbered, as described, and provided in their "0" notches with the radial spur T, and the separately-movable bars F, notched and numbered, as described, and provided with lateral lug V, adapted to be engaged by spur T, and thereby impart partial rotation to the next adjacent wheel E, substantially as shown, and for the purpose specified.

479,844. OIL-LAMP. JOHN D. YOUNG, Barnstaple, and HENRY R. YOUNG, London, England. Filed Feb. 11, 1891. Serial No. 381,264. (No model.) Patented in England Feb. 11, 1889, No. 2,391, and Dec. 29, 1890, No. 21,131; in France Feb. 12, 1891, No. 211,350; in Belgium Feb. 12, 1891, No. 93,744, and in Germany Feb. 19, 1891, No. 59,104.

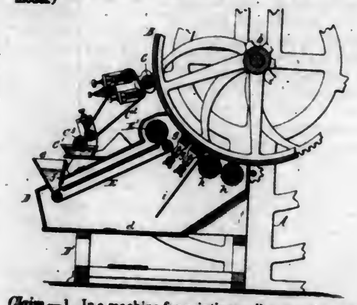
Claim.—1. An oil-lamp burner consisting of the body of the burner, wick-tubes, sliding extinguisher-boxes with their shutters and frame-lever having a fixed weight attached thereto, such weight being admitted into a recess formed in the lower part of the burner, and a lever-operating spring, all substantially as set forth, and for the purposes specified.



2. The combination, in oil-lamps, of the operating-lever having a fixed weight attached thereto and sliding extinguisher-boxes and shutters, and wick-tubes, with the burner-body having in its lower part a recess formed to receive the said lever-weight, substantially as set forth.

3. The combination, in oil-lamps, of the shutter-boxes 6 6, sliding upon wick-tubes 2 2 and having extinguishing-shutters 7 7, and side connecting-pieces 12 12, with the extending sliding legs 13 13 taking into slide-holes in the bottom of the burner, the whole being operated by the lever 5 and spring 19, all substantially as set forth.

4. The combination, in oil lamps, of the raising-gallery having the leg 5, in which is provided the hole 27, with the body of the burner having the slideway 24, upon which is carried the vertical lever 25, having a tooth 26, whose upper side is beveled or sloped considerably, the said lever being pressed inward by spring 28, all substantially as set forth, and for the purposes specified.

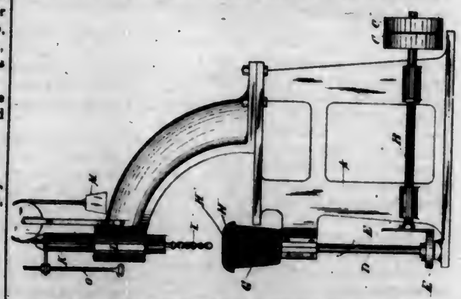


5. In oil-lamps, the combination of a raising-gallery, with the body of the burner having a cushion 29, substantially as described and shown, and for the purposes specified.

479,845. ANNEALING-BOX. AUGUSTUS BEYER, New Philadelphia, Ohio, assignor to himself and A. W. Brown, same place. Filed Dec. 1, 1891. Serial No. 413,671. (No model.)

Claim.—An annealing-box open at its bottom and provided with the usual carrier or bottom plate D and the auxiliary bottom plate B, having a series of transverse ribs C C, resting on upper side of the carrier or bottom plate D and forming air passages F between said two bottoms or plates, substantially as set forth.

479,846. APPARATUS FOR PRINTING WALL-PAPER. GEORGE K. BIRGE, Buffalo, N. Y. Filed July 27, 1891. Serial No. 400,784. (No model.)

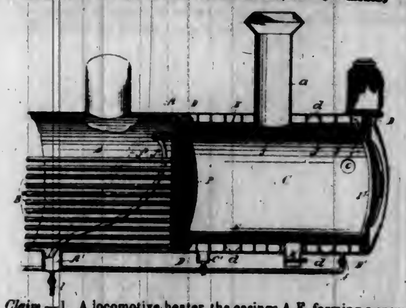


Claim.—1. In a machine for printing wall-paper, the combination, with an endless impression-surface, of a preliminary sizing-roller, whereby the pattern is printed by an adhesive liquid, a subsequent printing-roller, whereby the pattern is printed with color, and an intermediate bronze-applying device, whereby bronze or powdered material is applied to the size printing while the paper is moving in the printing-machine from the sizing-roller to the color-printing roller, substantially as set forth.

2. In a machine for printing wall-paper, the combination, with an endless impression-surface, of a sizing-roller arranged on the receiving side of the impression-surface, a color-printing roller arranged on the delivery side of the impression-surface, and an intermediate bronze-applying device arranged on the under side of the impression-surface, substantially as set forth.

3. In a machine for printing wall-paper, the combination, with an endless impression-surface, of a sizing-roller, by which the pattern is printed with an adhesive liquid, and a rotating bronze-applying device having its faces arranged at a distance from the under side of the impression-surface and from the paper moving with the same, whereby the bronze is thrown against the paper while the bronze-applying device does not come in contact therewith, substantially as set forth.

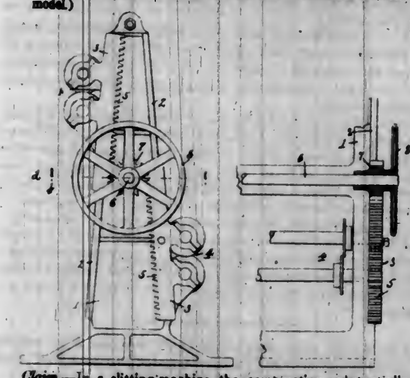
4. In a machine for printing wall-paper, the combination, with an endless impression-surface, of a sizing-roller, whereby the pattern is printed with an adhesive liquid, a bronze-applying device, whereby bronze or powdered material is delivered upon the printed paper, a polisher whereby the bronze is smoothed, a cleaner whereby the surplus bronze is removed, and a print-roller whereby a color is printed upon the bronzed paper, substantially as set forth.



479,847. MACHINE FOR MAKING HOLLOW ARTICLES. AMBROSE A. BLOUNT, Springfield, and FRANK K. WAY, Dayton, Ohio, assignors, by mesne assignments, to the Boston Filter Company, Boston, Mass. Filed Nov. 13, 1891. Serial No. 411,816. (No model.)

Claim.—1. The herein-described forming-tool for making hollow articles, the same consisting of a twisted blade or strip in the shape of a spiral with a transversely-rounded entering end and having the sides and end of said spiral rounded on its opposing edges, substantially as shown and described, and for the purpose set forth.

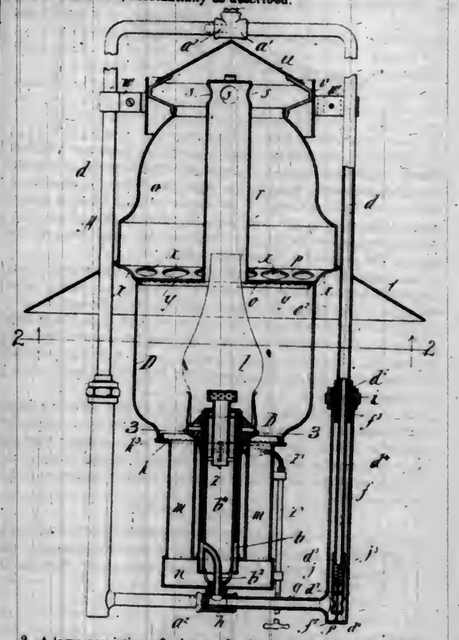
2. In a machine for making hollow articles, the combination, with a mold to form the outside of said articles, of a forming-tool consisting of a twisted blade or strip in the form of a spiral blunt on its entering end and provided with rounded opposing edges, substantially as and for the purpose described, one member being reciprocatable and either member rotatable, and means to effect such reciprocation and rotation of said members with respect to each other.



479,848. LOCOMOTIVE FEED-WATER HEATER. NEWTON S. CHAPMAN, Kansas City, Mo., assignor of one-half to Frank Hagerman, same place. Filed Apr. 4, 1892. Serial No. 427,633. (No model.)

Claim.—1. A locomotive heater, the casings A E, forming a space which is provided with horizontal partitions G, around which the water circulates, the coil-pipe I, connected to said chamber by drain-pipe I, and the return-pipe J, all in combination with a locomotive-boiler, substantially as and for the purposes set forth and described.

2. In a locomotive-heater, the water-chamber and the front extension, the horizontal partitions G, which keep up a circulation, the coil-pipe and return-pipe conveying the partially-heated water to the mud-drum, in combination with a locomotive-boiler, substantially as and for the purposes set forth and described.

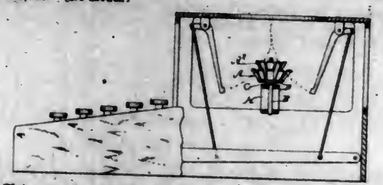


479,849. PAPER-SLITTING MACHINE. LEWIS P. CLAWSON and JOHN A. KELLER, Hamilton, Ohio, assignors to the Black & Clawson Company, same place. Filed Apr. 13, 1892. Serial No. 428,948. (No model.)

Claim.—In a slitting machine, the combination, substantially as set forth, of a pair of uprights provided with front and rear carriage-guides, slitter-carriages arranged for up-and-down motion on said guides and provided with inwardly-facing racks at each upright, a set of slitters mounted in each carriage, a shaft disposed across the machine between the planes of movement of the two carriages, and pinions on said shaft at each side of the frame in position to engage each with a pair of said racks.

479,850. LAMP. LESLIE A. COOPER, Springfield, Mass., assignor of one-half to Alfred A. Warner and Albert W. Allen, same place. Filed Jan. 28, 1892. Serial No. 419,713. (No model.)

Claim.—1. A lamp consisting of a burner having a central draft-tube and a conduit for conveying oil to the burner, a transparent chimney supported by the burner and extended upwardly therefrom, and a globe which widely surrounds the upper portion of the burner and extends upwardly therefrom and which also surrounds the chimney, a wall which substantially closes the globe at its bottom, there being, however, flues in communication with the globe-chamber, leading downwardly therefrom and communicating with the central draft-tube of the burner, a hood or dome having a bottom wall supported at the top of the globe-chamber and having an opening at its top and also having a central-draft tube, into the lower open end of which the chimney may direct the products of combustion, and having openings in its top, which has its position below the top of the hood, and the said hood having openings for taking air thereinto near its bottom and also having openings through its bottom for communicating with the globe-chamber, substantially as described.



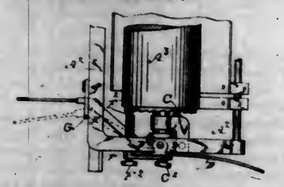
2. A lamp consisting of a burner having a draft-tube and conduit for conveying oil to the burner and the parallel vertical supports *d d*, the chimney *l*, supported by the burner and extended upwardly therefrom, and a globe which widely surrounds the upper portion of the burner extending upwardly therefrom, also surrounding the chimney and having a wall which substantially closes it at its bottom, there being, however, flues in communication with the globe-chamber, leading downwardly therefrom and communicating with the draft-tube of the burner, the hood or dome *g*, having the bottom wall *o*, with the openings *y y* for their communication between the hood and globe, and having at its bottom the air-ingress openings *x x*, the downwardly-flaring flange *t*, and the central draft-tube *r*, into the lower end of which the chimney may direct the products of combustion, which tube has openings in its top, which latter has its position below the top of the hood, and the said hood provided at its top with the exit-flues and also having the radially-extended clips *w w*, which have sliding engagements with the said parallel vertical supports, all substantially as and for the purposes set forth.

3. The combination, with a lamp, of a tubular support formed in sections *d* and *f*, the former having a connection with the oil-supply and having a contracted tubular extension which enters the section *f*, and which has the opening for establishing communication between the tube-sections *d* and *f*, and having the normally-closing valve with the axially-extended spindle f^3, and a coupling for drawing the section *f* to connection with the section *d* and for effecting the abutment of a portion of said section *f* against said spindle for forcing the valve open, and a pipe connection between said section *f* and the burner, substantially as described.

4. The combination, with a lamp, of a support therefor, consisting of tubular sections *d* and *f*, the former for connection with the oil-supply and the latter connected with the burner and having a wall or rest f^3 and rotatably engaged with its upper portion, the coupling *i*, and the section *d*, having the screw-threaded external portion, and the pipe extension, of reduced size, extended downwardly into the section *f* and having a valve-seat opening in communication with the passage of the section *f*, and the spring-pressed valve with a stem mov-

ably supported by the section which has the valve-seat and adapted to be borne upon by said rest on the coupling of the parts to hold the valve open, substantially as described.

479,351. DEVICE FOR INKING TYPE-WRITING MACHINES. ADOLPHUS S. DENNIS, Des Moines, Iowa, assignor to the Dennis Duplex Writing Machine Company, same place. Filed Oct. 10, 1891. Serial No. 408,390. (No model.)

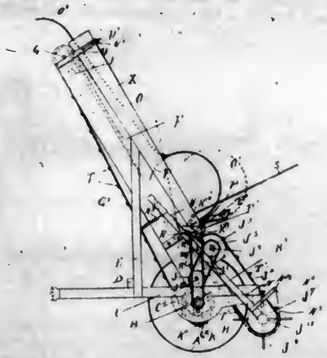


Claim.—1. In an inking-pad for type-writing machines, a flexible circular pad having incisions or openings extending radially from its circumference toward its center, a rigid stem having a shoulder, a rigid washer inclined upward at its circumference, a bibulous washer on top of the rigid washer, and means for clamping the pad and bibulous washer together on the stem, arranged and combined with the frame of the machine to operate as set forth.

2. An inking device for type-writing machines, comprising a stem adapted to be fastened to the frame of a machine, a rigid circular washer in engagement with a support at the lower portion of the stem and the circumferential edge of the washer inclined upward, a flexible circular pad on top of the rigid washer, bibulous washers on top of the pad, and a nut on the screw-threaded top end of the stem, adapted to clamp the pad and washers together in the manner set forth, for the purposes stated.

3. A detachable inking device for type-writing machines, comprising flexible pads connected with a rigid stem having a shoulder or fixed collar, a rigid plate supported by said collar, washers between the two pads, and a nut on the screw-threaded top end of the stem, arranged and combined with a type-writing machine to operate in the manner set forth.

479,352. LINE-SPACING MECHANISM FOR TYPE-WRITING MACHINES. ADOLPHUS S. DENNIS, Des Moines, Iowa, assignor to the Dennis Duplex Writing Machine Company, same place. Filed Oct. 10, 1891. Serial No. 408,391. (No model.)



Claim.—1. In a type-writing machine, a device for spacing, comprising a bent lever having a tubular short arm and a spring-actuated pawl in said arm adapted to engage a ratchet on the end of a roller, a tube having a spring-actuated detent therein adapted to engage the ratchet on the end of the roller, and a curved arm connected with the outer end of the pawl in the short tubular arm of the lever, and a lever adapted to engage the curved arm to simultaneously disengage the pawl and the detent from the ratchet on the end of the roller, arranged and combined with a carriage-frame and a roller mounted thereon having ratchet-teeth on its ends, to operate in the manner set forth.

2. A lever carrying a spring-actuated pawl, with its short arm pivoted to the sliding carriage of a type-writing machine, a tube carrying a spring-actuated detent and having an arm extending at right angles and connected with the outer end of the pawl, and a lever pivoted to the frame and its short arm extended under the arm of the detent-carrier, and a roller carried by the frame, having a circular ratchet on its end, arranged and combined to operate in the manner set forth, for the purposes stated.

479,353. HAY-LOADER. GEORGE A. DICKERMAN and JOSEPH P. ELLACOTT, Chicago, Ill.; said George A. Dickerman assignor to Frances S. Dickerman. Filed Sept. 28, 1891. Serial No. 407,068. (No model.)

Claim.—1. In a hay-loader, the combination of an elevator to carry the hay upward, a buncher of substantially the width of the elevator arranged adjacent to the surface thereof between its ends to intercept the hay being elevated and collect it into bundles, means whereby the buncher is moved away from the elevator to permit the bundle to continue with the elevator, and a guide substantially equal in width to the width of the elevator, between which and the elevator the hay moves as a bundle after leaving the buncher.

2. In a hay-loader, the combination, with the elevator, of a bunching device of substantially the width of the elevator, consisting of curved fingers arranged adjacent to and above the elevator and between its ends and supported upon a rock-shaft, and means for intermittently automatically rocking such shaft to gather and discharge the bunch or bundle.

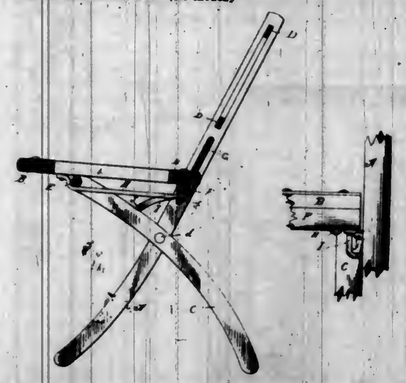
3. In a hay-loader, the combination, with the elevator, of a buncher consisting of substantially-semicircular fingers arranged adjacent to the elevator between its ends, and the guide-fingers curved at their lower ends to substantially correspond with the buncher-fingers and extending from the buncher to the discharge end of the elevator, whereby the hay after being bunched passes between the elevator and such guide-fingers to the place of delivery.

4. In a hay-loader, the combination, with the elevator, of the buncher situated adjacent to and between the ends of the elevator and consisting of curved bunching-fingers supported upon a rock-shaft, means for intermittently rocking such shaft to gather and discharge the bunch or bundle, and stripping-fingers supported on a rock-shaft and adapted in a like manner to be operated to strip the hay from the bunching-fingers.

5. In a hay-loader, in combination with an elevator, a bunching and discharge device located adjacent to and between the ends of the elevator and consisting of gathering and stripping fingers projecting from rock-shafts, and means for intermittently rocking such shafts in opposite directions.

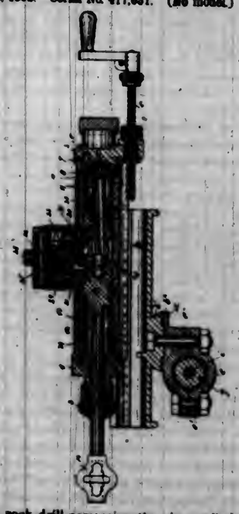
6. In a hay-loader, the combination, with the elevator, of a bunching device located adjacent to and between the ends of the elevator and consisting of bunching and stripping fingers supported each series upon a rock-shaft, said rock-shafts being operatively connected, so as to rotate with different rapidities in opposite directions, and driving connections for the same from some driving part of the machine.

7. In a hay-loader, the combination of an elevator, with a bunching device arranged between its ends, a supplemental elevator arranged above the lower portion of the main elevator, guide-slats passing parallel with the latter elevator and terminating at the bunching device, and a cross-piece, to which the upper ends of the said guide-slats are secured.



479,354. DIE. HENRY C. DICKINSON, Springfield, Mass., assignor to the Springfield Specialty Manufacturing Company, same place. Filed Oct. 5, 1891. Serial No. 407,819. (No model.)

Claim.—1. The metallic base-plate having a channel therein and a pin entering said channel, the removable die members B B, resting directly in said channel and having depressions in line with said pin and conforming to the shape of the stud which is covered and supported by said die members, the die member D, having a depression therein opposite the recess in the die members B B, and the block C, embracing and inclosing said die member D and having means for causing said die members to register, all combined substantially as described.



2. The base die-block having the channel therein and the pin supported at an intermediate part of the base of the channel and extending upwardly into the channel, the separable and removable die members B B, constructed to rest in the channel and having matching depressions in their adjacent faces in line with the pin and conforming to the exterior of the metallic stud, and the upper die-block with the depression conforming to the desired shape of the molded article, with means for guiding said die members in a direct line, all combined substantially as described.

479,355. FOLDING CHAIR. EDWARD E. ELDRIDGE, North East, Pa., assignor of one-half to Alonzo W. Stone, same place. Filed Mar. 5, 1890. Serial No. 342,801. (No model.)

Claim.—In a folding chair, substantially as described, the combination, with the legs A, extending above the seat-frame and having the longitudinal slots G in their inner sides, of the seat having the cross-piece F adjacent to its rear transverse edge, the pins connected to the said cross-piece and sliding in the slots G of the legs A, the guides H, secured to the under side of the seat and to the cross-piece F, the legs C, pivotally connected to the legs A, the transverse round E, connecting the upper ends of the legs C and sliding between the guides H and the lower side of the seat, and the arm I, connected to the cross-piece F and having an angular branch adapted to engage with the upper portion of one of the legs C when the chair is being unfolded, substantially as and for the purpose set forth.

479,356. ROCK-DRILL. THOMAS F. FARRELL, Paterson, N. J. Filed Jan. 11, 1892. Serial No. 417,631. (No model.)

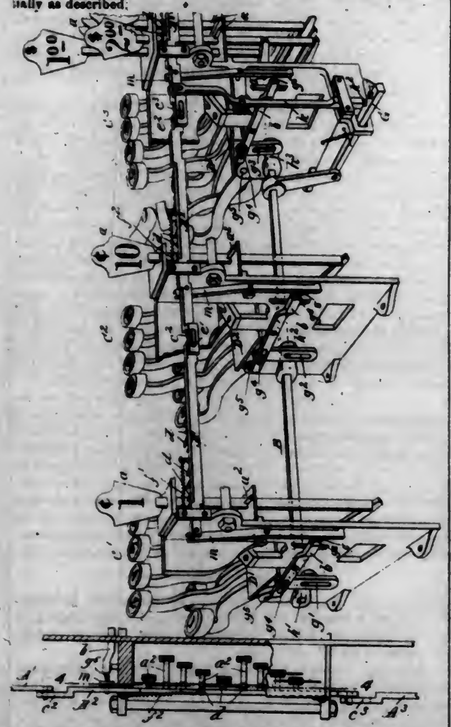
Claim.—1. A rock-drill containing therein a cylinder, a cylinder-head secured to each end of said cylinder, a drill-carrying piston adapted to move up and down in said cylinder, a drill-rotating bar provided at its top with a flattened portion adapted to rest in a corresponding recess on the inside of the upper cylinder-head, a wheel provided on its flattened surface with teeth and arranged to rest partly against the under side of said flattened portion of the drill-rotating bar and also against the inside of the said upper cylinder-head, a locking plate or disk at the under side of said wheel and adapted to prevent the rotating bar from turning during the downward stroke of the piston, pins arranged in said cylinder-head and adapted to operate in the teeth of said wheel, and spiral springs controlling said pins, all said parts being arranged and adapted to operate substantially as described, and for the purposes set forth.

2. In a rock-drill-rotating device, the combination, with the cylinder, piston, and cylinder-heads, of a rotating bar, a flattened top made integral with said bar and adapted to rest in a corresponding recess in the cylinder-head, a wheel provided at its upper surface with teeth and resting against said flattened top and the said cylinder-head, pins arranged in said cylinder-head and acting as pawls for said toothed wheel, and a locking-disk arranged beyond said wheel and adapted to force the said wheel against the flattened top of the rotating bar and the cylinder-head during the downward motion of the piston, thereby preventing said bar from turning, substantially as described, and for the purposes set forth.

3. In a rock-drill, the combination, with the cylinder and its guide, of a mounting-plate secured to said guide and provided with a circular projection b^3, a spindle provided at each end with a cap and around the center part with a shell consisting of two parts, the upper one of which is provided with a flattened top, to which the mounting-plate of the guide is pivotally secured, a circular recess arranged in said flattened top and adapted to receive the circular portion b^3, bolts holding said shell parts together, one of them serving, also, as a fulcrum for the mounting-plate, a bolt passing through said spindle and holding said caps and shells in place, a ball-socket arranged on each of said caps and made integral therewith, a leg holder or socket provided at its upper end with a ball adapted to work in said ball-socket, a recess arranged in said ball, a bolt pivotally secured with its lower rounded portion in said recess and with its upper portion in said ball-socket, and a yoke provided with the third or rear leg-holder and pivotally secured to the spindle, all said parts being arranged and adapted to operate substantially as described, and for the purposes set forth.

4. In a rock-drill, the combination, with the cylinder and the piston, of a groove provided in said piston, a valve chamber secured to said cylinder, a double-headed cylindrical piston-valve arranged in said valve-chamber, a valve-lever 23, pivotally secured in the joint of the cylinder and the said valve-chamber, and provided at its lower part 20 with inclines 18 and 19, a ball 22, arranged at the upper end of valve-lever 23, and a ball-socket arranged in the connecting-stem of the said double-headed piston-valve and adapted to engage with said ball 22, said valve-lever being adapted to be operated by the groove in the piston of the cylinder, substantially as described, and for the purposes set forth.

479,357. CASH REGISTERING AND INDICATING MACHINE. EDWARD N. FOOTE and JOHN J. RANGE, Northampton, Mass., assignors to the Boston Cash Register Company, same place. Filed Apr. 13, 1892. Serial No. 428,987. (No model.)



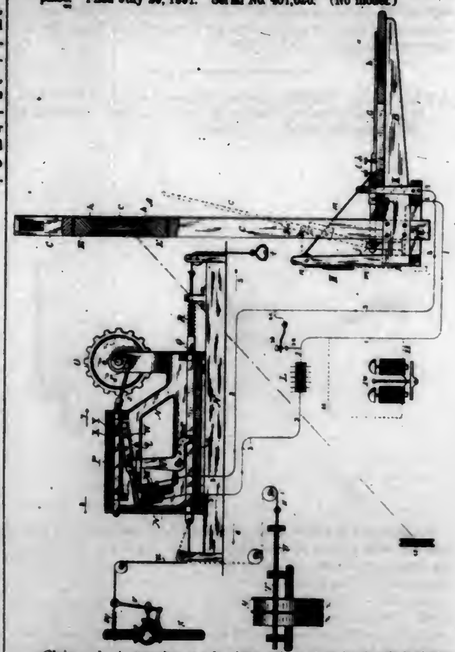
Claim.—1. A cash-register having two or more banks of keys and indicating-tags respectively therefor having support-stops, support-bars having supporting portions for the engagement with the indicator-stops, and the several bars having sliding engagements one relative to the other, whereby the sliding movement of a bar for one of the higher banks will draw the bars for the other banks, but whereby the sliding movement of the bar of a lower bank may be independent of the bar of the next higher bank, and means for effecting on the depression of the key of any bank a sliding movement of the highest support-bar and a special medium of connection between the keys of each of the banks below the highest bank and the support-bar therefor for effecting on the working of a lower-bank key the sliding movement of the support-bar for such bank, substantially as and for the purposes set forth.

2. A cash-register having two or more banks of keys and indicating-tags respectively therefor having support-stops, support-bars having portions for supporting engagement with the indicator-stops, and the several bars having sliding engagements one relative to the other, whereby the sliding movement of a bar for one of the higher banks will draw the bars for the other banks, but whereby the sliding movement of the bar of a lower bank may be independent of the bar of the next higher bank, and means for effecting on the depression of the key of any bank a sliding movement of the highest support-bar, and special mediums of connection between the keys of the highest bank and its support-bar and between the keys of the lower banks and their support-bars for effecting the sliding movements of the bars, respectively, of such banks, substantially as and for the purposes set forth.

3. In a cash-indicating machine, in combination, two or more

sets of movable indicators, support-bars arranged for supporting engagement respectively with the said sets of indicators and having sliding engagements with each other, whereby one may move out of its indicator-supporting position and draw the one next thereto, but whereby the latter on moving out of its indicator-supporting position will be without effect on the first-named bar, substantially as described.

4. In a cash registering and indicating machine, in combination, two or more banks of keys and sets of movable indicators therefor and support-bars respectively for the said indicators, having sliding engagements the one relative to the other, whereby the sliding movement of a bar for a higher bank will draw the bar of the lower bank, but whereby the sliding movement of the bar of a lower bank may be independent of the bar of the higher bank, means for moving the support-bar for one of said banks on the operation of any key of either bank, a separate lever connected to the support-bar for each bank, and an actuating-cam for each of said levers and each cam adapted to be moved by the operation of any key of one of the said banks, substantially as described.



5. In a cash registering and indicating machine, the combination, with two or more banks of keys and indicators respectively therefor, of separate support-bars for engagement with the indicator-stops of the several banks, having sliding engagements the one with the other, substantially as described, the rock-bar common to and having an engagement, substantially as described, with the key-levers of all of the banks, and a medium of connection between the said rock-bar and the support-bar of one of the banks of keys, the separate rocker-plates for the several banks of key-levers, levers pivotally mounted and connected, respectively, with the support-bars, and other levers having cams therein to exert forcing actions on said first-named levers and connected for their swinging movements to said rocker-plates, substantially as described.

6. The combination, in a cash registering and indicating machine having two or more banks of key-levers with sets of indicators respectively therefor and support-bars for the indicators, having engagements the one relative to the other, whereby the sliding movements of higher-bank bars will draw lower-bank bars, but whereby the movement of the lower-bank bars may be independent of the higher-bank bars, of levers *m*, intermediately pivotally supported, each having an abutment portion thereon, pivoted levers *b b*, intermediately pivoted to have their extremities swing in proximity with said abutment portion and each having the oblique cam g^6 thereon and said levers mounted for a slight movement laterally of their planes of swinging movement.

and mediums of connection between said levers and the keys of the different banks, substantially as and for the purpose described.

479,358. ELECTRIC STOP-MOTION FOR TEXTILE MACHINERY.

SAMUEL L. FOSTER, Wilmington, Del., assignor to John T. Ahrens, same place. Filed July 29, 1891. Serial No. 401,096. (No model.)

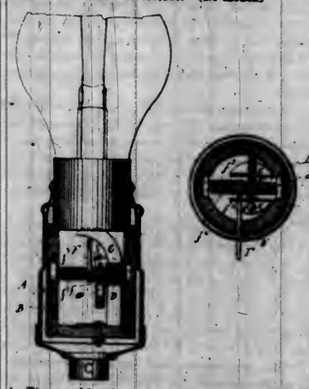
Claim.—1. A stopping mechanism and an electric circuit including an electric generator and an electro-magnet, which controls said stopping mechanism, said electric circuit terminating in separated electrodes, in combination with a movable circuit-controller movable between and from said electrodes, said circuit-controller having a guide through which the material acted upon in its normal condition freely passes, but which does not permit the passage of a tangle, knot, or equivalent obstruction, enlargement, or defect in said material, and said movable circuit controller having a portion which is normally located between said electrodes, substantially as set forth, whereby upon the occurrence of a tangle, knot, or equivalent obstruction, enlargement, or defect in the material acted upon said movable circuit-controller is moved by the material from between said electrodes, and the normal condition of the electric circuit is changed, thereby stopping the machine.

2. A stopping mechanism and a normally-open electric circuit including an electric generator and an electro-magnet, which controls said stopping mechanism, said electric circuit terminating in normally-separated spring-electrodes, in combination with a movable circuit-controller movable between and from said electrodes, said circuit-controller consisting of a pivoted lever having an insulated portion, which is normally located between and separates said spring-electrodes, said pivoted lever having a guide through which the material acted upon in its normal condition freely passes, but which does not permit the passage of a tangle, knot, or equivalent obstruction, enlargement, or defect in said material, on the occurrence of which said lever is moved by the material from between said electrodes, and the latter come together, thus closing the electric circuit and stopping the machine, substantially as set forth.

3. A defect-detector having two separated guides *b c*, between which material being acted upon passes, two normally-separated spring-electrodes, a stopping mechanism, and an electric circuit terminating in said electrodes, said circuit including a generator and an electro-magnet, which controls the operation of said stopping mechanism, in combination with a pivoted circuit-controlling lever, said lever having two separated arms located between said guides *b c*, between which arms the material passes in its path between said guides *b c*, and said lever having a portion which is normally located between said spring-electrodes, thereby separating the same, substantially as set forth.

4. A frame having two separated guides *b* and *c*, in combination with a circuit-controller having an open guide located between said guides *b c*, said controller being movable between said guides *b c*, the guide of said controller being when the controller is in one position in the line between said guides *b* and *c*, but being out of said line when said controller is in another of its positions, substantially as set forth.

5. The circuit-controller G, having a guide through which the material acted upon in its normal condition freely passes, but which prevents the passage of a tangle, knot, or equivalent obstruction, enlargement, or defect in said material, in combination with the terminal spring-electrodes J and K, which tend to approach each other and which grasp and hold said circuit-controller between them during the passage of said material in its normal condition, but which permit said circuit-controller to be withdrawn from between them on the occurrence of a tangle, knot, or equivalent defect in said material, substantially as set forth.



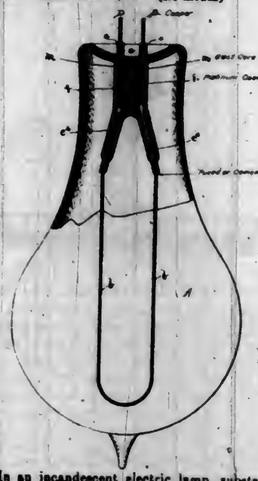
6. The pivoted circuit-controlling lever occupying normally a horizontal position and having a guide through which the material acted upon in its normal condition freely passes, but which prevents the passage of a tangle, knot, or equivalent obstruction, enlargement, or defect in said material, in combination with the terminal spring-electrodes J and K, which tend to approach each other and which grasp and hold said lever in its normal horizontal position during the passage of said material in its normal condition, but which permit said lever to be withdrawn from between them on the occurrence of such a defect, and a weight connected with said lever for maintaining it away from said electrodes when displaced by the occurrence of a defect in the material, substantially as set forth.

7. The lever G, having a guide between which material in its normal condition freely passes, but which does not permit the passage of a tangle, knot, or other equivalent obstruction, enlargement, or defect, said guide being formed by two arms adjustable to and from each other, whereby the guideway may be adjusted to accommodate varying sizes of the material in its normal condition, substantially as set forth.

8. The frame A, having entrance guide-opening *b* and upper guide-opening *c* above said guide-opening *b*, the overbalanced lever G, pivoted to said frame, said lever having guide-arms *i i*, with an open guide-space between them, said lever occupying normally a horizontal position between said guide-openings *b* and *c*, with its arms *i i* across said guide-opening *b*, whereby a warp or bundle of threads in traveling from opening *b* to opening *c* passes between said arms *i i*, and a tangle, knot, or similar defect in said warp lifts said lever, and said lever having a circuit-breaking block I of insulating material, in combination with a stopping mechanism, an electric circuit including a generator and an electro magnet, which controls said stopping mechanism, said circuit terminating in two spring-electrodes, which tend to approach each other, said block I on said lever being in the normal position of said lever located between said electrodes, thereby separating the same, substantially as set forth.

479,359. INCANDESCENT-LAMP SOCKET.

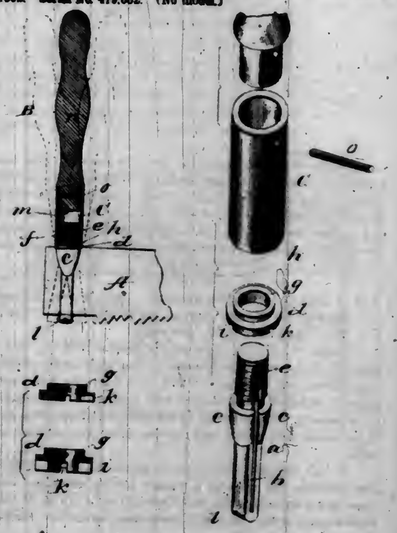
ISAAC GOLDBERG, New York, N. Y., assignor to Louis Stirn and Julius Sombern, same place. Filed Dec. 15, 1891. Serial No. 415,100. (No model.)



Claim.—1. The combination of a socket provided with electrical conductors, a spindle arranged between said conductors, an oblong block on said spindle, a ratchet-wheel and pawl also arranged on said spindle, a lever, and a clutch device interposed between the lever and the spindle, so as to produce the turning of the block when moving the lever in downward direction without turning the spindle when the lever is returned by its spring in upward direction, substantially as set forth.

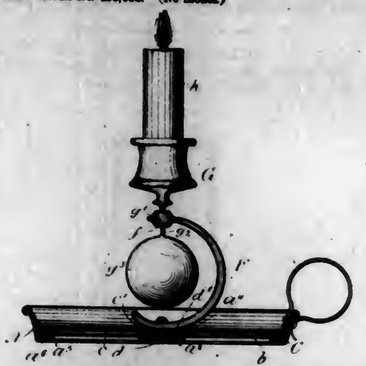
2. The combination, with a socket having electrical conductors, of a rotary spindle arranged between said conductors, a block on said spindle adapted to engage or release the said conductors, a ratchet-wheel on said spindle, a check-pawl engaging said ratchet-wheel, a sleeve mounted loosely on said spindle, a lever attached to said sleeve, a helical spring acting on said lever and sleeve, and a clutch device between the sleeve and the spindle, substantially as set forth.

479,360. INCANDESCENT ELECTRIC LAMP.



HENRY GREEN, Hartford, Conn., assignor of one-half to F. C. Rockwell, same place. Filed Sept. 2, 1891. Serial No. 404,535. (No model.)

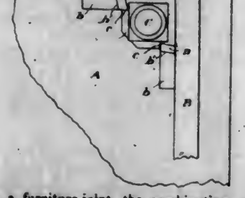
Claim.—In an incandescent electric lamp, substantially as described, the combination of the bulb, the seal connected to the neck of the bulb and comprising the body and the depending legs, the leading-in tubes incased in the body and depending legs of the seal, the glass cores or fillings in the leading-in tubes, the filament within the lamp having its ends secured in the lower ends of the tubes, and the wires secured in the upper ends of the tubes, all substantially as and for the purpose set forth.



479,361. CROSSCUT-SAW HANDLE.

JOHN GREEN, Renovo, Pa., assignor of one-half to Emerick Miciangi, same place. Filed Jan. 29, 1892. Serial No. 419,632. (No model.)

Claim.—A saw-handle provided with a ferrule, having a receptacle for a lubricant within the ferrule and an aperture in the end of the ferrule through which to move said lubricant, in combination with a saw-supporting bolt closing said aperture.

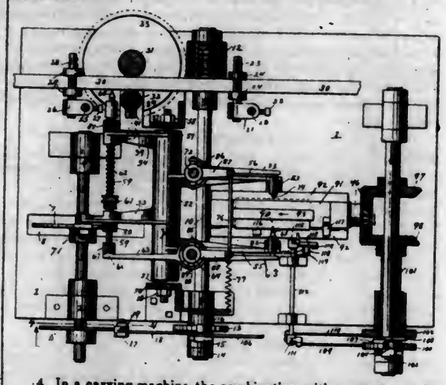


479,862. CANDLESTICK. HARRY M. HAMRICK, Philadelphia, Pa., assignor to the Mechanical Novelties Company, same place. Filed Feb. 2, 1892. Serial No. 420,082. (No model.)

Claim.—1. A candlestick provided with a base comprising a saucer-shaped skeleton plate having radial arms carrying a central hub, a frame-work provided with radial arms carrying a central seat, a translucent plate or disk intermediate of the plate and framework, a weighted candle-holder provided with a ball, and a curved arm secured to said seat and hub and provided with a spherical socket engaging said ball, substantially as and for the purposes set forth.

2. In a candlestick, a base comprising a saucer-shaped skeleton plate having radial arms carrying a central hub, a framework provided with radial arms carrying a central seat, a translucent plate or disk intermediate of the plate and frame, and means for connecting said framework and plate, substantially as and for the purposes set forth.

479,868. FURNITURE-LEG FASTENING. HENRY M. HANSON, Janesville, Wis., assignor to the Hanson Furniture Company, of Wisconsin. Filed Jan. 23, 1892. Serial No. 419,071. (No model.)



Claim.—In a furniture-joint, the combination, with horizontal bed-pieces meeting at an angle and provided on their inner sides with offsets having their inner edges inclined vertically and horizontally, of a detachable standard provided with vertical grooves facing said offsets and inclined horizontally, and wedge-shaped locking-pins secured between said grooves and offsets, substantially as shown and described.

479,864. CARVING-MACHINE. MAX HENTEL, Chicago, Ill., assignor to the National Machine Works, same place. Filed Sept. 23, 1891. Serial No. 406,564. (No model.)

Claim.—1. In a carving-machine, the combination, with a cutter movable both endwise and laterally, a pattern having elevations and depressions, and a stylus movable both laterally and endwise and adapted to follow the surface of said pattern, of differential connections between said stylus and cutter for transmitting from the former to the latter both lateral and endwise movement, substantially as set forth.

2. In a carving-machine, the combination, with a cutter movable both laterally and endwise, a pattern having elevations and depressions, and a stylus movable both laterally and endwise, of connections between said stylus and cutter, comprising means for transmitting the lateral and endwise movements of the stylus independently of each other, substantially as set forth.

3. In a carving-machine, the combination, with a cutter movable both laterally and endwise, a pattern having elevations and depressions, and a stylus movable both laterally and endwise for following said pattern, of connections between said stylus and cutter, comprising a pair of differential levers, one transmitting the lateral and the other transmitting the endwise movement of the stylus, substantially as set forth.

4. In a carving-machine, the combination, with a cutter movable both laterally and endwise, a pattern having elevations and depressions, and a stylus movable both laterally and endwise, of connections between said stylus and cutter, comprising a lever for transmitting the lateral movement of the stylus and a second lever carried by the first for transmitting the endwise movement of the stylus, substantially as set forth.

5. In a carving-machine, the combination, with a cutter, a pattern, and a stylus for following said pattern, of a lever carrying the stylus and cutter on opposite sides of its fulcrum and a second lever carried by the first and engaging the stylus and cutter-spindle at its opposite ends, said levers having differential motions, substantially as set forth.

6. In a carving-machine, the combination, with a cutter, a pattern, and a stylus, of a lever carrying the cutter and stylus at different distances from its fulcrum and a second lever fulcrumed to the first and engaging the cutter-shaft and stylus at equal distances from its fulcrum, substantially as set forth.

7. In a carving-machine, the combination of the lever X, having arms 53 and 55, the cutter 60, the endwise-movable spindle 62, carried by the arm 53, the endwise-movable stylus 65, engaged by the arm 55, and the lever 63, fulcrumed to the lever X and engaging the spindle 62 and stylus 65, substantially as set forth.

8. In a carving-machine, the combination of the lever X, having arms 53, 54, and 55, the endwise-movable cutter-spindle 62, journaled in the arms 53 and 54, the pulley 61, and the spindle, the spring 65, surrounding and exerting its force against the spindle, the endwise-movable stylus 65, engaged by the arm 55, and the lever 63, fulcrumed to the lever X and engaging the cutter-spindle and stylus, substantially as set forth.

9. In a carving-machine, the combination, with a pattern, of means actuated by the pattern, having elevations and depressions for producing a fac-simile thereof, and means actuated by the pattern for producing a complement thereof, both of said means comprising a stylus movable endwise, a cutter movable endwise, and connections between them for transmitting the movement of the former to the latter, substantially as set forth.

10. In a carving-machine, the combination, with a cutter and pattern, of two styluses presented in opposite directions and adapted to engage the pattern from opposite sides and means for transmitting the movement of either stylus to the cutter, substantially as set forth.

11. The combination, with the endwise-movable cutter and the pattern, of a pair of styluses, a pair of levers partaking of the endwise movement of said styluses, and means for transmitting the movement of either of said levers to the cutter, substantially as set forth.

12. The combination, with the endwise-movable cutter and the pattern, of the stylus 65, the lever 63, partaking of the endwise movement of said stylus and transmitting it to the cutter, the second stylus 74, the lever 73, by which it is carried, and a connection between the levers 63 and 73, substantially as set forth.

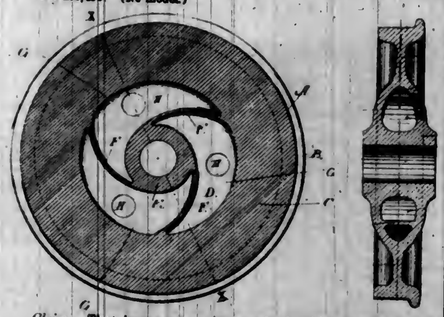
13. In a carving-machine, the combination of the levers X and X^5, the bar 80, connecting them, a plurality of cutters having spindles journaled in said bars, means for oscillating the levers, and means for producing the desired endwise movement of the cutter-spindles, substantially as set forth.

14. The combination of the levers X and X^5, the bars 80 and 82, connecting them, a plurality of cutters having their spindles journaled in bar 80, the rod 64, connected to levers X and X^5, the sleeve 84, surrounding said rod, a plurality of levers 63, &c., fulcrumed to the sleeve and engaging the cutter spindles, the stylus 65, engaged by the lever 63 and rod 82, and a pattern, substantially as set forth.

15. In a carving-machine, the combination, with a cutter movable endwise and means for feeding the stock, of an oscillating lever carrying the cutter back and forth across the stock and means for producing the desired endwise movement of the cutter, substantially as set forth.

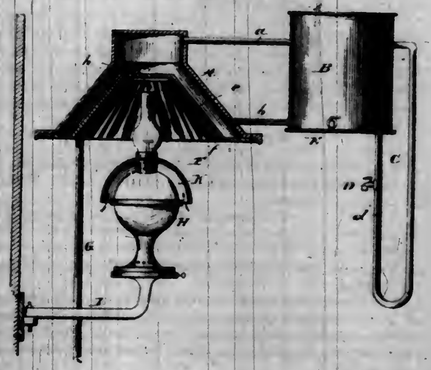
16. In a carving-machine, the combination, with a cutter movable endwise, a stylus movable endwise, and a pattern having elevations and depressions, of means for simultaneously advancing the pattern and stock at different surface speeds, an oscillating lever carrying the stylus and cutter, and means for transmitting the endwise movement of the stylus to the cutter, substantially as set forth.

479,865. PROCESS OF PLATING CLAY WITH GLASS AND IN ARTICLES MADE ACCORDINGLY. ARTHUR A. HOUGHTON and ROBERT D. HAIWEL, Corning, N. Y., assignors, by direct and mesne assignments, to the Clay Glass Tile Company, same place. Filed Oct. 15, 1891. Serial No. 408,783. (No model.)



Claim.—1. The process of manufacturing glass-plated bricks, tiles, and other articles, which consists in forming the article of clay or clay composition of approximately the same degree of contraction and expansion as the glass employed, raising the said article to a high temperature, applying to the surface to be coated glass in a molten condition, compressing the molten glass onto the surface of the brick, so that the under surface of the glass will adhere to the clay, and finally annealing the glass-plated article, substantially as set forth.

2. A brick or tile composed of clay or clay composition and glass compressed on the clay, said clay and glass being approximately of the same degree of contractibility and expansion, substantially as set forth.



3. A brick or tile composed of a body of clay or clay composition formed with an opening through it, such as *f*, and a glass plate compressed onto the face of said body and covering said opening, substantially as set forth.

479,866. CAR-WHEEL. ALFRED HYMAN, Albany, N. Y., assignor of one-half to Jacob Brockley, same place. Filed Apr. 9, 1892. Serial No. 428,435. (No model.)

Claim.—That improvement in car-wheels which consists in connecting the rim of the car-wheel to the hub by means of an annular member of single thickness integrally joined to two walls, which are bulged outwardly to form annular swells, said walls being connected together by means of curved arms, which are integrally joined to said hub and walls and which curve tangentially from the periphery of said hub, whereby the space between said hub and walls is separated into a series of segmental chambers, as and for the purpose herein specified.

479,867. MEANS FOR UTILIZING HEAT OF LAMPS. ALEXANDER S. H. JOHNSTON and ANNA JOHNSTON, Columbiana, Ohio, and JAMES G. THOMPSON, New Brighton, Pa., administrators of James J. Johnston, deceased, assignors of one-half to David C. Reinohl, Washington, D. C.; John R. Allen, present administrator, succeeding prior administrators. Filed Oct. 1, 1891. Serial No. 407,449. (No model.)

Claim.—1. An air-heater having a chamber within its walls, ingress and egress apertures, and a heat-reflecting surface, in combination with a branched tubular conduit upon which said heater is supported, communicating with the heating-chamber and extending to or near the floor of a compartment, and a support for a lamp between the branches of the conduit, substantially as described.

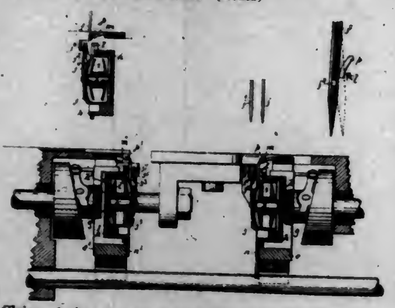
2. An air-heater having a chamber within its walls, ingress and egress apertures, and a heating-reflecting surface, in combination with a tubular conduit and a heating-coil within the conduit, substantially as described.

3. An air-heater supported upon a tubular conduit and having a heat-reflecting surface on its lower side, in combination with a lamp supported under said heater and a shield supported by and engaging the neck of the lamp.

4. An air-heater supported upon a tubular conduit, in combination with a lamp and a shade surrounding the chimney of the lamp and constructed to collect heat radiated from the burner through the chimney and direct the same against the air-heating chamber.

5. An air-heater supported upon a tubular conduit, in combination with a lamp and a vertically-separable shade pivotally secured to the tubular conduit and surrounding the chimney of the lamp, as and for the purpose set forth.

479,868. MEANS FOR UTILIZING HEAT OF LAMPS. ALEXANDER S. H. JOHNSTON and ANNA JOHNSTON, Columbiana, Ohio, and JAMES G. THOMPSON, New Brighton, Pa., administrators of James J. Johnston, deceased, assignors of one-half to David C. Reinohl, Washington, D. C.; John R. Allen, present administrator, succeeding prior administrators. Filed Oct. 1, 1891. Serial No. 407,449. (No model.)



Claim.—1. The combination, with a water-reservoir, of a water-heating chamber and suitable connections, an air-heating chamber under said water-heating chamber and a conduit for conducting air to said air-heating chamber, and a heating device under the water and air heating chamber.

2. The combination of a water-heating chamber, an air-heating chamber having one of its walls formed by one of the walls of the water-heating chamber, means for conducting air from or near the floor of a compartment to said air-heating chamber, and a heating device under both of said chambers.

3. The combination, with a reservoir, of a water-heating chamber provided with a deflecting-surface, a reflector, an air-heating chamber between the water-heater and the reflector, and a suitable heating device.

4. The combination, with a reservoir, of a water-heating chamber provided with a deflecting-surface, a reflector attached to the water-chamber, an air-heating chamber, a conduit for conducting air to said chamber, and a heating device.

479,369. SEWING-MACHINE. FERDINAND KERN, Linden, N. J., assignor to the Kern Multiple Machine Company, of New Jersey. Filed Nov. 3, 1891. Serial No. 410,716. (Model.)

Claim.—1. In a sewing-machine, in combination, the needle, a loop-taker disposed in such position with respect to the needle as to normally engage the needle-thread beneath the fabric and co-operate with the needle in forming the stitch, and a member interposed between said needle and said loop-taker, whereby the engagement of the needle-thread by its loop-taker is prevented, and a support for said member admitting of its being retracted to permit the formation of stitches, substantially as described.

2. In a sewing-machine, in combination, the needle, a loop-taker disposed in such position with respect to the needle as to normally engage the needle-thread beneath the fabric and co-operate with the needle in forming the stitch, a member whereby the needle-thread is shoved out of position to be engaged by said loop-taker, and means whereby said member may be retracted to permit the formation of stitches, substantially as described.

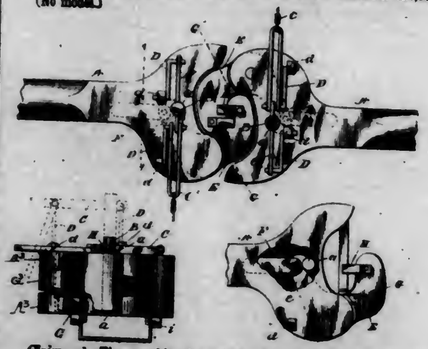
3. In a duplex sewing-machine, in combination, the two needles, a loop-taker for each of said needles disposed in such position with respect to the needle as to normally engage the needle-thread beneath the fabric and co-operate with the needle in forming the stitch, and a movable member whereby the needle-thread of one of said needles may be shoved out of position to prevent the engagement thereof by its loop-taker, substantially as described.

4. In a sewing-machine, in combination, the needle, the loop-taker by which the needle-thread is engaged beneath the fabric, an inclined member located in the normal path of said needle, whereby said needle may be deflected away from said loop-taker, and means whereby said member may be retracted, leaving the needle and loop-taker in the normal relative position for forming stitches, substantially as described.

479,370. ROCKING-HORSE. EMANUEL KEUSER, Philadelphia, Pa., assignor to Mary Keuser, same place. Filed Mar. 3, 1892. Serial No. 423,854. (No model.)

Claim.—1. A rocking-horse mounted on a truck and having cords secured to the body of said horse and passing in reverse direction around pulleys on the axle of the truck, ratchets secured to said axle, and said pulleys carrying pawls which engage with said ratchets, substantially as described.

2. A rocking-horse mounted on a truck having ratchets secured to the axle, and pulleys which surround the ratchets, carrying pawls which engage said ratchets, and cords secured to the body of the horse and passing in reverse direction around the said pulleys, substantially as described.



479,370.

3. A rocking-horse having a truck with a front cross-piece and a rear axle, a body pivoted to said truck, pulleys on the front cross-piece and pulleys on the rear axle, and cords attached to the front of the body and passing around the pulleys on the front cross-pieces and in reverse direction around pulleys on the rear axle, substantially as described.

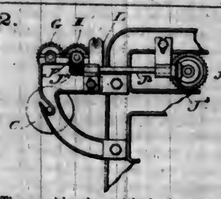
4. A rocking-horse having a truck with a front cross-piece and running-wheels and a rear axle with running-wheels, pulleys loosely mounted on said axle and cross-piece, ratchets secured to the axles, and pawls engaging said ratchets, and cords secured to the opposite ends of the body of the horse and passing in reverse direction around the pulleys on said rear axle, said parts being combined whereby continuous forward motion is imparted to said rocking horse, substantially as described.

479,371. CAR-COUPLING. EDGAR KLING, Louisville, Ky., assignor to Isaac Kling, same place. Filed Mar. 30, 1892. Serial No. 427,000. (No model.)

Claim.—1. The combination of the draw-bar and pin, the rod slidably connected to said bar, and the straps pivoted to said rod and to a suitable support, whereby when the rod is pulled longitudinally it is caused to rise vertically, substantially as specified.

2. The combination of the draw-bar, the coupling-jaw, and the plate adapted to uphold the locking-pin until the jaw-shank passes in rear thereof, substantially as described.

3. The combination of the draw-bar, the coupling-pin, and the swinging jaw with the plate connected to the end of the jaw-shank and adapted to uphold the pin until the shank passes behind the pin-openings, substantially as described.

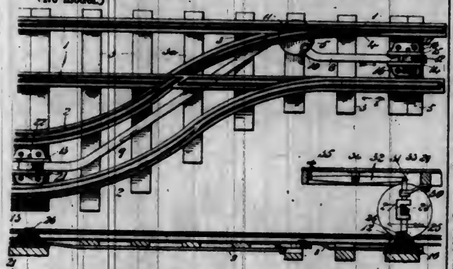


4. The combination of the draw-bar and the swinging jaw connected therewith with the coacting beveled lug and recess on said bar and jaw for causing said jaw to swing open, substantially as described.

5. The combination of the draw-bar having a forwardly-projecting downwardly-beveled lug on its front end beside the jaw and the swinging jaw having a beveled recess adapted to receive and engage said lug, substantially as and for the purpose described.

6. In combination with a draw-bar, a swinging jaw having an arm, as H, substantially as and for the purpose specified.

479,372. LET-OFF MECHANISM FOR DOUBLE-PILE FABRIC LOOMS. MARK LEACH, JOHN HEATON, and JOHN BENTLEY, Bradford, England, assignors to John Dobson and James Dobson, Philadelphia, Pa. Filed Mar. 26, 1890. Serial No. 345,677. (No model.)



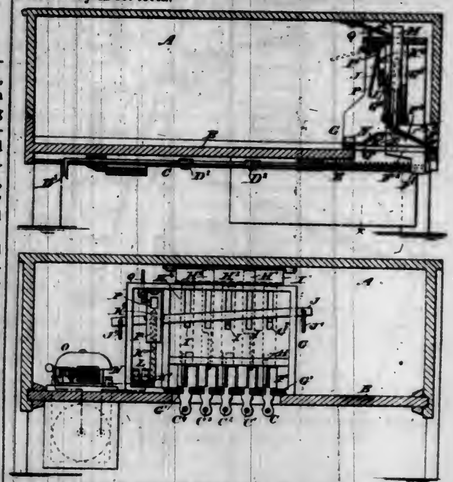
479,372.

Claim.—1. The combination, with the loom-frame and the warp-beam C, of a pair of covered friction-rollers D and E of uniform size, arranged parallel and adjacent to but separate from each other, with connecting actuating-gearing on the axes of their shafts, said gearing being adapted to revolve them at a uniform speed, but in opposite directions to each other, the shaft of one of said rollers being extended and provided with mechanism to rotate the same, and a continuously-driven actuating-shaft with driving-gearing actuating the said shaft, whereby the pile-warp fed from the beam may pass over and partly around the first feed-roller, and then to and under and partly around the second feed-roller, substantially as described.

2. The combination of mechanism for supplying, delivering, and guiding pile-warp to the weaving mechanism, consisting of a warp-beam, a pair of separated covered rollers of even diameter, and their shafts, with cog-gears on the ends of said roller shafts engaging with each other and adapted to revolve said rollers at a uniform speed, but in opposite directions to each other, a continuously-driven shaft with actuating-gearing thereon meshing with gearing on the end of the shaft of one of said covered rollers, and guiding devices between the delivering covered roller and the weaving mechanism, said parts being constructed, combined, and arranged relatively to each other, substantially as and for the purposes set forth.

479,373. AUTOMATIC RAILWAY-SWITCH. JOHN LIPMAN and CHARLES J. RINDERKNECHT, Indianapolis, Ind., assignors of one-fourth to Frank X. Bourpere, same place. Filed Nov. 23, 1891. Serial No. 413,450. (No model.)

Claim.—1. The combination, with a switch-rail and a pivoted disk provided with a pin for shifting the switch-rail, of a rod pivoted to the said disk and provided with a toothed rack and an oscillatory trip provided with teeth engaging with the said rack and having a detent arranged in the path of the trip-bar on the car, substantially as set forth.



2. The combination, with a switch-rail and a pivoted disk provided with a pin for shifting the switch-rail, of a rod pivoted to the said disk and provided with a toothed rack, a standard arranged in the center of the track and provided with reversely-inclined sides, an oscillatory strip supported in the said standard and provided with a detent and with teeth engaging with the said rack, and a trip-bar carried by the car and arranged to one side of the center of the track, whereby the trip-bar is raised slowly out of contact with the detent after operating it to shift the switch-rail according to the direction of the motion of the car, substantially as set forth.

479,374. ALARM-LOCK. FRANK MAHANNAH, Omaha, Nebr., assignor of one-half to John R. Mahannah, same place. Filed Sept. 29, 1891. Serial No. 407,109. (Model.)

Claim.—1. The combination, in an alarm-lock, with a stationary frame, a series of vertical locking-bolts mounted thereon, an alarm, and connections between the bolts not in the combination and the said alarm, of a series of sliding blocks, one for each bolt, each block having on its upper face at opposite sides of its longitudinal center reversely-extending inclines, one incline serving to lower the bolt when it is active and the other to raise it when inactive or out of the combination.

2. The combination, with the vertically-sliding reversible bolts, of a sliding block beneath each bolt, each block having on its upper face at opposite sides of its longitudinal center reversely-extending inclines, one incline serving to lower the bolt when active or in the combination and the other serving to raise the same bolt when inactive or out of the combination, substantially as set forth.

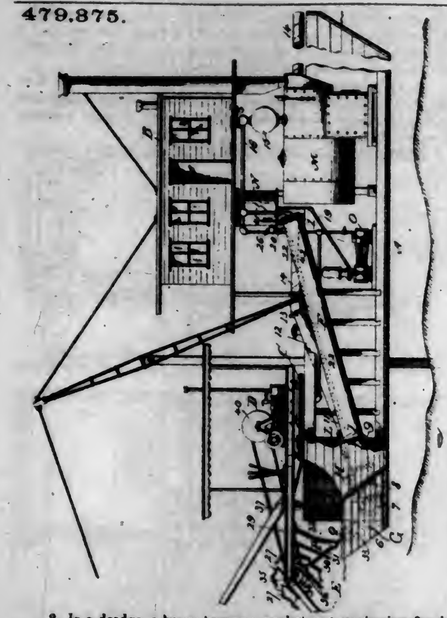
3. The combination, with the vertically-sliding bolts and their operating-blocks, of keys formed of two longitudinally-aligned rods having overlapped parallel inner ends adjustably clamped together, substantially as set forth.

4. In an alarm-lock, the combination, with a series of locking-bolts, of a sliding block for each locking-bolt and each block being provided with two wedges or inclines arranged in opposite directions and adapted to engage the lower end of the respective bolt, substantially as shown and described.

5. In an alarm-lock, the combination, with a pivoted plate arranged in a casing, of a series of locking-bolts mounted to slide vertically in the drawer, sliding blocks for the said locking-bolts and each provided with two inclines arranged in opposite directions, the inclines being adapted to engage the lower end of the respective bolt, and keys for imparting a sliding motion to the said blocks, substantially as shown and described.

6. In an alarm-lock, the combination, with a pivoted plate arranged in a casing, of a series of locking-bolts mounted to slide vertically in the drawer, sliding blocks for the said locking-bolts and each provided with two inclines arranged in opposite directions, the inclines being adapted to engage the lower end of the respective bolt, keys for imparting a sliding motion to the said blocks, and springs pressing on the said keys for returning the same to a normal position for being pressed, substantially as shown and described.

7. In an alarm-lock, the combination, with bolts provided with pins and mounted to slide vertically, of a bar adapted to be engaged by the pins of the bolts not forming a combination and a sleeve adapted to be actuated by the said bar to establish an electric connection with an electric alarm, substantially as shown and described.



8. In an alarm-lock, the combination, with bolts provided with pins and mounted to slide vertically, of a bar adapted to be engaged by the pins of the bolts not forming a combination, a sleeve adapted to be actuated by the said bar to establish an electric connection with an electric alarm, and an electric alarm provided with two spring-plates adapted to be connected with each other by the said sleeve, substantially as shown and described.

9. In an alarm-lock, the combination, with a series of bolts mounted to slide vertically and each provided with a pin, of a bar adapted to be raised by pins of the bolts not forming a combination, a sleeve adapted to be raised by the said bar and arranged to establish an electric connection with an electric alarm, and a pivoted arm adapted to lock the said sleeve in an uppermost position and raised by the said bar, substantially as shown and described.

479,375. DREDGING-MACHINE. JAMES M. MILLER, Washington, D. C. Filed June 23, 1891. Serial No. 397,223. (No model.)

Claim.—1. In a dredge, the combination, with a barge having a pocket and mechanism for depositing dredged material within the said pocket, of a steam and vacuum pumping apparatus supported in an inclined position on the barge and opening at its lower end into the pocket below the water-line.

479,875.

2. In a dredge, a barge having a pocket and mechanism for depositing dredged material within the said pocket, in combination with a steam and vacuum pumping apparatus opening into the pocket, a tapered discharge-nozzle, and a discharge pipe connecting therewith and leading to the dump, and connections uniting the said apparatus and the nozzle.

3. In a dredge, a barge having a pocket and mechanism for depositing dredged material within the said pocket, in combination with a fender located behind the dredging mechanism and a series of agitators arranged within the pocket.

4. In a dredge, a barge having a pocket, mechanism for depositing dredged material within the said pocket, a steam and vacuum pumping apparatus opening into the pocket, and a series of agitators for disintegrating the material in the pocket.

5. In a dredge, a barge having a pocket open at or slightly above the water-line and mechanism for depositing dredged material within the said pocket, in combination with a series of agitators arranged within the pocket and means for actuating the dredging mechanism and the agitators in unison.

6. In a dredge, a barge having a pocket open at or slightly above the water-line and a series of agitators arranged within the said pocket, in combination with a drive-shaft carrying the dredging apparatus and mechanism carried by the shaft for actuating the agitators.

7. In a dredge, the combination, with a barge having a pocket and mechanism for depositing dredged material within the pocket, of a steam and vacuum pumping apparatus supported in an inclined position on the barge and opening into the pocket below the water-line, said apparatus comprising two parallel cylinders, a discharge-pipe, a three-way coupling connecting the said cylinders and discharge-pipe and provided with automatically-operating valves, and steam-supply and water-supply pipes connecting with the cylinders.

479,876. WATCH. JAMES L. NEWELL, Ashland, Wis., assignor to Walter B. Felton and Everitt W. Felton, same place, William H. Webb, Superior, and Anselm C. Bossard, Kaukauna, Wis. Filed Mar. 24, 1892. Serial No. 426,209. (No model.)

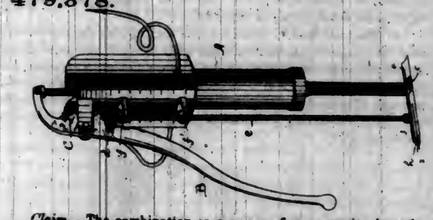
Claim.—1. In a watch provided with the usual train of works carried between two pillar-plates, an upper pillar-plate having recesses to receive and carry the cannon-pinion and hour and minute wheels and provided on its upper surface with a dial-cap removably held in place over said recesses, leaving a peripheral space on said pillar-plate for the printing or impressing thereon of the hours and subdivisions thereof, all substantially as shown.

2. In a watch provided with the usual train-works carried between two pillar-plates, an upper pillar-plate having recesses to receive and carry the mechanism controlling the relative movements of the hour and minute hands and provided on its upper surface with a circular abutment, in combination with a dial cap capable of being sprung or snapped into and removably held by said abutment over said recesses, leaving a peripheral space on said pillar-plate exterior to said dial-cap for the printing or impressing thereon of the hours and subdivisions thereof, all substantially as shown.

3. In a watch provided with the usual train-works carried between two pillar-plates, an upper pillar-plate having recesses to receive and carry the mechanism controlling the relative movements of the hour and minute hands and having symbols indicating the hours and their subdivisions printed or impressed upon the exterior peripheral area of said plate, in combination with a dial-cap and means for removably attaching said dial-cap to said plate immediately over said recesses, all substantially as shown.

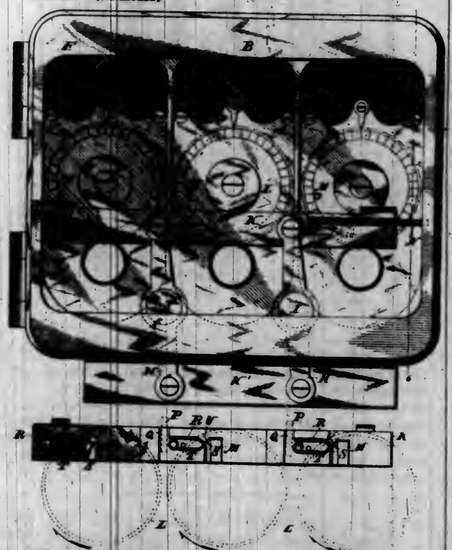
4. In a watch provided with the usual train-works carried between two pillar-plates, an upper pillar-plate having recesses to carry the mechanism controlling the relative movements of the hour and minute hands and provided on its upper surface with a circular groove, in combination with a circular dial-cap dished near its peripheral edge and capable of being sprung or snapped into said groove and held over said recesses and leaving a circular space exterior thereto on the face of said plate for printing or impressing symbols of the hours and subdivisions thereof, all substantially as shown.

479,877. MORTISING-AUGER. ANDREW L. NEWTON, Norwich, Conn., assignor of one-half to Mabel A. Evans, same place. Filed June 20, 1891. Serial No. 396,981. (No model.)



Claim.—1. In an auger, substantially as described, the combination, with the bit having the square shoulders adjacent to its upper end, of the laterally-reciprocating cutting-blade 6, the longitudinally-slotted cross-head mounted on the bit and engaging the shoulders thereof, the upwardly-extending lug carried by said cross-head, the cap-piece loosely mounted on the bit and having a rectangular groove engaging the lug of the cross-head, the lever pivotally connected at an intermediate point in its length to the bit and having its ends connected to the cross-head and the blade 6, respectively, a suitable means for rotating the bit, and a suitable means for holding the cap-piece stationary, substantially as specified.

2. In an auger, substantially as described, the combination, with the bit having the square shoulders adjacent to its upper end and the laterally-reciprocating cutting-blade 6, of the longitudinally-slotted cross-head mounted on the bit and engaging the shoulders thereof the upwardly-extending lug carried by said cross-head, the cap-piece loosely mounted on the bit and having a rectangular groove engaging the lug of the cross-head, suitable means for transmitting reciprocatory motion from the cross-head to the cutting-blade 6, a suitable means for rotating the bit, and a suitable means for holding the cap-piece stationary, substantially as specified.



479,878. COMBINED PUMP AND MIXER. ADELBERT M. PHILLIPS, Lockport, N. Y., assignor to Harrison S. Chapman and Charles A. Barnes, same place. Filed Oct. 24, 1891. Serial No. 409,703. (No model.)

479,878.

Claim.—The combination, in a pump, of an operating-lever having a segmental rack at its pivotal point, a vertical shaft journaled at the side of the pump, a pinion at the upper end of said shaft to engage the rack, and a dasher, as described, at the lower end of the shaft to operate below the suction-pipe of the pump, as and for the purpose set forth.

479,879. TIME-LOCK MECHANISM. EMORY STOCKWELL and HERBERT C. STOCKWELL, Stamford, Conn., assignors to The Yale & Towne Manufacturing Company, same place. Filed Nov. 13, 1891. Serial No. 411,529. (No model.)

Claim.—1. In a time-lock, a block or frame carrying the time-movements and the operative mechanism of the lock, in combination with a case, which is secured to the door and supports said block on cushioned studs, so that the entire operative mechanism is free to move with reference to the case and may be removed therefrom without derangement, substantially as set forth.

2. In a time-lock, the combination of time mechanism, a primary unlocking-bar, a secondary unlocking-bar, pivotal connections between the two bars, and a dog or other device to be actuated or unlocked, the arrangement being that the time mechanism engages with the primary unlocking-bar, and said bar acts through the pivotal connections upon the secondary unlocking-bar, and the secondary unlocking-bar acts upon a dog or other device to be actuated, substantially as described.

3. In a time-lock, in combination with time mechanism, an unlocking-bar K, composed of two parts hinged together, provided with a spring tending to keep them apart, substantially as described.

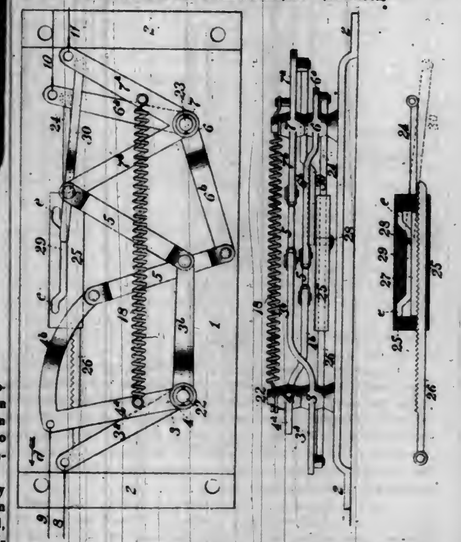
4. In a time-lock, the combination of time mechanism and bars K K', of the projections P, the bar K being composed of two parts and its hinged part being provided with notches for engagement with the projections, substantially as set forth.

5. In a time-lock, the combination, with time movements, of the pin M, the primary unlocking-bar K, composed of two parts and provided with an incline R and with a lug or rib S, substantially as set forth.

6. In a time-lock, the combination, with the lock-case having openings with connecting mechanism and a secondary unlocking-bar adapted to cover said openings in the case, substantially as set forth.

7. In a time-lock, the combination, with time-movements and primary and secondary unlocking-bars K and K', of pivoted connecting-levers between the bars and connecting the bars with the time-movements, substantially as set forth.

8. In a time-lock, the combination of a time-movement and a primary unlocking-bar, with which it engages, and a secondary unlocking-bar actuated by the primary bar, and two or more pivoted parallel connecting-levers supporting said bar, substantially as set forth.



9. In a time-lock, a primary unlocking-bar having a movable section and a rib or projection in the lock, with which such movable section tends to engage, whereby the bar cannot be moved in the direction for unlocking until the time-movements are properly operated, substantially as set forth.

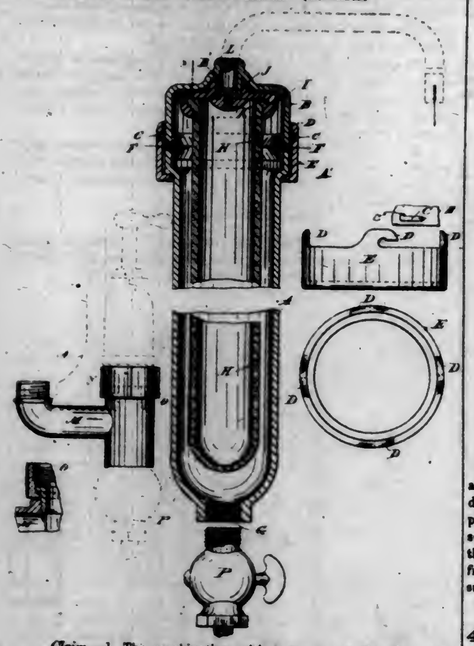
10. In a time-lock, a block or frame held in place within the lock-case upon studs fastened to the inside of said case with cushion-springs both in front and rear of said block, said block being also provided with a plurality of recesses, each to receive separate self-contained movements, so that said block and the movements may be bodily removed from the lock-case or each movement may be separately removed from said block, substantially as described.

11. In a time-lock, the combination of time mechanism, the primary and secondary unlocking-bars, and between said bars double connecting mechanism, so that upon the failure of any one connection the connection between the time-movements and the device to be unlocked is not severed, substantially as described.

12. In a time-lock, the combination, with time-movements and a device to be unlocked thereby, of balanced connecting mechanism between the time-movements and the device to be unlocked, substantially as described.

479,880. COMPENSATOR FOR SIGNALS. JAMES J. TURNER, Pittsburg, assignor to the Union Switch and Signal Company, Swissvale, Pa. Filed Feb. 11, 1892. Serial No. 421,165. (No model.)

Claim.—1. In a compensator for signals, the combination of two pairs of connected bell-crank levers, one member of each pair being connected to an operating-lever and the other member of each pair to a signal, and mechanism whereby motion is transmitted from the lever-operated member of one pair to the signal-operating member of the other pair, substantially as set forth.



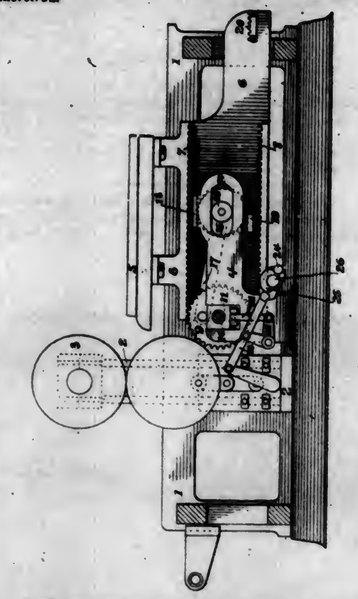
2. In a compensator for signals, the combination of two pairs of connected bell-crank levers, one member of each pair being connected to an operating-lever and the other member of each pair to a signal, mechanism whereby motion is transmitted from the lever-operated member of each pair to the signal-operating member of the other pair, and a spring connected to one member of the lever-operated pair and to the signal-operating member of the other pair, substantially as set forth.

3. In a compensator for signals, the combination of two pairs of connected bell crank levers, one member of each pair being connected to an operating-lever and the other member of each pair to a signal, mechanism whereby motion is transmitted from the lever member of

each pair to the signal-operating member of the other pair, a spring connected to one member of the lever-operated pair and to the signal-operating member of the other pair, and a lock for securing the synchronous movement of all the members of both pairs, substantially as set forth.

4. In a compensator for signals, the combination of two pairs of connected levers 3 7 and 4 6, a box having a cam slot formed therein and connected to one arm of the lever 6, a serrated or toothed rod connected to the lever 3 and projecting into said box, a toothed or serrated block arranged in the box and adapted to engage the serrated rod, and a pin operated by the lever 7 for forcing the block into engagement with the serrated rod, substantially as set forth.

479,381. LIQUID-PURIFYING DEVICE. FRANK K. WAY, Dayton, Ohio, assignor to the Domestic Water Purifier Company, Chicago, Ill. Filed Oct. 26, 1891. Serial No. 409,782. (No model.)



Claim.—1. The combination, with a case, a cap therefor, and a filter proper having a projecting shoulder at one end and mounted within said case, of a flexible coupling between said filter proper and said cap and consisting of an annular recessed portion embracing said shouldered end of the filter proper and of a tubular portion opposite thereto, the said cap having an extension matching said tubular portion of the coupling, and a stud-bolt supporting said coupling and mounted in said cap extension.

2. In a liquid-purifying device, the combination, with a casing, a cap therefor, and a filter proper mounted within said casing, of couplings between said cap and casing and said cap and filter proper, respectively, the first consisting of an annular portion or ridge extending outward to be gripped between the edges of the cap and the casing and of flaring portions thinned at their edges and pressing against the inside of the casing, the other consisting of an undercut recessed portion forming a lip adapted to support the filter proper, and an oppositely-extending tubular portion adapted to embrace a matching portion of the cap and be pressed tightly against the same by the pressure of the water, and means to maintain the said couplings and their adjacent parts respectively in engagement.

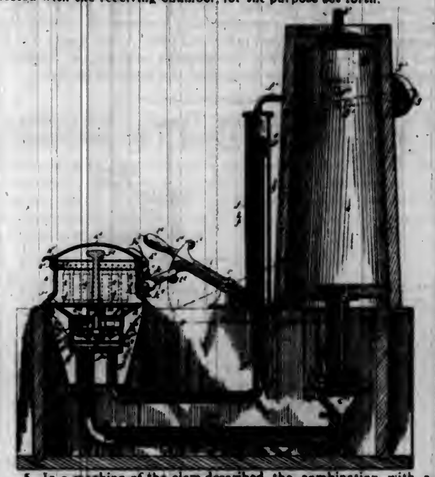
479,382. MECHANISM FOR OPERATING BEDS OF PRINTING-MACHINES. STORRS WHITLOCK, Shelton, Conn. Filed Aug. 3, 1891. Serial No. 401,456. (No model.)

Claim.—1. The combination, with the bed having two opposed driving-racks, of the main driving-gear and means for engaging it first with one rack and then with the other, two supplemental racks, also carried by said bed, and means, as described, whereby the main driving-gear imparts movement to the bed through and by means of said supplemental racks during the time of its disengagement from the main racks, substantially as specified.

2. The combination, with the bed having the forward-driving main rack and the rearward-driving main rack, of the three supplemental racks carried by the bed and bracket and a supplemental driving-gear connected to and operated by means of said main driving-gear and adapted to engage the supplemental racks on the bed and to carry said bed during the disengagement of the main driving-gear therefrom

3. The combination, with the longitudinal reciprocating bed and a pair of opposed main driving-racks mounted thereon, of a main driving-gear and means for engaging it alternately with said racks, a pitman cranked to the main driving-gear and operated thereby, and supplemental driving means interposed between the said pitman and the bed, whereby during the disengagement of the main driving-gear from the main driving-racks the bed is actuated through said pitman, substantially as specified.

479,388. APPARATUS FOR BLEACHING AND DYEING. GEORGE YOUNG, Winton, and FRANK PEARL, Gorton, near Manchester, England; said Pearn assignor to William Crippin, Egerton Mills, Patricroft, near Manchester, England. Filed Jan. 15, 1892. Serial No. 418,155. (No model.) Patented in England Jan. 22, 1890, No. 1,157; in Brazil Nov. 21, 1890, No. 995; in France Jan. 23, 1891, No. 210,970; in Belgium Feb. 18, 1891, No. 93,799; in Italy Feb. 18, 1891, LX, 133; in Spain and Colonies Aug. 13, 1891. No. 11,992, and in Austria-Hungary Sept. 21, 1891.



Claim.—1. In a machine of the class described, the combination of a vat, a treating-chamber in communication with and having its lower end below the level of the liquid in the vat, a receiving-chamber in communication with the treating-chamber and vat through a valved passage, a table for the material to be treated covering the mouth of said valved passage within the treating-chamber and having a port or ports opening into the passage, and a suitable exhausting apparatus adapted to draw the liquid from the vat into the treating-chamber through the port or ports in the table to and through the valved passage into said receiving-chamber, for the purpose set forth.

2. In a machine of the class described, the combination of a vat, a treating-chamber in communication with and having its lower end below the level of the liquid in the vat, a receiving-chamber in communication with the treating-chamber and vat through a valved passage, a table for the material to be treated covering the mouth of the passage within the treating-chamber and having a port or ports opening into said passage, an air-exhaust in communication with the passage and treating-chamber, and a suitable exhausting apparatus connected with the receiving-chamber, for the purpose set forth.

3. In a machine of the class described, the combination of a vat, a treating-chamber arranged above the level of the liquid in the vat, a connection between the chamber and vat having its inlet below the level of the liquid, a receiving-chamber in communication with the

treating-chamber and vat through a valved passage, a table for the material to be treated covering the mouth of said valved passage within the treating-chamber and having a port or ports opening into the passage, and a suitable exhausting apparatus adapted to draw the liquid from the vat into the treating-chamber through the port or ports in the table to and through the valved passage into said receiving-chamber, for the purpose set forth.

4. In a machine of the class described, the combination of a vat, a treating-chamber arranged above the level of the liquid in the vat, a connection between the chamber and vat having its inlet below the level of the liquid, a receiving-chamber in communication with the vat and treating-chamber through a valved passage, a table for the material to be treated detachably seated on the mouth of said passage within the treating-chamber, and a suitable exhausting apparatus connected with the receiving-chamber, for the purpose set forth.

5. In a machine of the class described, the combination, with a vat, a treating-chamber, and a tubular connection between the two having its inlet below the level of the liquid in the vat, of two receiving-chambers in communication with the vat and treating-chamber through independent valved conduits, a chamber common to both conduits within the treating-chamber, a table for the material to be treated covering said chamber for the conduits and having one or more ports, and suitable exhausting devices connected with the receiving-chambers, for the purpose set forth.

6. In a machine of the class described, the combination, with a vat, a treating-chamber, and a tubular connection between the two having its inlet below the level of the liquid in the vat, of two receiving-chambers of unequal capacities in communication with the vat and treating-chambers through independent valved conduits, a chamber common to both conduits within the treating-chamber, a table for the material to be treated covering said chamber for the conduits, and an exhausting apparatus adapted to be connected with either receiving-chamber, for the purpose set forth.

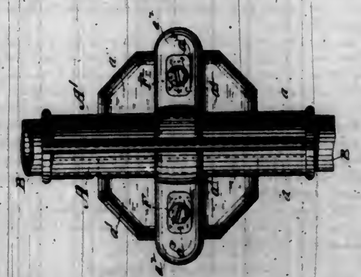
7. In a machine of the class described, the combination, with a vat, a treating-chamber closed at one end by a cover and inlet at the opposite end by the liquid in the vat, a duct formed around the upper end of the treating-chamber and communicating therewith, and a three-way valve connected with said duct, of two receiving-chambers connected with the vat and treating-chamber through independent valved conduits, a chamber common to two of the conduits within the treating-chamber, a table covering said chamber for the conduits and having one or more ports, and an exhausting device adapted to be connected with either receiving-chamber, for the purpose set forth.

8. In a machine of the class described, the combination, with a vat, a treating-chamber in communication therewith below the level of the liquid therein, a receiving-chamber in communication with the treating-chamber and vat through a valved duct, and a table seated on said valved duct within the treating-chamber and having a port or ports leading to the chamber and duct, of an exhausting device, a slide-valve having a port or passage adapted to be connected with said device and the receiving-chamber, and a lever for actuating the slide-valve, for the purpose set forth.

9. In a machine of the class described, the combination, with a vat, a treating-chamber in communication therewith below the level of the liquid therein, two receiving-chambers, independent valved ducts connecting the receiving-chambers with a chamber located in the treating-chamber above the level of such liquid, a table provided with a port or ports seated on the chamber in said treating-chamber, and valved passages connecting the receiving-chamber with the vat, of an exhausting device, a slide-valve adapted to connect either receiving-chamber with the exhausting device, and a lever for operating the slide-valve, for the purpose set forth.

10. In a machine of the class described, the combination, with a vat, a treating-chamber in communication therewith below the level of the liquid therein, said treating-chamber being closed at top and having a duct encompassing the upper end thereof and in communication therewith, a three-way cock connected with said duct, two receiving-chambers, independent valved ducts connecting the receiving-chamber with a chamber located within the treating-chamber above the level of the liquid in the vat, a table provided with one or more ports seated on the chamber within said treating-chamber, and valved passages connecting the receiving-chambers with the vat, of an exhausting device, a slide-valve adapted to connect either receiving-chamber with said device, and a lever arranged and adapted to simultaneously operate the slide-valve and three-way cock, for the purpose set forth.

11. The combination, with the vat *a*, the treating-chamber *A*, seated thereon and extending into the same, the valve-casing A^7, constructed with the upper flaring portion *d* and having valves c^4 f^4, two passages c^7 c^7, leading to the valve-chamber above said valves, and a central passage leading to the flaring portion *d* and to the valve-chamber below the valves, and a table having one or more ports seated fluid-tight on said flaring portion of the valve-casing, of two receiving-chambers *b f*, two pipes connecting the receiving-chambers with the two passages c^7, and a suitable exhausting device adapted to be connected with either of the receiving-chambers, for the purpose set forth.

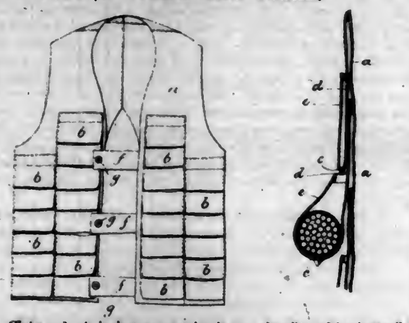


12. The combination, with the vat *a*, the treating-chamber *A*, seated thereon and extending into the same, the valve-casing A^7, constructed with the flaring portion *d* and having valves c^4 f^4, two passages c^7 c^7, leading to the valve-chamber above the valves, and a central passage leading to the flaring portion *d* and to the valve-chamber below the valves, and a table having one or more ports seated fluid-tight on said flaring portion of the valve-casing, of two receiving-chambers *b f*, two pipes connecting the receiving-chambers with the passages c^7 c^7, respectively, discharge-valves operating automatically to discharge the contents of the receiving-chambers into the vat, and an exhausting device adapted to be connected with either of the receiving-chambers, for the purpose set forth.

13. The combination, with the treating-chamber and an exhaust-chamber located therein so as to form passages between the two, of the perforated table *j*, seating on said exhaust-chamber and forming the top thereof, said table having an open-ended hollow handle, for the purpose set forth.

14. The combination, with the treating-chamber, a three-way cock provided with an operating-handle, the receiving-chambers *b f*, a slide-valve casing having passages connected with said chambers, and a slide-valve controlling the said passages, of a lever connected with the slide-valve and a segement on the lever or lever-fulcrum having two pins adapted to engage the handle of the three-way cock, for the purpose set forth.

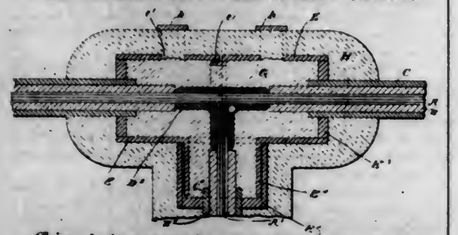
15. The combination, with the receiving-chambers *b f*, of a slide-valve casing having passages *e e* connected with said chambers, a suction-passage adapted to be connected with a suction apparatus, and ports e^4 e^5 e^{11} of the slide-valve e^3, adapted to control said ports and a cover for the valve-casing provided with air-ports e^6, substantially as and for the purpose set forth.



479,384. PIPE-HOLDER. CHARLES H. ALAFAW, St. Louis, Mo., assignor of one-half to Alfred M. Baker, same place. Filed Dec. 21, 1891. Serial No. 415,730. (No model.)

Claim.—The combination of the sections, the bar, and the screw or spike, said sections each consisting of a semicircular part, a base, and a rib and the two sections jointly forming a tubular holder, said

bar being a separate part from both said sections, enabling said sections to be adjusted laterally upon said bar, and said sections being attachable to said bar, substantially as described.



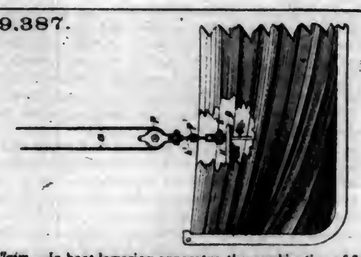
479,385. SHOOTING-JACKET. EDWARD D. BEAR, Arlington, Mass. Filed Sept. 21, 1891. Serial No. 406,561. (No model.)

Claim.—1. A jacket or vest having a plurality of horizontally-arranged cartridge-holding pockets at the front and side portions thereof, each pocket being attached to said jacket along its upper portion and entirely along one end, the other end and bottom being substantially free, so that it can swing outwardly from the body of said jacket, and having an opening at its upper side by which the cartridge may be inserted and removed, as set forth.

2. A huntsman's jacket or vest provided with a series of horizontally-arranged cartridge-receiving pockets, the rear wall of the lower pocket extending up, back, or in rear of the pocket next above, one end of each pocket being connected with the body of the jacket, while the other end and bottom are left substantially free, as shown and described.

479,386. CAST JOINT FOR ARMORED CONDUCTORS. FREDERICK M. BENNETT, New York, N. Y., assignor to Joseph W. Marsh, Pittsburg, Pa. Filed Mar. 28, 1890. Serial No. 345,693. (No model.)

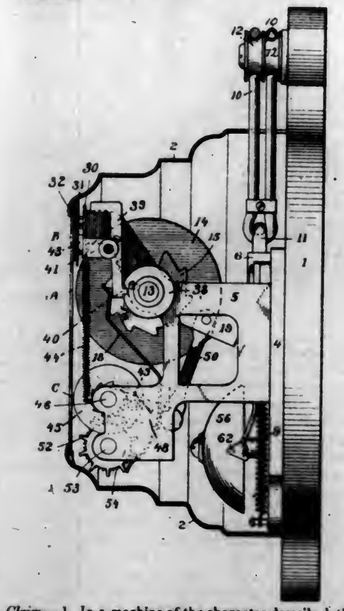
Claim.—1. As a means for making joints for electric cables, a hollow box-body having separable ends, the ends having openings, the inner contours of which are adapted to snugly hug the periphery of the cables to be joined, while the outer periphery of the ends fits tightly into the cylindrical body of the box, substantially as described.



2. As a means for making joints for electrical cables, a hollow cylindrical box-body having ends fitting the contour of the cables and having a drum at one side of the cylinder and an end piece fitting the contour of the cables and adapted to be applied to the drum, substantially as described.

3. As a means for uniting cables at an angle to each other, a cylindrical box having a drum provided with end pieces fitting the coupling of the cables and a joint for the reception of the exposed ends of the conductors of the cables, substantially as described.

4. As a means for making a T-shaped joint for electrical cables, the combination, with the exposed ends of the conductors of the adjacent cables, of a T-shaped coupling-piece, to which the ends are connected, and a cylindrical box having a drum, the box being provided with heads, through which the adjacent ends of the cables pass, substantially as described.



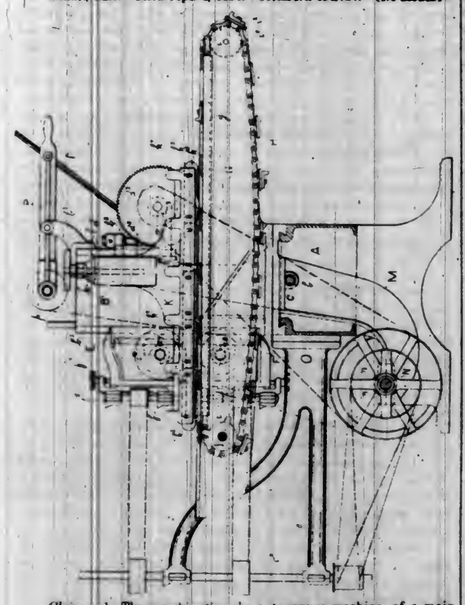
5. The combination, with two or more metal armored conductors, of a hollow cast-metal joint and of a hollow core, both provided with perforations and stopping devices.

479,387. BOAT-LOWERING APPARATUS. HENRY E. BOWRING, East, Molesey, England. Filed Apr. 17, 1891. Serial No. 389,376. (No model.) Patented in England Oct. 14, 1890, No. 16,364.

Claim.—In boat-lowering apparatus, the combination of fall, suspension-bar, point of suspension at the end of the fall adapted to engage with and carry the suspension-bar, a horizontal bar bisected by the suspension-bar and joined to it near its top at right angles, and a pair of rigid rods connecting the respective outer ends of the horizontal bar to the fall above the point of suspension, as set forth.

479,388. FARE-REGISTER. FREDERICK C. BOYD and RICHARD MARTIN, New Haven, Conn. Filed Dec. 14, 1891. Serial No. 414,910. (No model.)

Claim.—1. In a machine of the character described, the shaft 13, bearing the independently-journaled indicating-wheels constituting the trip-register and having means for engaging and restoring said wheels to zero, as described, of the zero-register, an operating-lever for actuating said zero-register, and a locking-lever normally holding the shaft 13 as against rotation, but adapted to be engaged and withdrawn by the upward movement of the actuating-lever of the zero-register, whereby prior to the return of the indicating-wheels the operation of the zero-register is essential, substantially as specified.



2. In a machine as described, the combination, with the vertically-movable cord-operated slide, of the triple-toothed pawl and means of connection between it and the slide, the trip-register consisting of the wheels 14, independently journaled upon the shaft 13 side by side, means, as described, interposed between said shaft and each of the wheels for turning the latter back to zero by the rotation of the former, a zero-register having a lever for its actuation step by step, and a locking-lever normally holding the shaft 13 as against rotation and lying in the path of the actuating-lever of the zero register, the whole adapted to operate substantially as described.

3. In a machine of the character described, the combination, with a set of indicating-wheels constituting a trip-register for the indication of the separate fares, a shaft whereon said wheels are independently journaled, a snail cam and spring-actuated plunger interposed between said shaft and each of the wheels for engaging and turning back the latter by rotation of the former, a locking-lever normally engaging the shaft of the indicating-wheels and preventing the rotation thereof in either direction, a zero-register contiguous to the indicating-train, and an actuating-lever for said zero-register, said lever adapted to release the locking-lever when the zero-register is operated, substantially as described.

4. In a machine of the character specified, a vertically-movable slide constituting the prime mover and a triple toothed actuating-pawl operated by said slide, in combination with the shaft 13, a series of indicating-wheels independently journaled on said shaft and constituting the trip-register and provided each with a ratchet-wheel in position to be engaged by the triple pawl, the means for connection between said shaft and wheels, consisting of the snail-cams on the shaft and the spring-actuated plungers on the wheels, the zero-registering train adjacent to the indicating-wheels, an operating-lever for the zero-registering train, and a locking-lever normally engaging and holding the notched disk on the shaft 13, but adapted to be engaged and thrown out of its locked position by the operating-lever of the zero-register, substantially as described.

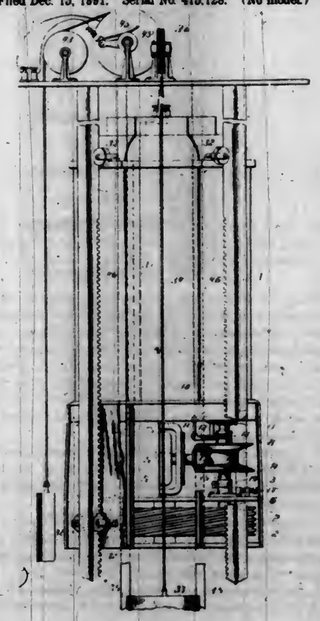
5. The prime mover consisting of the slide and the yoke and the pivoted triple pawl actuated by said prime mover, in combination with the shaft 13, the wheels 14 upon said shaft, the ratchet-wheels borne upon said wheels 14 in the field of operation of the triple pawl, the cams and plungers interposed between the wheels 14 and the shaft, the locking-lever having normal engagement with said shaft 13, the zero-register, and a lever 41 for the operation of said register and adapted, also, at each registering movement to release the shaft 13 by disengaging the locking-lever therefrom, the whole arranged and adapted to operate as described.

479,389. TENONING-MACHINE. GEORGE W. BUSBEE, Delhi, and FREDERICK DANNER, Home City, assignors to the Egan Company, Cincinnati, Ohio. Filed Sept. 4, 1891. Serial No. 404,727. (No model.)

Claim.—1. The combination, in a tenoning-machine, of a main frame, a pair of supplemental frames thereon, a screw-shaft or similar means for adjusting one or both of them longitudinally on the main frame, with a cutter head or heads on each supplemental frame, vertically-adjustable bearings in which they are mounted, a saw on each supplemental frame, an extended support in which the saw is mounted projecting in advance of the supplemental frame, and an adjusting-screw or similar means for raising and lowering the support, substantially as and for the purpose specified.

2. The combination, in a tenoning-machine, of a main frame, a pair of supplemental frames thereon, a screw-shaft or similar means for adjusting one or both of them longitudinally on the main frame, with a cutter head or heads on each supplemental frame, vertically-adjustable bearings in which they are mounted, a saw on each supplemental frame, an extended support in which the saw is mounted projecting in advance of the supplemental frame, an adjusting-screw or similar means for raising and lowering the support, and an endless traveling feed, substantially as and for the purpose specified.

3. The combination, in a tenoning-machine, of a main frame, a pair of supplemental frames thereon, a screw-shaft or similar means for adjusting one or both longitudinally on the main frame, with a tenon cutter or cutters on each supplemental frame, vertically-adjustable bearings in which they are mounted, a cope cutter or cutters in rear of the same and adjustable with and independently thereof, a saw on each supplemental frame, and an extended support in which the saw is mounted projecting in advance of the supplemental frame, substantially as and for the purpose specified.



4. The combination, in a tenoning-machine, of a main frame, a pair of supplemental frames thereon, a screw-shaft or similar means for adjusting one or both of them longitudinally on the main frame, with a cutter head or heads on each supplemental frame, vertically-adjustable bearings in which they are mounted, an extended support projecting in advance of the supplemental frame, a plate on the support, a saw-arbor mounted on the plate, and bolts or similar means for adjusting the plate relatively to the support, whereby the saw-arbor is adjusted in a horizontal plane, substantially as and for the purpose specified.

5. The combination, in a tenoning-machine, of a pressure-bar, a groove in the lower end thereof, a series of disconnected pressure-plates inserted in the groove, the forward end of one being in rear of the rear end of the next succeeding plate in front thereof, a series of sockets above the ends of the pressure-plates, and springs taking into the sockets and bearing against the ends of the plates, substantially as and for the purpose specified.

6. The combination, in a tenoning-machine, of a pressure-bar, a groove in the lower end thereof, a series of disconnected pressure-plates inserted in the groove, the forward end of one being in rear of the rear end of the next succeeding plate in front thereof, the pins A^4, taking through each pressure-plate independently near the ends thereof, the slots A^4 in the pressure-bar for receiving the pins, a series of sockets above the ends of the pressure-plates, and springs taking into the sockets and bearing against the ends of the plates, substantially as and for the purpose specified.

7. In a double-ended self-feed tenoning-machine, the combination of the main frame, a supplemental frame at each end thereof, means for adjusting the distance between them, the cutter-heads mounted on each of the supplemental frames, the adjustable saw-supports in front of the cutter-heads, and the driving-shaft underneath for driving both the cutter-heads and the saws independently.

479,390. ELEVATOR. MARVIN Y. CALCUTT, Seattle, Wash., assignor of two-thirds to Henry L. Rochelle and Edward Brady, same place. Filed Dec. 15, 1891. Serial No. 415,128. (No model.)

Claim.—1. In an elevator, the combination of a screw having a vertical axis and operating in vertical screw-racks, a car carried by or supported upon the screws, an electric motor located in a frame depending from the car and geared to the screw, roller-bearings interposed between the screw-frame and the weight supported thereby, and a central adjusting-screw to regulate the pressure on the rollers, substantially as described.

2. In an elevator, a screw having a vertical axis and engaging vertical screw-racks, a car located above the screw, a frame suspended from the car, a motor mounted in the frame and having a horizontal armature-shaft provided with a pinion, a vertical shaft carrying gears engaged by the pinion, the lower end of said shaft being also provided with a pinion to actuate the screw, and an adjusting-screw for moving the shaft laterally, as and for the purpose specified.

3. In combination with an elevator-car, an electric motor secured to the car, electric cables leading from the car to a drum located at the top of the elevator-well, said drum being provided with cable-receiving grooves, and a counterbalance-rope winding in a groove between the cable-grooves to counterbalance the cables, as and for the purpose specified.

REISSUES.

11,254. RAILWAY-CAR. JOHN M. BURTON, Wichita, Kans. Filed May 14, 1892. Serial No. 433,095. Original No. 470,326, dated Mar. 8, 1892.

Claim.—1. In a railway-car, the combination of the end-sill bars, the channeled bars arranged at the inner side of said end-sill bars and provided with post-recesses in the upper flanges thereof, the channeled end-wall posts stepped into said recesses, the intermediate sills arranged with their ends seated within said channel-bars and within the channel of the said wall-posts, said intermediate sills being provided with screw-threaded shanks extending through holes in said end posts and in said end-sill bars, and nuts on said shanks for locking said parts in position, substantially as set forth.

2. A railway-car one of the side sills of which is provided with an outward flange forming a step upon which one of the side walls rests and with an inward flange forming a step which serves as a support for the flooring-planks.

3. In the frame of a railway-car, the combination of a side sill provided with an outward flange, a side post supported on said flange, and a clamping-plate fastened to said side sill and provided with a loop engaging said post and clamping it in position.

4. In the frame of a railway-car, the combination of a side sill provided with an outward flange, a side post supported on said flange, a clamping-plate fastened to said side sill and provided with a loop engaging said post and clamping it in position, and a sheathing extending down between said clamping-plate and sill.

5. In the frame of a railway-car, the combination of a side sill provided with an outward flange, a channeled side post supported on said flange, a clamping-plate fastened to said side sill and provided with a loop engaging said post and clamping it in position, and a sheathing composed of plates having flanges engaging said channeled posts and extending down between said clamping-plate and sill.

6. In a railway-car frame, the combination of a side sill and an end sill, the meeting ends of said sills being provided with interlocking hooks, substantially as described.

7. In a railway-car frame, the combination of an end sill having inwardly-projecting flanges the upper flange being provided with slots, a channeled end post stepped into said end sill through one of said slots, a longitudinal sill extending into the channeled end post between said flanges of the end sill, and means for fastening said post, substantially as described.

8. In a railway-car frame, the combination of an end sill having inwardly-projecting flanges, the upper flange being provided with slots, a channeled end post stepped into said end sill through one of said slots, a longitudinal sill extending into the channeled end post between said flanges of the end sill, said longitudinal sill being provided with a screw-threaded shank extending through said end sill, and a nut on said shank for clamping said posts together.

9. In a railway-car frame, the combination of a channeled corner-post, side sheathing provided with a flange engaging one of the flanges of said post, end sheathing provided with a flange engaging the other flange of said post, a filling-strip interposed between one flange of said post and one of said sheathings, and a filling-strip interposed between the opposite side of the same sheathing and the flange of the other sheathing, substantially as described.

10. In a railway-car frame, the combination of a channeled corner-post, side sheathing provided with a flange engaging one of the flanges of said post, end sheathing provided with a flange engaging the other flange of said post, a filling strip interposed between one flange of said post and one of said sheathings, a filling-strip interposed between the opposite side of the same sheathing and the flange of the other sheathing, and an inner strip entering the channeled post and clamping-post and clamping the flanges of the sheathing-plates therein.

11. A railway-car consisting of the combination, with the lower frame and end walls, of a series of sections of metallic plates provided with side flanges and bent to form a combined side-wall sheathing and roof-covering, a series of combined metallic channeled posts and carlings arranged inclosing the flanges of said plates within their channels, and a series of supplemental flanged and channeled bars arranged within the channels of said combined posts and carlings and clamped therein by means of bolts for holding said plates, substantially as set forth.

12. In a railway-car frame, the combination of a channeled corner-post, side sheathing provided with a flange engaging one of the flanges of said post, end sheathing provided with a flange engaging the other flange of said post, a filling-strip interposed between one flange of said post and one of said sheathings, a filling-strip interposed between the opposite side of the same sheathing and the flange of the other sheathing, and an inner strip entering the channeled post and provided with flanges shutting over the inner faces of the sheathing-plates.

13. A railway car provided with metallic channeled bars, each bar comprising two side-wall posts disposed on opposite sides of the car and a carling continuous with said posts, and metallic plates provided with side flanges and made to conform to the said combined posts and carlings and arranged with their flanges clamped within the channels of the combined posts and carlings, said plates forming a combined side-wall sheathing and roof-covering, substantially as set forth.

14. In a railway-car frame, the combination of an end wall composed of channeled posts, and sheathing-plates having side flanges clamped within said posts, and a channeled carling at the end of the car shutting over said end wall.

15. In a railway-car frame, the combination of a channeled carling at the end of the car-frame and an end wall the upper edge of which extends into the channel of said carling.

16. A railway-car provided with metallic channeled side-wall posts, in combination with metallic sheathing-plates provided with side flanges corresponding with the flanges of the posts and arranged within the channels of said posts, with corresponding flanged metallic channeled clamping-bars arranged within the channels of said posts and engaging said sheathing-plates, and with wooden bars arranged within said channeled clamping-bars, the whole being secured together by means of bolts arranged through said posts and bars, substantially as set forth.

17. A railway-car consisting of the combination, with the lower frame and end walls, of a series of combined metallic channeled side-wall posts and carlings, series of sections of metallic plates provided with side flanges and bent to form a combined side-wall sheathing and roof-covering and arranged with their flanges clamped within the channels of said combined posts and carlings, and the two-part sill-bars of the car, arranged clamping the lower end portion of said posts and plates between them, substantially as set forth.

18. A railway-car provided with the side walls and roof made in combined sections consisting of a series of combined metallic channeled posts and carlings and of a corresponding series of metallic plates bent to conform to the posts and carlings and provided with side flanges held clamped within the channels of said combined posts and carlings and with end walls consisting of similar parts and plates similarly united and clamped and arranged terminating at their upper end within the channel of the end carlings of the car, substantially as set forth.

19. A railway-car provided with end sills, with channel-iron end-wall posts stepped into mortises or recesses of said sills, and with the intermediate car-sills or stringers secured within said sills within the flanges of said posts, substantially as set forth.

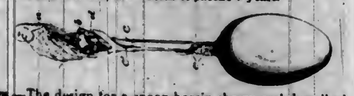
20. A railway-car roof consisting of a series of inverted metallic U-shaped or channeled carlings and of a corresponding series of metallic plates provided with side flanges clamped within the hollows or channels of said carlings, substantially as set forth.

DESIGNS.

21,714. SPOON. CHARLES S. CHAMPION, Washington, D. C. Filed June 23, 1892. Serial No. 437,779. Term of patent 3½ years.

Claim.—The design for a spoon, as herein shown and described.

21,715. SPOON. HUGH B. HOUSTON, Philadelphia, Pa., assignor to J. B. Caldwell & Co. Filed June 9, 1892. Serial No. 436,156. Term of patent 14 years.



Claim.—The design for a spoon, substantially as shown and described.

21,716. SPOON. FREDERICK F. HOBE, Colorado Springs, Colo. Filed June 10, 1892. Serial No. 436,270. Term of patent 3½ years.

Claim.—The design for a spoon, substantially as herein shown and described.

21,717. SPOON. JAMES M. VAN SLYKE, Madison, Wis. Filed Apr. 2, 1892. Serial No. 427,546. Term of patent 7 years.

Claim.—The design for a spoon herein shown and described.

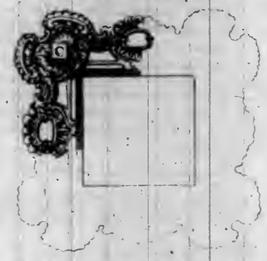
21,718. WATCH-CHARM. JAMES A. DAWLEY, Denver, Colo. Filed Sept. 19, 1891. Serial No. 406,964. Term of patent 3½ years.

Claim.—The design for a watch-charm or similar article, as herein shown and described.

21,719. WATCH-CASE. JOHN C. DUEBER, Canton, Ohio. Filed June 13, 1892. Serial No. 436,612. Term of patent 14 years.

Claim.—The design for a watch-case, as herein described and shown.

21,720. WATCH-CASE. JOHN C. DUEBER, Canton, Ohio. Filed June 13, 1892. Serial No. 436,613. Term of patent 14 years.



Claim.—The design for a watch-case, as herein described and shown.

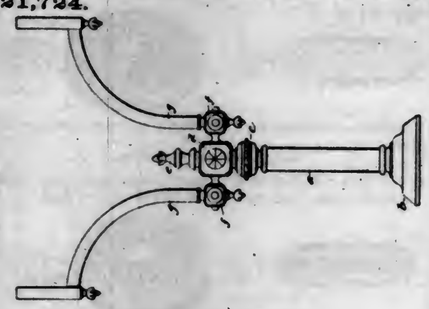
21,721. WATCH-CASE. CHARLES L. DEPOLLIER, Brooklyn, N. Y. Filed June 21, 1892. Serial No. 437,521. Term of patent 3½ years.

Claim.—The design for a watch-case, as herein shown and described.

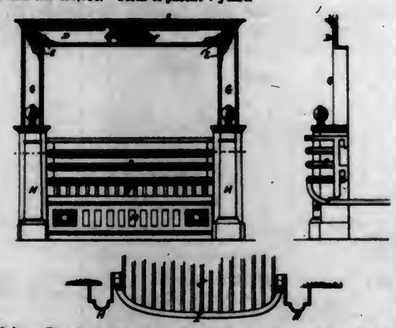
21,722. TABLE-TOP. FRANK YOKEL, Meriden, Conn., assignor to the Meriden Bronze Company, same place. Filed June 20, 1892. Serial No. 437,361. Term of patent 3½ years.

Claim.—The design for a table-top, as herein shown and described.

21,723. HOLDER FOR LAMP-FOUNTS. FRANK YOKEL, Meriden, Conn., assignor to the Meriden Bronze Company, same place. Filed June 20, 1892. Serial No. 437,362. Term of patent 3½ years.



Claim.—The design for a lamp-fount, as herein shown and described.



21,724. STANDARD FOR WASH-BASIN SLABS. JAMES TOTHAM, New Haven, Conn., assignor to Peck Bros. & Co., same place. Filed June 13, 1892. Serial No. 436,574. Term of patent 14 years.

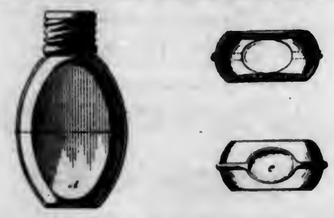
Claim.—The design for the standard for wash-basin slabs, as herein described, and shown in the accompanying illustration.

21,724.

21,725. FIREPLACE-FRONT. ROBERT M. HOVEY, New York, N. Y., assignor to Wm. H. Jackson & Co., same place. Filed Apr. 21, 1892. Serial No. 430,156. Term of patent 7 years.

Claim.—The design for a fireplace-front, as shown and described, the same comprising the representation of a molded denticulated projecting cornice over figures in relief of "Colonial sunburst" and acanthus-leaves on the frieze, figures representing vertical columns in relief on the lower half of the pilasters with caps, rectangular bases, and globular finials, and below the figure of a grate the figure of a crown-plate with openings and checkered squares and representations of beaded border-moldings, forming altogether the figure of an ornamental rectangular fireplace-front.

21,726. ANDIRON. EDWARD T. SCHOONMAKER, New York, N. Y. Filed Jan. 27, 1892. Serial No. 419,457. Term of patent 3½ years.

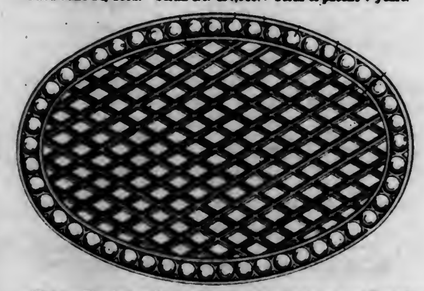


Claim.—The design for andirons herein shown and specified.

21,727. ORNAMENTATION OF GLASS VESSELS. LOUIS A. ROSE, Paris, France, assignor to L. Straus & Sons, New York, N. Y. Filed June 24, 1892. Serial No. 437,914. Term of patent 14 years.

Claim.—The design for the ornamentation of glass vessels, substantially as herein shown and described.

21,728. POCKET-BOTTLE. HORATIO H. FRASER, New York, N. Y. Filed May 26, 1892. Serial No. 434,501. Term of patent 14 years.



Claim.—The design for a pocket-bottle, substantially as shown.

21,729. CAMPAIGN-BUTTON. RUDOLPH LIEBMANN, New York, N. Y. Filed May 31, 1892. Serial No. 435,073. Term of patent 3½ years.

Claim.—The design for a campaign-button, substantially as herein shown and described.

21,730. RUBBER MAT. HENRY R. SPADONE, New York, N. Y. Filed June 24, 1892. Serial No. 437,913. Term of patent 7 years.

Claim.—The design for a rubber mat herein shown and described.

21,731. CORNICE. AUGUST CARLEWITZ, Newark, N. J. Filed May 6, 1892. Serial No. 432,082. Term of patent 7 years.

Claim.—The design for a cornice herein shown and described, the same comprising the upper and lower plain moldings B and C and the intervening cove A, with raised stem and leaves, substantially as shown and described.

TRADE-MARKS

REGISTERED JULY 19, 1892.

21,455. SOAP FOR LAUNDRY AND HOUSEHOLD USE. THOMAS ARMSTRONG, Baltimore, Md. Filed June 15, 1892.

GOODY-2-SHOES

Essential feature.—The words and figure "GOODY-2-SHOES." Used since 1884.

21,456. SALVE. BOSCHEE'S GALL CURE COMPANY, Old Town, Me. Filed Apr. 19, 1892.

BE SURE AND WORK THE HORSE

Essential feature.—The words "BE SURE AND WORK THE HORSE." Used since April 4, 1892.

21,457. CORSETS. JOSEPH BROKEL & Co., New York, N. Y. Filed June 10, 1892.

AZRA

Essential feature.—The word "AZRA." Used since April, 1892.

21,458. BICYCLES. BUFFALO WHEEL COMPANY, Buffalo, N. Y. Filed June 15, 1892.

NIAGARA.

Essential feature.—The word "NIAGARA." Used since July, 1891.

21,459. FLUID REMEDY FOR CONSUMPTION AND ALL DISEASES OF THE LUNGS. MRS. STEVEN D. CHAPMAN, Orville, Tex. Filed Apr. 9, 1892.

Consumption Conquered

Essential feature.—The words "CONSUMPTION CONQUERED" with a picture of the registrant, Mrs. Steven D. Chapman. Used since January, 1892.

21,460. COMPOUND OF FRUIT AND CASCARA-BARK FOR THE CURE OF DYSPEPSIA AND OTHER DISEASES. HENRY T. BOOTH, Brooklyn, N. Y. Filed May 17, 1892.

FRUITANZA

Essential feature.—The word "FRUITANZA." Used since April 4, 1892.

21,461. WATCHES. ELGIN NATIONAL WATCH COMPANY, Chicago, Ill. Filed June 10, 1892.

ELGIN ILL'S

Essential feature.—The word "ELGIN" and the abbreviation "ILL'S." Used since April, 1867.

21,462. WATCHES. ELGIN NATIONAL WATCH COMPANY, Chicago, Ill. Filed June 10, 1892.

ELGIN

Essential feature.—The word "ELGIN." Used since April 11, 1868.

21,463. WATCHES. ELGIN NATIONAL WATCH COMPANY, Chicago, Ill. Filed June 10, 1892.

LADY ELGIN

Essential feature.—The words "LADY ELGIN." Used since December 11, 1870.

21,464. WATCHES. ELGIN NATIONAL WATCH COMPANY, Chicago, Ill. Filed June 10, 1892.

ELGIN NATIONAL WATCH CO.

Essential feature.—The words "ELGIN NATIONAL WATCH CO." Used since February, 1874.

21,465. WATCHES. ELGIN NATIONAL WATCH COMPANY, Chicago, Ill. Filed June 10, 1892.

ELGIN WATCH CO.

Essential feature.—The words and abbreviation "ELGIN WATCH CO." Used since October, 1873.

21,466. SHERRY-WINE. ERNST FELDMANN, New York, N. Y. Filed May 25, 1892.

GALWEY-MONGRAND

Essential feature.—The word "GALWEY-MONGRAND." Used since January 28, 1889.

21,467. WHISKY. CLARENCE M. ROOF, New York, N. Y. Filed June 17, 1892.

NEW YORK CLUB

Essential feature.—The words "NEW YORK CLUB." Used since July 1, 1889.

21,468. MONTHLY SERIAL OR FAMILY PAPER. ELIZABETH J. SMITH, Providence, R. I. Filed June 21, 1892.

HOME GUARD

Essential feature.—The words "HOME GUARD." Used since December 1, 1886.

21,469. JEWELRY. UNITED SOCIETY OF CHRISTIAN ENDEAVOR Boston, Mass. Filed May 20, 1892.

Essential feature.—The capital letter "E" surrounded by the capital letter "C." Used since May 15, 1888.

21,470. WASHING-POWDER. THOMAS ARMSTRONG, Baltimore, Md. Filed June 15, 1892.

HORSE-SHOE

Essential feature.—The words or symbol "HORSE SHOE." Used since April 1, 1892.

21,471. SCOURING AND CLEANING POWDER. THOMAS ARMSTRONG, Baltimore, Md. Filed June 15, 1892.

Essential feature.—The words "LITTLE GIANT." Used since April 1, 1892.

21,472. RAZORS. BROCH & THIERRS CUTLERY CO., St. Louis, Mo. Filed Mar. 21, 1892.

CLIMAX

Essential feature.—The word "CLIMAX." Used since December 21, 1882.

21,473. PERFUMERY. BEAN & VAIL BROTHERS, Philadelphia, Pa. Filed June 18, 1892.

OUR PET

Essential feature.—The words "OUR PET." Used since May 1, 1888.

21,474. PERFUMERY. BEAN & VAIL BROTHERS, Philadelphia, Pa. Filed June 18, 1892.

Essential feature.—A representation of the United States Government building of the World's Columbian Exposition at Chicago, Ill. Used since May 5, 1892.

21,475. MINERAL WATER. CARSE & OHLWEILER, Rock Island, Ill. Filed May 26, 1892.

BLACK HAWK

Essential feature.—The words "BLACK HAWK" and a portrait of the head and bust of an Indian. Used since April 1, 1882.

21,476. CIGARS. CHARLES J. COOPER, Newark, N. J. Filed June 13, 1892.

VENDOME CLUB CIGARS

Essential feature.—The words "VENDOME CLUB CIGARS." Used since May 1, 1892.

21,477. DENTIFRICE. FLORENCE MANUFACTURING COMPANY, Northampton, Mass., New York, N. Y., and Chicago, Ill. Filed June 20, 1892.

OPERLE CREAM.

Essential feature.—The words "OPERLE CREAM." Used since June 1, 1892.

21,478. RAZORS AND POCKET AND CARVING KNIVES. HERMANN BOKER & Co., New York, N. Y. Filed June 4, 1892.

Essential feature.—The perspective representation of the building of the World's Columbian Exposition at Chicago, Ill. Used since May 14, 1892.

21,479. CIGARS. PETER LE FRANCIS, Cambridge, Mass. Filed May 9, 1892.

Northern Light.

Essential feature.—The words "NORTHERN LIGHT." Used since May 1, 1888.

21,480. PENCILS, COMPRISING LEAD-PENCILS AND PENCIL AND PEN HOLDERS. AMERICAN LEAD PENCIL COMPANY, New York N. Y. Filed May 17, 1892.

GLASS-FINISH

Essential feature.—The word "GLASS-FINISH." Used since September 15, 1891.

21,481. SEWING-MACHINES. CHARLES G. AKAN, Chicago, Ill. Filed June 6, 1892.

HOMESTEAD

Essential feature.—The word "HOMESTEAD." Used since 1882.

21,482. CORSETS FOR LADIES' USE. BAY STATE CORSET COMPANY, Springfield, Mass. Filed June 18, 1892.

R V

Essential feature.—The letters "R V." Used since March 22, 1890.

21,483. ROASTED AND SELF-SETTLING COFFEE. GRIGGS, COOPER & Co., St. Paul, Minn. Filed Apr. 2, 1892.

Essential feature.—The representation of a keystone bearing a shield surmounted by a crown. Used since April 22, 1891.

21,484. ROASTED COFFEE. MIDLAND COFFEE AND SPICE COMPANY, St. Joseph, Mo. Filed Mar. 31, 1892.

MIDLAND

Essential feature.—The word "MIDLAND." Used since September, 1890.

21,485. CURE FOR DRUNKENNESS. ALONZO HOTSMAN, Toledo, Ohio. Filed May 17, 1892.

Essential feature.—A portrait of the registrant and the word "ALCOMANIA." Used since March 1, 1892.

21,487.

ALCOMANIA

21,486. LUBRICATING-OIL. HENRY W. PEABODY & Co., Boston, Mass. Filed June 13, 1892.

GREYHOUND

Essential feature.—The word "GREYHOUND." Used since May, 1891.

21,487. SMOKED HAMS, SHOULDERS, AND BACON. SWIFT AND COMPANY, Chicago, Ill. Filed May 19, 1892.

SWIFT'S PREMIUM

Essential feature.—The words "SWIFT'S PREMIUM," the word "Premium" extending in a straight line and the word "Swift's" being arranged in the form of an arch above it. Used since May 11, 1892.

21,488. REMEDY FOR THROAT DISEASES. MARIA SCOTT, San Diego, Cal. Filed May 12, 1892.

Scott's Singing Balm

Essential feature.—The words "SCOTT'S SINGING BALM." Used since November 4, 1889.

21,489. LINIMENTS, EMBROCATIONS, AND LIKE EXTERNAL REMEDIES. WILBUR F. YOUNG, Meriden, Conn. Filed June 4, 1892.

ABSORBINE

Essential feature.—The word "ABSORBINE." Used since June 15, 1891.

21,490. CULINARY VESSELS. HERMAN AICH, New York, N. Y. Filed June 14, 1892.

ONYX

Essential feature.—The word "ONYX." Used since May 1, 1892.

21,491. ACCOUNT-BOOKS. ROBERT R. BARTON, Catlettsburg, Ky. Filed June 11, 1892.

Essential feature.—A fac-simile of registrant's signature in connection with the representation of the pages of an account-book. Used May 1, 1891.

21,492. VETERINARY REMEDIES, INCLUDING CONDITION-POWDERS FOR HORSES AND CATTLE. R. A. CRANSHILL & Co., Lynchburg, Va. Filed June 24, 1892.

BLACK BEAUTY

Essential feature.—The words "BLACK BEAUTY." Used since January 28, 1892.

21,493. TOILET AND LAUNDRY SOAP. H. C. DAVIS, Jr., & Co., Norfolk, Va. Filed June 17, 1892.

Essential feature.—The word "SWEETHEART." Used since May 1, 1892.

21,494. CEMENT. RICHARD M. SPENCER, Duluth, Minn. Filed June 14, 1892.

SQUARE ■ BRAND.

Essential feature.—A square figure and the words "SQUARE BRAND." Used since June 6, 1892.

21,495. CANNED SALMON. TAYLOR, YOUNG & Co., Portland, Oreg. Filed May 3, 1892.

INDIAN CHIEF

Essential feature.—The words "INDIAN CHIEF" formed of block capitals. Used since October 1, 1889.

21,496. CHAINS, RINGS, CLIPS, HOOKS, AND OTHER CARRIAGE-HARDWARE. BAKER CHAIN AND WAGON IRON MANUFACTURING COMPANY, Allegheny, Pa. Filed June 3, 1892.

Essential feature.—The representation of a wagon-clip bearing the name "BAKER." Used since January 3, 1887.

21,497. WEARING-APPAREL, OUTER AND UNDER WEAR, BEDDING, AND THE MATERIALS OF WHICH THEY ARE MADE. DR. JAEGER'S SANITARY WOOLEN SYSTEM COMPANY, New York, N. Y. Filed Mar. 2, 1892.

DR JAEGER'S SANATORY WOOLEN GOODS.

Essential feature.—The words "DR. JAEGER'S SANITORY WOOLEN GOODS." Used since April 19, 1887.

21,498. WEARING-APPAREL, OUTER AND UNDER WEAR, BEDDING, AND THE MATERIALS OF WHICH THEY ARE MADE. DR. JAEGER'S SANITARY WOOLEN SYSTEM COMPANY, New York, N. Y. Filed Mar. 2, 1892.

JAEGER GOODS

Essential feature.—The words "JAEGER GOODS." Used since April 19, 1887.

21,499. WEARING-APPAREL, OUTER AND UNDER WEAR, BEDDING, AND THE MATERIALS OF WHICH THEY ARE MADE. DR. JAEGER'S SANITARY WOOLEN SYSTEM COMPANY, New York, N. Y. Filed Mar. 2, 1892.

JAEGER

Essential feature.—The word "JAEGER." Used since April 19, 1887.

21,500. UNDERWEAR AND THE KNIT AND WOVEN FABRICS OF WHICH IT IS COMPOSED. DR. JAEGER'S SANITARY WOOLEN SYSTEM COMPANY, New York, N. Y. Filed Mar. 2, 1892.

JAEGER UNDERWEAR

Essential feature.—The words "JAEGER UNDERWEAR." Used since April 19, 1887.

21,501. NORWEGIAN BRANDY. JOSEPH R. LYSHOLM, Trondhjem, Norway. Filed June 6, 1892.

Essential feature.—The representation of a Norwegian peasant boy seated astride a keg and holding a keg under each arm. Used since September 14, 1885.

21,502. NORWEGIAN BRANDY. JOSEPH R. LYSHOLM, Trondhjem, Norway. Filed June 6, 1892.

Essential feature.—The word "AQUAVIT" in combination with a circular figure or disk. Used since September 14, 1885.

21,508. MEN'S OVERALLS, PANTALOONS, SUSPENDERS, SHIRTS, SCARFS, COLLARS, AND CUFFS. PLANT & ISAAC, Cincinnati, Ohio. Filed May 6, 1892.

HOPE

Essential feature.—The word "HOPE." Used since January, 1868.

21,504. WHISKY. THOMAS PEASE, SON & Co., Darlington, England, and Leith, Scotland. Filed June 25, 1892.

BOS

Essential feature.—The word "BOS." Used since December 19, 1891.

21,505. FLAVORING-EXTRACTS. A. J. HILBERT & Co., Milwaukee Wis. Filed June 27, 1892.

Essential feature.—The word "FISHERS." Used since October, 1878.

21,506. MEAD. JOHN MCCLOSKEY, New Orleans, La. Filed June 13, 1892.

ESTABLISHED 1891.
Mc CLOSKEY'S
ORIGINAL
NEW ORLEANS MEAD.

Essential feature.—A crescent bearing the word "ESTABLISHED" and the figures "1851" in conjunction with the words "MCCLOSKEY'S ORIGINAL NEW ORLEANS MEAD." Used since June, 1851.

21,507. TIN AND TERNE PLATES, INCLUDING ROOFING-PLATES AND BRIGHT PLATES. C. S. MESSER & Co., New Haven, Conn. Filed June 27, 1892.

ELM

Essential feature.—The word "ELM." Used since June 1, 1892.

21,508. COMPRESSED PEA-SOUP. THE C. W. KOTT COMPANY, New York, N. Y., and Boston, Mass. Filed May 11, 1892.

Essential feature.—The representation of a quart-measure. Used since February 1, 1891.

21,509. COMPRESSED PEA-SOUP. THE C. W. KOTT COMPANY, New York, N. Y., and Boston, Mass. Filed May 11, 1892.

Essential feature.—The representation of a human arm and hand. Used since February 1, 1891.

21,510. FLY-PAPER. THE FLY BUTTON CO., Maumee, Ohio. Filed June 27, 1892.

Essential feature.—The representation of a button with a fly thereon. Used since May 2, 1892.

THE NORRIS PETERS CO.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

ECKERSON *v.* COX.

Decided June 9, 1892.

PRACTICE—INTERFERENCE—REDUCTION TO PRACTICE.

As between interference contestants, he who was last to conceive of an improvement is not entitled to take a patent therefor over him who was first to conceive, unless by reason of the latter's delay his opponent becomes the first to reduce to practice.

APPEAL from the Examiners-in-Chief.

PRINTING-PRESS.

Application of D. I. Eckerson filed July 28, 1890, No. 360,132. Application of J. L. Cox filed July 22, 1890, No. 359,563.

Messrs. M. T. E. Chandler & Co. for Eckerson; *Mr. W. G. Henderson*, associate.

Mr. T. H. Alexander for Cox.

SIMONDS, *Commissioner:*

This is an appeal from a decision of the Examiners-in-Chief awarding priority of invention to Cox.

Eckerson's history, as stated by himself, is as follows: He conceived the invention in controversy in March, 1888; made certain drawings in November, 1888, and certain other drawings in the latter part of 1889; began working drawings March 25, 1890, which he finished April 23, 1890. He began the construction of a working-machine about the 1st of June, 1890; applied for a patent July 28, 1890, and he had a working-machine finished in December, 1890.

Cox made a working model embodying the larger part of the improvement in controversy in 1878. In 1886 he possessed an idea and knowledge of the improvement in controversy in its entirety, and in that year made certain drawings of parts thereof. He made certain other drawings in January, 1890. In April or May, 1890, he made a very large and complete drawing of the whole thing. He began the construction of a full-size machine in May or June, 1890, and had it finished in August or September, 1890.

Cox was the first to make actual reduction to practice, and he was the first to make a constructive reduction to practice by filing an application for a patent. He also had a conception of the invention in controversy before Eckerson had such conception.

Eckerson contends that Cox was not duly diligent in reducing to practice, largely because of the delay between 1[illegible] 1886. As this delay occurred before Eckerson appeared in the field, and Cox was nevertheless the first to reduce to practice, it is not seen how it can inure to the benefit of Eckerson. The cases decided by the courts do not seem to hold that he who was the last to conceive of an improvement is entitled to take a patent therefor over him who was first to conceive, unless, by reason of the delay on the part of him first to conceive, his opponent becomes the first to reduce to practice, which is not the present case.

The decision of the Examiners-in-Chief is affirmed.

MORFORD *v.* CARPENTER.

Decided June 23, 1892.

1. PRACTICE—EARLY SKETCHES AS EVIDENCE TO ESTABLISH DATE OF CONCEPTION—THEIR WEIGHT AS SUCH.

The fact that an applicant's rough sketch, introduced to corroborate him upon his alleged date of conception, shows a variation from the true proportions of the actual perfected invention will not necessarily impair its weight as evidence even though these proportions are an important feature of the patent.

2. DELAY IN REDUCTION TO PRACTICE—HOW ACCOUNTED FOR.

A delay of five months between conception and reduction to practice is satisfactorily explained by proof of applicant's limited means during that period.

APPEAL from Examiners-in-Chief.

ELECTRO-HEATING APPARATUS.

Application of Thomas E. Morford filed December 19, 1890, No. 375,175. Patent granted Charles E. Carpenter February 24, 1891, No. 447,023; application filed September 27, 1890.

Mr. P. H. Gunckel for Morford.

Messrs. Elliott & Omohundro for Carpenter.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiners-in-Chief awarding priority of invention to Morford with reference to the following interference issue:

In an electro-heating apparatus, the combination, with the heated surface-plate and the resistance, of a coating of enamel or its equivalent securing the resistance to but insulating it from said plate.

Carpenter's application for patent was filed September 27, 1890. Morford's application was filed December 19, 1890. A patent inadvertently issued upon Carpenter's application February 24, 1891, No. 447,023; but in this interference the status of both contestants is that of applicants. If Carpenter was an original inventor, the date of the making of the invention by him, so far as it can be determined from the evidence, was September 9, 1890. He states that he conceived the invention about December 1, 1889, (Q. 700;) but the idea which he then had was simply the idea of a desirable result without a knowledge of a means how to attain that result. On the 9th day of September, 1890, he had made a surface-plate such as is defined in the interference issue, and under all the circumstances

that must be taken to be the date both of his effective conception and of his reduction to practice.

Morford testifies that in the month of July, 1890, he communicated the improvement in controversy to Arthur E. Morford, Thomas T. Morford, and Parker H. Litchfield, and that during the same month he make a sketch exhibiting the improvement and showed and explained the same to the two other Morfords; also, that during the month he had a plate enameled (but not containing the entire invention) and exhibited the same to Carpenter. Arthur E. Morford and Thomas T. Morford corroborate Thomas E. Morford's testimony as to disclosure to them and as to the sketch. Litchfield corroborates Morford as to the disclosure to him. Carpenter admits that Morford had the surface-plate enameled in July, 1890, and that in that month he showed the same to him.

Morford made no actual reduction to practice previous to his application for patent December 19, 1890; but that application is necessarily a constructive reduction to practice. Morford's delay between the conception in July, 1890, and the constructive reduction to practice in the following December is about five months. He accounts for this delay by saying that he was not possessed of the necessary means to make application for patent, and also that for a large part of the time his occupation forced him to go from place to place in such a way as practically to prevent him from giving attention to the matter. As Morford was a young married man at this time, having a salary of only ten dollars a week from July to October and only fifteen dollars a week after that, and was compelled to borrow money from his father to eke out the payment of his expenses, his plea of lack of funds must be taken to be satisfactory.

Carpenter criticises different features of Morford's case. He says that the sketch which Morford made in July, 1890, does not necessarily or probably disclose the improvement in controversy because that sketch has walls at the edges of the enamel, and because when the sketch is developed by enlargement to a full-sized device the enamel proves to be about half an inch thick, while in practice it is less than a sixteenth of an inch thick. These are criticisms based upon fruition, but applied to a first conception. Moreover, it is thought that the sketch is just such a one as would naturally be made for the purpose in hand, for there are not many persons who would hastily attempt to make a sketch showing with accurate dimensions the embedding of a resistance-coil in a coating of enamel something less than one-sixteenth of an inch thick. Carpenter contends that the walls at the edges of the enamel in this sketch indicate an intention to use something else besides enamel—pulverized clay, for instance—an idea that is negatived by the fact that Morford's device, as disclosed in July, 1890, was intended to be water-proof.

Carpenter contends, further, that there is a discrepancy between Morford's allegation in his preliminary statement that he conceived of the improvement in controversy in June, 1890, and the fact, as developed in his evidence, that the conception was not made until July, 1890, overlooking the fact in making this criticism that there is a larger discrepancy of much the same kind in his own case. Again, about July 15, 1890, Morford had a plate coated with enamel without embedding a resistance-coil, while his sketch and his disclosure to the other Morfords made a few days previously embodied the full idea, and Carpenter claims that this is a feature of inconsistency. Morford explains by saying that he had no resistance-coil which he felt that he could use for that purpose, and this particular criticism by Carpenter overlooks the fact that Carpenter, after seeing this plate which Morford had had enameled, himself had five or six other plates enameled without embedding a resistance-coil. Still further, Carpenter makes the criticism that Morford did not disclose the improvement to Carpenter or the company with which both were connected under circumstances naturally calling for it. This criticism overlooks the fact that neither did Carpenter make a similar disclosure to Morford at a time when their relations were friendly and disclosure would seem to have been natural.

In Carpenter's testimony there occurs the following:

> Question 713. Was that all you did about this enamel matter? If not, please state fully what you did from that date on.
>
> Answer. On September 8th I left for Chicago and took with me the sad-iron plate which Mr. Morford had brought from Chicago, together with a resistance-card, and on the following day, September 9th, about ten o'clock a. m., called upon Mr. Omohundro, of the firm of Elliott & Omohundro, at Chicago, and explained my invention to him and instructed him to apply for a patent upon the same, and said that I would show him an apparatus constructed in this way some time in the afternoon. I then took a cab and drove to Cribben, Sexton & Company's factory, and in Mr. Cribben's presence detached the wires from the card of asbestus and took this plate with wires to the enameling-room. The foreman gave this enameled-surface plate another coating of enamel and I placed the wires myself upon and into this coating of enamel while it was wet. He then said that if I would return about two o'clock it would be dry and fused, or "burned," as he called it. I remember then of going back to the hotel and returned, I think, about two o'clock, when the iron was given another coat of enamel, which completely covered the wire. The drying and burning required about an hour, and as soon as the same was cold enough to handle I wrapped it up in a piece of paper and took it to Mr. Omohundro at his office, instructing him, to make drawings from it and forward the same to me by express to New York city, and also to send specifications for the patent upon it as soon as prepared also to my address in New York. I left Chicago upon that day, I believe, at five p. m. for New York.

This rather extraordinary celerity on Carpenter's part in instructing his solicitor to prepare an application for patent on the same day he made reduction to practice, but before accomplishing that reduction, is a somewhat curious thing in view of Carpenter's statement that the whole thing had flashed upon him when Morford showed him the enameled plate in the previous July, and it is unexplained in the evidence. It leads to the suspicion that some material fact had occurred not developed in the testimony.

It must either be found that Morford fully conceived the invention in controversy in July, 1890—which was previous to Carpenter's conception in September, 1890—or the testimony of the three Morfords and that of Litchfield must be rejected because of the things claimed by Carpenter to be inconsistencies on the part of Morford. The criticisms made by Carpenter are not sufficient for that purpose.

The decision of the Examiners-in-Chief is affirmed.

EX PARTE HAGGENMACHER.

Decided June 27, 1892.

TRADE-MARK—FOREIGN APPLICANT—RULE WHERE "LOCATION" AND "CITIZENSHIP" ARE AT VARIANCE.

Where an applicant for a Trade-Mark appears on the record as "located" in a foreign country other than that of which he is a citizen, his application will be governed by the existing treaty, convention, or law of the country of location rather than that of citizenship.

ON petition.

TRADE-MARK FOR MACHINES.

Application of Carl Haggenmacher filed March 12, 1892.

Mr. H. W. T. Jenner for the applicant.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiner of Trade-Marks declining to register a Trade-Mark.

The question involved is a somewhat unusual one. A citizen of Switzerland, located and having a place of business at Buda-Pesth in Austria, is an applicant here for the registration of a Trade-Mark which is of a character specially excepted from protection under the laws of Austria. The applicant urges apparently that citizenship, regardless of location, is the true criterion in determining questions of this character. The Examiner, however, takes the ground that the place of business as set forth in applicant's specification is the reasonable and proper test, and he denies the application, as asking for something which this country, by virtue of its existing treaty with Austria, is bound to deny to a citizen of that country. The mark sought to be registered is an arbitrary word-symbol, and the Austro-Hungarian law explicitly forbids the registration of such marks. If, then, the question is to be determined by Austrian law, it follows that the registration must be refused, since this Government guarantees to furnish applicants such protection and such protection only as their respective governments accord them. It is significant that the law guarantees protection to Trade-Marks when the owners thereof are—

> domiciled in the United States or *located* in any foreign country or tribe which, by treaty, convention, or law, affords similar privileges to citizens of the United States.

There seems no ambiguity here and little chance for a misconception of the meaning of the law. It is an old principle of statutory construction that words are to be given their natural and every-day meaning rather than a forced and unreasonable construction. The word "located" was probably used advisedly by the framers of this statute. We are not at liberty to assume that by the use of a broad term, whose meaning is well defined and whose use is common, the framers of the statute meant to convey a meaning other than that usually attached to it; but if there were otherwise any doubt as to the meaning of the word in this connection, there is no room for it in this case, since in the next paragraph of the act under consideration occurs the phrase "location and citizenship," which shows that the words are used contrastingly and with their own respective and ordinary meanings.

Since this is a true test, and since the applicant by his own voluntary statement appears on the records of this Office as having his primary place of business in Austria, it is the duty of the Office to be guided by Austrian law. Applicant has applied for the registration of a mark in which the Austrian law explicitly declares he has no property right. His mark cannot be protected as against the public in that country—in other words, it is public property. This being so, the application for registration here must be denied.

EX PARTE KUPPENHEIMER BROTHERS.

Decided July 7, 1892.

TRADE-MARK—WHAT IS NOT REGISTRABLE AS.

A fac-simile of the certificate issued by a State Board of Pharmacy to registered pharmacists is not registrable as a Trade-Mark.

ON petition.

TRADE-MARK FOR CIGARS.

Application of Kuppenheimer Brothers filed September 23, 1891.

SIMONDS, *Commissioner:*

This is a petition taken from the action of the Examiner of Trade-Marks, denying the registry, as a Trade-Mark for cigars, of a fac-simile of the certificate issued by the Board of Pharmacy of Michigan to registered pharmacists.

It is conceivable that upon the suggestion of the Board of Pharmacy of Michigan a court would enjoin any one from attempting to use their certificate as a Trade-Mark for cigars, and it is conceivable that such board might have serious objections to any such use of their certificate.

It is further conceivable that registered pharmacists in Michigan may wish to give public notice of the fact that they hold these certificates by affixing labels or the like to packages of goods, cigars, or anything else sold by them (not, however, in any way contending that such certificate is a Trade-Mark,) and that the registry by this office of that certificate as a Trade-Mark would interfere with the doing of such a thing by the registered pharmacists of Michigan.

It is still further conceivable that this certificate, affixed as a Trade-Mark to a box of cigars, may convey in some way the impression to the purchaser that the particular cigars bearing such Trade-Mark are guaranteed or approved by the Board of Pharmacy of Michigan.

It is thought that the Patent Office should not lend its aid in any of these directions.

The petition is denied.

RAFFARD *v.* DE FERRANTI.

Decided June 18, 1892.

INTERFERENCE—TESTIMONY IN FOREIGN COUNTRIES—HOW TAKEN.

Testimony cannot properly be taken in foreign countries otherwise than as prescribed by Rule 158, (3) unless this procedure be waived *by stipulation of the parties.* [Rule 158 (5).]

APPEAL on motion.

ELECTRIC LOCOMOTIVE.

Application of Nicolas Jules Raffard filed July 25, 1891, No. 400,397. Patent granted Sebastian Z. de Ferranti April 30, 1889, No. 402,311.

Messrs. Bentley & Knight for Raffard.

Messrs. Baldwin, Davidson & Wight for de Ferranti.

FROTHINGHAM, *Assistant Commissioner:*

The junior party to this interference, Raffard, filed a motion before the Examiner of Interferences to take testimony abroad. This motion was in harmony with the requirements of Rule 158. The senior party, de Ferranti, however, at a later date and before a hearing was had, formally asked by motion that Raffard's request for a commission to take testimony abroad be modified and that the Examiner of Interferences order that the testimony be taken orally rather than by written interrogatories and cross-interrogatories, as the rule provides. The Examiner granted Raffard's motion to take testimony under the rule and denied de Ferranti's motion for a modified order, whereupon de Ferranti has appealed to the Commissioner.

Rule 158, under which a suitor before this Office may secure and introduce evidence taken in foreign countries, is precise in its terms and points out a definite and specific mode of procedure. It directs that after a petitioner has presented his motion and secured permission to take such testimony interrogatories must be filed within a limited time, and cross-interrogatories, also, if the opposing party shall elect to question the witness. This is the natural and prescribed way of proceeding under the rule; but it is definitely provided that this procedure may be waived to the extent of permitting an oral examination *by stipulation of the parties*. There can be no doubt as to the meaning of this, and there is no question that a party seeking the protection of the rule is entitled to all the privileges which it guarantees in terms. Plainly, nothing short of the mutual assent of all the interested parties can avoid its strict letter.

But the appellant lays much stress upon the alleged fact that an exclusive construction of the rule is at variance with the practice by the Federal courts, and he urges that it is a matter of discretion with the Commissioner whether or not the rule shall be relaxed in particular cases, quoting in support of his proposition Rule 153, which provides that—

> In contested cases the practice on points to which the rules shall not be applicable will conform * * * to that of the United States courts.

It may be said in answer to this contention that while it is the policy of the Patent Office to follow the rules of the Federal courts as far as those rules may be adapted to meet the peculiar conditions of practice here it was never intended that the Office should not pass such rules for the proper conduct of its business and for the protection of parties before it as best meet its requirements. The rule under which this question arises was undoubtedly framed with reference to this principle, and it is not difficult to foresee the endless vexation and expense that might result to parties before the Office if this plain intent were overridden by such a ruling as that asked for by de Ferrranti in the present case. It is therefore held that Rule 153 is not of any force in determining the question under consideration, since the precise point at issue is plainly met and covered by Rule 158. But it may be said in conclusion that, even granting this to be a question for the exercise of a reasonable discretion on the part of the Office, the appellant has fallen far short of making such a showing as would, in my opinion, warrant the granting of the motion.

The decision of the Examiner of Interferences is therefore affirmed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

REMINGTON STANDARD TYPE-WRITER MANUFACTURING COMPANY *et al. v.* BAILEY.

Decided June 11, 1892

PATENT—INFRINGEMENT—PRELIMINARY INJUNCTION AGAINST A SELLING AGENT.

A complainant may have a preliminary injunction against an infringing defendant who is a mere selling agent where, the patent having nearly expired, the court might refuse it against a manufacturer giving proper security.

Mr. H. D. Donnelly for the complainants.

Messrs. Campbell, Hotchkiss & Reiley and *Messrs. Maynadier & Beach* for the defendant.

LACOMBE, *J.:*

This is an application for preliminary injunction against infringement of Patent No. 170,239, (to Lucien S. Crandall, November 23, 1875,) for improvement in type-writing machines.

The third claim of the patent is as follows:

> 3. The combination of the vibrating platen with the swinging compound type-bars, provided with types corresponding to each vibration on printing-point of the platen, substantially as specified.

The record shows that Crandall was the first to use swinging type-bars provided each with more than one type and a vibrating platen by whose vibrations the centers or printing-points on which the types strike might be increased. The combination of these two novel features in the art of type-writing seems clearly covered by the claim above quoted, unless, as defendant contends, the use of the word "compound" confines the claim to bars, which not only bear a plurality of types, but also, by means of the oscillating finger-levers (elsewhere described in the patent) are themselves oscillated, thus having a duplex motion. I am of opinion, however, that the word "compound" is used to indicate that the bars bear more than the single type, which was characteristic of all type-bars before Crandall made his invention. As thus construed the third claim is concededly infringed by defendant's machine.

The first claim seems to cover a combination of which oscillating finger-levers, and therefore oscillating type-bars, are elements, and these are not found in defendant's machine. The validity of the second claim for the vibrating platen and mechanism to vibrate it is not sufficiently free from doubt to warrant a preliminary injunction.

Were the manufacturers defendants in this suit, it might be, in view of the short time the patent has to run, that preliminary injunction should be refused upon giving proper security; but as defendant is only a selling agent complainant may take his order against infringement of the third claim.

U. S. Circuit Court—Southern District of New York.

CUERVO *v.* JACOB HENKELL COMPANY *et al.*

Decided March 14, 1892.

TRADE-MARK—INFRINGEMENT—INJUNCTION—LABELS ON CIGARS.

A manufacturer of cigars whose goods are protected by Trade Mark is entitled to an injunction against a manufacturer of cigar-boxes who, although he does not make cigars, furnishes the trade with boxes supplied with labels confessedly counterfeits of the complainant's registered mark.

BILL by G. Garcia Cuervo against the Jacob Henkell Company and others for infringement of Trade-Mark. Heard on motion for a preliminary injunction. Granted.

Messrs. Jones & Govin for the complainant.

Messrs. Wise & Lichtenstein for the defendants.

LACOMBE, *J.:*

There is no dispute as to the facts of this case. The complainant, a manufacturer of cigars, is concededly the owner of a Trade-Mark which, as an entirety, is embodied in four separate labels placed inside and

outside the boxes containing his cigars. The goods thus marked and put up have obtained a wide celebrity and for the last twenty-five years have had an extensive sale in this and other States of the Union. The defendants do not make or deal in cigars. They manufacture cigar-boxes, which they sell to cigar-makers. They also procure from lithographers labels which are almost an exact reproduction of those used by the complainant, even the signature being copied therein. That boxes thus labeled are so close an imitation of the packages in which complainant sells his goods that an ordinarily careful purchaser would be deceived thereby is not controverted. Not only do the defendants affix to their boxes the three labels which are placed thereon before packing, but with each box they also sell to their customers a fourth label, which can only be placed on the box, as complainant places it, after the box is filled and closed. Were there any conflict as to the intent of the defendants it would be difficult to escape the conviction that they prepare these boxes for the express purpose of enabling their customers to foist upon the public goods not of complainant's manufacture, representing them to be genuine. But there is no conflict. Defendants concede that they know for what purpose their labeled boxes are to be used, and that they make and sell them for that purpose.

In defense it is urged that it has been for many years the custom of the cigar trade in this country to use what are known as "Spanish labels;" that labels like those complained of in this suit have been on open sale at various lithographers and could be obtained by any one, and that nearly all the cigar-box manufacturers in this city, as well as in other cities in this country, have made and sold boxes bearing labels similar to those complained of in this suit. As to the imitation of labels of other manufacturers—"Spanish labels" generally, as defendants call them—that is wholly immaterial. Complainant is not to be deprived of his Trade-Mark because other owners of other Trade-Marks suffer infringement without objection; and as to other imitations of his own Trade-Mark there is not a particle of evidence to show that these were made or sold with his consent or acquiescence. This defense has been so frequently and forcibly condemned by authority that further discussion is profitless. (*Taylor* v. *Carpenter*, 3 Story, 458; 2 Woodb. and M., 7; Browne, Trade-Marks, sec. 685, and cases cited.) Nor is there anything to the suggestion that injunction will not lie against defendants because they do not themselves make, pack, or sell the fraudulent cigars. No doubt they may make the boxes without objection. There is no Trade-Mark, so far as appears, in the style, size, or shape of a cigar-box. But they do much more. They procure labels counterfeiting the complainant's and assemble these labels with their boxes with the obvious purpose of enabling others by the use of the labels to palm off their goods upon the public as the goods of the complainant. Complainant is clearly entitled to an injunction against all who knowingly combine together to accomplish that purpose. (*De Kuyper* v. *Witteman*, 30 O. G. 345; 23 Fed. Rep., 871; *Hostetter Co.* v. *Brueggeman-Reinert Distilling Co.*, 56 O. G. 550; 46 Fed. Rep., 188.)

Motion granted.

U. S. Circuit Court—Southern District of New York.

IN RE VINTS CHGER *al.*

Decided April 15, 1892.

TRADE-MARK—SIMULATED ON FOREIGN IMPORTS—SECTION 7 OF THE TARIFF ACT OF OCTOBER 1, 1890.

In an application for mandamus to compel the collector of customs to examine into the validity of a certain registered Trade-Mark which he had declared simulated on certain imported goods which he had declined to admit to entry under the provisions of section 7 of the tariff act of October 1, 1890, *Held* that the circuit court had no jurisdiction to grant a mandamus, and that whether the decision of such officer that any particular import is within the statute's prohibition is reviewable in the courts was not before the court in this proceeding.

APPLICATION for mandamus.

STATEMENT OF THE CASE.

This was an order to show cause why a mandamus should not be issued to compel the collector of the port of New York to take and hear the evidence and proofs of the applicants, composing the firm of Markt & Co., and to determine whether one E. Meyers, of the Meyers Putz Pomade Company, were the owners of an alleged trade-mark, and whether, notwithstanding the fac-simile of the alleged Trade-Mark of the Meyers Putz Pomade Company on file in the office of said collector, entry should be refused of certain goods imported by the said firm of Markt & Co. It appeared from the affidavit upon which the order to show cause was granted that the applicants, composing the firm of Markt & Co., doing business in New York city, imported the merchandise in question—namely, a certain quantity of metal polish, called "Universal Metall Putz Pomade;" that on or about the 14th day of March, 1892, the firm of Markt & Co. attempted to enter the same at the custom-house in the city of New York, but that the collector of said port refused to allow the goods to be entered upon the grounds that he, the said collector, had received from the Secretary of the Treasury a certificate to the effect that the Meyers Putz Pomade Company had, in accordance with section 7 of chapter 1244 of the laws of the United States of 1890, (the tariff act of October 1, 1890,) caused to be deposited with the Department of the Treasury a fac-simile of a trade-mark which the said Meyers Putz Pomade Company claimed as domestic manufactures, and that he (the said collector) had neither the power nor the time to investigate the question whether or not the Meyers Putz Pomade Company were domestic manufacturers or the rightful owners of the said Trade-Mark.

The affidavit of the said applicants for the mandamus further set forth that one E. Meyers, who had been succeeded by the Meyers Putz Pomade Company, was formerly the agent of the firm of Schmitt & Foerderer, the manufacturers of the goods in Germany, and as such agent, and as long ago as 1886, imported goods into this country under the identical marks and trade-marks which he and the Meyers Putz Pomade Company now claimed were their property; further, that the Meyers Putz Pomade Company was a corporation incorporated under the laws of West Virginia, having its principal office at Boston, Mass., and that the Trade-Mark which the Meyers Putz Pomade Company claimed was derived from one E. Meyers, who was formerly the agent of said firm of Schmitt & Foerderer, which latter firm had used such Trade-Mark long prior to its alleged adoption by the Meyers Putz Pomade Company. On the return of the order to show cause the affidavit of the collector of customs at New York was read, by which it appeared that on or about the 19th day of February, 1892, the deponent, as such collector, received from the Treasury Department at Washington a letter, dated February 18, 1892, inclosing the two fac-similes of the Trade-Mark therein referred to of the Meyers Putz Pomade Company, which fac-similes were duly recorded at the New York custom-house February 23, 1892, pursuant to instructions contained in the circular of the Treasury Department,

dated October 31, 1890, (printed in Synopsis Decisions of the Treasury Department for 1890, No. 10,309;) that the merchandise attempted to be entered was invoiced from Wahlershausen-Cassel, Germany, as "metal polish," contained in small tin boxes, having on the top of each an inscription or trade-mark, which boxes were in condition to be put upon the market of this country and sold; that said merchandise was examined according to law by the appraiser of said port of New York, who, on the 23d day of March, 1892, made his official return thereof to deponent, as such collector, stating therein, among other things, "Trade-Mark illegal;" that deponent, as such collector, thereupon, exercising due and proper care, decided that the articles of merchandise imported as above did copy or simulate the Trade-Mark of "The Meyers Putz Pomade Company," of which fac-similes were received from the Treasury Department and recorded and filed in the New York custom-house, as above set forth, and that such articles of merchandise should not be admitted to entry at the custom-house and port of New York.

Section 7 of the tariff act of October 1, 1890, above referred to, is as follows:

SEC. 7. That on and after March first, eighteen hundred and ninety-one, no article of imported merchandise which shall copy or simulate the name or trade-mark of any domestic manufacture or manufacturer shall be admitted to entry at any custom-house of the United States. And, in order to aid the officers of the customs in enforcing this prohibition, any domestic manufacturer who has adopted trade-marks may require his name and residence and a description of his trade-marks to be recorded in books which shall be kept for that purpose in the Department of the Treasury, under such regulations as the Secretary of the Treasury shall prescribe, and may furnish to the Department fac-similes of such trade-marks; and thereupon the Secretary of the Treasury shall cause one or more copies of the same to be transmitted to each collector or other proper officer of the customs.

On behalf of the applicants for the mandamus it was argued that repeated applications had been made for relief both to the collector of the port and to the Secretary of the Treasury without effect and that, unless the court interfered by mandamus to compel the collector to examine into the question of the legality of the alleged Trade-Mark filed in the Treasury Department at Washington and the right as claimed by the importers to use the same as their own, the importers seemed to be without remedy, as their merchandise was deteriorating in value and possession thereof was refused them by the collector.

On behalf of the collector it was urged, first, that the circuit court of the United States had no authority or power to issue a writ of mandamus as an original and independent proceeding, the United States attorney citing, among other authorities, *Bath Co.* v. *Amy*, (13 Wall., 244;) *McIntire* v. *Wood*, (7 Cranch., 504;) *McClung* v. *Silliman*, (6 Wheat., 601;) secondly, that even if the court had jurisdiction mandamus would lie only where there is a refusal to perform a ministerial act involving no exercise of judgment or discretion or where the officer refuses to decide and the aggrieved party could have the decision of the officer reviewed by another tribunal, citing *Commissioner* v. *Whiteley*, (4 Wall., 522;) *Decatur* v. *Paulding*, (14 Pet., 515;) thirdly, that more cannot be required of a public officer by mandamus than the law has made it his duty to do, citing *Ex parte Rowland*, (104 U. S., 612.)

Messrs. Goepel & Raegener for the applicants.

Mr. Edward Mitchell, United States attorney, and *Mr. James T. Van Rensselaer*, assistant United States attorney, for the collector.

LACOMBE, *J.:*

Under the provisions of section 7 of the tariff act of October 1, 1890, the question whether a domestic manufacturer has adopted a name or trade-mark and whether any articles of imported merchandise do copy or simulate such name or trade-mark are to be determined, in the first instance, by the administrative officers to whom the execution of the tariff laws is entrusted. The provision of the same section that a record shall be kept in the Treasury Department describing such trade-marks does not make that record conclusive evidence of the fact that the person who "may require his name and residence and a description of his trade-marks to be recorded" is a domestic manufacturer or has any trade-mark. The record-book is, in the language of the statute, but an "aid" to the customs officers, and the prohibition is directed only against articles which copy or simulate the genuine trade-marks of *bona fide* domestic manufacturers. Whether the decision of the proper customs officers that any particular import is within the prohibition is reviewable in the courts, and, if so, in what way it may be presented for review, is not now before this court. This application is for a mandamus to compel the collector to examine into the facts and decide whether entry should be refused or not, and it is abundantly settled by authority that the power to issue a writ of mandamus as an original and independent proceeding does not belong to the United States circuit courts. (*Bath Co.* v. *Amy*, 13 Wall , 244.)

Motion denied.

Changes in Classification.

(ORDER No. 768.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 18, 1892.

Sub-class 9, Tire-heating furnaces, in Class 152, Wagon, Car, and Track Irons, is hereby transferred from Division XIII to Class 75, Division III.

N. L. FROTHINGHAM,
Acting Commissioner.

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1890, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Vol. 7. Appendix No. 7, July 1, 1887, to June 30, 1888. One volume, 68 pages. In paper covers, $1 50.

Vol. 8. Appendix No. 8, July 1, 1888, to June 30, 1889. One volume, 72 pages. In paper covers, $1.50.

Vol. 9. Appendix No. 9, July 1, 1889, to June 30, 1890. One volume, 84 pages. In paper covers, $1.50.

Vol. 10. Appendix No. 10, July 1, 1890, to June 30, 1891. One volume, 98 pages. In paper covers, $1.50.

World's Columbian Exposition.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 8, 1892.

To the Inventors and Manufacturers of the United States:

It is the intention of the Patent Office to make at the World's Columbian Exposition at Chicago in 1893 an exhibit which will show that great advance in the several arts which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as is possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions, embodied in concrete form and properly arranged, will, it is believed, constitute a grand historical exhibit of the progress of the useful arts and one which will be of great interest not only to inventors and manufacturers, but to the public generally.

The Office collection of models has been seriously impaired by fire, and is further incomplete by reason of the fact that models have not generally been required or received during the last ten years. The Office is not, therefore, in possession of the models of many valuable inventions which might properly be included in such an exhibit, and without which indeed, the exhibit would be incomplete. The limited appropriation for this exhibit will not permit the Office to make such models. An urgent appeal is therefore made to all inventors and manufacturers to come to the assistance of the Office in this matter, either by loans of models already built or by the construction of such models not in the possession of the Office as should properly be placed in such a collection. Of course, where models are loaned to the Office all proper credit will be given both in labels and catalogues to the parties by whom the loans are made, and such disposition will be made of the models after the close of the exhibit as the owners shall direct. Many inventors and manufacturers have already indicated a willingness to co-operate with the Office in this matter, and it is confidently expected that such a response will be made to this general appeal as will assure the unparalleled success of this attempt to graphically and concretely show the development of American invention.

W. E. SIMONDS,
Commissioner.

Withdrawal of Cases from Issue.

Hereafter all amendments proposed to allowed applications which involve a withdrawal from issue, and all petitions and requests relating thereto, shall be filed with the docket clerk, Mr. J. M. Emory, and transmitted by him to the Primary Examiner for report. If the Examiner shall report favorably to the admission of such amendment, the matter will be laid before the Commissioner for immediate determination. If the Examiner shall report unfavorably, the case will be docketed and will be heard and decided by the Commissioner in regular course, unless good reasons shall appear for immediate action.

Notice.

All solicitors, agents, or attorneys who, in circulars or advertisements or otherwise, refer to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

Names of Applicants.

When the full first name of the applicant does not appear either in his signature or in the preamble to the specification, the Examiner will, in his first official letter, require an amendment supplying the omission, and he will not pass the application to issue until the omission has been supplied, unless an affidavit shall have been filed setting forth that the full first name of the applicant is the one originally given by him.

Issue of July 26, 1892.

PATENTS

GRANTED JULY 26, 1892.

479,891. VALVE FOR STEAM OR HIGH-PRESSURE FLUIDS. WILLIAM G. ADAMS and JOHN S. FOSTER, Philadelphia, Pa. Filed Oct. 3, 1891. Serial No. 407,590. (No model.)

Claim.—1. The combination of a valve-body provided with inlet and outlet orifices and a valve-seat, a continuous closed casing capable of rocking movement mounted upon said body and communicating only therewith, and a valve operatively connected with said casing and so arranged with relation to said seat as to be shifted toward or from the same in conformity with the rocking movement of the casing, substantially as set forth.

2. The combination of a valve body provided with inlet and outlet orifices and a valve-seat, a continuous closed casing capable of rocking movement mounted upon said body at a point intermediate between said inlet and outlet orifices, said casing being adjacent to but out of the direct path of the fluid, and a valve operatively connected with said casing and so arranged with relation to said seat as to be shifted toward or from the same in conformity with the rocking movement of the casing, substantially as set forth.

479,892. METAL-SHEARS. HENRY AIKEN, Pittsburg, Pa. Filed Nov. 18, 1891. Serial No. 412,014. (No model.)

Claim.—1. The combination of a series of hydraulic motors set in tandem, each comprising a cylinder and plunger, one of which is stationary and the other movable, supports for the stationary parts of the motors, common guides within which the movable parts move, connections between said movable parts, and an operating-tool, substantially as and for the purposes described.

2. The combination of a series of hydraulic motors, each comprising a cylinder and plunger one of which is stationary and the other movable, supports for the stationary parts of the motors, said motors being set one in advance of the other with their moving parts connected, and an operating-tool at the outer end of the last motor of the series, substantially as and for the purposes described.

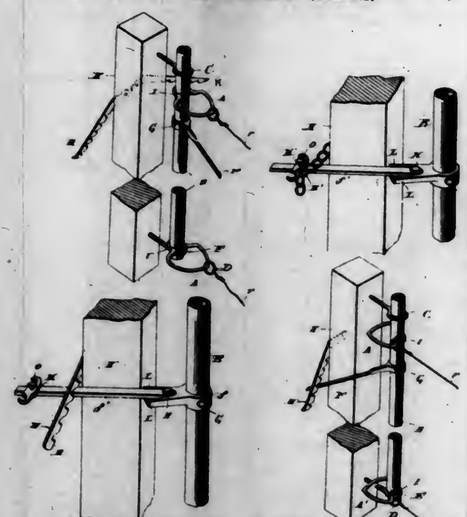
3. In metal-shears, the combination of a series of hydraulic motors, each comprising a cylinder and plunger, of which one is stationary and the other movable, supports for the stationary parts of the motors, said motors being set one above the other with their moving parts connected, a head or block above the end of the series, an upright frame connecting the same with the base of the machine, a shear-knife fixed to the head or block, and a shear-knife moved by the motors, substantially as and for the purposes described.

4. The combination of an upright series of stationary plungers set on supports one above the other, cylinders set on the plungers, a guide-frame for the cylinders, said cylinders being connected, so that the power of one shall be transmitted to the next, an operating-tool, a plunger fixed to the top of the guide-frame, and a cylinder set on the plunger and acting on said series in the opposite direction, substantially as and for the purposes described.

5. The combination of an upright series of stationary plungers set on supports one above the other, cylinders set on the plungers, a guide-frame for the cylinders, said cylinders being connected, so that the power of one shall be transmitted to the next, an operating-tool, a plunger fixed to the top of the guide-frame, and a cylinder set on the plunger and acting on said series in the opposite direction, substantially as and for the purposes described.

6. The combination of a series of stationary plungers set on supports, cylinders set on the plungers, a guide-frame for the cylinders, said cylinders being connected, so that the power of one shall be transmitted to the next, a knife-blade moved by said series of cylinders, and a stationary knife-blade fixed to the end of the frame, substantially as and for the purposes described.

479,893. FOLDING CHAIR. RICHARD W. BATES, Chicago, Ill. Filed Jan. 28, 1892. Serial No. 419,523. (No model.)

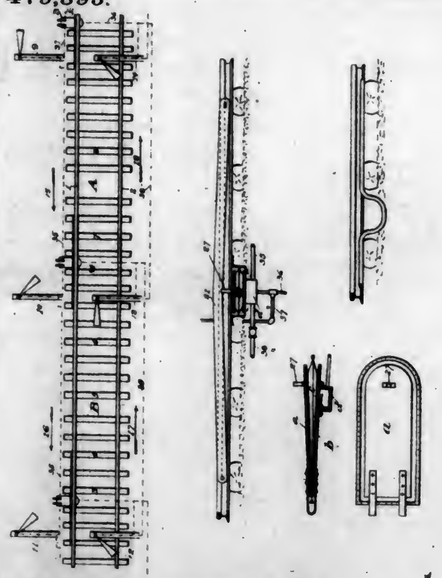


Claim.—A folding chair having the back and seat frames made of light metallic tubing pivoted together, as shown, in combination with a bottom made of a series of separate chains having one of their ends secured to the top rung of the seat-frame and their opposite ends

479,393.

passed over a rung a^3 of the back-frame level with the top rung of the seat-frame and severally attached to a free cross-piece b' behind said rung a^3, which free cross-piece projects beyond the side edges of the bottom, so as to engage the side pieces of the back-frame above the rung a^3 for holding the chains extended laterally and taut between the open frames, as specified.

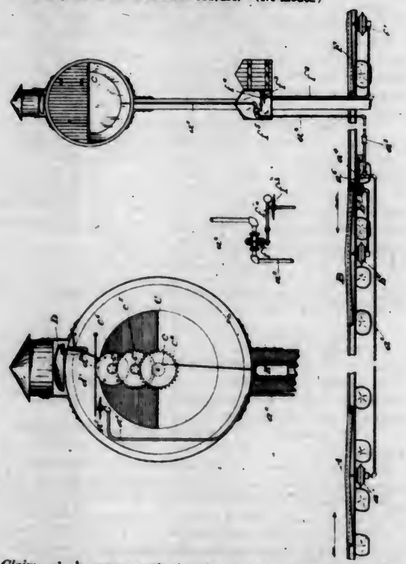
479,394. WIRE GATE. CRAYTON BERRYMAN, Sioux City, Iowa. Filed Dec. 28, 1891. Serial No. 416,173. (No model.)



Claim.—1. The combination of a rigidly-set post K, through the upper and lower portions of which pass suitable eyebolts C and E, a movable upright B, supported loosely in the eyebolts, wires *r*, which are connected with the upright by means of clevises A and rings D and are tightened or loosened by the movement of the clevises in the rings, a lever fastened securely to the upright and adapted to turn the upright in either direction, thus changing the position of the clevises in the rings, by which the wires of the gate are tightened or loosened, and a fastening secured to the post to hold the lever securely in position when the gate is closed, all substantially as set forth.

2. The combination of a rigidly-set post K, through the upper and lower portions of which pass suitable eyebolts C and E, a movable upright B, supported loosely in the eyebolts, wires *r*, which are connected with the upright by means of clevises A and rings D and are tightened or loosened by the movement of the clevises in the rings, a lever *f f*, rigidly attached to the upright, having a joint that permits a limited horizontal movement, and a fastening device on the post, adapted to engage therewith.

3. The combination of a rigidly-set post K, through the upper and lower portions of which pass suitable eyebolts C and E, a movable upright B, a lever secured thereto having an adjustable clasp furnished with suitable hooks, and a thumb-screw, clevis-hooks A, rings D, wires *r*, and a chain H', all substantially as set forth.

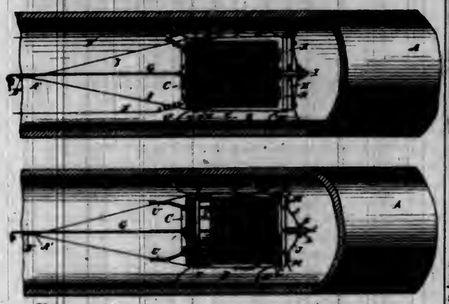


479,895. RAILROAD-SIGNAL. ROBERT T. BOWIE, Benson, Md., assignor to the Bowie Pneumatic Signal Company, of West Virginia. Filed Mar. 26, 1891. Serial No. 386,429. (No model.)

479,895.

Claim.—In a signaling system for rail or tram ways, a track divided into a series of blocks, and a lever or bar located at the end of each block, operated by a passing train or car, in combination with an air-chamber in which the air is compressed by the passage of the train over the lever, a series of pneumatic pipes for setting the signals and power driving mechanism for operating the signal-shaft, and an independent air-receiver connected with the power mechanism, whereby said power mechanism is rewound by the pulsation of air from a track-compressor.

479,896. SIGNALING DEVICE. ROBERT T. BOWIE, Benson, Md., assignor to the Bowie Pneumatic Signal Company, of West Virginia. Filed May 12, 1891. Serial No. 392,421. (No model.)



Claim.—1. In a pneumatic signaling system, a signaling mechanism located near a track or railway, a compressible air-chamber in which the air is compressed by a passing engine or train, and a tube for conveying the compressed air to the signaling mechanism when the air-chamber is compressed by an engine or train running in a given direction, in combination with means for allowing the compressed air in the tube to escape and prevent it from affecting the signaling mechanism when the air-chamber is compressed by a train running in the opposite direction.

2. In a pneumatic signaling system, a signaling mechanism located near a track or railway, a compressible air-chamber in which the air is compressed by a passing engine or train, a tube for conveying the compressed air to the signaling mechanism, and a check-valve in the air-conveying tube to prevent the air from returning when forced through the tube by an engine or train running in a given direction, in combination with an aperture in the tube behind the check-valve, opened by mechanism operated by a passing engine or train to allow the air in the tube behind the valve to escape and prevent it from affecting the signaling mechanism when the air-chamber is compressed by an engine or train running in the opposite direction.

3. In a pneumatic signaling system, a signal-box containing a train of gears revolved by a weight, and a lever and detent for checking and holding the train, in combination with an expansive air-chamber operated by an engine or train upon the railway to expand the chamber and lift the detent-lever to release the gear-train, and means also actuated by an engine or car on the track to allow the air to escape from the expanded chamber and permit the detent-lever to engage and stop the gear-train.

4. In a railway-signaling device, a flash-signal normally at rest and means for imparting to the same continuous revolution, in combination with means for releasing and arresting the signal operated by a passing train or car upon the railway, substantially as described.

479,397. CORD-CARRIER FOR UNDERGROUND CONDUITS. STEPHEN R. BRADLEY, Nyack, N. Y. Filed Jan. 27, 1892. Serial No. 419,475. (No model.)

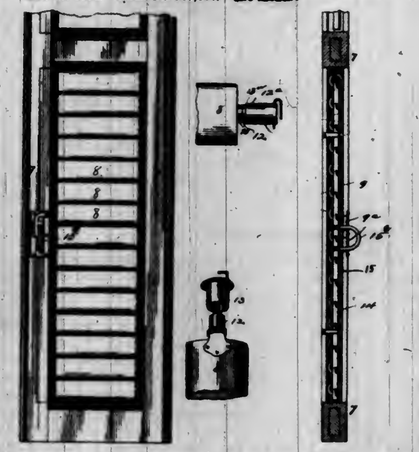
Claim.—1. The combination, in a carrier, of an electro-magnet, an armature having a retractile spring, means connected with the armature, and other means connected with the magnet which bear against the walls of the tube, both of said means being adapted to resist rearward movement, whereby the attraction of the armature by the magnets effects a forward movement of the magnets and the action of the armature-spring effects a forward movement of the armature, substantially as set forth.

2. The combination, in a wire carrier, of an electro-magnet, an armature, a spring or springs for retracting the armature, elastic legs attached to the armature, and other similar legs attached to the magnets, substantially as set forth.

3. The combination, in a wire-carrier, of an electro-magnet, an armature, a spring or springs for retracting the armature, elastic legs attached to the armature, other similar legs attached to the magnets, and longitudinally-moving rings provided with cords adapted to slide over the legs and draw them inwardly, substantially as set forth.

4. The combination, in a wire-carrier, of an electro-magnet, a sliding armature, a spindle projecting beyond the magnets upon which the armature slides, a spring or springs attached to the spindle, which engage with the armature, and devices actuated by the movement of the armature which engage with the sides of the tube, and other devices for supporting the magnets, substantially as set forth.

5. In a wire-carrier, an electro-magnet, an armature, means for retracting the armature, and spider legs attached both to the armature and to the magnets and provided with rearwardly-extending barbs, substantially as set forth.



6. In a wire-carrier, an electro magnet, an armature, means for retracting the armature, spider legs attached both to the armature and the magnets, provided with rearwardly extending barbs, and means for drawing the spider legs inwardly, operated by a cord or wire extending to the rear end of the tube, substantially as set forth.

7. In a wire-carrier, an armature provided with springs for its retraction and having legs attached to it extending from the armature to the inner walls of the tube, an electro magnet, and a movable ring provided with means to pull the same rearwardly, adapted to slide over the inclined surface upon the legs, substantially as set forth.

8. In a wire-carrier, an electro-magnet and an armature provided with springs for its retraction and having legs attached to it extending from the armature to the inner walls of the tube, said legs having rearwardly-extending barbs or points to engage with the walls of the tube, substantially as set forth.

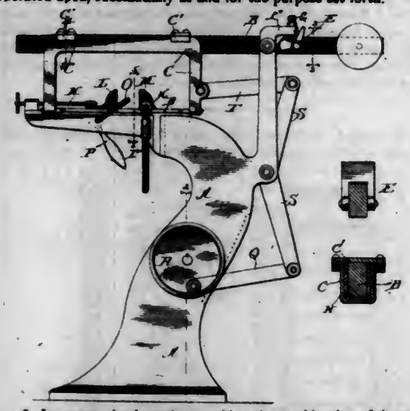
9. The combination, in a wire-carrier, of an electro-magnet provided with an armature, means attached to the armature which engage with the walls of the tube, and other means attached to the magnets, which likewise engage with the walls of the tube, said means being (both of them) provided with devices whereby they catch on the walls of the tube when moved in one direction, but not when moved in the other direction, substantially as set forth.

479,398. WINDOW-BLIND. HENRY T. BURNHEIM, Elgin, Ill. Filed Apr. 30, 1891. Serial No. 389,677. (No model.)

Claim.—1. The combination, with the pivoted slats of a blind, of sleeves applied to the tenons of said slats, said tenons having projections thereon, whereby they are adapted to interlock with the sleeves, and an operating-bar eccentrically connected with said sleeves, substantially as described.

2. In combination with a blind having one of its vertical stiles cut away, a strip fitted to said stile at the cut-away portion, a longitudinal recess in the outer face of said strip and perforations through its inner wall, pivoted slats having their tenons extended through the perforations in the strip into the recess, sleeves upon said tenons, and said tenons having projections thereon adapted to interlock with the sleeve, and an operating-bar eccentrically connected to said sleeves and adapted to be reciprocated within the recess, substantially as described.

3. In a blind, the combination, with the pivoted slats, of a removable grooved strip adapted to be secured to one of the vertical stiles of the frame, said strip being recessed on its outer face and perforated through its inner face for the passage of the slat-tenons, said tenons having ferrules secured thereon, sleeves fitted over said ferrules, and means for locking the sleeves and ferrules together, and an operating-bar eccentrically connected to said sleeves and adapted to be reciprocated within the recess of the grooved strip, substantially as described.



4. In means for adjusting the slats of window-blinds in unison, the combination, with said slats and a grooved strip having perforations to receive the slat-tenons, of ferrules secured on the tenons and bearing locking-pins, sleeves fitting over said ferrules and adapted to be locked thereto by engagement with the pins, said sleeves having eccentric projections thereon, and an operating-bar engaged with the several projections of the sleeves and having a handle working through a slot in the grooved strip, substantially as described.

479,399. POWER HACK-SAWING MACHINE. OLIVER COLBORNE, Chicago, Ill. Filed Mar. 28, 1892. Serial No. 426,832. (No model.)

Claim.—1. In a power hack-sawing machine, the combination of a main frame, a lever pivoted therein counterweighted at one end and

serving at its other end as a guide and support for the yoke which carries the saw-blade, and an elbow-lever pivoted to the counterweighted lever and abutting against a projection from the main frame for co-operation therewith in order to sustain the saw-blade in an elevated position, substantially as and for the purpose set forth.

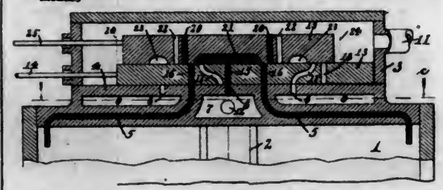
2. In a power hack-sawing machine, the combination, with the saw proper of a curved limiting-stop having bearings in the main frame and a cam mounted thereon for clamping it in such bearings and having its end projecting into the path of the material to be operated upon, substantially as and for the purpose set forth.

3. In a power hack-sawing machine, the combination of the main frame, a driving-crank having bearings therein, a bell-crank lever pivoted to the main frame and connected pivotally by links or pitmen with such crank and with a yoke carrying the saw-blade, and a pivoted counterweighted lever affording a support and guide for such yoke, substantially as and for the purpose set forth.

4. In a power hack-sawing machine, the combination of a main frame, a driving-crank having bearings therein, a bell-crank lever pivoted to the main frame and connected pivotally by links or pitmen with such crank and with a yoke carrying the saw-blade, another lever independently pivoted in the main frame and carrying a yoke for the saw-blade at one end and a counter-weight at the other end, and an elbow-lever pivoted to the weighted lever and acting in conjunction with a set-screw in the main frame in order to sustain the blade in an elevated position, substantially as and for the purpose set forth.

5. In a power hack-sawing machine, the combination of a main frame, a lever pivoted therein and carrying the movable saw-frame at one end and a counter-weight at the other end, a set-screw having a bearing in the main frame and acting against the counterweighted lever to adjust the downward movement of the saw-frame, and the locking device carried by the counterweighted lever and operating against the main frame to retain the saw-blade in an elevated position while the material to be operated upon is being placed, substantially as and for the purpose set forth.

6. In a power hack-sawing machine, the combination of a main frame, supporting mechanism for driving the saw, a lever pivoted to the main frame and having a bearing at one end for the movable frame of the saw and a counter-weight at its other end, a set-screw journaled in the main frame and normally bearing upon the upper surface of the counterweighted lever, an elbow-lever pivoted to the counterweighted lever, having approximately horizontal and vertical arms, and a stationary pin secured to the counterweighted lever underneath the horizontal arm of the elbow-lever, whereby the counterweighted lever is normally held at a determinate position when it is depressed at either end, substantially as and for the purpose set forth.



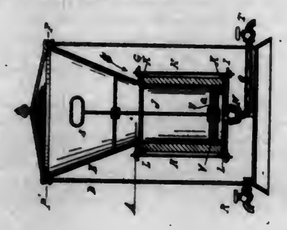
479,400. RADIATOR-VALVE DEVICE. JOHN COLLIS, Des Moines, Iowa. Filed Apr. 21, 1891. Serial No. 389,801. (No model.)

Claim.—1. In a radiator-valve device, a shell having an outlet-opening at which to connect the device with a radiator and a supply-opening and a discharge-opening in vertical line with each other to one side of the outlet-opening at which to connect the device with the circulating-pipe system, said supply and discharge openings having permanent open communication with each other in the shell past the said outlet-opening, in combination with a vertically-adjustable valve confined in the shell with relation to its outlet-opening and provided with means for operating it to open and close the said opening, substantially as described.

2. A three-way-valve device for use with a radiator and its circulating-pipe system, comprising a shell having an outlet-opening *o*, a tube cast therein adapted to be connected at its outer end with the inlet-opening of a radiator and projecting at its other end within the shell to form a valve-seat *n*, a supply-opening *p* and a discharge-opening *q*, respectively, above and below the plane of the outlet-opening to one side of the latter and having branches *f'* and *e'* connecting them with the circulating-pipe system, and a vertically-adjustable valve C, confined in the shell with relation to the said outlet-opening and provided with means for raising and lowering it to open and close the opening *o*, the openings *p* and *q* having permanent direct communication with each other, whereby when the valve is closed the circulation is continued between the said branches and whereby when the valve is open condensation in the steam-supply from the branch pipe *f'* discharges directly into the branch pipe *e'*, substantially as described.

479,401. STEAM-ENGINE VALVE. JOHN R. COOK and CAREY S. HINCHMAN, Rushville, Ind. Filed Apr. 21, 1892. Serial No. 429,992. (No model.)

Claim.—In a steam-engine valve, the combination, substantially as set forth, of a valve-seat with two steam-ports and with three exhaust-ports, a seat-plate adjustable on said valve-seat and provided with ports to coincide with the two steam-ports and central exhaust-port of the valve-seat when the plate is in one position and with ports to register with the steam-ports and two outside exhaust-ports of the valve-seat when shifted to another position, and a slide-valve working upon said seat-plate and having three exhaust-pockets and four steam-ports.



479,402. FOOD PRODUCT AND METHOD OF MAKING THE SAME. SAMUEL CRUMP, Montclair, N. J. Filed Nov. 9, 1891. Serial No. 411,297. (No specimens.)

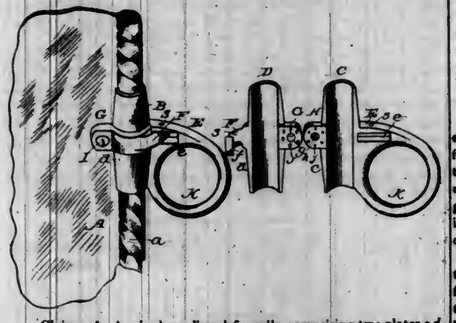
Claim.—1. As a new article of manufacture, a non-fibrous food compound composed of the natural ingredients of the cocoanut deprived of the fibrous portions of the nut, having added thereto sugar and the milk of the cocoanut, and in a condensed or desiccated form, substantially as hereinbefore set forth.

2. As a new article of manufacture, a non-fibrous food compound having as component parts the natural ingredients of the cocoanut deprived of the fibers thereof, with a proportion of sugar, and in a condensed or desiccated form.

3. The method of preparing a product of cocoanut hereinbefore described, which consists in crushing, grinding, or dividing the nut, adding thereto the milk of the cocoanut, sugar, and a proportion of water, straining the mass, and subjecting the liquor to evaporation *in vacuo*.

479,403. FILTER. JOHN J. CURRAN, Toledo, Ohio. Filed Mar. 21, 1891. Serial No. 385,895. (No model.)

Claim.—1. In a water-filter, the combination, with an outer case, of an inner case hanging within the outer and having a horizontal flange at its lower end, a porous cylinder below the pendent case, a plate below the lower end of said cylinder, than which it is larger in diameter, and rods detachably connecting said flange and plate, substantially as and for the purpose set forth.



2. In a water-filter, the combination, with an outer case, of an inner case hanging within the outer and having an inturned flange at its lower end, a porous cylinder smaller in diameter than said pendent case and resting against said flange, a plate below the cylinder and larger in diameter than the same, threaded rods passing through said flange and plate, and nuts thereon, substantially as and for the purpose set forth.

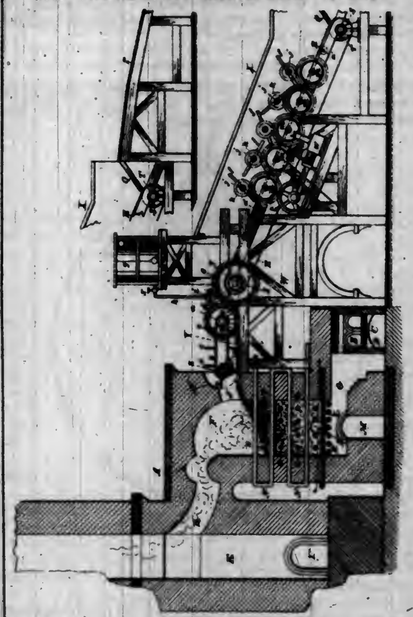
3. In a water-filter, the combination, with an outer case and an inner case hanging therein and having a flange at its lower end, of a porous cylinder below the flange, a plate below the cylinder, a vertical ring-shaped member on the plate surrounding the end of the cylinder, and rods connecting said flange and plate outside the ring, all substantially as set forth.

4. In a water-filter, the combination, with an outer case, an inner case hanging therein and removable therefrom, a flange on said inner case, a porous cylinder, a plate supporting the cylinder, rods connecting the plate and flange, and a downwardly-extending tube at the center of said plate, of a refuse-pipe within the outer case and leading outside the same to a faucet, and a socket on the inner end of said pipe, into which said tube passes when the inner case and cylinder are inserted, substantially as and for the purpose set forth.

5. In a water-filter, the combination, with an outer case, an inner case hanging therein and removable therefrom, a porous cylinder, a plate below the same having a downwardly-extending tube at its center, and connections between said plate and inner case, of a socket into which said tube fits, a refuse-pipe leading thence outside the outer casing, a piston-head within said cylinder, comprising two perforated plates and a sheet of packing between and extending beyond the edges thereof, and an operating-rod secured to said head and rising to within said inner case, as and for the purpose hereinbefore set forth.

479,404. CRINGLE FOR SAILS. WILLIAM R. CUTLER, Bath, Me., assignor of two-thirds to Alexander M. Cutler, same place, and William P. Cutler, Baltimore, Md. Filed Apr. 4, 1892. Serial No. 427,702. (No model.)

Claim.—1. A cringle or lizard for sails, comprising two plates *c d*, approximately semicircular in cross-section and forming, conjunctively, a tubular clamp, said plates being pivotally connected together at one edge and provided at their free edges with coincident lugs G H, and a clamping-screw I, passing through said lugs, substantially as and for the purpose set forth.



2. A cringle or lizard for sails, comprising two clamping-plates pivotally connected together and provided with clamping means for locking said plates together, and a ring or loop carried entirely by one of said plates, substantially as and for the purpose set forth.

3. A cringle or lizard for sails, comprising two clamping-plates, one of which being provided with an arm E, having an elongated slot *e*, and the other plate provided with an arm F, carrying a T-head *f*, adapted to engage and be locked in said slot, substantially as and for the purpose set forth.

4. In a cringle or lizard for sails, the combination of two members, one of which being provided with a slotted arm and the other with an angular arm carrying at its free end an approximate T-head adapted to be received by the slotted arm and engage the distal side thereof, and means for clamping said plates at their free edges, substantially as and for the purpose set forth.

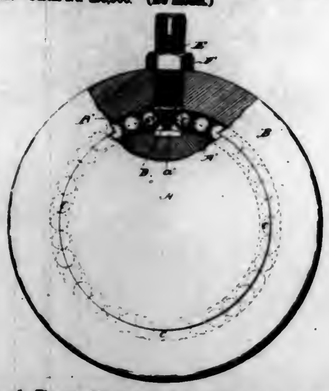
5. As an improved article of manufacture, a cringle or lizard for sails, consisting of two metallic members, one of which being provided with an approximate semicircular clamping-plate, a lug projecting from the free edge thereof, and with a slotted arm at its opposite edge, the other plate being provided with a coincident clamping-plate and lug and with an angular arm having an approximate T-head adapted to engage said slotted arm, all parts of said respective members being integral, a ring or loop integral with one of the members, and a clamping-screw engaging said lugs, substantially as and for the purpose set forth.

479,405. GARBAGE OR REFUSE CREMATORY. ALFRED G. DELABOY, New York, N. Y., assignor of one-half to John R. McKay, same place. Filed Oct. 13, 1891. Serial No. 408,562. (No model.)

Claim.—1. In a garbage-crematory, the endless conveying-belt extending from the dumping-point to a receiving-platform and a spray for treating the garbage with an inflammable material after reaching the upper end of said belt, combined with the endless scraper-belt to move the garbage along said platform, and the furnace having the garbage-combustion chamber intermediate the fire-box and flue and its inlet in line with said platform, the whole being arranged and operating substantially as and for the purposes set forth.

2. In a garbage-crematory, the endless conveying sieve-belt and the series of agitator-arms over said belt, combined with the spray for treating the garbage with an inflammable material prior to its entering the combustion-chamber and the furnace to receive the garbage, said furnace having a combustion-chamber for garbage, means therein for lightening the mass, the fire-box, and flue, with independent grates for the said chamber and box, the whole being arranged and operating substantially as and for the purposes set forth.

3. In a garbage-crematory, the endless conveying-belt and the spray at the upper end of said belt and leading from a tank of inflammable material, combined with the furnace having the flue, garbage-combustion chamber, and fire-box, the whole being arranged and operating substantially as and for the purposes set forth.



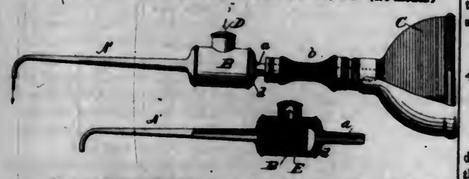
4. In a garbage-crematory, the endless conveying-belt and the spray leading from a tank of inflammable material, combined with the furnace, the flue, garbage-combustion chamber and fire box therein, the series of tubes for lightening the mass in the combustion-chamber, and the tubular grate-bars in said chamber, the whole being arranged and operating substantially as and for the purposes set forth.

5. In a garbage-crematory, the endless conveying-belt extending upward from the dumping-point, the platform receiving the material from said belt, and the endless belt having scraper-arms on said platform, combined with the furnace having the inlet to its garbage-combustion chamber in line with said platform, said inlet at its upper part being of a form adapted to be closed by said arms and having its lower surface inclined, the whole being arranged and operating substantially as and for the purposes set forth.

6. In a garbage-crematory, the furnace having the fire-box and grate, the combustion-chamber with grate and door for same, the flue with door at base of same, the passages between the fire-box and combustion-chamber and between the combustion-chamber and flue, and the inlet for garbage to said combustion-chamber, and means for lighting the mass in said combustion-chamber, the whole being arranged and operating substantially as and for the purposes set forth.

7. In a garbage-crematory, the furnace, combined with the endless conveying sieve-belt extending from the dumping-point to a receiving-platform, the endless scraper-belt on said platform leading to the inlet of the garbage-combustion chamber of said furnace, the transverse shafts carrying agitator-arms over said sieve-belt, and means, substantially as described, for actuating said shafts and arms, substantially as and for the purposes set forth.

479,406. MEANS FOR SECURING COLLARS TO CRANK-PINS. SIMEON K. DICKERSON and CHARLES D. KEE, Roanoke, Va. Filed Mar. 30, 1892. Serial No. 426,560. (No model.)



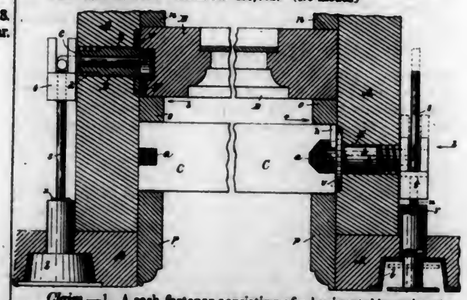
Claim.—1. The combination, with a crank-pin, of a collar, balls interposed between said crank-pin and collar, a wedge adapted to enter between two of said balls and bind the remaining balls, and a binding-screw for impinging against said wedge, substantially as and for the purposes described.

2. The combination, with a crank-pin, of a collar, balls interposed between said crank-pin and collar, a wedge seated in the crank-pin and adapted to enter between two of said balls, and a binding-screw, substantially as and for the purposes described.

3. The combination, with a crank-pin provided with a groove, of a collar provided with a similar groove, balls in said grooves, and a wedge for forcing said balls together, substantially as and for the purposes described.

4. The combination, with a crank-pin provided with a circumferential groove, of a collar provided with a similar groove to one side of the groove in the crank-pin, balls in the space formed by the grooves, a wedge adapted to enter between two of said balls, said wedge being provided with grooves in its inclined faces, and a binding-screw, substantially as and for the purposes described.

479,407. DENTAL SYRINGE. JOHN M. DRENNAN, New York, N. Y., assignor to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed June 2, 1892. Serial No. 435,264. (No model.)



Claim.—The combination, with the syringe, the tube of which has the chamber or enlargement, of the removable heat-retaining plug inclosed in said chamber, substantially as and for the purpose set forth.

479,408. REDUCTION OF IRON ORE. CHARLES J. RAMIN, New York, N. Y. Filed Dec. 5, 1891. Serial No. 414,157. (No specimens.)

Claim.—1. The method herein described for reducing iron ore, which consists in adding to the ore the bituminous reducing agent termed "brea," grinding the two together to obtain an intimate mixture and pulverulent mass, and finally subjecting the mixture thus obtained to a reducing heat in a suitable furnace, substantially as and for the purposes specified.

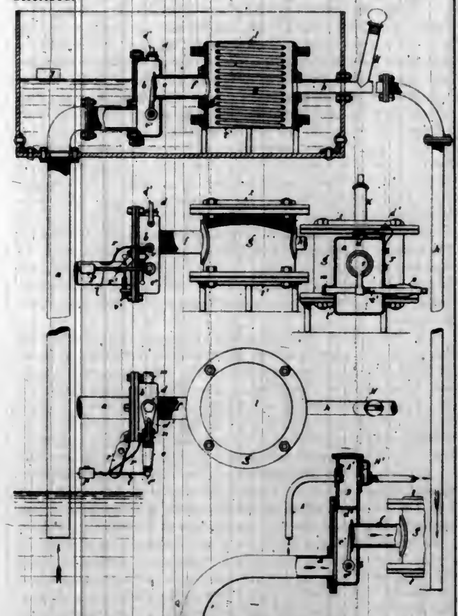
2. The process herein described for reducing iron ore, which consists in liquefying the bituminous reducing agent termed "brea," adding thereto iron ore to assist in pulverization, pulverizing the admixture of brea and iron ore, adding the pulverulent reducing agent thus obtained to the mass of ore to be reduced, and finally subjecting the whole to a reducing heat in a suitable furnace, substantially as and for the purposes specified.

479,409. SASH-FASTENER. JOHN L. EBERT, Farmington, N. Y. Filed Apr. 19, 1892. Serial No. 429,772. (No model.)

Claim.—1. A sash-fastener consisting of a horizontal barrel in the window-casing opposite the sash, a non-endwise moving rotary axial shaft in said barrel, and a spring in the barrel to turn the shaft, the axis of the latter being parallel with the plane of the sash, the shaft having a pawl or arm at right angles with it to engage the sash and having its opposite end turned at right angles with the shaft, in combination with a push-button held in the casing, formed with an extended part at right angles with said shaft, and a longitudinally-adjustable block secured to the extended part of the push-button to engage the upturned part of said shaft, and a returning-spring for said push-button, substantially as shown and described.

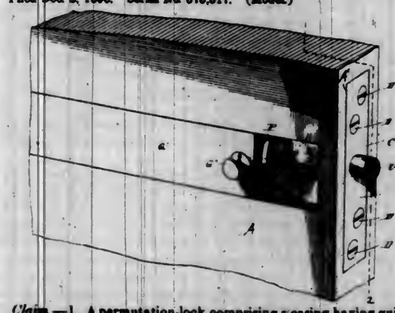
2. A window provided with a lock and holder for each sash, placed at opposite sides of the window, each lock and holder consisting of a shaft in the casing of the window opposite the edge of the sash, provided with a pawl to engage the sash, the axes of said shafts being parallel and in the same horizontal plane, and a push-button for each sash-holder to actuate said shaft thereof, said shafts and push-buttons being actuated by springs, the springs of said shafts acting in a manner to press the sashes toward each other or against the middle stops *o o*, substantially as described.

479,410. ELECTRIC BELT. ANDREW M. EELUND, Minneapolis, Minn. Filed May 2, 1892. Serial No. 431,531. (No model.)



Claim.—In a medical battery, a series of cells electrically connected and inclosed by a flexible covering of insulating material, said covering being provided with elastic extensions, and means for securing the battery in position, the contact-plates and conductors, whereby the current may be conducted to any portion of the body, and the substitute blanks in the form of links, as described, for decreasing the strength of the current, substantially as and for the purpose set forth.

479,411. ELEVATING-SIPHON. EUGÈNE ETÈVE and JULES LEMICHEL, Paris, France. Filed Feb. 17, 1892. Serial No. 421,633. (No model.) Patented in France May 24, 1890, No. 205,888; in England Dec. 24, 1890, No. 21,084, and in Belgium Oct. 19, 1891, No. 96,353.



Claim.—1. The combination, in a siphon, of a suction-pipe *a* and discharge-pipe *h*, of smaller diameter than said suction-pipe *a*, with the box *b*, containing the stop-valve *c* and valve *d*, and with the chamber *g*, having movable and resilient walls, in connection with said box *b* through the stop-valve *c*, and having flexible heads *t t'*, separated by a spring *x*, said box *b* and chamber *g* being interposed between said suction-pipe *a* and discharge-pipe *h* and so arranged that a portion of the water circulating in said suction-pipe will be discharged through valve *d* into a suitable elevated reservoir, substantially as described.

2. The combination, in a siphon, of a suction-pipe *a*, leading into a compartment *b*, having an upper outlet-valve *d* and a weighted stop-valve *c*, with chamber *g*, having movable and resilient walls, and discharge-pipe *h*, of smaller diameter than the pipe *a*, all arranged so that at stated intervals the valve *d* will open and stop-valve *c* close, and vice versa, whereby a portion of the water in said suction-pipe *a* will be discharged through valve *d* into a suitable elevated reservoir and a portion will be discharged into said discharge-pipe *h*, substantially as described.

3. In a siphon, the combination of the box *b*, having an orifice *f*, with a spindle *d'*, passing through said box *b* and carrying the valve *e* within the box *b*, adapted to close said orifice *f*, and with a weighted lever *p*, adapted to actuate said spindle *d'*, adjustable springs *r r'*, between which said weighted lever *p* vibrates, and with the sleeve *m* and elastic packing *o* placed about said spindle *d'*, substantially as and for the purposes set forth.

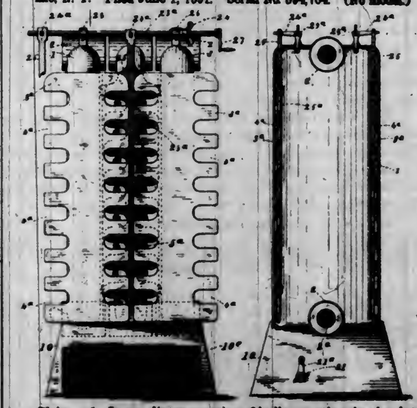
479,412. COMBINATION-LOCK. JOHN F. FOSTER, Marceline, Mo. Filed Dec. 2, 1890. Serial No. 373,317. (Model.)

Claim.—1. A permutation-lock comprising a casing having guide-ribs upon the inner surfaces of its sides, a number of supports or standards having notches upon their edges to receive the ribs, and also having each a central opening, a central cavity in the side of the support or standard having a circular margin, and an upper and lower segmental shoulder formed upon the side of the standard concentric with the margin of the cavity, and a number of revoluble permutation-disks, each provided with a central opening and on each side with a boss having a circular margin to register with the margin of the standard cavity, and a circular periphery registering with the segmental shoulders of the standards and having, also, a number of recesses, each communicating at its inner end with the central opening of the disk, substantially as set forth.

2. A permutation-lock comprising a suitable casing, a number of standards or supports having each a central bore, a number of operative permutation-disks having each also a central opening, and a number of recesses opening radially from said central opening, and a number of intermediate blind disks having each a central opening and also a single radial recess opening from said central opening, substantially as set forth.

3. A permutation-lock comprising a longitudinally-movable bolt having a reduced body portion, a number of collars mounted revolubly upon the reduced portion of the bolt and having each a radial lug or wing, and a number of stationary washers also surrounding the reduced portion of the bolt and retained in position by set-screws, substantially as set forth.

4. A permutation-lock comprising a suitable casing having a number of guide-ribs upon the inner surfaces of its sides, a number of supports having notched edges to receive the guide-ribs, a number of revoluble disks mounted in cavities in opposite sides of the supports and having each a central opening, and a number of radial recesses opening from said opening, and a locking-bolt extending through said openings and provided with revoluble collars having each a radial lug or wing to enter one of the radial recesses, substantially as set forth.



5. A permutation-lock comprising a suitable casing having guide-ribs upon the inner surfaces of its side walls, a number of supports having notches in their edges to receive said ribs, and having also each a central opening and a circular cavity in each side, a locking-bolt having a number of revoluble collars, each provided with a radial lug or wing, a number of revoluble permutation-disks mounted revolubly in said cavities and having each a central opening, and a number of radial recesses opening from said central opening, and a spring surrounding the bolt and operating to retain the same in its outermost position, substantially as set forth.

6. A permutation-lock comprising a suitable casing, a number of supports mounted therein, a block mounted in the outer part of the casing, a bolt extending horizontally through the block and supports, a laterally-projecting finger-piece carried by the bolt, a slot in the block to receive the finger-piece, and screws passed through the end of the lock-casing and impinging upon the block, substantially as set forth.

7. A permutation-lock comprising a suitable casing having an opening in one of its side walls, a slide working in said opening, and a number of permutation-disks mounted revolubly within the casing and having characters upon their peripheries, the peripheries of the disks being exposed through the opening when the slide is moved into open position, substantially as set forth.

8. A permutation-lock comprising a suitable casing having guide-ribs upon the inner surfaces of its side walls, a number of supports for the locking-bolt having central openings and notches upon their peripheries to receive the ribs, a plate located at the inner end of the lock-casing and having notched edges and a central opening, auxiliary supports at the ends of the casing having notched edges and a circular cavity in one side and also a central opening, a block located in the outer end of the casing and having a central channel for the bolt, and screws passed through the outer end of the casing and impinging upon the block, substantially as set forth.

479,413. SEMI-DIRECT RADIATOR. ARTHUR H. FOWLER, Buffalo, N. Y. Filed June 1, 1891. Serial No. 394,704. (No model.)

Claim.—1. In a radiator, a series of hollow sections having lateral flanges at each side provided with openings or perforations, the flanges of two sections extending toward each other, a vertically-sliding plate

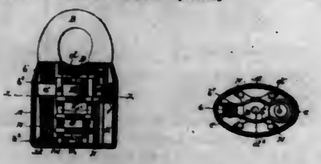
provided with similar openings and located in slideways at the sides of said flanges, and a means, substantially as above described, for moving them so as to cover or uncover the openings, in combination with an intermediate section and a means, substantially as above set forth, for securing them together.

2. In a radiator, a series of three connected hollow sections having passages communicating with each other, the outer sections having open-work flanges projecting laterally in opposite directions from the narrow sides of the same toward each other, so as to inclose the intermediate section and present a perforated wall at each side to permit the air to pass out from the sides, as well as upward through the top, and an intermediate section having a series of hollow projections which extend into the air-space for increasing the heating surface, substantially as described.

3. The combination of two outside hollow radiator-sections with an intermediate smaller hollow section wholly inclosed within the sides and flanges of the two adjoining sections and made tapering from the bottom up to the top, so as to gradually enlarge the surrounding air-space from the base upward, the whole being closely connected together by nipples at the top and bottom and communicating with the interior, substantially as described.

4. In a radiator, the combination of two outside radiator-sections provided with flanges extending laterally from each side and an intermediate section inclosed between the two outside sections and their flanges, the whole connected together by nipples at the top and bottom which communicate with the interior of the sections, substantially as described.

5. In a radiator, a series of hollow sections secured together so as to have a free passage through the whole, and flanges extending laterally from the outer sections toward each other, the intermediate sections being smaller and substantially inclosed by the outer sections and their flanges, thereby leaving a central air-space surrounding the intermediate section for the air to ascend between the sections through the top of the radiator, substantially as specified.



6. A radiator consisting of two outer sections and a smaller intermediate section located between them, an outer section being permanently connected to one side of the intermediate section by nipples rigidly secured to both and the other side of the intermediate section being secured to the other outer section by a removable joint, substantially as and for the purposes described.

7. A radiator consisting of two outer sections and a smaller intermediate section located between the two outer sections, one outer section being rigidly and permanently connected at one side with one side of the intermediate section by nipples rigidly secured thereto at the top and bottom, the other side of the outer section having an opening provided with an annular recess to receive a short nipple for a removable connection attachment with another radiator-section, the other side of the intermediate section having a removable connection with the opposite outer section, consisting of a short nipple and a bolt and nut for securing them at the top and bottom, and the outer side of the opposite outer section having openings to receive the nipple for a permanent connection with another radiator-section, substantially as described.

8. A radiator consisting of hollow sections connected together, having a passage-way from one to the other, and open-work flanges extending laterally in opposite directions from the narrow sides of the sections, in combination with vertically-sliding plates and mechanism for operating them to open or close the openings in the flanges, a hollow box upon which the radiator stands, an inclosed receptacle having inclined open sides communicating with an opening leading outside, and pivoted damper for opening or closing the inclined openings or closing the openings in the outer box, whereby the air may be taken wholly from the outside or from the room in which the radiator is located, or both, substantially as described.

9. The combination, with two outside radiator-sections, of an intermediate section inclosed vertically between the inner sides and projecting flanges of the outer sections, so as to leave an air-space surrounding the intermediate section and being provided with a series of projections for increasing the heating-surface, and the whole connected together, substantially as described.

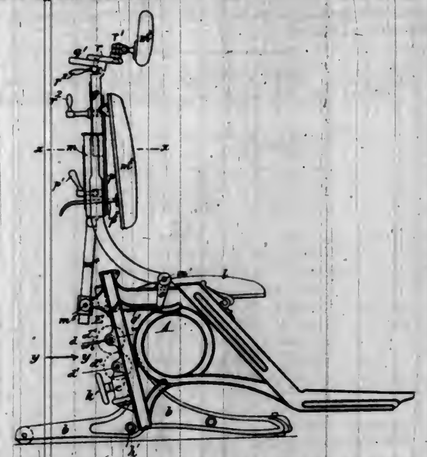
479,414. PADLOCK. EDWARD T. FRAIM, Lancaster, Pa. Filed Oct. 30, 1891. Serial No. 410,382. (Model.)

Claim.—1. In a padlock, the combination, with the case and shackle, of a stationary plate having legs formed on one face thereof, a spring located between said legs and extending horizontally between the ends of the case, said spring being adapted to engage the long limb of the shackle to lock both limbs in the case and prevent the long limb being withdrawn therefrom, and means for holding the spring in place, substantially as and for the purpose specified.

2. In a padlock, the combination, with a case having vertical ribs formed therein, of a shackle with notches cut in the body of the long limb and a boss formed on the end thereof, an upper plate located between said ribs and having an aperture through it, studs on the upper and legs on the lower face of said plate, a V-shaped spring located between said legs and adapted to engage with the notches and boss of said long limb, and means for holding the spring between said legs, substantially as and for the purpose specified.

3. In a padlock, the combination, with a case having vertical ribs formed therein, of a shackle with notches cut in the body of the long limb and a boss formed on the end thereof, an upper perforated plate located between said ribs and having studs on the upper and legs on the lower face thereof, a V-shaped spring located between said legs and having a head constructed to receive the short limb of the shackle, the leaves of the spring being adapted to engage with the notches and boss of the long limb, a stationary plate located below said spring and having an extension projecting under the head thereof, and means for supporting the stationary plate, substantially as and for the purpose specified.

4. In a padlock, the combination, with a case having vertical ribs formed therein, of the long limb of the shackle, constructed to be engaged by a spring to lock both limbs in the case and prevent the long limb being withdrawn therefrom, an upper stationary plate located between said ribs and having legs formed on one face thereof, a spring located between said legs adapted to engage the long limb of the shackle, and plates resting upon the bottom of the case and supporting the upper stationary plate, substantially as and for the purpose specified.



5. In a padlock, the combination, with a case having vertical ribs formed therein, of a shackle with notches cut in the body of the long limb and a boss formed on the end thereof, an upper perforated plate located between said ribs and having studs on the upper and legs on the lower face thereof, a V-shaped spring located between said legs and having a head constructed to receive the short limb of the shackle, the leaves of the spring being adapted to engage with the notches and boss of the long limb, a stationary plate located below said spring and having an extension projecting under the head thereof, and plates resting on the bottom of the case and supporting the stationary plate below the spring, substantially as and for the purpose specified.

6. In a padlock, the combination, with a case having vertical ribs formed therein, of a shackle with notches cut in the body of the long limb and a boss formed on the end thereof, an upper perforated plate located between said ribs and having studs on the upper and legs on the lower face thereof, a V-shaped spring located between said legs and having a head constructed to receive the short limb of the shackle, the leaves of the spring being adapted to engage with the notches and boss of the long limb, a stationary plate located below said spring and having an extension projecting under the head thereof, plates resting on the bottom of the case and supporting the stationary plate below the spring, and a lug formed on the bottom of the case and adapted to engage the boss on the long limb of the shackle when locked in the case, substantially as and for the purpose specified.

479,415. CHAIR. THOMAS H. GARDNER and EDWARD GARDNER, Cornbrook, Manchester, England. Filed July 9, 1891. Serial No. 398,891. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a chair base or foot, standard-sections fixed thereon, racks on these standards, another set of standard-sections movable endwise thereon, a seat suitably supported, cross-bars connecting these movable standards and constituting with them a gear-frame, means for lifting this frame, a cross-shaft mounted in this gear-frame, pinions on this shaft gearing with the racks on the fixed standard-sections, a rotary self-acting locking-clutch on the shaft, which clutch permits the gear-frame to rise, but prevents its descent, a worm-wheel on the rotary pawl of the clutch, a worm of slight pitch gearing with the worm-wheel, and an actuating-wheel controlling the worm, these members being organized and operating, as specified, to lift and hold up the gear-frame and allow it to descend when the clutch is released by the rotation of the worm-wheel and continue to descend as long as that wheel rotates, but is automatically locked by the stoppage of its rotation.

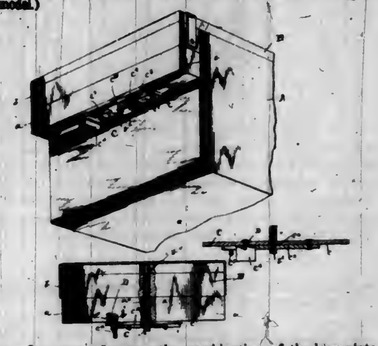
2. The combination, substantially as hereinbefore set forth, of a chair base or foot, standard-sections fixed thereon, racks on these sections, another set of standard-sections movable endwise thereon, cross-bars connecting these sections and constituting with them a gear-frame, means for lifting this frame, a lower cross-shaft mounted in this gear-frame, pinions on this shaft gearing with the racks on the fixed standard-sections, an upper cross-shaft also mounted in the gear-frame, pinions thereon, gearing connecting the two cross-shafts, a seat-frame, standard-sections carrying it, movable endwise on or parallel with the gear-frame, means for locking the seat-support and gear-frame together, and racks carried by these standard-sections and gearing with the pinions on the upper cross-shaft, these members being organized and operating, as specified, to cause the gear-frame and seat-frame to move together at all times.

3. The combination, substantially as hereinbefore set forth, of a chair base or foot, standard-sections fixed thereon, racks on these sections, another set of standard-sections movable endwise thereon, cross-bars connecting these sections and constituting with them a gear-frame, means for lifting this frame, a lower cross-shaft mounted in this gear-frame, pinions on this shaft gearing with the racks on the fixed standard-sections, a rotary self-acting locking-clutch on this shaft, which clutch permits the frame to rise, but prevents its descent, a worm-wheel on the rotary pawl of the clutch, a worm of slight pitch gearing with the worm-wheel, an actuating-wheel controlling the worm, a seat-frame, standard-sections which carry it movable endwise on or parallel with the other standard-sections, racks carried thereby, an upper cross-shaft carried by the gear-frame, pinions on this shaft working in these racks, and gearing connecting the two cross-shafts, these members being organized and operating, as specified, to cause the gear-frame and seat-frame to move together at all times while free to rise, but automatically locked to prevent their descent until the locking-clutch common to both is released.

4. The combination, substantially as hereinbefore set forth, of a chair base or foot, standard sections or racks fixed thereon, a gear-frame movable endwise thereon, a seat-frame, endwise moving standard-sections or supporting-racks carrying it, gearing carried by the gear-frame engaging with both the fixed and movable rack-sections, and a rotary locking clutch, its releasing-gear and actuating-wheel, also carried by the gear-frame, these members being organized and operating, as specified, to allow the seat-frame to rise without obstruction, but automatically preventing its descent until the locking-clutch is released and kept released by the rotation of its actuating-wheel when the seat-frame descends by its own weight.

5. The combination, substantially as hereinbefore set forth, of a chair-seat frame and a chair-back pivotally connected or hinged to the seat-frame above the top of the bottom on which the cushion is supported in approximately the same axial line as that of the hip-joints of the occupant of the chair.

6. The combination, substantially as hereinbefore set forth, of a chair-seat frame, a chair-back pivotally connected or hinged to the seat-frame in approximately the same axial line as that of the hip-joints of the occupant of the chair above the top of the bottom on which the cushion is supported, and a counterbalancing-spring connected to the chair-frame and to the back, for the purpose specified.



7. The combination, substantially as hereinbefore set forth, of the chair-seat frame, the back pivotally connected therewith, a downwardly-projecting rod connected to the back, and a clutch through which the rod extends, comprising clamping devices normally engaging the rod to prevent its downward movement, but which are constructed and arranged to permit the rod to move upwardly freely, and means for positively actuating the clamping devices to release them from the rod to permit it to descend, the arrangement being such that the back may be swung rearwardly and held in the desired position by positively releasing the clamping devices, but may be moved forward or righted quickly without any manipulation of the clamping devices.

8. The combination, substantially as hereinbefore set forth, of the chair-seat frame, the back pivotally connected therewith, the downwardly-projecting rod hinged to the back, a pivoted clutch through which the rod extends, comprising devices which clamp the rod when it is moved backwardly, but which permit it to be moved upwardly freely, and means for releasing the clamping devices to permit the downward movement of the rod, and a counterbalancing-spring connected with the chair-back and the chair-seat frame, for the purpose specified.

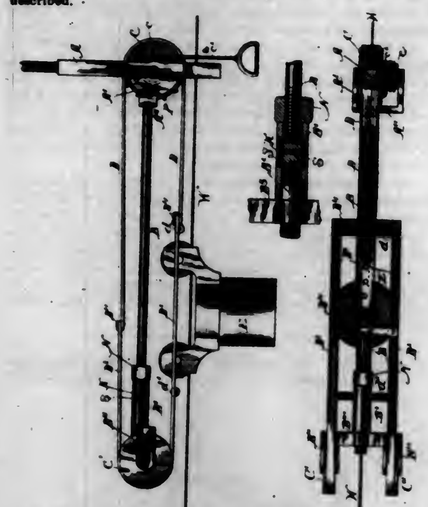
9. The combination, substantially as hereinbefore set forth, of a chair-seat frame, a chair-back, journals or pivot-joints connecting the back and seat-frame, an arm projecting downwardly from the journal of the chair-back, a counterbalancing-spring connecting said arm with the seat-frame, a self-acting locking-clutch on the back of the seat-frame, and an adjusting-rod movable endwise through the clutch and pivoted to the chair-back, these members being organized and operating as and for the purpose specified.

10. The combination, substantially as hereinbefore set forth, of a chair-seat frame, a chair-back, brackets thereon, journals or pivot-joints connecting these brackets and the side bars of the seat-frame above and nearer the front than the rear of said bars, a spring counterbalancing the weight of the chair-back, a self-acting locking-clutch on the back of the seat-frame, an adjusting-rod movable endwise through the clutch, and means, substantially such as described, for throwing the clutch out of operation to permit the descent of the chair-back.

479,416. BOX-FASTENER. JOHN G. GIMBERE and EDWARD SCHULTZ, Jr., Houston, Tex. Filed Apr. 15, 1891. Serial No. 389,082. (No model.)

Claim.—In a cover-fastener, the combination of the base-plate provided with a perforation adapted for the reception of a bolt, a movable plate mounted on the base-plate and having a perforation and a slot connected with the same and having its movement limited by guides and provided with an outwardly-turned lug c^4, a bolt provided with a neck, and a gravity locking-pin arranged in an opening of the base-plate and adapted to engage the lug c^4, substantially as described.

479,417. CASH-CARRIER. EMANUEL C. GIFT, Freeport, Ill., assignor of one-half to Oscar J. Ziegler, same place. Filed Aug. 13, 1891. Serial No. 402,523. (No model.)



Claim.—1. The combination, with a suitable bracket or standard and a suitably-supported track, of an arm supported by the standard above the track, pulleys supported above the track at opposite ends of said arm, an endless belt extending about said pulleys, and two transverse stops fastened to the endless belt and separated by a space sufficient to receive a carrier moving on the track, that part of the belt to which the stops are fastened being made up of two parallel straps separated by a space for the passage of a carrier on the track, substantially as shown and described.

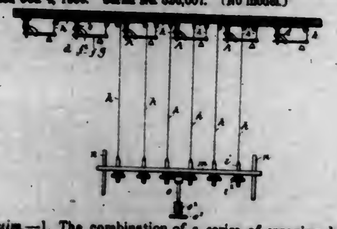
2. The combination, with the bracket or standard A, of the pulley C, journaled therein, the arm B, supported thereby, the pulleys C' C', journaled at the free end of the arm, the endless belt extending about the pulleys C C' and made up of the single strap D and the parallel straps D', and the stops d d, fastened transversely upon the straps D', substantially as shown and described.

3. The combination, with the bracket or standard A, having the integrally-formed plates A' and web A^3, of the pulley C, journaled between said plates, the arm B, fastened to and supported by the web A^3, the transverse web B^3, supported at the free end of the arm B and

longitudinally adjustable thereon, the plates B^2 B^2, supported by the web B^2, and the pulleys C C, journaled therein, the endless belt D D', extending about said pulleys C C, and the stops d d, fastened to the part D' of the belt, substantially as shown and described.

4. The combination, with the standard or bracket A, arm B, and pulleys C C, of the endless belt extending about said pulleys and made up of the single strap D and the parallel straps D', said single strap being perforated and said pulley C being furnished with pins p, adapted to enter the perforations in the belt D, substantially as shown and described.

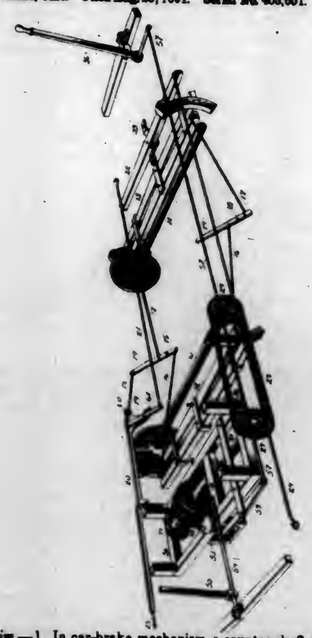
5. The combination, with the bracket or standard A, plates A^1, and web A^2, of the arm B, fastened to the plate, the sleeve B', adjustable on the end of said rod and formed with a slot S, the pin K, permitting longitudinal movement of the sleeve upon the rod, but preventing rotation of the sleeve, the nut N, adapted to adjust the sleeve upon the rod, the plates B^2, supported by the sleeve, and the pulleys C C, journaled in said plates, substantially as shown and described.



479,418. PUZZLE. HENRY C. GUERTIN, Winchendon, Mass. Filed Sept. 18, 1891. Serial No. 406,085. (No model.)

Claim.—1. A puzzle comprising a box or similar body provided with points of obstruction on its bottom, a hollow body adapted to roll on said bottom and provided with a mouth or opening, and a ball of a size suitable to enter said mouth, substantially as specified.

2. A box having a series of vertical hoops or loops, as g, disposed therein, in combination with the hollow body C, having the mouth A, and ball D, substantially as set forth.



479,419. APPARATUS FOR COOLING MALT LIQUORS. CLARENCE C. HANFORD, Medford, and CHARLES D. STANFORD, Boston, Mass. Filed Oct. 4, 1889. Serial No. 326,007. (No model.)

Claim.—1. The combination of a series of spraying devices or delivery-tubes, each having a deflector controlling the orifice thereof and a support for said deflector, with a movable bar and flexible connectors between said bar and each of said deflector-supports, as described, and means for operating said bar, whereby all the said deflectors may be moved simultaneously, each deflector being movable independently of the others by its flexible connector, substantially as and for the purpose set forth.

2. The combination, with a series of spraying devices or delivery-tubes, each having a deflector controlling the orifice thereof and a lever connected with said deflector, of cords or chains connected with said levers and a movable bar and adjustable connectors by which said cords are adjustably connected with said bar, substantially as and for the purpose described.

479,420. BRAKE MECHANISM FOR CARS. HENRY V. HARTE, Cleveland, Ohio. Filed Aug. 25, 1891. Serial No. 403,651. (No model.)

Claim.—1. In car-brake mechanism, a counter-shaft driven from the car-axle and a pinion fixed thereon, a friction-band having internal gear, friction mechanism to engage said band, and a winding-drum with a head carrying pinions free to travel within the friction-band, substantially as described.

2. In car-brakes, a friction-band having gear on its inside, a draw-bar, and mechanism operated by said band and connected with the said draw-bar, a shaft having a pinion to operate said friction-band, and a device to engage said friction-band and hold it from rotating, substantially as described.

3. The counter-shaft and a series of pinions operated thereby, the winding-drum turned by said pinions, the internally-geared band meshing with said pinions, and the clamping mechanism for said band, substantially as described.

4. In brake mechanism for cars, the internally-geared band and the clamping mechanism about the same, the counter-shaft and the pinions to turn said band, the winding-drum and the draw-bar, and power connections from the car-axle to the counter-shaft, substantially as described.

5. In brake mechanism for cars, a counter-shaft and positive driving mechanism connecting the shaft with the car-axle, a pinion fixed on said shaft, a band-wheel driven by said pinion and intermediate gear, a winding-drum, and friction mechanism to lock said band-wheel and cause the drum to rotate, substantially as described.

6. In a car-brake, a counter-shaft and driving-pinions, an internally-geared friction-band meshing with said pinions, a clamp to tighten on said band and stop its rotation, a winding-drum driven through said pinion, and mechanism connecting with the car-axle to drive said parts, substantially as described.

7. In car-brake mechanism, a car-axle, a counter-shaft having a fixed pinion, a friction-wheel sleeved loosely upon said shaft and having internal teeth, gears between said friction-wheel and said pinion, and a drum operated through said gears, substantially as described.

8. In a car-brake, a brake-bar, a shaft driven from the car-axle, an internally-geared band and clamps to engage the outer surface thereof, pinions operated from said shaft meshing with said geared band, and a rotating device operated by said gear and connected with the draw-bar, substantially as described.

9. The counter-shaft provided with a fixed pinion, a sleeve about said shaft, and a winding-drum about said sleeve provided at one end with a disk, pinions on said disk meshing with the pinion on the counter-shaft, an internally-geared band meshing with the pinions on the said disk, and friction-clamps about said band, substantially as described.

10. In a car-brake, a shaft connected with the car-axle by positive driving mechanism, a pinion on said shaft, and a drum and a disk rigid therewith carrying a pair of pinions meshing with said pinion, in combination with a band-gear meshing with said pair of pinions and friction-clamps engaging the outer surface of said band-gear, substantially as described.

11. In a car-brake mechanism, the car-axle, a counter-shaft, and driving mechanism connecting said axle and shaft, in combination with a friction-band having a supporting-sleeve at one side around said shaft and a bushing supporting said sleeve, a winding-drum, and gear to turn said drum meshing with the said friction-band, substantially as described.

12. In a car-brake, a friction-band and clamps arranged around said band, in combination with a shaft and sliding mechanism on said shaft connected with said clamps, substantially as described.

13. In a car-brake, a rotating band having internal gear and an outside friction-surface, clamps to engage said friction-surface, a separate loose cam connected with each clamp, and a shaft with fixed cams engaging said loose cams, substantially as described.

14. In a car-brake, a pair of fixed cams on a shaft and a pair of movable cams between the fixed cams, in combination with a friction-band and clamps to engage said band having one end connected with the said movable cams, substantially as described.

15. In a car-brake, a rotating shaft carrying fixed cams and a pair of movable cams between the fixed cams, in combination with clamps held at one end by said movable cams, a friction-band engaged by said clamps, a winding-drum, a shaft supporting said drum, and gear operated by said shaft engaging said friction-band and rotating said drum, substantially as described.

16. In a car-brake, a counter-shaft driven from the car-axle and a drive-pinion fixed thereon, a band-gear and pinions between said band-gear and said drive-pinion, clamps to engage the band-gear, and a shaft with cams to tighten said clamps, substantially as described.

17. In a car-brake, mechanism to set the brake, consisting of a shaft rotated by a lever, clamps operated by devices on said shaft and a friction-band having internal gear engaged on its surface by said clamps, in combination with a winding-drum, a shaft on which said drum is mounted, and pinions driven by said shaft and engaging said friction-band, substantially as described.

18. In a car-brake, a brake-bar, brake mechanism to bear against the wheels, an evener connected with said brake mechanism and said brake-bar, and a drum driven from the car-axle to move said brake-bar, substantially as described.

19. In a car-brake, a draw-bar and an evener on said draw-bar to operate the brake mechanism, in combination with a shaft having power connection with a car-axle, a winding-drum on said shaft connected to the brake-bar, and mechanism to lock said shaft and the winding-drum together, substantially as described.

20. In a car-brake, a counter-shaft driven from the car-axle and a winding-drum thereon, a brake-bar and an evener operated thereby, brake mechanism operated from said evener, and friction mechanism to engage the said winding-drum, with the shaft carrying the drum whereby the drum is turned, substantially as described.

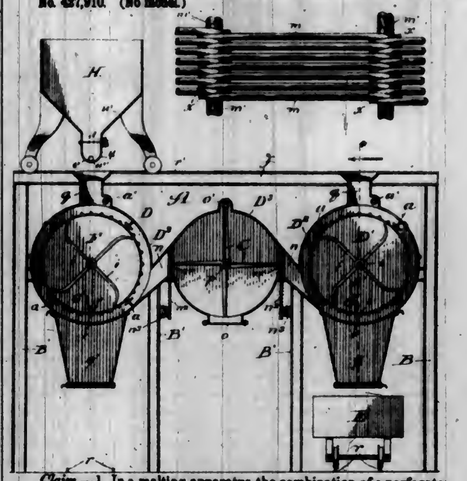
21. In car-brake mechanism, a draw-bar, an evener pivoted, and a fixed stop on the said bar to limit the movement of the evener beyond said stop, substantially as described.

22. In car-brake mechanism, a draw-bar having fixed stops for an evener and an evener pivoted between said stops, substantially as described.

23. In car-brake mechanism, a draw-bar and an evener thereon and a connection with said evener to unite to the brake mechanism of a second car, substantially as described.

24. In car-brake mechanism, a draw-bar and an evener thereon, a horizontally-arranged evener and connections between said eveners, and connections on the horizontally-arranged evener to control the brake mechanism of another car, substantially as described.

25. In car-brake mechanism, a counter-shaft, friction mechanism sleeved loosely on said shaft, and fixed bushing supporting said friction mechanism, in combination with a stationary sleeve around said shaft and a winding-drum supported on said sleeve and operated through said friction mechanism, substantially as described.



26. In car-brake mechanism, a counter-shaft driven from the car-axle and a friction-band provided with a sleeve portion loosely surrounding the said shaft, in combination with a bushing surrounding said sleeve and forming a bearing therefor and a frame to which the bushing is rigidly fastened, substantially as described.

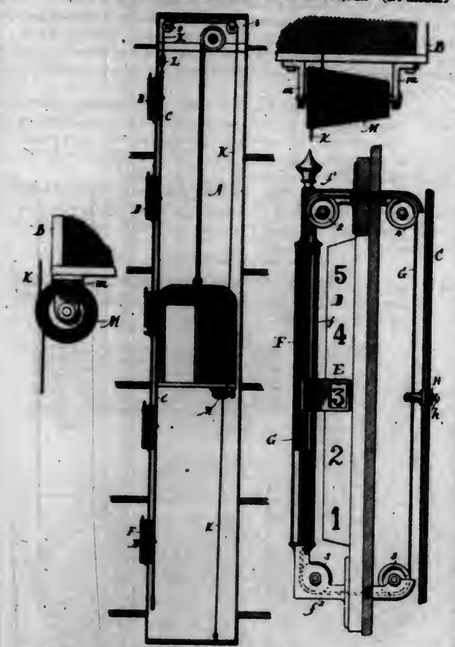
27. In car-brake mechanism, a friction-band and friction-clamps thereon, in combination with a shaft having separate movable pieces thereon to which the said clamps are connected, and means on said shaft to move said pieces toward and from one another, substantially as described.

28. In car-brake mechanism, a shaft, a friction-band sleeved loosely on said shaft and having internal gear geared to said shaft and friction-clamps around its outside, in combination with a vertically-arranged shaft having separate movable pieces connected with said clamps, substantially as described.

29. In car-brakes, a shaft, a winding-drum on said shaft, friction mechanism about said shaft, the supporting-frame, and bushing fixed to said frame supporting the said friction mechanism, substantially as described.

479,421. APPARATUS FOR MANUFACTURING MALT. CHARLES HAUPTMANN and JOSEF SCHWARZ, Chicago, Ill. Filed Apr. 5, 1892. Serial No. 427,910. (No model.)

Claim.—1. In a malting-apparatus, the combination of a perforate rotary drum forming the grain-receptacle and having a gate and enveloped in a stationary casing having a supply-inlet and discharge-outlet, a rotary stirrer in the drum, adapted to be rotated contrary thereto, and means for supplying moist air to the drum, substantially as described.



2. In a malting apparatus, the combination of a perforate rotary drum having a gate G and inclosed in a casing D^3, having a supply-inlet q and a discharge-outlet q', deflectors a, interposed at intervals between the drum and its envelope, a rotary stirrer F in the drum, and a fan C, communicating with the drum through its said casing, substantially as described.

3. In a malting apparatus, the combination, with an inclosure A, of a circumferentially perforate rotary drum having a gate G and inclosed in a casing D^3, having a supply-inlet q and a discharge-outlet q', a rotary stirrer F in the drum, adapted to be rotated in the direction contrary to the rotation of the drum, and a fan C, communicating with the drum through the said casing and forming a support in the said inclosure for stored ice, substantially as described.

4. In a malting apparatus, the combination, with an inclosure A, of rotary drums D and D', each having a gate G and being inclosed in a casing D^3, having a supply-inlet q and a discharge-outlet q', a rotary stirrer F in each drum, adapted to be rotated in the direction contrary to that of the drum, and a fan C, interposed between and controllably communicating with the two drums, substantially as described.

5. A malting apparatus comprising, in combination with an inclosure A, a steep-tank car H on a track r' above the said inclosure, rotary drums D and D', each having a gate G and being inclosed in a casing D^3, having an upper supply-hopper q and a lower discharge-hopper q', a rotary stirrer F in each drum, deflectors a, provided at intervals around the drums inside their said casings, and a fan C, interposed between and controllably communicating with the two drums and having an air-straining inlet and a water-supply pipe in its casing D^3, the whole being constructed and arranged to operate substantially as described.

479,422. INDICATOR FOR ELEVATORS. THADDEUS W. HERRMAN, Chicago, Ill., assignor to the Elevator Supply and Repair Company, same place. Filed June 24, 1891. Serial No. 397,342. (No model.)

Claim.—1. An indicator mechanism for elevators, comprising the combination, with suitable individual indices and with a vertically-moving part of the elevator mechanism—such, for example, as the car—of an indicator-cable connected with said indices and by the shifting of which cable said indices are operated, said indicator-cable extending into engagement with said vertically-moving part of the elevator mechanism and having a fixed support and being sustained in a manner permitting its working length to be varied, and suitable means for shifting said cable to vary its working length, and thereby effect the proper movement of the indices, substantially as described.

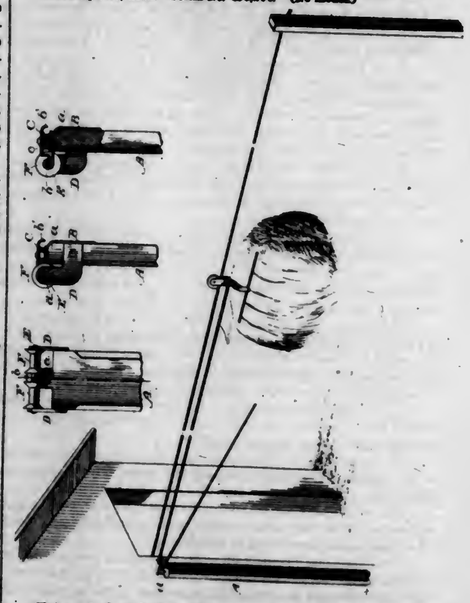
2. An indicator mechanism for elevators, comprising the combination, with suitable individual indices and with a vertically-moving part of the elevator mechanism, such as the car, of an indicator-cable engaged by said vertically-moving part of the elevator mechanism, said indicator-cable extending from top to bottom of the hatchway and having a fixed connection and being sustained in a manner permitting it to be shifted so as to vary its working length, and suitable means for shifting said indicator-cable to vary its working length, and thereby impart movement to the several indices, substantially as described.

3. An indicator mechanism for elevators, comprising the combination, with suitable individual indices, of a vertically-moving part of the elevator mechanism—such, for example, as the elevator-car—an indicator-cable extending from top to bottom of the hatchway, a fixed support for one end of said cable, the opposite end of said cable being free to move and being suitably connected with the indices, and suitable means operated by the vertically-moving part of the elevator mechanism, whereby the working length of said cable may be varied to effect the movement of said indices, substantially as described.

4. An indicator mechanism for elevators, comprising the combination, with suitable individual indices, of an indicator-cable suitably connected with said individual indices, a reciprocating part of the elevator mechanism, such as the car, with which said cable is engaged, said indicator-cable having a fixed connection or support and being connected with the indices in manner permitting the working length of said cable to be varied, and suitable differential mechanism for varying the working length of the cable to effect the shift of the indices, substantially as described.

5. An indicator mechanism for elevators, comprising the combination, with suitable indices, of an indicator-cable extending from top to bottom of the hatchway, a fixed support for one end of said cable, the opposite end of said cable being free to move and being suitably connected with the indices, and a differential drum over which said cable passes and whereby the working length of said cable may be varied to effect the movement of the indices, substantially as described.

6. An indicator mechanism for elevators, comprising an indicator-cable having one end sustained by a fixed connection and having its opposite end free to shift and suitably connected with the indices, an elevator-car, and a differential drum or pulley connected to said elevator-car over which said indicator-cable passes and whereby the working length of said cable may be varied to impart movement to the indices, substantially as described.



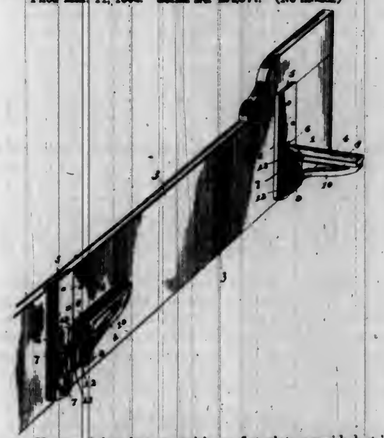
7. An indicator mechanism for elevators, comprising the combination, with suitable indices, of means for shifting said indices, consisting of an indicator-cable connected with said indices, a vertically-moving part of the elevator mechanism with which said cable is engaged, and a spirally-grooved idler-drum of varying diameter over which said indicator-cable passes, whereby said cable when shifted from end to end of said drum will cause the working length of said indicator-cable to vary to effect the movement of the indices, substantially as described.

8. An indicator mechanism for elevators, comprising a suitable indicator-cable extending from top to bottom of the hatchway and a differential mechanism engaging the said cable to impart a varying shift thereto, said differential mechanism being connected to the elevator-car, and a suitable index or indices, and a connection between said index and said cable, substantially as described.

9. An indicator mechanism for elevators, comprising the combination, with suitable indices, of the indicator-cable K, extending from top to bottom of the hatchway and suitably connected to said indices, an elevator-car B, and a spirally-grooved drum or pulley M, attached to the elevator-car over which drum the indicator-cable passes, substantially as described.

10. An indicator mechanism for elevators, comprising the combination, with suitable indices, of the indicator-rod C, connected to said indices, an indicator-cable K, extending from top to bottom of the hatchway and having its lower end fast and its upper free end connected to the indicator-rod, and a differential drum carried by the car and around which drum the said indicator-cable passes, substantially as described.

479,428. HAY-CARRIER. JOSEPH L. HOFFMAN, Longtown, Mo. Filed Apr. 22, 1892. Serial No. 430,261. (No model.)



Claim.—1. In a device of the character described, the combination, with an upright post carrying a pulley journaled on a vertical bearing upon the top of said post, of a horizontal shaft located at the top of said post and in front of said pulley and two pulleys or spools journaled upon said horizontal shaft and located in front of the central pulley and respectively at each side of the same, said pulleys being independent of each other, and the arrangement being such that the horizontal pulley is located centrally between the two pulleys or spools projecting at the front of the post, substantially as and for the purpose set forth.

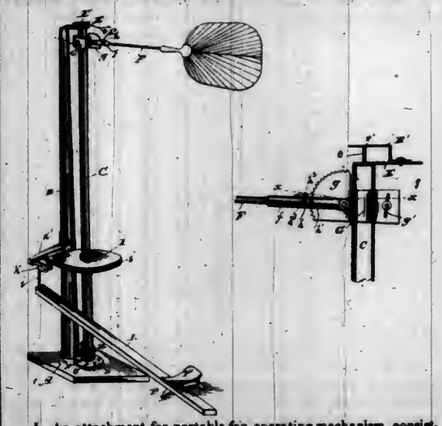
2. In a device of the character described, the combination, with an upright post provided at its upper end with an upward projection, of a U-shaped plate mounted upon the latter, a pulley journaled in said plate and upon a vertical bearing, brackets projecting forwardly and upwardly from the sides of the post, a horizontal shaft secured in said brackets, and two corresponding pulleys or spools journaled on said shaft, substantially as and for the purpose set forth.

3. In a device of the character described, the combination, with an upright post provided at its upper end with an upward projection, of a plate secured to the latter, bent forwardly over the same and thence rearwardly, the free end of said plate being turned downwardly, a pulley journaled in the frame formed by said plate, a horizontal shaft located in front of the post, and two corresponding pulleys or spools journaled on said shaft, substantially as and for the purpose set forth.

4. A device of the character described, consisting of a vertical post having an upwardly-projecting central extension at its upper end, a plate secured at the back of said extension, thence bent forwardly over the same and formed in front of the post with an eye, thence bent rearwardly and its free end finally downwardly, a pulley journaled in the frame formed by said plate, forwardly and upwardly projecting brackets secured to the sides of the post and provided at their free ends with eyes in horizontal alignment with the eye of the plate, a shaft mounted in said eyes, and two corresponding pulleys or spools journaled on the shaft between the supports therefor, substantially as and for the purpose set forth.

479,424. BRACKET. JOHN HUFF and ELLIS JOHNSON, Lusk, Wyo. Filed Mar. 11, 1892. Serial No. 424,877. (No model.)

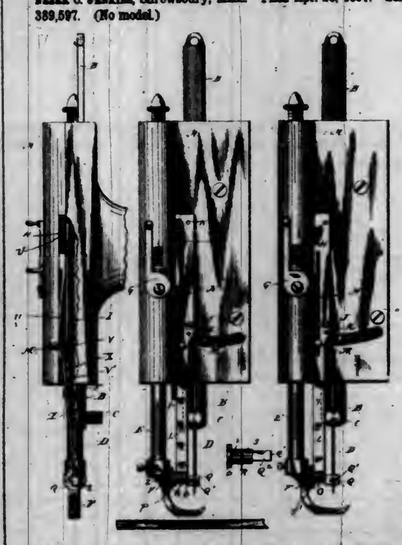
Claim.—A bracket comprising a flat plate provided at its upper edge with a horizontal supporting-flange 5 and having a longitudinal slot intermediate of its ends and provided with outwardly and upwardly projecting lugs arranged in pairs on opposite sides of the slot and having beveled edges, the lower lugs being connected at their bottoms with a supporting-web formed integral with them, and a detachable bracket-arm having a central longitudinal flange to fit into the slot and provided with integral downwardly-projecting lugs arranged in pairs on opposite sides of the flange and having beveled edges to conform to the lugs of the plate, substantially as described.



479,425. FAN-OPERATING DEVICE. ROBERT F. HUNT, Washington, D. C. Filed Aug. 15, 1889. Serial No. 320,901. (No model.)

Claim.—1. In a portable fan-operating mechanism, the combination, with a base and upright rigidly mounted thereon, the plate having the bearing therein on the base, and the projections or lugs thereon, of the fan-shaft journaled in said bearing, the coil-spring surrounding said shaft and having the catch engaging said projections, and the pulleys, cord, and treadle, substantially as and for the purpose specified.

2. In a fan-operating mechanism, the combination, with the base, upright, and fan-shaft journaled at the bottom on the base and having the journal at the upper end, of the bearing for the top of the same, formed by the arm on the upright having the bearing thereon for the journal, and the movable bracket for preventing the upward movement of the shaft and journal, substantially as described.

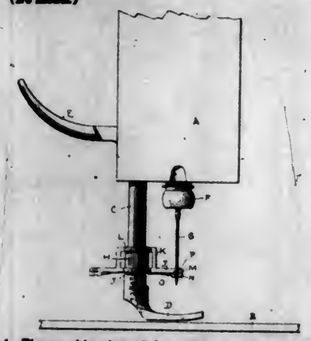


3. In a portable fan-operating mechanism, the combination, with the vertical fan-shaft and operating-treadle, as described, of the bracket on the fan-shaft, having the toothed segment thereon, the arm pivoted in said segment and having the sleeve thereon engaging the teeth thereof with the notches to permit the vertical adjustment of the arm, substantially as described.

4. In a portable fan-operating mechanism, the combination, with the vertical fan-shaft and operating-treadle, as described, of the adjustable bracket split on one side, with the thumb-screw for drawing the sides together and having the toothed segment thereon, the fan-arm pivoted on said segment and having the sleeve thereon engaging the teeth with the notches to permit the vertical adjustment of the arm, substantially as described.

5. An attachment for portable fan-operating mechanism, consisting of the forwardly-extending base, with the bearing at one end, and the top or treadle pivoted in said bearings and adapted to rest on the operating-treadle, whereby the necessity for fastening the base down is dispensed with, substantially as described.

479,426. NEEDLE-THREADER FOR SEWING-MACHINES. EBENEZER C. JENKINS, Shrewsbury, Mass. Filed Apr. 20, 1891. Serial No. 389,597. (No model.)



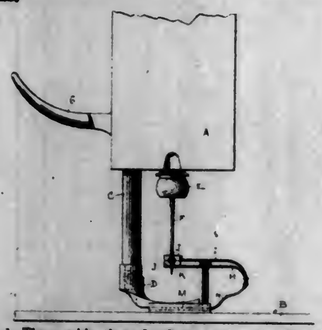
Claim.—1. The sewing-machine-needle-threading device consisting of the bar sliding on the machine-head, the thread-guide journaled in the lower end thereof, having the toothed sector, and the rack with which said sector is adapted to co-operate, substantially as described.

2. The sewing-machine-needle-threading device consisting of the bar L, sliding on the head, the thread guide journaled in the lower end thereof, the slot S, cut in the bar L, and the pin B for limiting the

rotation of the thread-guide, and means for rotating the thread-guide, substantially as described.

3. The sewing-machine-needle-threading device consisting of the sliding bar L, the thread-guide Q, journaled in the lower end thereof and having the toothed sector P, the rack T, with which said sector may engage to turn said guide, and a guide with which the sliding bar co-operates, and means whereby the thread-guide will be moved in a straight line while the sector is in engagement with said rack and then on a curved line to and from the needle, substantially as described.

479,427. NEEDLE-THREADER FOR SEWING-MACHINES. EBENEZER C. JENKINS, Shrewsbury, Mass. Filed Nov. 5, 1891. Serial No. 410,933. (No model.)

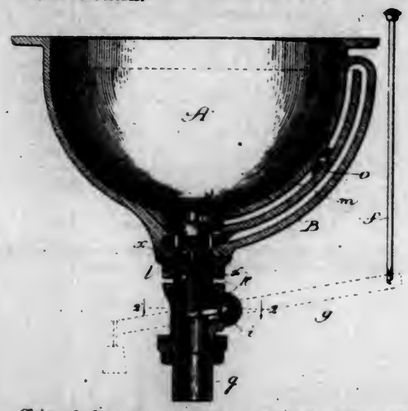


Claim.—1. The combination of the presser-bar, the collar loosely mounted on the same, means, as a set-screw, for holding the collar in vertical adjustment, the arm J, bridge-piece K, and piece L, united as described, the pieces J and K being journaled on the presser-bar below and above the collar, and the thread-guide carried by the arm J, whereby the thread-guide may be turned laterally relatively to the presser-bar and vertically adjusted on the presser-bar by collar H, substantially as described.

2. The combination of the presser-bar, the collar H, held on the same, the frame having a bearing above and below said collar, the frame having the spring-arms 1, 2, 3, and 4, and the thread-guide carried by the said frame, substantially as described.

3. The combination of a presser-bar, the collar H, mounted on a collar S or bush held on said presser-bar, the ends of said bush projecting above and below said collar H, and a frame carrying a threading device, said frame being journaled on the projecting ends of said bush, and thus on the presser-bar, substantially as described.

479,428. SEWING-MACHINE-NEEDLE THREADER. EBENEZER C. JENKINS, Shrewsbury, Mass. Filed Nov. 5, 1891. Serial No. 410,933. (No model.)

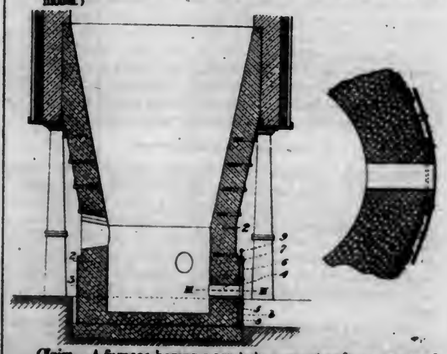


Claim.—1. The combination of a frame, a thread-guide suitably attached to said frame, and side flanges M, fastened to said frame, the distance between said flanges being substantially the width of the presser-foot of a sewing-machine, the whole being arranged so that the device may be held in place by the presser-foot and the thread-guide in register with the eye of the needle, substantially as described.

2. The combination of spring H, bent as described, the spring I, fastened to the spring H, each spring carrying at the end thereof a member of a divided thread-guide, and a fulcrum mounted between the springs, and the flanges M, fastened to the spring H, whereby the device may be set in place on a sewing-machine, substantially as described.

3. The combination of spring H, bent substantially as described, a divided thread-guide carried by said spring, and the pieces M M, fastened to said spring H, said flanges extending above and below the spring H, for the purpose set forth.

4. The combination of spring H, spring I, fastened thereto, the thread-guide J, carried by said springs, the flanges M, fastened to the spring H, the cross-piece N, and the screw tapped in said piece N, the head P of said screw resting between said springs H and I, substantially as described.



479,429. WASH-BASIN. JAMES KELLY, Chicago, Ill., assignor of one-half to John Kelly, same place. Filed Dec. 21, 1891. Serial No. 415,729. (No model.)

Claim.—1. In combination with a wash-basin, a plug *p*, seated over its discharge-opening *r*, a chamber B, formed in the wall of the basin, divided into channels *n* and *m* by a diaphragm *o*, extending upward and defining the water-line in the basin, the said channels *n* and *m* leading, respectively, into the basin above the plug at the upper end of the discharge-opening and into the discharge-pipe below the plug, and the channel *n* being provided with a swell *t*, substantially as described.

2. In a wash-basin, the combination, with the discharge-outlet *r* and its plug *p*, of a combined overflow and discharge siphon leading from the inner base of the basin in the wall thereof upward and defining the water-line therein and thence down to the discharge from the basin below the plug, a swell in the outgoing channel of the siphon for augmenting the backflow of water for the seal, and means for raising the plug from its seat from without the basin, substantially as described.

479,430. WATER-COOLING DEVICE FOR FURNACES. JULIAN KENNEDY, Pittsburg, Pa. Filed Feb. 19, 1892. Serial No. 422,150. (No model.)

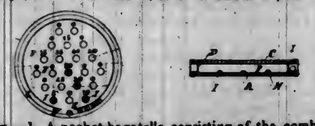
Claim.—A furnace having a tap-hole, a guard or frame surrounding the same, an exterior splash-plate fixed to the guard or frame and open to afford access to the intermediate space, and a water-supply pipe adapted to wet the furnace-walls within the splash-plate, substantially as and for the purposes described.

479,431. PHONOGRAPH. VINCENZ LABOLA, Vienna, assignor to Bela Steiner, Buda-Pesth, Austria-Hungary. Filed July 11, 1891. Serial No. 399,190. (No model.)

Claim.—1. In a phonograph, the combination, with the blank or phonograph cylinder carrier, of a producer or reproducer arranged above said carrier and comprising a casing, a diaphragm arranged therein with its axis parallel to the axis of rotation of the cylinder, two sound-ducts leading to opposite sides of the diaphragm, a stylus-carrier adapted to rock in bearings on the under side of said casing, said stylus-carrier being connected with the diaphragm by an arm E^2, a hinged support for said producer or reproducer, and an adjusting device for adjusting the same relatively to the phonograph-carrier, substantially as and for the purpose set forth.

2. The combination, with a revoluble carrier for the blank or phonogram cylinder, said carrier being provided with interiorly-threaded bearings, of a stationary screw-shaft adjustable about its own axis, for the purpose set forth.

3. The combination, with the blank or phonograph carrier, its motor, the producer or reproducer arranged above said carrier, and a hinged support for said producer or reproducer, of two connected levers adapted to stop the motor and simultaneously lift the producer or reproducer support from the carrier.

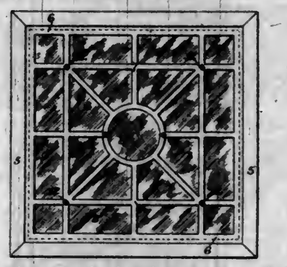


4. The combination, with the blank or phonogram cylinder carrier, its motor, and the producer or reproducer, of two levers adapted to operate jointly to stop the motor and move the producer or reproducer away from the carrier, for the purpose set forth.

5. The combination, with the blank or phonogram carrier, its motor, the winding-shaft thereof, the winding-key having endwise motion on the shaft, and interlocking devices connected with the shaft and key to interlock the same, of a lever having a bearing on the winding-key at or about at its point of interlocking with the winding-shaft and adapted to drop on said winding-shaft when the key is moved out of engagement therewith, said lever being provided with a projection in the path of the governor or fly of the motor when said lever rests on the winding-key, for the purposes specified.

6. The combination, with the blank or phonogram carrier, its motor, the winding-arbor thereof, the winding-key having endwise motion on the shaft, interlocking devices connected with the shaft and key to interlock the same, and the producer or reproducer, of a lever having bearing on the winding-key at or about at its point of interlocking with the winding-shaft and adapted to drop on said winding-shaft when the key is moved out of engagement therewith, said lever being provided with a projection in the path of the governor or fly of the motor when said lever rests on the winding-key, and an auxiliary lever actuated by the motor-locking lever and adapted to hold the producer or reproducer away from the carrier when said motor-locking lever rests on the winding-key, for the purpose set forth.

7. The combination, with the producer or reproducer, the motor-governor, the winding-shaft of the motor, provided with a radial lug or projection a^2, and the key D, provided with a flange *d* and a lug or projection adapted to engage the radial lug a^2, and a spring exerting its power to hold said lugs in engagement, of the lever B, provided with the lug or projection *b*, the lever B′, provided with the pin b^2, and a fulcrum common to both levers, for the purposes set forth.

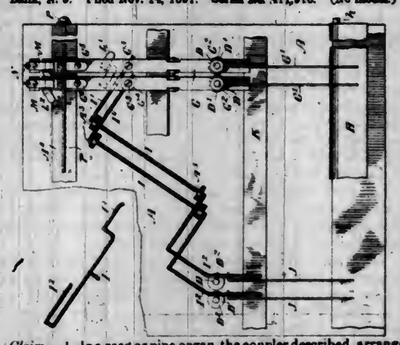


479,432. POCKET BAGATELLE-BOARD. FRANK L. LATHROP, Brooklyn, N. Y. Filed June 26, 1891. Serial No. 397,566. (No model.)

Claim.—1. A pocket-bagatelle consisting of the combination of an inclosed case having a transparent cover, a partition forming two communicating compartments within the case, a series of numbered depressed pockets in one of said compartments adapted to retain balls which have settled therein and permit the inclination of the case in any direction without disturbing such balls, and a plurality of balls adapted to be rolled from one compartment into the other and to be caused by manipulation of the case to settle in said pockets and make a score according to the numbers of the latter, substantially as set forth.

2. The combination of the glass C, the partition D, the perforated false bottom F, the bottom A, a support or edge between said bottoms, said parts being superposed one on the other, as shown, a plurality of balls I, of diameter smaller than the perforations of said false bottom, and the rim forming with the said portion a circular runway and having flanges overlapping said glass and bottom and holding in contact said superposed parts, substantially as set forth.

479,433. WINDOW OR DOOR SASH. GEORGE B. LEE, Providence, R. I., assignor of two-thirds to George W. Stafford and Thomas E. Nudd, same place. Filed July 23, 1891. Serial No. 400,471. (No model.)



Claim.—1. A metal sash adapted to contain panels formed of sheet metal, having designs cut or stamped therefrom to form front and back frames, as described.

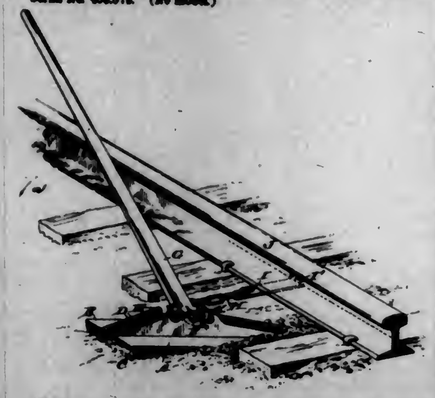
2. The combination with front and back frames stamped from sheet metal, one or both having strengthening-ribs 10, of fastening devices adapted to hold the frames together, as described.

3. The combination, with the frame 9, having ribs, each of which is provided with a fastening device secured to such ribs, and panels held in place between such ribs, of the front frame 6, having bars 7, perforations in said bars through which fastening devices pass, and nuts 12 to secure said fastening devices, as described.

479,434. KEY-COUPLER FOR ORGANS. JOHN LLOYD, Jr., Red Bank, N. J. Filed Nov. 14, 1891. Serial No. 411,918. (No model.)

Claim.—1. In a reed or pipe organ, the coupler described, arranged to operate the coupled valve by a gentle yielding force, as herein specified.

2. In a reed or pipe organ, the coupler described, arranged to operate the coupled valve by a gentle yielding force, in combination with a stronger spring or set of springs which, unless prevented, hold the valves closed and with coupling-wires, as I I′ I^3, arranged to prevent the action of such latter springs and to allow the valves to open when required, substantially as herein specified.



3. In a reed or pipe organ, the coupler described, arranged to operate the coupled valve by a gentle yielding force, in combination with a stronger spring or set of springs which, unless prevented, hold the valve closed and with mechanism operated by the key-lever for relieving the valve from the control of such stronger springs and allowing it to be opened, as herein specified.

4. In a reed or pipe organ having coupling-wires arranged to allow the depression of a key to open its proper valve and also to liberate and allow to be opened a valve giving the octave thereof, provis-

lose, as the levers L and their lateral arms L', for holding out of action the valves on one side of the octave of the one being played, so that only the extreme lowest and highest keys shall produce their octave-sounds, as herein specified.

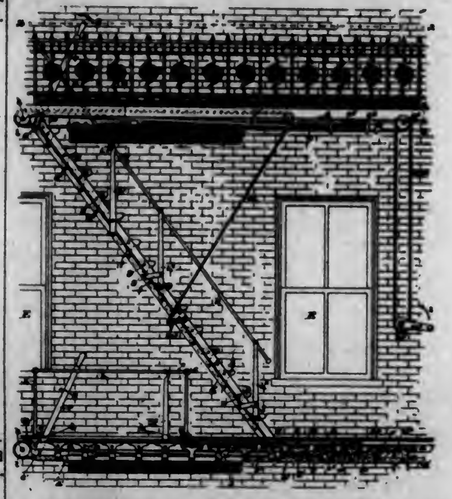
5. In a reed or pipe organ having coupling-wires adapted to sound the octaves of the extreme keys, the levers L and the lateral arms L' L² thereon adapted to engage each lever L with the corresponding lever on one side thereof and to insure that the levers L on one side of the one being played shall be operated, and thus to allow the sounding of the octave of the extreme key to compel the non-sounding of the octaves of others, the key-levers of which may be depressed simultaneously, as herein specified.

479,485. TRACK-RAIL-ALIGNING DEVICE. WALLACE H. LOUNSBURY and ALONZO H. MCQUEW, Centreville, S. D. Filed Oct. 13, 1891. Serial No. 408,578. (No model.)

Claim.—1. A rail-track-aligning device comprising a frame, a lever mounted to turn in the said frame and adapted to be actuated thereon, and a plate connected with the said lever and adapted to engage the rail, substantially as shown and described.

2. In a rail-track-aligning device, the combination, with a frame formed with parallel toothed arms, of a lever adapted to be passed between the said toothed arms and provided with a projecting pivot-pin engaging a set of corresponding teeth on the said arms, and a plate connected with the said lever and formed with a flange adapted to engage the base of the rail, substantially as shown and described.

3. In a rail-track-aligning device, the combination, with a frame formed with parallel toothed arms, of a lever adapted to be passed between the said toothed arms and provided with a projecting pivot-pin engaging a set of corresponding teeth on the said arms, a plate connected with the said lever and formed with a flange adapted to engage the base of the rail, and a chain for connecting the said plate with the said lever, substantially as shown and described.



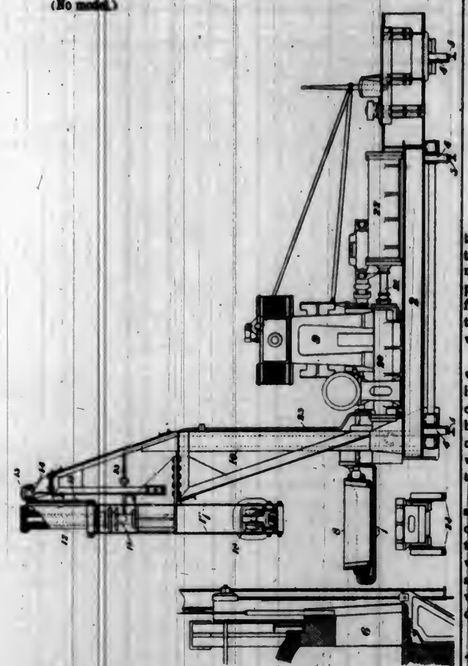
4. A rail-track-aligning device provided with a frame comprising a base-plate, angular flanges projecting from the ends of the said base-plate and standing in the same direction, and toothed arms held on the said plate, substantially as shown and described.

5. In a rail-track-aligning device, the combination, with a frame comprising a base-plate, angular flanges projecting from the ends of the said base-plate and extending in the same direction, and toothed arms arranged on top of the said base-plate, of a lever formed with a pivot-pin adapted to engage the said toothed arm, a chain connected with the said lever, and a plate connected with the said chain and formed at its free end with an angular flange adapted to engage the base of the rail, substantially as shown and described.

6. In a rail-track-aligning device, the combination, with a frame comprising a base-plate, angular flanges projecting from the ends of the said base-plate and extending in the same direction, and toothed arms arranged on top of the said base-plate, of a lever formed with a pivot-pin adapted to engage the said toothed arms, a chain connected with the said lever, a plate connected with the said chain and formed at its free end with an angular flange adapted to engage the base of the rail, and a cam projection formed on the fulcrum end of the said lever below the said chain, substantially as shown and described.

479,486. FIRE-ESCAPE. WILLIAM W. LUMMUS, Lynn, Mass. Filed July 10, 1890. Serial No. 358,232. (No model.)

Claim.—1. The combination, in a fire-escape, of a balcony attached to and projecting from the wall of a building and provided with an opening in its floor, a flight of stairs composed of two stringers, each comprising two parallel independent bars placed one above the other and each attached at one end by independent pivots to the under side of said balcony, said pivots being arranged in the same vertical plane, a series of treads, each connected at each end by independent pivots in the same vertical plane to two stringer-bars, a hand-rail-supporting standard erected in a fixed position on the balcony-floor at the head of the stairway-opening, a second rail-supporting standard pivoted by two independent pivots in the same vertical plane to the two bars of a stringer, and a hand-rail pivoted to the upper ends of said standards, all so constructed and arranged that said hand-rail will at all times be maintained in a position parallel to and at a suitable distance from the stair-stringers to serve as a hand-rail, whatever may be the position of said stringers.



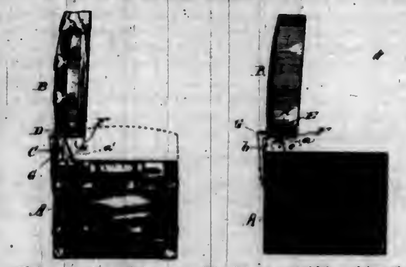
2. The combination, in a fire-escape, of a balcony attached to and projecting from the wall of a building and provided with a stairway-opening in its floor, a flight of stairs comprising four stringer-bars, two at each side of the stairs, the bars of each pair being arranged one above the other and pivoted at one end by independent pivots in the same vertical plane to the under side of the balcony, and a series of treads, each connected at each end by independent pivots in the same vertical plane to two of said stringer-bars, two standards pivoted by a single pivot to the upper of said stringer-bars, two links, each pivoted at one end to one of said standards and at its other end to the lower stringer-bar, and a hand-rail pivoted to the upper ends of both of said standards, all so constructed and arranged that when the stair-stringers are raised into a horizontal position the hand-rail will be folded down upon the upper stringer-bar, substantially as described.

3. In combination with a balcony attached to and projecting from the wall of a building and having a stairway-opening through its floor, a flight of stairs having its side stringers, each composed of two parallel bars arranged one above the other and connected at one end by independent pivots in the same vertical plane to the under side of said balcony and each of its treads connected to the two bars of its stringer by independent pivots in the same vertical plane, a fixed standard at the head of said stairs, a double or slotted standard pivoted to the two bars of a stringer by independent pivots in the same vertical plane and having its upper end bent to form a recess in its upstairs side, a section of a hand-rail pivoted to said fixed and double or slotted standards, a section of a hand-rail pivoted to two other standards, the lower ends of which are connected by a single pivot each to the upper bar of a stringer, the upper end of said rail extending between the two parts of the double or slotted standard and being provided with lateral projections to engage the recessed sides of said double or slotted standard, and two links, each pivoted at one end to one of said singly-pivoted standards and at its other end to the lower stringer-bar, substantially as described.

4. The combination, in a fire-escape, of a balcony attached to and projecting from the wall of a building and provided with a stairway-opening in its floor, a flight of stairs pivoted at one end to the under side of said balcony, a system of drums, ropes, or chains and sheaves or sprocket-wheels for raising the movable end of said stairway to a horizontal position beneath said balcony, an automatic locking device for holding said stairs in said horizontal position, a lever and connections for retracting said locking device to release said stairs and permit the same to drop to the proper inclined position for use, and an air-cylinder and its piston constructed and adapted to serve as an air-cushion to retard the descent of said stairs, substantially as and for the purposes described.

479,487. CHARGING-MACHINE FOR FURNACES. JOHAN F. LUNDAHL, Homestead, Pa. Filed Sept. 17, 1891. Serial No. 405,956. (No model.)

Claim.—1. In a charging apparatus for furnaces, the combination of a carrier movable in front of the furnace or furnaces, a box-support carried thereby, means for feeding the box-support forward, a platform mounted on the carrier and extending longitudinally in front of the furnace or furnaces, means for moving the platform vertically, and carrying devices mounted on the platform and adapted to deliver the charge to the box-support, substantially as and for the purposes described.



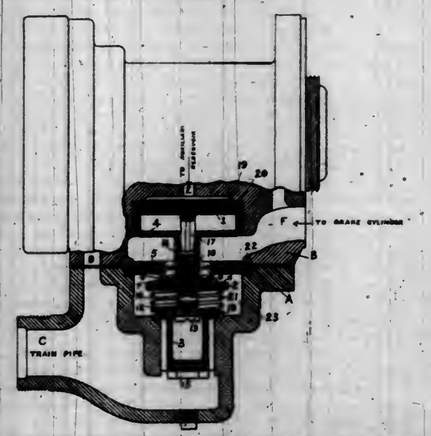
2. In charging apparatus for furnaces, the combination of a carrier movable in front of the furnace or furnaces, a box-support carried thereby, means for feeding the box-support forward, a lifting-cylinder and plunger mounted on the carrier, and carrying devices upheld above the box-support by the cylinder and plunger and extending substantially parallel with the furnace or furnaces, substantially as and for the purposes described.

3. In charging apparatus for furnaces, the combination of a carrier movable in front of the furnace or furnaces, a box-support carried thereby, means for feeding the box-support forward, a platform mounted on an upright frame on the carrier and extending longitudinally of the furnace or furnaces, means for moving the platform vertically, and carrying devices mounted on the platform and adapted to deliver the charge to the box-support, substantially as and for the purposes described.

4. In charging apparatus for furnaces, the combination of a carrier movable in front of the furnace or furnaces, a box-support carried thereby, means for feeding the box-support forward, motors, comprising cylinders and plungers, upheld by the carrier, supporting devices connected with said motors and movable vertically thereby, and gearing connecting the movable elements of the motors and causing them to move in unison, substantially as and for the purposes described.

5. In a charging apparatus for furnaces, the combination of a carrier movable in front of the furnace or furnaces, a box-support carried thereby, means for feeding the box-support forward, a platform mounted on the carrier, means for moving the platform vertically, and carrying devices suspended from trolleys which are mounted on and are movable on the platform above the box-support, substantially as and for the purposes described.

479,488. TRUNK. FRANCIS LYFORD, Augusta, Me. Filed Oct. 12, 1891. Serial No. 408,483. (No model.)

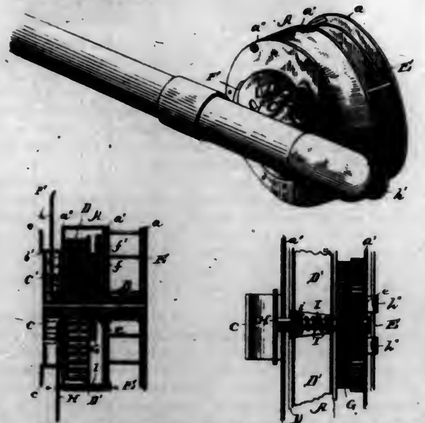


Claim.—1. A trunk having a lid of the same width and length as the body of the trunk, pivotally attached at its ends to the end walls of the trunk at points above the center of depth of and at or near the upper rear corners of the lid, whereby said lid is adapted to swing practically clear of the upper edges of the walls of the trunk and when fully raised to stand or be supported with its top in vertical line with the rear wall of the trunk and bodily above the upper edges of the walls of the same, substantially as described.

2. The combination, with a trunk having a back valance formed with an inturned upper edge, of a lid having a longitudinal groove in its rear wall, said lid being pivoted at its ends near their upper rear corners to plates or brackets secured to the end walls of the trunk-body, so as to swing practically clear of the upper edges of the walls of the trunk and when fully raised stand bodily above the trunk-walls, with its top in vertical line with the rear wall of the trunk, substantially as described.

3. A trunk having its lid pivoted at its ends to plates or brackets secured to the end walls of the body of the trunk, so as to swing clear of the upper edge of said body, a lug secured to the rear wall of the trunk and formed with an elongated slot or opening, the upper end of which is formed with inwardly and downwardly inclined outer surface, and an upwardly and outwardly extending hook secured to the rear wall of the lid and adapted to enter said slotted lug, substantially as described.

479,489. FLUID-PRESSURE VALVE. HARRY G. MANNING, Watertown, N. Y., assignor to the New York Air Brake Company. Filed Dec. 5, 1891. Serial No. 414,160. (No model.)



Claim.—1. In a fluid-pressure valve for quick-action train-brakes, a piston 1, exposed to reservoir-pressure on one side and to train-pipe pressure on the other side and independent of the control of the main piston of the triple valve, combined with the valve 2, controlling a passage between the train-pipe and the brake-cylinder, a port 16, opening communication between the under side of piston 1 and the under side of valve 2, and a check-valve 3, connected to valve 2 by a connection of such length as to keep check-valve 3 off its seat when

valve 2 is seated, thus affording open communication for fluid-pressure from the train-pipe to the under side of piston 1, substantially as set forth.

2. In a fluid-pressure valve for quick-action train brakes, a valve 2, controlling a passage between the train-pipe and a brake-cylinder, held on its seat by train-pipe pressure, and a piston 1, exposed to train-pipe pressure on the side next the valve and to reservoir-pressure on the side opposite the valve, so that the pressure from the reservoir tending to open valve 2 will be resisted by the train-pipe pressure on both the piston and the valve, combined with a check-valve attached to valve 2 by a connection of such length as to keep the check-valve off its seat when valve 2 is seated and an open passage from the chamber above the check-valve to the under side of piston 1, substantially as set forth.

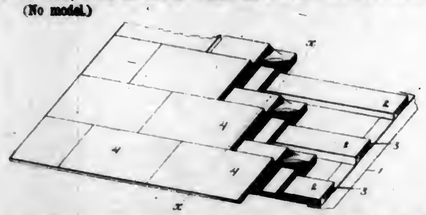
479,440. FISHING-REEL. HERMAN W. MARTIN, Ilion, N. Y., assignor to Frances I. Martin, same place. Filed May 6, 1891. Serial No. 391,836. (No model.)

Claim.—1. In a fishing-reel, the combination, with an inclosing shell, of a shaft journaled therein, a spring-barrel having a coiled spring therein, a line-spool arranged within the inclosing shell, a train of gears intermediate of the spring-barrel and the line-spool, and a winding wheel or disk attached to one end of the shaft and arranged closely adjacent to said reel, substantially as shown and described, for the purpose specified.

2. In a fishing-reel, the combination, with an inclosing shell or case, of a shaft journaled therein, a coiled spring fitted in a suitable barrel arranged in a chamber of said shell and connected at one end with the shaft, a line-spool fitted loosely around the shaft in another chamber of the reel, a train of gears connecting the spring-barrel and the line-spool, a winding wheel or disk secured to one end of the shaft and provided with a series of stops or pins, and a pallet pivoted on the inclosing shell and engaging with the stops or pins on said wheel, substantially as and for the purpose specified.

3. In a fishing-reel, the combination, with an inclosing case or shell adapted to be secured on a pole, of a central shaft journaled therein, a coiled spring arranged in a suitable barrel which is fitted loosely on the central shaft, a line-spool fitted loosely on the central shaft, a train of gears intermediate of the spring containing the barrel and the line-spool, a winding-wheel attached to the end of the central shaft, arranged closely adjacent to the inclosing shell of the reel, a pallet pivoted to the inclosing shell and engaging with the winding-wheel, and a brake fulcrumed on the side of the reel and contacting with the line-spool, substantially as shown and described, for the purpose specified.

4. In an automatic fishing-reel, the combination of a line-spool, a brake-plate fulcrumed on the outer shell of the reel, and a brake pin or rod arranged between the brake-plate and line-spool and adapted to be moved longitudinally against the side of said line-spool, substantially as described.



5. In a fishing-reel, the combination, with an outer shell, a spring and its barrel, and a line-spool, of a winding-wheel arranged laterally of the shell, close to the side thereof, and geared to the spring-barrel, substantially as described.

6. In a fishing-reel, the combination, with an outer shell, a spring-drum containing a spring, and a line-spool, of a winding-wheel having the integral lips or flanges struck up from the metal plate forming the wheel and a verge or pallet pivoted to the reel case or shell and engaging with the lips of the winding-wheel, substantially as described.

7. In a fishing-reel, the separable spring-drum comprising the flat perforated disk or plate and another plate having integral posts fitted in the apertured plate and secured thereto, substantially as described.

8. In a fishing-reel, the casing or shell comprising the outer pillar-plates and the intermediate pillar-plate having the enlarged central aperture, all of said plates being rigidly fastened together, combined with a central shaft, a line-spool fitted closely on said shaft between the central pillar-plate and one of the outer pillar-plates and having a hollow gear-stud passing through the aperture in the central pillar-plate, the spring-drum arranged between said central pillar-plate and the outer plate and having a gear or pinion meshing with the gear-stud of the line-spool by an intermediate gear mounted on the central pillar-plate, and the winding-wheel rigid with the shaft exteriorly of the casing, substantially as described.

479,441. TILE. FREDERICK N. MARVICK, San Mateo, and JOHN WALTER, Winter Haven, Fla. Filed June 22, 1891. Serial No. 397,083. (No model.)

Claim.—1. A tile provided with a body portion having upper and lower flanges, said upper flange being formed at one end on its bottom surface with a depending projection which is bounded on two sides by a plane and a curved surface, substantially as described.

2. A tile provided with a body portion having upper, lower, and side flanges, one of said side flanges being formed in its upper surface with a recess or depression which is bounded on two sides by a plane and a curved surface, substantially as described.

3. A tile provided with a body portion having an upper and a lower flange, said upper flange being arranged in a lower plane than said lower flange, with side flanges, one of said side flanges being formed on its upper surface with an inwardly-inclined gutter, and means for securing said tile to strips or ribs which are fastened to the beams or rafters of roofs, substantially as described.

4. A tile provided with a body portion having an upper and a lower flange and side flanges, said upper flange being arranged on a lower plane than said lower flange, one of said side flanges having formed on its upper surface an inwardly-inclined gutter, and means for securing said tile to strips or ribs which are fastened to the beams or rafters of roofs, said means consisting of a beveled support formed on the bottom surface of said tile, substantially as described.

5. A tile provided with a body portion having an upper and a lower flange and side flanges, one of said side flanges having provided on its upper surface an inwardly-inclined gutter and a recess or depression, as 16, which is bounded on two sides by a plane and a curved surface, and means for securing said tile to strips or ribs fastened to the beams or rafters of roofs, substantially as described.

6. A tile provided with a body portion having an upper, lower, and side flanges, said upper flange being formed at one end with a depending projection which is bounded on two sides by a plane and a curved surface, one of said side flanges being formed on its upper surface with a recess or depression which is bounded on two sides by a plane and a curved surface, and means for securing said tile to strips or ribs which are fastened to the beams or rafters of roofs, substantially as described.

7. A tile provided with a body portion having upper, lower, and side flanges, said upper flange being formed at one end with a depending projection which is bounded on two sides by a plane and a curved surface, one of said flanges being formed on its upper surface with a recess or depression which is bounded on two sides by a plane and a curved surface, and a beveled support formed on the bottom surface of said tile for securing said tile to strips or ribs which are fastened to the beams or rafters of roofs, substantially as described.

8. A tile provided with a body portion having upper, lower, and side flanges, said upper flange being arranged in a lower plane than said lower flange and formed at one end, on its bottom surface, with a depending projection which is bounded on two sides by a plane and a curved surface, one of said side flanges being formed on its upper surface with an inwardly-inclined gutter and at its upper end with a recess or depression which is bounded on two sides by a plane and a curved surface, and means for securing said tile to strips or ribs fastened to the beams or rafters of roofs, substantially as described.

9. A tile provided with a body portion, with a flange at its upper

end, having a depending projection at one end, with a beveled flange at its lower edge, with side flanges, a recess or depression bounded by plane and curved surfaces, an inwardly-inclined gutter, and a depending beveled support on its bottom surface, in combination with a correspondingly-beveled strip or rib secured to a beam or rafter of a roof, substantially as described.

479,442. TILE. FREDERICK N. MARVICK, San Mateo, Fla., assignor of one-half to David S. Tingley and Samuel J. Wells, same place. Filed Nov. 3, 1891. Serial No. 410,769. (No model.)

Claim.—1. A tile provided with an upper flange having a transverse recess or gutter formed therein, with an upwardly-projecting and transversely-extending shoulder or ledge which forms the outer wall of said recess or gutter, with a lower flange which is arranged in a higher plane than said upper flange, and with rearwardly-curved recesses, as 9, terminating in the upper surface of said lower flange, substantially as described.

2. A tile provided with an upper flange having a transverse recess or gutter formed therein, with an upwardly-projecting and transversely-extending shoulder or ledge which forms the rear wall of said recess or gutter, and with angularly-shaped elevations at one end of said recess or gutter having inclined or mitered edges, substantially as described.

3. A tile provided with an upper flange having a transverse recess or gutter formed therein, with an upwardly-projecting and transversely-extending shoulder or ledge which forms the rear wall of said recess or gutter, with a lower flange which is arranged in a higher plane than said upper flange, with rearwardly-curved recesses, as 9, terminating in the upper surface of said lower flange, and with angularly-shaped elevations at one end of said recess or gutter having inclined or mitered edges, substantially as described.

4. A tile provided with upper and lower flanges at its upper end, the lower flange having A-shaped deflectors along its upper edge, and with deep grooves leading downwardly from said deflectors, substantially as described.

5. A tile provided with upper and lower flanges at its upper end, the lower flange having A-shaped deflectors along its upper edge, with deep grooves leading downwardly from said deflectors, and means for fastening said tile to strips and ribs, which are fastened to the beams or rafters of roofs, substantially as described.

6. A tile provided with upper and lower flanges at its upper end, the lower flange having A-shaped deflectors along its upper edge, with deep grooves leading downwardly from said deflectors, and means for fastening said tile to strips and ribs, which are fastened to the beams and rafters of roofs, said means consisting of a beveled support, as 24, formed on the bottom surface of the tile, substantially as described.

7. A tile provided with upper and lower flanges at its upper end, the lower flange having A-shaped deflectors along its upper edge, with deep grooves leading downwardly from said deflectors, and with intermediate shallow grooves, substantially as described.

8. A tile provided with upper and lower flanges at its upper end, the lower flange having A-shaped deflectors along its upper edge, with deep grooves leading downwardly from said deflectors, and with intermediate shallow grooves, said grooves gradually lessening in depth down to their lower ends, substantially as described.

9. A tile provided with upper and lower flanges at its upper end, the lower flange having A-shaped deflectors along its upper edge, with deep grooves leading downwardly from and between said deflectors, and with upwardly-projecting stops at the upper ends of said grooves, substantially as described.

10. A tile provided with upper and lower flanges at its upper end, the lower flange having A-shaped deflectors along its upper edge, with deep grooves leading downwardly from said deflectors, with intermediate shallow grooves, and with upwardly-projecting stops at the upper ends of said deep grooves, substantially as described.

11. A title provided with upper and lower flanges at its upper end, the lower flange having A-shaped deflectors along its upper edge, with deep grooves leading downwardly from and between said deflectors, and with upwardly-projecting stops at the upper ends of said grooves, said grooves gradually lessening in depth down to their lower ends, substantially as described.

12. A tile formed with longitudinally-extending and alternating deep and shallow grooves in its upper surface and with intermediate ribs having rounded upper portions and flattened lower portions, substantially as described.

13. A tile formed with longitudinally-extending and alternating deep and shallow grooves in its upper surface and with intermediate ribs having curved upper ends, rounded upper portions, and flattened lower portions, substantially as described.

14. A tile formed with longitudinally-extending and alternating deep and shallow grooves in its upper surface and with oppositely and downwardly inclined grooves at the lower ends of said shallow grooves, substantially as described.

15. A tile formed with longitudinally-extending and alternating deep and shallow grooves in its upper surface, which gradually lessen in depth down to their lower ends, with intermediate ribs, and with oppositely and downwardly inclined grooves at the lower ends of said shallow grooves, substantially as described.

16. A tile formed with longitudinally-extending and alternating deep and shallow grooves in its upper surface, which gradually lessen in depth down to their lower ends, with intermediate ribs having rounded upper portions and flattened lower portions, and with oppositely and downwardly inclined grooves at the lower ends of said shallow grooves, substantially as described.

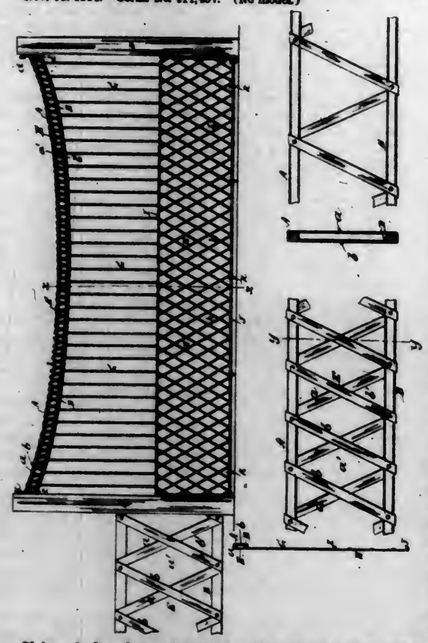
17. A tile formed with longitudinally-extending and alternating deep and shallow grooves in its upper surface, which gradually lessen in depth down to their lower ends, with intermediate ribs having rounded upper portions, flattened lower portions, and curved upper ends, with upwardly-projecting stops at the upper ends of said deep grooves, and with oppositely and downwardly inclined grooves at the lower ends of said shallow grooves, substantially as described.

18. The combination of two tiles formed at their adjacent sides with overlapping and underlapping flanges constituting the joint, said underlapping flange having inwardly-inclined grooves upon its upper surface, and with oppositely and downwardly inclined grooves leading inwardly from said joint, substantially as described.

19. The combination of two tiles provided with upper and lower flanges, the former having upwardly and rearwardly inclined recesses, with upwardly and transversely extending shoulders or ledges which form the outer walls of said recesses and with angularly-shaped elevations at the ends of said recesses, having mitered edges, substantially as described.

20. The combination of two tiles provided with upper and lower flanges, the former having upwardly and rearwardly inclined recesses, with upwardly and transversely extending shoulders or ledges which form the outer walls of said recesses, with overlapping and underlapping grooved flanges along their sides, and with angularly-shaped elevations at the ends of said recesses, having mitered edges, substantially as described.

21. The combination of two tiles provided with upper and lower flanges, the former having upwardly and rearwardly inclined recesses, with upwardly and transversely extending shoulders or ledges which form the outer walls of said recesses, with overlapping and underlapping grooved flanges along their sides, with angularly-shaped elevations at the ends of said recesses, having mitered edges, and with downwardly and upwardly curved recesses adjacent to said elevations, substantially as described.



22. The combination of two tiles provided with upper and lower flanges, the former having upwardly and rearwardly inclined recesses, with upwardly and transversely extending shoulders or ledges which form the outer walls of said recesses, with overlapping and underlapping grooved flanges along their sides, the underlapping flange having inwardly-inclined grooves in its upper surface, which are formed with rearwardly-curved upper ends, with angularly-shaped elevations having mitered edges, with opposing flat shoulders adjacent to said elevations at one side thereof, and with downwardly and upwardly curved recesses at the other side thereof, substantially as described.

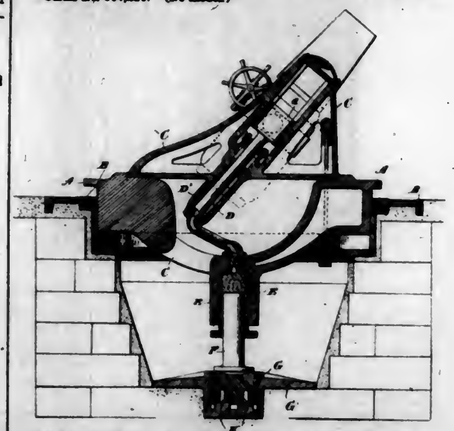
23. The combination of two tiles provided with upper and lower flanges, the former having upwardly and rearwardly inclined recesses, with upwardly and transversely extending shoulders or ledges which form the outer walls of said recesses, with overlapping and underlapping grooved flanges along their sides, the underlapping flange having inwardly-inclined grooves in its upper surface, which are formed with rearwardly-curved upper ends, with angularly-shaped elevations having mitered edges, with opposing flat shoulders adjacent to said elevations at one side thereof, with downwardly and up-

wardly curved recesses at the other side thereof, with deep and shallow grooves, and with ribs intermediate of said grooves, substantially as described.

24. The combination of two tiles provided with upper and lower flanges, the former having upwardly and rearwardly inclined recesses, with upwardly and transversely extending shoulders or ledges which form the outer walls of said recesses, with overlapping and underlapping grooved flanges along their sides, the underlapping flange having inwardly-inclined grooves in its upper surface, which are formed with rearwardly-curved upper ends, with angularly-shaped elevations having mitered edges, with opposing flat shoulders adjacent to said elevations at one side thereof, with downwardly and upwardly curved recesses at the other side thereof, with deep and shallow grooves, and with ribs intermediate of said grooves, said grooves having curved upper ends, rounded upper portions, and flattened lower portions, substantially as described.

479,448. FENCE. DAVID MILLIKEN, Fort Wadsworth, N. Y. Filed Nov. 10, 1891. Serial No. 411,437. (No model.)

Claim.—1. In a fence substantially such as described, the combination of the supports C D, suspenders A B, upper lattice-work *a b*, pendants G, lower lattice-work H, and means for securing said lower lattice-work H against lateral displacement, the whole arranged substantially in the manner and for the purpose described.



2. In a fence substantially such as described, the combination of the supports C D, suspenders A B, upper lattice-work *a b*, pendants G, lower parallel bars I J, and lower lattice-work H, the whole arranged and operating substantially in the manner and for the purpose described.

479,444. MINER'S TOOL. NATHAN W. MOODEY, Fresno, Cal. Filed Oct. 20, 1891. Serial No. 409,311. (No model.)

Claim.—As an improved article of manufacture, the implement for the use of miners in fastening caps on giant-powder fuses and splitting the same preparatory to igniting, made, essentially, in the form of pliers, the same having jaws 77, semicircular and beveled at 8 to form crimpers, and also provided, respectively, with a tongue and notch arranged in the transverse middle of their free ends and adapted to engage, the notch being V-shaped and the tongue being beveled and sharpened to fit snugly in the notch, substantially as and for the purpose specified.

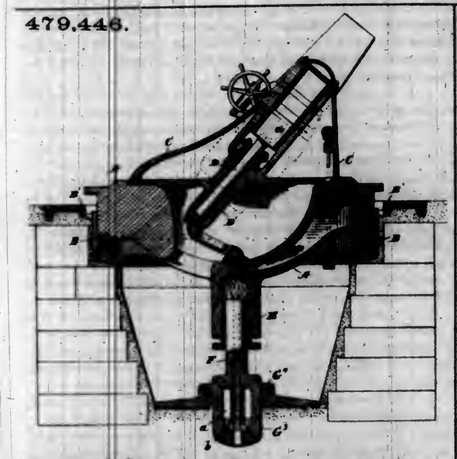
479,445. MORTAR-MOUNTING. WILLIAM H. MORGAN, Alliance, Ohio, assignor of three-fourths to Thomas R. Morgan, Sr., Thomas R. Morgan, Jr., and John R. Morgan, same place. Filed June 23, 1891. Serial No. 397,229. (No model.)

Claim.—1. The combination, with a vertically-movable gun-carriage, of a cylinder and plunger for elevating said carriage, means actuated by the recoil of the gun for forcing a liquid into said cylinder, and means adapted to yield to accommodate fluid force into the cylinder before the carriage begins to move upwardly, substantially as set forth.

2. The combination, with a vertically-movable gun-carriage and hydraulic devices supporting the gun and adapted to yield under the recoil thereof, of a cylinder and plunger for elevating said carriage, a port or pipe leading from the hydraulic devices on the carriage to the hydraulic cylinder under the carriage whereby the liquid forced from the upper hydraulic device operates to elevate the carriage, and means connected with the lower cylinder and adapted to yield to make space for the fluid forced into the lower cylinder before the carriage begins to move upwardly, substantially as set forth.

3. The combination, with a vertically-movable gun-carriage and hydraulic devices thereon adapted to yield under the recoil, of a cylinder and plunger for elevating the carriage, pipes leading from the hydraulic devices on the carriage to the cylinder below the carriage, and springs supporting one of said parts, substantially as set forth.

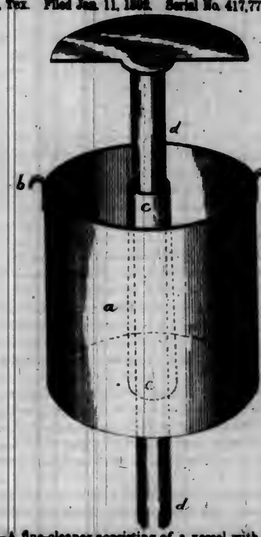
4. The combination, with a vertically-movable gun-carriage and hydraulic devices thereon adapted to yield under the recoil, of a cylinder attached to the carriage for elevating the same and a spring-supported plunger fitting in said cylinder, substantially as set forth.



5. The combination, with a vertically-movable gun-carriage and hydraulic devices thereon adapted to yield under the recoil, of a cylinder attached to the carriage, a plunger fitting in said cylinder, and a yielding block supporting said plunger, the said cylinder and plunger adapted to elevate the carriage, substantially as set forth.

479,446. MORTAR-MOUNTING. WILLIAM H. MORGAN, Alliance, Ohio, assignor of three-fourths to Thomas R. Morgan, Sr., Thomas R. Morgan, Jr., and John R. Morgan, same place. Filed June 24, 1891. Serial No. 397,352. (No model.)

Claim.—1. The combination, with a gun-carriage and hydraulic devices thereon adapted to yield under the recoil, of a cylinder and plunger for elevating the carriage, pipes leading from the hydraulic devices on the carriage to the cylinder below the carriage, and an air-chamber in open communication with said cylinder, substantially as set forth.

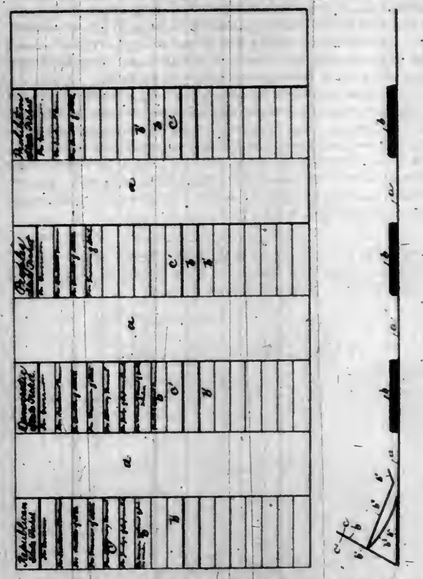


2. The combination, with a gun-carriage and hydraulic devices thereon, adapted to yield under the recoil, of a cylinder and plunger below the cylinder, pipes leading from the hydraulic devices on the carriage to the cylinder below the carriage, an air-chamber and fluid passage-ways leading from the cylinder below the carriage to the air-chamber, substantially as set forth.

479,446.

3. The combination, with a gun-carriage and hydraulic devices thereon, adapted to yield under the recoil, of a cylinder below the carriage and connected thereto and a stationary plunger fitting said cylinder and provided with an air-chamber and with a bore or passage-way leading from its inner end to said chamber, substantially as set forth.

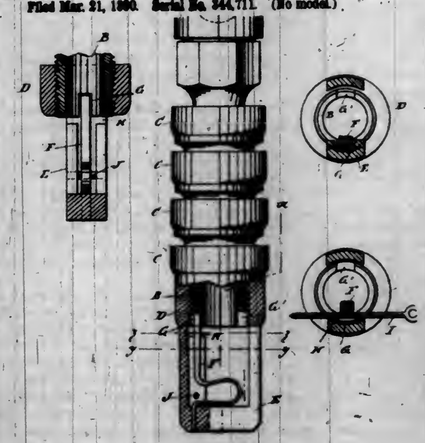
479,447. STOVE-FLUE CLEANER. THOMAS B. MOTHERSHED, Corsicana, Tex. Filed Jan. 11, 1892. Serial No. 417,777. (Model.)



Claim.—A flue-cleaner consisting of a vessel with a tube extending therethrough and a handle fitted to slide through said tube and carrying a scraper, as set forth.

479,448. FIRE-EXTINGUISHER. WILLIAM W. MCKAY, Dickinson, N. D. Filed July 24, 1891. Serial No. 400,571. (No model.)

Claim.—The improved fire-extinguishing blanket herein described, consisting of a plurality of metallic plates arranged in parallel series, the plates of each being connected together by rings joining the adjacent corners and having loose play in elongated slots therein, and loops connecting each two adjacent ring slots to form the blanket, as set forth.

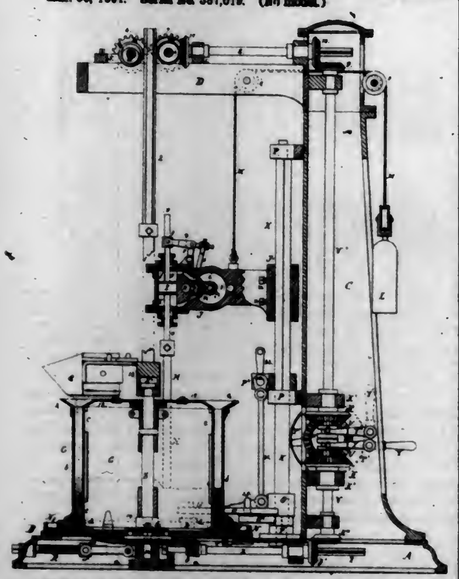


479,449. TALLY-SHEET. ALVIN L. NICHOLS, Grove City, Ohio. Filed Oct. 17, 1891. Serial No. 408,623. (No model.)

Claim.—1. In a tally-sheet, the sheet *b*, having, as described, two or more parallel folds, as b', b^3, b^3, and b^4, name-spaces on both faces of the first fold and registering with each other, tally-spaces on the remaining folds arranged opposite said name-spaces, and two rows of numbers in multiples of five arranged, as described, above said tally-spaces, substantially as and for the purpose specified.

2. In a tally-sheet, the sheet *b*, having, as described, two or more parallel folds, as b' b^3 b^3 b^4, name-spaces on both faces of the first fold and registering with each other, tally-spaces on the remaining folds arranged opposite said name-spaces, number-spaces on the fold b^3 and arranged in alignment with the tally-spaces, and name and number spaces on the opposite sides of the folds b^3 b^4, said last-mentioned spaces registering with the horizontal tally-rows of the opposite side of the sheet, substantially as described.

479,450. VALVE. BLANCHER D. NORTRUP, Washington, Pa. Filed Mar. 21, 1890. Serial No. 344,711. (No model.)



Claim.—1. The combination of a piston for deep-well pumps, having an externally-threaded lower end and a cap screwed thereon and provided with a depending U-shaped offset and a longitudinally-extending latch mounted within said offset and projecting at its free end into the threaded portion of the cap and into engagement with the lower portion of the piston-body, substantially as set forth.

2. As a new article of manufacture, an end cap D for pistons of deep-well pumps, provided with internal screw-threads and a depending U-shaped offset E, having a notch H in the inner side of one arm, and a longitudinally-extending spring-latch secured at one end in the offset and extending at its free end past said notch into the screw-threaded portion of the cap, substantially as set forth.

3. A piston A for deep-well pumps, the body of which has notches G' in its lower edge and an end cap D screwed thereon and formed with the U-shaped offset E, one arm of which has a transverse notch H across its inner face, and a longitudinally-extending spring F, secured at its lower end within the offset and extending at its upper portion past said notch H into one of the notches in the body, and a pin I to pass through notch H under the spring F and press it inwardly out of notch G', substantially as set forth.

479,451. MACHINE FOR MAKING CEMENT PIPES. EMANUEL OBERLE, Omaha, Nebr., assignor to Jeff W. Bedford, same place. Filed Mar. 30, 1891. Serial No. 387,019. (No model.)

Claim.—1. In a cement sewer-pipe-molding machine, the combination, with the horizontally-rotating pipe-mold, of the vertically-sliding arm or rammer-stock, the guide-bar upon which it is arranged to slide, the steam or air cylinder carried by said arm, the piston having a rammer secured to its rod, and a counterbalancing device or weight, substantially as specified.

2. The combination, with the rotating sewer-pipe and the vertical raising core-mold mechanism shown, of the steam-rammers H, with the arms J, the pistons I, cylinders I', and the weight L, and guide-arbors K and arms O, with friction-rollers *g*, and the guide-ring N, substantially as and for the purpose herein mentioned.

3. The combination, with the rotating pipe-mold consisting of the outer shell *b*, the expanding core-mold *c*, and bell-mold *d*, the rotating mechanism shown, and the core-mold-raising mechanism shown, of the steam rammer or rammers H, with their cylinders I', piston I, valve *n*, the arbor K, the arms J, and the weight L, substantially as and for the purpose herein set forth.

4. The combination, with the horizontally-rotating pipe-mold consisting of the outer-shell *b* and core-mold *c* and bell-mold *d*, and the mold-rotating mechanism shown, of the steam rammer or rammers H, with their pistons I, and cylinders I', and the arms J and arbors K and weight L, and the core-mold-raising mechanism consisting of the friction-rollers 3 and 4 and the bar 2 and gears 6 and 7, the shaft 8 and V', and the bevel-gears 9, 10, 11, and 12, substantially as and for the purpose herein set forth.

5. In a sewer-pipe-molding machine, the combination, with a rotating table B and guide-hub 59 and the outer mold *b* and bell-mold *d*, of the inner mold *c*, with the shaft 8 and its pivot 58, the sleeve 22, the wings 23, the shoulders 21, the rollers 24, the studs 27, the slots 26, and stops 60.

6. In a sewer-pipe machine, the combination of a rotary mold comprising an expansible vertically-movable core, mechanism for raising said core, a drive-shaft, gearing therefrom to rotate said mold, a clutch to throw said gearing into or out of gear with the drive-shaft, gearing from the drive-shaft to operate the core-raising mechanism, and a clutch to throw said gearing into and out of gear with the drive-shaft, substantially as described.

7. In a pipe-machine, the combination, with a rotary mold, of a vertically-adjustable support arranged above the mold, provided with a cylinder having suitable ports and valves, and a reciprocating piston in said cylinder, the piston-rod thereof being provided with a rammer to operate on the substance in the mold, said valve being connected with and operated by said piston-rod, substantially as described.

8. In a sewer-pipe machine, the combination, with the mold, of a vertically-adjustable and laterally-movable support above the mold, an automatic reciprocating engine carried by said support above the mold, and a rammer carried by the piston-rod of said engine to pack the substance in the mold, substantially as described.

9. In a sewer-pipe machine, the combination of the rotary mold, a vertically and laterally movable support, means, substantially as described, for counterbalancing the same, a vertically-disposed automatic reciprocating steam or air engine carried by such support, a rammer carried by the piston-rod of such engine to pack the material in said mold, and means, substantially as described, controlling the lateral swing of said support and engine.

10. In a sewer-pipe machine, the combination of the rotary mold and means for rotating the same, the vertical shaft, a vertically-movable support on the shaft, an automatic reciprocating engine carried by and moving laterally and vertically with said support, a rammer carried by the piston-rod of said engine to pack the material in said mold, a counterbalancing device for said support and engine, and means, substantially as described, connected with said shaft to automatically turn the same to swing said support and engine laterally, substantially as described.

11. The combination, with a mold, of a vertically-disposed vertically-movable automatic reciprocating steam or air engine, a rammer carried by the piston-rod of said engine to pack the material in the mold, and operating mechanism whereby there is a relative movement between the mold and engine, so that the material is packed around the mold, substantially as described.

12. In combination, the vertically-movable support having a cylinder formed therein, a steam-chest communicating with opposite ends of the cylinder, a rocking valve controlling the ports and exhaust, a reciprocating piston in the cylinder, connections between the piston-rod and said valve to automatically operate the same, the rammer carried by said piston-rod, and a mold in which said rammer operates, substantially as described.

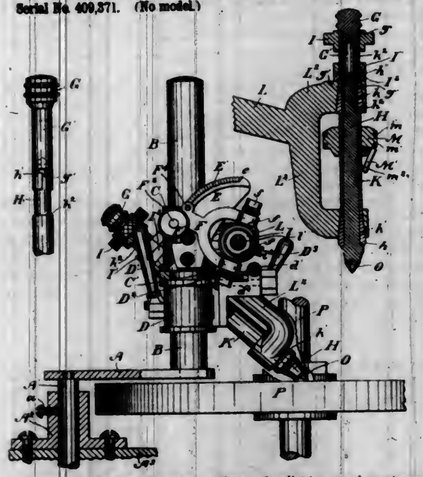
13. In combination, the mold, mechanism for rotating the same, a vertical shaft and supports therefor, an arm connected with said shaft and engaging the mold to control the turning of the shaft, a horizontal support mounted to turn with and slide vertically on said shaft and provided with raising means, and a reciprocating steam or air engine carried by said support and vertically disposed and having its piston-rod provided with a rammer to pack the material in the mold, substantially as described.

14. The combination, with the rotary mold, of the vertical shaft, an arm therefrom engaging said mold to control turning of shaft, means, substantially as described, to throw said arm out of operative relation with the mold, and the vertically-movable reciprocating engine having its carrier sliding on said shaft, substantially as described.

15. In combination, a bed, a rotary table supported thereon and capable of horizontal adjustment, a mold on said table, mechanism for adjusting said table horizontally, comprising a movable cross-head connected with said table, a screw for shifting the head and table, a movable shaft mounted in said head and geared to drive said table, and mechanism for driving said shaft, substantially as described.

16. In combination, a mold having a removable core provided with an upwardly-extending lifting-bar, a support extending upwardly and over the mold, a horizontally-adjustable frame on said support, two horizontal shafts carried by said frame, provided with friction-wheels to engage and lift said bar, and a longitudinally-adjustable drive-shaft geared to drive said horizontal shafts, substantially as described.

17. In a sewer-pipe machine, the combination, with operating and lifting mechanism, of a mold comprising an outer shell and an inner removable expansible core having inclined vertical faces, as described, and a lifting-bar having means to engage said faces when moving down and thereby expand the core, and means, substantially as described, whereby the core is contracted when said bar is raised, substantially as described.



18. In combination, the mold having its bell end at the top, a bell-mold, and steam or air ramming engine located above the same and capable of moving vertically and laterally, and means, substantially as described, to automatically swing said ramming-engine laterally to pack the bell when the mold is filled to the bell, substantially as described.

19. The combination of the mold having its bell at the top, the vertically-movable expansible bell-mold, and rammers and operating mechanism, substantially as described.

20. The combination of the mold, a vertically-movable steam or air ramming engine for said mold, an air-pump carried by the carrier of said engine and automatically operated by the movement of the engine, and a cylinder supplied by said pump and having its piston connected to raise said engine, substantially as described.

21. The combination of the rotary mold, the vertical shafts having arms held against the sides of the mold to control turning of shafts, means to yieldingly hold the arms against the mold, and the steam or air ramming engines carried by said shafts, substantially as described.

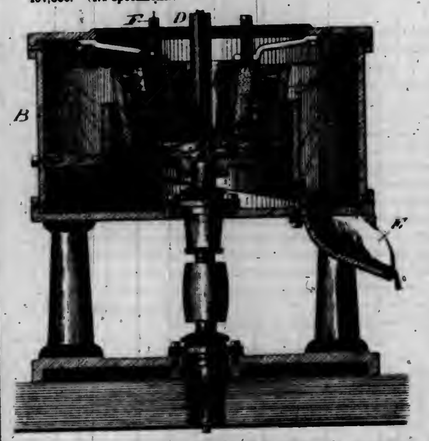
479,452. MACHINE FOR CUTTING AND POLISHING PRECIOUS STONES. EDWIN PASSMORE, Somerville, Mass. Filed Oct. 21, 1891. Serial No. 409,371. (No model.)

Claim.—1. In a machine for cutting and polishing precious stones, an upright post, in combination with a bearing-piece mounted on said post to slide and turn thereon, said bearing-piece being provided with a graduated scale, an angularly-adjustable frame mounted in said bearing-piece, a pointer and clamping device engaging with said scale and mounted on a connection of said frame to turn therewith, and a revoluble stone-holding stick suitably mounted in said frame, substantially as described.

2. In a machine for cutting and polishing precious stones, a suitably-mounted angularly-adjustable frame, in combination with a revoluble stick-holder having bearings in said frame and provided with a graduated regulating-drum mounted thereon, a stone-holding stick fixed in said holder to turn therewith, and a spring-lever pivoted to a connection of the frame, said lever having a pin engaging with said graduated drum, substantially as and for the purposes described.

3. In a machine for cutting and polishing precious stones, a suitably-supported bearing-piece provided with a graduated scale, in combination with an angularly-adjustable frame mounted in said bearing-piece, a clamping device and pointer engaging with said scale and mounted on a connection of said frame, whereby the frame may be set at any desired angle of inclination, a revoluble stick-holder having bearings in said frame and provided with a graduated regulating-drum, a stone-holding stick fixed in said holder to turn therewith, and a spring-lever pivoted to a connection of the frame, said lever having a pin engaging with said drum, all constructed and arranged substantially as and for the purposes described.

4. In a machine for cutting and polishing precious stones, an upright post B, in combination with a bearing-piece C C^3, mounted on said post to slide and turn thereon, a lateral arm L', mounted in said bearing-piece to turn therein, a frame L^3 L^3, carried at the end of said arm, and a revoluble stone-holding stick H, suitably held in said frame, substantially as described.



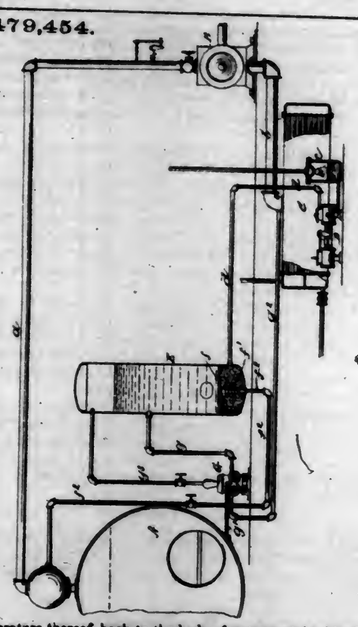
5. In a machine for cutting and polishing precious stones, a frame L^3 L^3, in combination with a revoluble stick-holder K, having bearings in said frame and having the screw-threaded portion A^2, a stone-holding stick H, having the enlarged end A and provided with the pin A', a socket G', engaging with the stem of said stick, having bayonet-slots *g'*, engaging with said pin and provided with an enlarged head G, and a thumb-nut I, mounted on said screw-threaded portion A^2 of the holder, all constructed and arranged and operating substantially as described.

6. In a machine for cutting and polishing precious stones, the combination, with an upright post B, of a bearing-piece C C^3, supporting a suitably-mounted angularly-adjustable revoluble stone-holding stick, a clamping-sleeve D, having a fastening device whereby the said sleeve may be clamped at any desired height on said post, a cam B^3, fixed to a spindle mounted in a connection of the sleeve D, and a cam-operating handle D^3, the said cam being arranged to support the bearing-piece and to adjust the working position of the bearing-piece on the post, substantially as described.

7. In a machine for cutting and polishing precious stones, the combination, with an upright post B, of a bearing piece C C^3, supporting a suitably-mounted angularly-adjustable stone-holding stick, and a wedge-shaped piece C' on the bottom of said bearing-piece, and a clamping-sleeve D, provided with a handle-operated cam D^3, engaging with said piece, substantially as and for the purposes described.

8. In a machine for cutting and polishing precious stones, the combination, with an upright post B, of a bearing-piece C C^3, supporting a suitably-mounted angularly-adjustable stone-holding stick, said piece C C^3 being loosely mounted on said post to slide and turn thereon and having, also, a lateral play on said post, substantially as and for the purposes described.

479,453. PROCESS OF SEPARATING PARTICLES OF DIFFERENT DEGREES OF SPECIFIC GRAVITY. ORRIN B. PECK, Chicago, Ill., assignor to Melinda Peck, same place. Filed Oct. 5, 1891. Serial No. 407,809. (No specimens.)



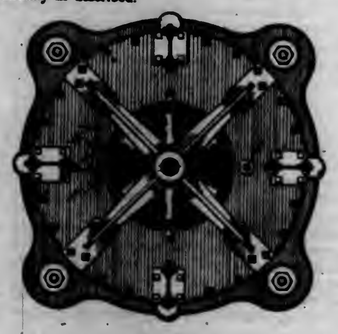
Claim.—1. The process of separating particles of different degrees of specific gravity in a finely-divided or powdered condition, which consists in subjecting them to the action of centrifugal force in a revolving vessel and at the same time forcing streams of water and air or steam against them, substantially as described.

2. In an apparatus for separating particles of different degrees of specific gravity while in a finely-divided or powdered condition, the combination of a revoluble vessel, means for revolving the same, and means for forcing sprays or jets of water and air or steam against the inner walls of the revolving vessel, substantially as described.

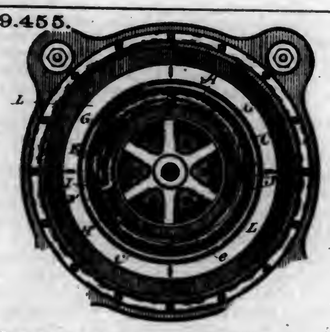
479,454. GENERATION OF STEAM-POWER. CASSIUS C. PECK, Warsaw, N. Y. Filed Oct. 26, 1891. Serial No. 409,817. (No model.)

Claim.—1. The process herein set forth of attaining increased efficiency in the generation of steam, consisting in generating steam of a prescribed pressure and temperature in a suitable generator, utilizing the energy of the steam in a suitable motor, condensing the exhausted steam by an independent supply of condensing liquid having no direct contact with the exhaust-steam or its water of condensation, heating the water of condensation thus obtained to or approximating the temperature of the water remaining in the steam-generator by means of live steam derived therefrom, and returning the said heated water of condensation, together with the steam condensed in equalizing the

479,454.



temperature thereof, back to the body of water contained in the generator to be reconverted into steam.

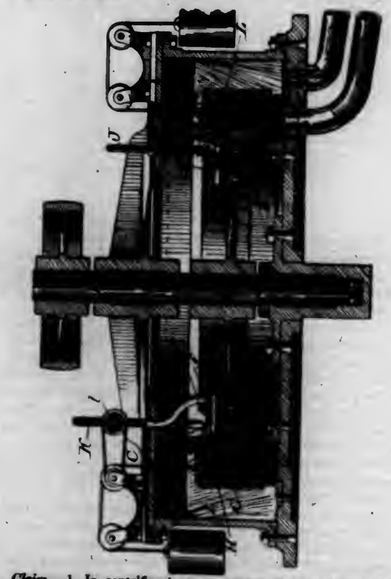


2. The combination of a steam-generator A, a steam-engine B, connected with and operated by steam from said steam-generator A, a surface condenser C, connected with and arranged to condense the exhaust-steam from said steam-engine B by means of an independent supply of condensing liquid having no direct contact with the steam or water of condensation, forcing mechanism D, and pipe connections for transferring the water of condensation from said surface condenser C to a heater E, said heater E arranged to heat the said water of condensation received from the surface condenser C to or approximating the temperature of the water remaining in the steam-generator A by means of live steam derived directly from said steam-generator A, and means for returning the said water of condensation and the steam condensed in equalizing the temperature thereof back to the body of water contained in the steam-generator A, the several parts being arranged with relation to each other and operating substantially in the manner and for the purpose described.

479,455. PROCESS OF SEPARATING POWDERED OR FINELY-DIVIDED PARTICLES, &c. ORRIN B. PECK, Chicago, Ill., assignor to Melinda Peck, same place. Filed Jan. 11, 1892. Serial No. 417,661. (No specimens.)

Claim.—1. The process of separating powdered or finely-divided particles containing mineral-bearing substances of different degrees of specific gravity, which consists in subjecting such particles to the action of centrifugal force and then discharging the heavier particles from the action of centrifugal force by jets or streams of water under pressure, substantially as described.

479,455.



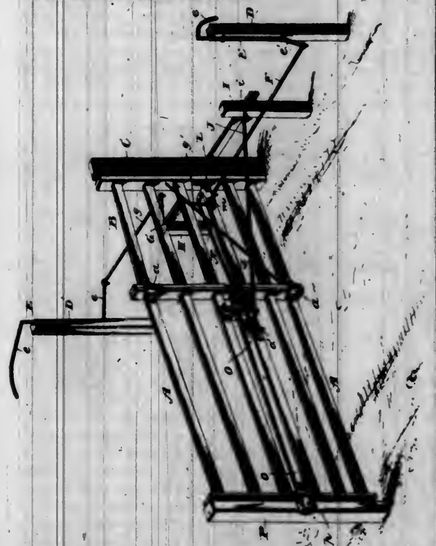
2. The process of separating powdered or finely-divided particles containing mineral-bearing substances of different degrees of specific gravity, which consists in subjecting such particles to the action of centrifugal force, assisting in discharging the lighter particles from the action of centrifugal force by gentle sprays of water, and then assisting in discharging the heavier particles from the action of centrifugal force by jets or streams of water under pressure, substantially as described.

3. The process of separating powdered or finely-divided particles containing mineral-bearing substances of different degrees of specific gravity, which consists in subjecting such particles to the action of centrifugal force and currents or sprays of water and then discharging the heavier particles from the action of centrifugal force by the combined action of centrifugal force and hydraulic streams or jets of water, substantially as described.

4. The process of separating powdered or finely-divided particles containing mineral-bearing substances of different degrees of specific gravity, which consists in subjecting such particles to the action of centrifugal force at one place and discharging the lighter particles from the action of centrifugal force at another place farther around in the direction of revolution and discharging the heavier particles from the action of centrifugal force at another place farther around in the direction of revolution, substantially as described.

479,456. CENTRIFUGAL ORE-SEPARATOR. ORRIN B. PECK, Chicago, Ill., assignor to Melinda Peck, same place. Filed Jan. 11, 1892. Serial No. 417,662. (No model.)

Claim.—1. In centrifugal ore-separators, the combination of a rotatable separating-surface adapted to receive the material to be treated, means for forcing jets or streams of water under pressure for removing the material treated from the action of centrifugal force at



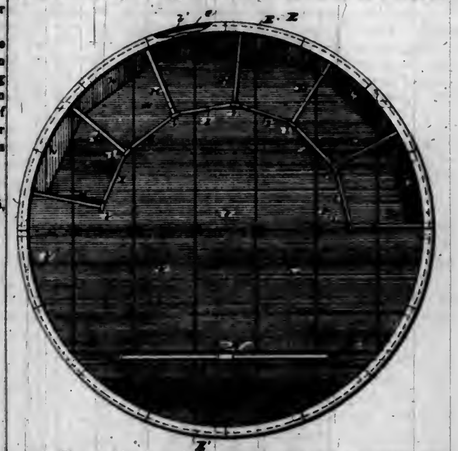
desired times, and means for rotating the separating-surface, substantially as described.

2. In centrifugal ore-separators, the combination of a rotatable separating-wheel, means for depositing the material to be treated on the separating-surface of such wheel, means for forcing jets or streams of water under pressure for removing the material treated from the action of centrifugal force at desired times, and means for rotating the separating-wheel, substantially as described.

3. In centrifugal ore-separators, the combination of a rotatable separating-wheel, means for depositing the material to be treated on the separating-surface of such wheel at desired intervals, means for supplying water upon the material while under treatment for assisting in the discharge of the lighter particles, means for forcing jets or streams of water under pressure on the material after it has been sprayed to assist in discharging the heavier particles, and means for rotating the separating-wheel, substantially as described.

4. In centrifugal ore-separators, the combination of a rotatable separating-wheel, means for depositing the material to be treated on the separating-surface of such wheel, a water-supply pipe spraying water on the separating-surface of the wheel to assist in the separation of the lighter particles and a hydraulic pipe forcing streams or jets of water against the separating-surface of the wheel to remove the heavier particles, means for catching and securing such particles, and means for rotating the separating-wheel, substantially as described.

479,457. GATE. ALFRED PETERSON, Orion, Ill. Filed Mar. 15, 1892. Serial No. 424,995. (No model.)



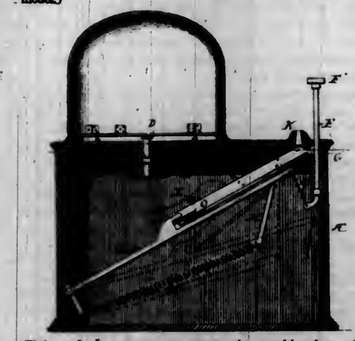
Claim.—1. The combination of the two gate-sections A and B, hinged together, the section B being hinged to a post, the bell-crank lever attached to the section B, the latch device connected to one arm of said lever and having one end working in a notch in the adjacent uprights of the two sections and extended across the same, the two oppositely-extending gate-swinging devices connected to the other arm of the lever, and the rod extending between the section A and a relatively-fixed point.

2. The combination of the two gate-sections A and B, hinged together, the section B being hinged to the post, the bell-crank lever attached to the section B, the stop device to limit its motion, the sliding latch-bar capable of a vertical motion, the locking-bar to cooperate with said latch-bar, the rod connecting the latter and one arm of said bell-crank lever, the two crank-shafts on opposite sides of the gate, the connections between said shafts and the other arm of said bell-crank lever, including upon one side a bell-crank lever G, and a vertical rod g', connecting one arm thereof with the bell-crank lever on the section B, and the rod extending from the section A to a relatively fixed point.

479,458. VOTING-BOOTH. FREDERICK K. PLUMBLY, Buffalo, N. Y. Filed June 20, 1891. Serial No. 397,095. (No model.)

Claim.—1. A knockdown building consisting, essentially, of the sills, the floor having the segmental strips secured on its under side around the edge thereof, a side consisting of sheets of iron supported by said strips and secured to said floor, a ring resting upon the upper edge of the side and forming a backing for the same with its vertical portion, battens on the outside and inside of the side overlapping the contiguous edges of the sheet of iron and secured together by bolts, and a roof secured to said ring and supported therefrom, as and for the purpose specified.

2. The combination, with the sills, of the floor secured thereto, the segmental strips secured around the edge of said floor, the side secured with its lower end to said floor and resting on said strips, a ring resting upon the upper edge of the side and to which said side is secured, said ring being composed of sections, a door-frame located in said side and formed integral with one of said sections, and a roof secured to said ring and supported therefrom, substantially as set forth.



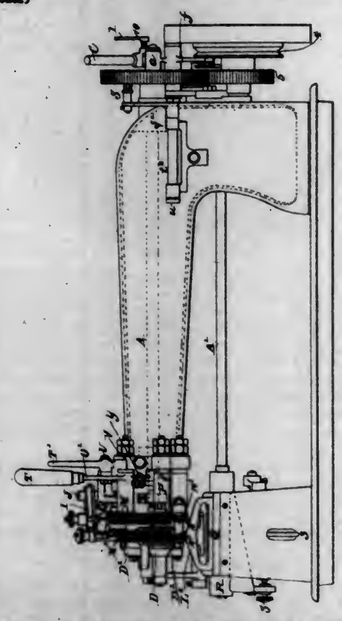
3. The combination, with the circular structure, of a conical canvas roof removably secured with its lower end to the upper end of said structure, a ventilator at the apex of said roof, a pole engaging said ventilator and supporting the same and the apex of the roof, a stop in said pole, a socket on said pole engaging said stop, and supporting-braces from the top of said structure supporting said socket, as set forth.

4. The combination, with the floor and side, of a door-frame D, a groove in each vertical edge for the reception of the contiguous edges of the sheets of iron adjoining said frame, the section E' of the ring E, secured to the upper edge of said door, and the remaining sections E, secured together, substantially as set forth.

5. The combination, with the timbers a, of the sills a', resting upon the same, the floor secured to said sills a', the stripe b', secured on the under side of the said floor and projecting beyond the edge thereof, the side resting upon said strips and nailed to the edge of the floor the door in said side, and the roof secured to the upper end of the side, as set forth.

479,459. COIN-OPERATED GAME APPARATUS. WILLIAM R. POPE, New York, N. Y., assignor to the Automatic Manufacturing Company, of New York. Filed Feb. 29, 1892. Serial No. 423,274. (No model.)

Claim.—1. In a game apparatus, the combination, with the disk forming a support for the dice, of a system of coin-controlled levers,



an operating-rod for the levers, a spring for retracting the levers, and an arm connected to the levers for operating the disk, substantially as described.

2. In a game apparatus, the combination, with the disk forming a support for the dice and having a downward projection, of the coin-controlled levers having an arm arranged to strike the projection on the disk, an operating-rod for the levers, and a spring for retracting them, substantially as described.

3. In a game apparatus, the combination, with the disk forming a support for the dice and having a downward projection, of the levers, an arm connected to one of the levers for operating the disk, an operating-rod for the levers, and a spring for retracting them, and connections between the levers controlled by a coin, whereby the levers are operated only when the coin is in position, substantially as described.

4. In a game apparatus, the combination of the disk having a projection, the chute-lever, an arm carried by said lever, a stop for said lever, another lever having a projection arranged to normally pass by the chute-lever, a spring connecting the two levers, and a push-rod connected to one of the levers and arranged to operate both when a coin is interposed between the two levers, substantially as described.

479,460. MACHINE FOR TREATING SKINS, &c. OSCAR POTRLOUP, Limoges, France. Filed Oct. 15, 1890. Serial No. 368,344. (No model.)

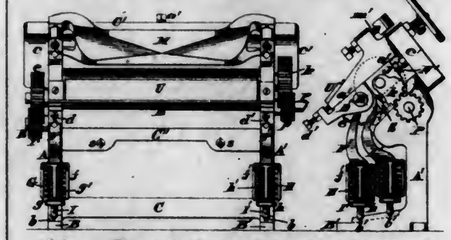
Claim.—1. In combination, the knife and the knife-carrier pivotally supported to have movement vertically and laterally, the means for reciprocating said carrier, with its pivotal support, forward and backward, means for moving the carrier up and down, and the guiding means for moving the carrier laterally as it moves forward and backward, substantially as described.

2. In combination, the knife and the knife-carrier, the pivotal support therefor, consisting of the block E', the vertical shaft F, passing through the same and the eyes of the knife-carrier, the horizontal shaft E, passing through the said block and upon which the carrier and its block pivots vertically, the movable supports for the shaft E, the means for reciprocating the shaft-supports, with the block E' and carrier, forward and backward, and the guiding means I J for moving the carrier laterally as it moves forward and backward, substantially as described.

3. In combination, the knife, the knife-carrier, the means for moving the same to and from the work, the spring for applying the tension to the carrier, and the means for automatically regulating said tension as the carrier moves the knife to and from the work, consisting of the lever NN', connected to the spring, and the cam for operating the said lever, substantially as described.

4. The combination, with the beating-knife and its carrier, of the cam X', roller g' and its oscillating lever NN', and spring M' and support Z' to give the beating-knife the desired force or pressure on the skin.

5. In combination, the knife, the knife carrier arranged to have vertical movement to move the knife to and from the work, the means for operating the carrier, consisting of the lever OO', having a roller, and the cam for operating the lever, the pivoted hook carried by the lever, and the catch v on the frame for engaging the same and holding the lever up from the operative connection with the cam, the said lever, with its roller, being arranged intermediate of the cam and carrier, whereby the said lever will raise the carrier and the knife from working position when the lever is disconnected from the cam, substantially as described.



6. The combination, with the knife-bearer C, of connecting-rod L', mounted on axle E, and of the oscillating lever K, to continue and carry over by rod L the above-specified forward-and-backward motion to beating-knife bearer C.

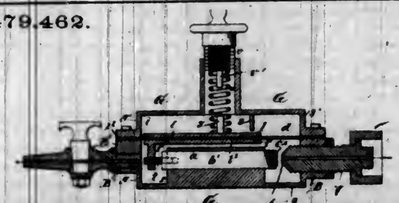
7. The combination, with the main shaft and knife L^3, the cam X^3 on the main shaft, and the rollers g^4 Z, and abutment b, of elbow-lever PP' and a screw Y, mounted to limit or suspend the action of knife L^3 on the skin, substantially as set forth.

8. In combination, the main shaft, the knife and carrier, the connections from the said shaft to the carrier for operating the same, the main shaft, the feed-roller 1, the shaft A', carrying the same, the connection from said shaft to the main shaft, including the rod a, the lever c, the pawl-and-ratchet mechanism between the same and the shaft A', and the adjustable connection between the said lever and the rod a, consisting of the socket d, to which the rod is pivoted, and the jam-screw, substantially as described.

9. The combination, substantially as described, of the feed-rollers 1 and 2, the main shaft A, with the cutting and beating mechanism actuated thereby, the secondary shaft A', controlling the movement of the feed-rolls 1 and 2, mechanism for transmitting a step-by-step movement to the secondary shaft from the main shaft, the platen, and the wedge and screw for adjusting the platen, substantially as set forth.

479,461. LEATHER-SPLITTING MACHINE. SILAS H. RANDALL, Wyoming, Ohio. Filed Apr. 9, 1892. Serial No. 428,457. (No model.)

Claim.—1. The combination, in a leather-splitting machine, of a frame to which is secured a knife, which frame is provided with bearings a a', against which slide roll-carriers J J', in which is journaled a gage-roll K, and against which bearings a a' also slide, roll-carriers D D', in which is journaled a feed-roll E, pressure devices, which obliquely press roll-carriers D D' J J' against and along bearings a a', stops which limit the motion of roll-carriers D D', and a device which adjusts the roll-carriers J J' along said bearings a a', the only parts of the frame which these roll-carriers D D' J J' touch being said bearings a a', as herein described.

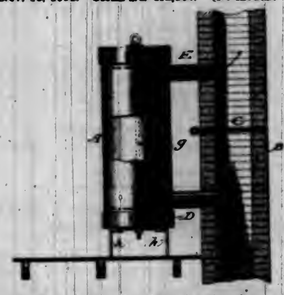


2. The combination, in a leather-splitting machine, of a frame A A', having bearings a a', the roll E, journaled in carriers D D', each of which is in contact with said bearings, push-stems F F', working obliquely against said bearings and provided with cages f f' for springs, and adjustable springs G H, housed within said cages.

3. The combination, in a leather-splitting machine, of the push-stems F F', working against roll-carriers, as described, cages f f' belonging to said stems, springs G H within said cages, bearers g h for said springs to rest upon, spindles g' h', projecting within said springs and from said bearers, and adjusting-screws I I', engaged with said spindles.

479,462. PRESSURE-REGULATING VALVE. CARL A. REHPEN and EMIL ANDRE, Hanover, Germany, assignors to Franz Heuser & Co., same place. Filed Oct. 12, 1889. Serial No. 326,810. (No model.) Patented in France June 24, 1886, No. 176,992; in Germany Mar. 16, 1889, No. 53,170; in England July 26, 1889, No. 11,925; in Italy Sept. 30, 1889, XXIII, 26,908, and I, 104, and in Austria-Hungary Dec. 19, 1889, No. 32,900 and No. 63,698.

Claim.—1. A diaphragm pressure-regulator comprising a casing having inlet and outlet passages, a tubular valve-bearing on the bottom

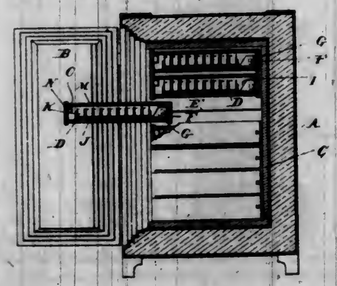


479,462.

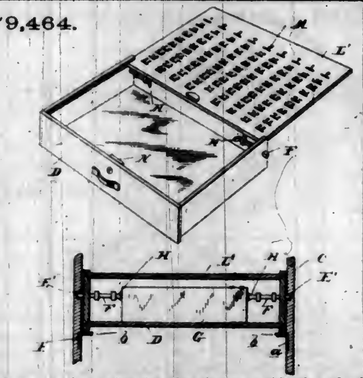
of the casing, a cylindrical valve b' to said bearing operating to control the flow of liquid through the passage, a flexible diaphragm above the inlet and outlet passages, stiffening-plates l and l', secured to the opposite faces of the diaphragm near one end thereof to form a hinge-joint i, an arm depending from the lower plate l, connected with the valve, and an abutment for limiting the amplitude of vibration of said stiffened diaphragm, substantially as and for the purpose set forth.

2. A diaphragm pressure-regulator comprising a casing having inlet and outlet branches, said inlet branch being adjustable in its bearings in the casing and having a valve-seat formed at its inner end, a tubular bearing on the bottom of the casing, a valve b' in said bearing operating to control the flow of liquid through the inlet branch, a flexible diaphragm above said inlet and outlet branches, stiffening-plates l and l', secured to the opposite faces of the diaphragm near one end thereof to form a hinge-joint i, and a connection between the lower plate and the valve b', substantially as and for the purpose set forth.

479,463. HEATING APPARATUS. MARY ROE, Dayton, Minn. Filed Nov. 16, 1891. Serial No. 412,107. (No model.)



Claim.—1. The combination, in a heating-drum, of removable heads held in place by removable rods encircled by caps which press downward upon the upper head of the drum, substantially as set forth, for the purpose specified.



2. The combination, in a heating-drum, of removable rods which pass downward through the upper head and inner part of the drum, thence through the lower head and removable section (to which standards are to be attached) into nuts, said rods being encircled by caps which press downward upon the upper head of the drum, all substantially as shown, for the purpose specified.

3. The combination, in a heating-drum, of hot-air spaces below and above a cavity, the inner and outer cylinders of said drum uniting on either side of the cavity in the form of a half-circle, all substantially as described, for the purpose specified.

479,464. SAFE. ALBERT A. ROOT, Detroit, Mich. Filed Feb. 23, 1892. Serial No. 422,444. (No model.)

479,464.

Claim.—1. In a safety-deposit safe, the combination of a drawer or till having an apertured lid and compartments corresponding to the apertures arranged in series, the compartments of each series being connected, substantially as described.

2. In a safety-deposit safe, the combination of a drawer or till having an apertured lid, independently-pivoted compartments corresponding to the apertures arranged in series, and a connecting-rod upon which the compartments of each series are independently pivoted, substantially as described.

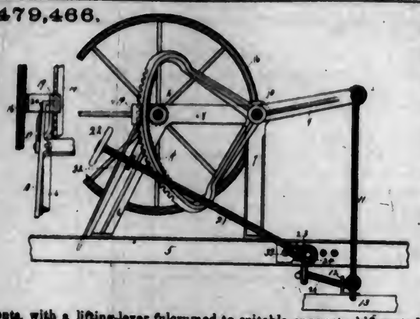
3. In a safety-deposit safe, the combination of a drawer or till having an apertured lid, compartments corresponding to the apertures, and a detachable case J, in which said compartments are located, substantially as described.

4. In a deposit-safe, the combination, with a drawer and supports therefor having guideways formed therein, of bolts passing through the drawer and resting in said guideways and a removable block located between the ends of the bolts, substantially as described.

5. In a saving-deposit safe, the combination, with the lining C, of the drawers D, the guides E, formed of angle-iron having the leg a set in a gain in the side of the lining flush with the case thereof, and the leg b, extending laterally therefrom and forming the guides for the drawer, and the bolts H, engaging in apertures in the side of the case, substantially as described.

6. In a safe-deposit safe, the combination of the drawers, the bolts H to prevent their detachment, but permit a limited withdrawal thereof, the case J in said drawers, the block G, having the inclined face I, the compartments in said case, and the lid L', substantially as described.

479,465. TUG-HOOK. ANDREW RYAN, Bayfield, Wis. Filed Nov. 25, 1891. Serial No. 413,125. (No model.)



Claim.—1. The combination, with a hook, of a tongue consisting of a spring secured to one side of the hook and conforming substantially to the outline thereof and having its free end at a point beyond the end of the hook bent transversely over the shank to a point beneath the end of the hook and thence upwardly, closing the mouth of the hook, substantially as described.

2. The combination, with a hook, of a tongue consisting of a flat spring secured to one side of the hook at a point beyond the end of the hook, bent upwardly and transversely across the top of the shank, and at a point beneath the end of the hook bent upwardly and rearwardly, its extreme end resting beneath the end of the hook and closing the mouth thereof, substantially as described.

479,466. ROAD-GRADER. HENRY J. SCHNEIDER, Fort Wayne, Ind., assignor to Charles Pape, same place. Filed Mar. 18, 1892. Serial No. 425,396. (No model.)

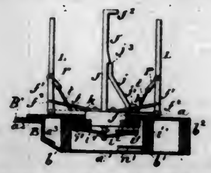
Claim.—1. In a road-grader having a frame mounted on wheels, the combination of a bar supporting the scraper-blade and its attach-

479,466.

ments, with a lifting-lever fulcrumed to suitable supports, bifurcated at one end and having lifting-rods pivotally attached at the other end, with suitable connections to said supporting-bar, the bifurcated ends being connected by a segment provided with teeth on both its inner and outer curves, a pinion meshing with the teeth on the inner curve of said segment and provided with a journal supported in suitable bearings attached to a hand-wheel, a lug provided with a slot adapted to receive and guide therein the teeth on the outer curve of said segment with part of the segment, a spring-lever provided at one end with a pin and adapted to enter an orifice in said lug and engage the outer teeth of said segment, an operating-rod provided with a beveled gear-wheel meshing with another beveled gear-wheel, to which is attached a threaded rod, both rods being journaled suitably in bearings, a follower mounted on a cross-bar attached to said frame, a screw-collar attached to said follower and adapted to engage said threaded rod, and a shifting-rod pivotally attached one end to said supporting-bar and the other to a lug attached to said follower.

2. In a road-grader having a frame mounted on wheels, the combination of a bar supporting the scraper-blade and its attachments, with a lifting-lever fulcrumed to suitable supports, bifurcated at one end and having lifting-rods pivotally attached at the other end, with suitable connections to said supporting-bar, the bifurcated ends being connected by a segment provided with teeth on both its inner and outer curves, a pinion meshing with the teeth on the inner curve of said segment and provided with a journal supported in suitable bearings attached to a hand-wheel, a lug provided with a slot adapted to receive and guide therein the teeth on the outer curve of said segment with part of the segment, and a spring-lever provided at one end with a pin adapted to enter the orifice in said lug and engage the outer teeth of said segment.

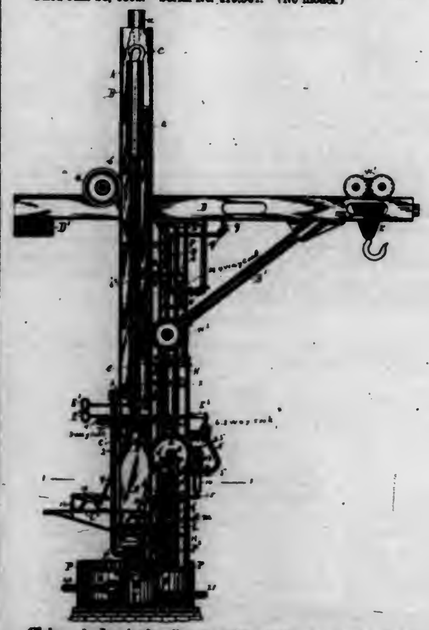
3. In a road-grader having a frame mounted on wheels, the combination of a bar supporting the scraper-blade and its attachments, an operating-rod provided with a beveled gear-wheel meshing with another beveled gear-wheel, to which is attached a threaded rod, both rods being journaled suitably in bearings, a follower mounted on a cross-bar attached to said frame, a screw-collar attached to said follower and adapted to engage said threaded rod, and a shifting-rod pivotally attached one end to said supporting-bar and the other to a lug attached to said follower.



4. In a road-grader having a frame mounted on wheels, the combination of a bar supporting the scraper-blade and its attachments, an operating-rod provided with a beveled gear-wheel meshing with another beveled gear-wheel, to which is attached a threaded rod, both rods being journaled suitably in bearings, a shifting-rod pivotally attached to said supporting-bar, and a screw-collar rigidly attached to said shifting-rod and adapted to engage said threaded rod.

5. In a road-grader having a frame mounted on wheels, the combination of a bar supporting the scraper-blade and its attachments, with a lifting-lever fulcrumed to suitable supports, bifurcated at one end and having lifting-rods pivotally attached at the other end, with suitable connections to said supporting-bar, the bifurcated ends being connected by a segment provided with teeth on both its inner and outer curves, a pinion meshing with the teeth on the inner curve of said segment and provided with a journal supported in suitable bearings attached to a hand-wheel, a lug provided with a slot adapted to receive and guide therein the teeth on the outer curve of said segment with part of the segment, and means to lock said lifting-lever at any desired elevation.

479,467. GRAIN-CONVEYER FOR MINERS, &c. GEORGE SOBYBEEZ, Walnut, Tex. Filed Mar. 27, 1891. Serial No. 386,705. (No model.)



Claim.—1. In a grain-conveyer, the combination of a platform A, comprising the plates *a*, projecting inwardly over the side walls or strips *b* and *b'* and leaving a slot g^2 in the platform, a notch *c'* in one of the projecting edges, a spring below said slot g^2 near the notch *c'*, a conveyer-block D, moving in said slot g^2, a lever J, pivoted in said block, with the extension I extending down below said block, arms *f f*, mounted on vertical pivots having a rotary movement in said block D, cranks i^2 i^2, rigidly secured to said pivots, connecting-rods i^3 i^3, connecting said cranks to the extension I, as shown, and the lever J, provided with a rod *j*, all as shown, and for the purpose described.

2. In a grain-conveyer, the combination of a platform A, comprising the plates *a*, projecting inwardly over the side walls or strips *b* and *b'* and leaving a slot g^2 in the platform, notches *c'* in one of the projecting edges, a spring *n'* below the slot g^2, projecting to near the notch *c'*, a conveyer-block D, moving in said slot g^2, a slot D^2 in said block D, as shown, a lever J, pivoted in the block D, with the extension I extending down below said block D and grainward, as shown, arms *f f*, mounted on vertical pivots having a rotary movement in the block D, cranks i^2 i^2, rigidly secured to the lower end of said pivots *i i*, connecting-rods i^3 i^3, connecting said cranks to the extension I, substantially as shown, and the lever J, provided with a rod *j*, all for the purpose described.

3. In a grain-conveyer, the combination of a platform A, a slot g^2 therein, a switch *o* in the projecting plate *a* near the outer end of the slot, a spring *n* below said slot g^2, projecting grainward with its free end to near the switch *o*, a conveyer-block D, moving in said slot g^2, a lever J, pivoted in said block, provided with the downward-projecting arm I, arms *f f*, mounted on vertical pivots, cranks i^2 i^2, secured to said pivots *i i*, connecting-rods i^3 i^3, connecting the cranks i^2 i^2 to the arm I, arms *f' f'*, pivoted to the free ends of arms *f f* and connected to the block D by the rods *k k*, in connection with extensions L L, provided with arms or projections P P and pivoted to the free ends of arms *f' f'* and linked to the arms *f f* by wires or rods *t t*, as shown, and means to open said extensions at the right time with the lever J, provided with the rod *j* and crooked at its upper end, as shown, and for the purpose described.

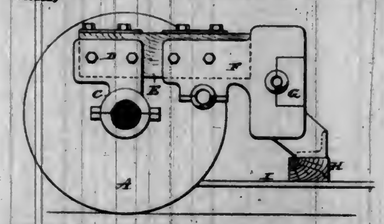
479,468. HYDRAULIC CRANE. HENRY C. SHAW, Joliet, Ill. Filed Jan. 23, 1892. Serial No. 419,561. (No model.)

Claim.—1. In a hydraulic crane, the combination of the auxiliary cylinder H, provided with a pressure-supply pipe, the ram F, the lifting-cylinder B^4 and its ram B^3, and the pipes 4 and 8 for connecting said cylinders, and the cock 7, interposed between said pipes, substantially as and for the purpose set forth.

2. In a hydraulic crane, the combination, with the pillar A and jib D, of cylinder H, pipe X for supplying said cylinder under pressure, hollow open-bottom ram F, located within cylinder H and secured at its upper end to said jib, cylinder B^4, arranged adjacent to and connected with cylinder H by means of a supply-pipe, hollow open-bottom ram B^3, located within cylinder B^4 and secured at its upper end to said jib, pipes 4, 8, and *d* for connecting said cylinders with cock 7, cock 7, pipe *c*, leading from said cock to tank B, tank B, pipes C, 1, and 2, leading from said tank to hollow bearing *a'*, and the hollow bearing *a'*, having the discharge-pipe 20, all arranged to operate substantially as and for the purpose set forth.

3. In a hydraulic crane, the combination, with the pillar and jib of the cylinders H and J and their hollow open-bottom rams F and G, pressure-supply pipe X for supplying cylinder H under pressure, cock *n*, connected with hollow ram F, cylinder F^2, pipe *g* for connecting said cylinder and cock, cylinder F^3, pipe *g* for connecting said cylinder and cock, rams F^3 and F^4, carriage E, hollow ram G, discharge-pipe V for connecting cock *n* with said ram G, pipes *d'* and *c*, and the means for operating said cock *n*, substantially as and for the purpose set forth.

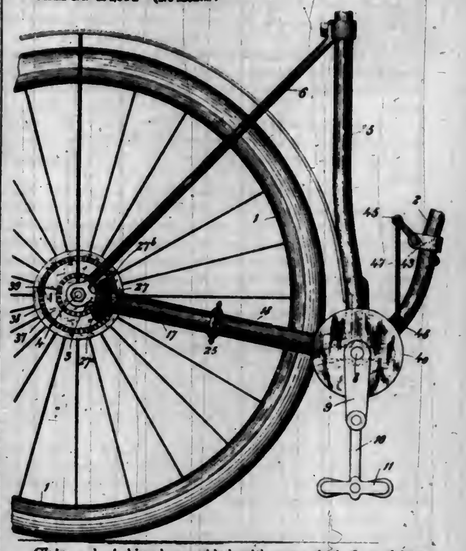
4. In a hydraulic crane, the combination, with the pillar and jib, of the cylinder H, water-motor K, a pipe for connecting said cylinder and motor, having a cock for regulating the supply of water from said cylinder to said motor, bevel-gears *d' d*, and shaft *f m*, friction-clutch N, gear-wheel L, loose in its shaft-pinion P', annular gear P, clutch 17, and the means for operating said clutch, substantially as and for the purpose set forth.



5. The combination of the pillar A, having the hollow bearings *a* and *a'*, jib D, having the wheels W journaled to its inner end and adapted to roll on the back of the pillar, brace B' for supporting the outer end of said jib and having wheels W^2 boxed to its lower end and adapted to roll on the pillar on its opposite side from wheels W, the box of said wheels W being attached to ram F, cylinders B^4, J, and H, respectively provided with the hollow open-bottom rams B^3, G, and F, connecting said cylinders and jib, cylinders F^2 and F^3, secured to said jib and provided, respectively, with the rams F^3 and F^4, respectively connecting said cylinders with carriage E, adapted to travel on said jib, the pipes *g*, *g'*, and V, having cock N for connecting ram G with cylinders F^2 and F^3, and the means for rotating the crane in either direction, substantially as and for the purpose set forth.

6. In a hydraulic crane, the combination of the water-motor K, pipe 5 for feeding said motor, discharge-pipe P^2, shafts *f* and *m*, friction-clutch for connecting said shafts, bevel-gears *d d'*, gear-wheel P, driven from shaft *m* and loose on its shaft, pinion P', annular gear P, base S, clutch 17 on the upper end of the shaft of gear L, lever 15, pivoted at *h* to cylinder J and having the weight 16, yoke 18 for connecting clutch 17 with one end of said lever, cylinder 13, connected with and opening into pipe 5, plunger 24, having cross-head 25, and yoke 14 for connecting said plunger with the outer end of said lever, substantially as and for the purpose set forth.

7. In a hydraulic crane, the combination, with its pillars and jib, of a lifting-cylinder having a ram connecting it with the jib and an auxiliary pressure-supply cylinder having a ram connecting it with the jib and connected by a pipe with the lifting-cylinder, substantially as and for the purpose set forth.



8. In a hydraulic crane, the combination of a distributing-cylinder and its ram for nearly sustaining the jib and its appendages, a lifting-cylinder and its ram, and the means for connecting and supplying said cylinders, substantially as and for the purpose set forth.

479,469. MOTOR-FRAME FOR ELECTRIC LOCOMOTIVES. SIDNEY H. SHORT, Cleveland, Ohio, assignor to the Short Electric Railway Company, same place. Filed Oct. 29, 1889. Serial No. 328,546. (No model.)

Claim.—The combination, with a driving-axle, of a two-part motor-frame, one part journaled on the axle and the other supported by the truck-frame, wooden beams interposed between and serving to connect the two parts of the motor-frame, and a wooden cross-beam supported at the ends on the side bars of the truck-frame and serving as an insulating-support for one end of the motor-frame, substantially as set forth.

479,470. BICYCLE. GEORGE T. SMALLWOOD, Washington, D. C., assignor of one-half to Otis Cole, Rochester, N. Y. Filed Mar. 9, 1892. Serial No. 424,314. (No model.)

Claim.—1. A bicycle provided with a crank-shaft, a driving-wheel, and a flexible shaft connecting the crank-shaft and driving-wheel, said crank-shaft being located outside the wheel, substantially as set forth.

2. A bicycle provided with a crank-shaft, a driving-wheel, and a flexible drive-shaft extending alongside the driving-wheel and connecting the same with the crank-shaft, substantially as set forth.

3. In a bicycle, the driving-wheel, a shiftable drive-shaft, and power and speed devices adapted to the shiftable drive-shaft, substantially as set forth.

4. In a bicycle, the driving-wheel, a longitudinally-shiftable drive-shaft, and power and speed devices adapted to the drive-shaft, substantially as set forth.

5. In a bicycle, the driving-wheel, a flexible drive-shaft, and power and speed devices adapted to the drive-shaft, substantially as set forth.

6. In a bicycle, the driving-wheel, a shiftable flexible drive-shaft, and power and speed devices adapted to the drive-shaft, substantially as set forth.

7. In a bicycle, the driving-wheel and a torsion drive-shaft adapted to drive the wheel, substantially as set forth.

8. In a bicycle, the driving-wheel, the crank-shaft provided with links, the pedals carried by the links for turning the crank-shaft and to assist in overcoming dead-centers, and a power-storing device operated by the crank-shaft, substantially as set forth.

9. In a bicycle, the combination, with the driving-wheel, the crank-shaft, and a disk having a double series of teeth, of a drive-shaft having a double-faced wheel adapted to engage either of said series of teeth and having connection with the driving-wheel, substantially as set forth.

10. In a bicycle, the herein-described relatively adjustable gearing provided with intermeshing teeth running to points at their extremities, substantially as set forth.

11. In a bicycle, the combination, with the driving-wheel, the crank-shaft, and two disks respectively on the driving-wheel and crank-shaft, said disks being each provided with a double series of teeth, of a shiftable drive-shaft having a double-faced wheel at each end, adapted to engage with the teeth on said disks, substantially as set forth.

12. In a bicycle, the combination, with the driving-wheel and the crank-shaft, of a drive-shaft adapted to connect the driving-wheel and the crank-shaft, said drive-shaft comprising relatively movable casings and a torsion-spring located within and connected with the casings, substantially as set forth.

13. In a bicycle, the combination, with the driving-wheel and the

crank-shaft, of a drive-shaft adapted to connect the driving-wheel and the crank-shaft, said drive-shaft comprising relatively-movable casings, a boxing connecting the casings, ball-bearings within the boxing, and

Claim.—1. The combination of a dressing-case having horizontal ways near the bottom, horizontally-movable slides engaging said

whereby the machine may be employed for forming cigar-bunches with

479,478. MACHINE FOR PASTING, CUTTING, AND TRIMMING

crank-shaft, of a drive-shaft adapted to connect the driving-wheel and the crank-shaft, said drive-shaft comprising relatively-movable casings, a boxing connecting the casings, ball-bearings within the boxing, and a torsion-spring located within and connected with the casings, substantially as set forth.

14. In a bicycle, the combination, with the driving-wheel, the crank-shaft, and power and speed devices, of a shiftable drive-shaft to which said power and speed devices are adapted, said drive-shaft comprising relatively-movable casings and a torsion-spring located within and connected with the casings, substantially as set forth.

15. In a bicycle, the herein-described gearing, the same comprising a wheel having two series of teeth separated by a peripheral groove and a noise-deadening ring confined in said groove, substantially as set forth.

16. An attachment for bicycles, tricycles, and the like, the same comprising relatively-movable casings provided with gear-wheels and a spring confined within and acting upon the casings, substantially as set forth.

17. An attachment for bicycles, tricycles, and the like, the same comprising relatively-movable casings provided with gear-wheels, a boxing in which the meeting ends of the casings bear, and a spring confined within and acting upon the casings, substantially as set forth.

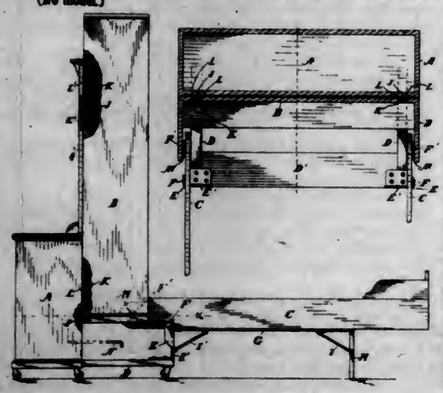
18. An attachment for bicycles, tricycles, and the like, the same comprising relatively-movable casings provided with gear-wheels and a torsion-spring acting upon the casings, substantially as set forth.

19. An attachment for bicycles, tricycles, and the like, the same comprising relatively-movable casings provided with gear-wheels and a spiral spring acting upon the casings, substantially as set forth.

20. An attachment for bicycles, tricycles, and the like, the same comprising relatively-movable casings provided with gear-wheels, a confined inner tube or spindle, and a spiral spring inclosing the tube or spindle and inclosed in and acting upon the casings, substantially as set forth.

21. An attachment for bicycles, tricycles, and the like, the same comprising a hollow flexible shaft provided with gear-wheels and a tube or spindle extending therethrough and on which the flexible shaft turns, substantially as set forth.

22. An attachment for bicycles, tricycles, and the like, the same comprising relatively-movable casings provided with gear-wheels, a spiral spring within and acting upon the casings, and a tube or spindle extending through the spring and casings and on which the spring and casings turn, substantially as set forth.



23. An attachment for bicycles, tricycles, and the like, the same comprising a hollow flexible shaft provided with gear-wheels, a tube or spindle extending therethrough, and a friction-clutch on the tube, substantially as set forth.

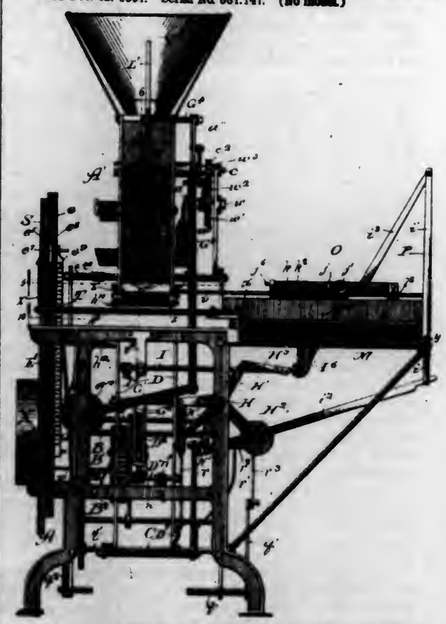
24. An attachment for bicycles, tricycles, and the like, the same comprising a hollow flexible shaft provided with gear-wheels, a tube or spindle extending therethrough, and anti-friction bearings on which the gear-wheels turn, substantially as set forth.

25. In a bicycle, the combination of the driving-wheel and a flexible or torsion drive-shaft with the crank-shaft, links pivoted to the cranks of the latter, and the pedals carried by the links, substantially as and for the purpose set forth.

26. In a bicycle, the driving-wheel, power-storing mechanism operated by the pedals, and a clutch for preventing reaction of the power-storing mechanism, substantially as set forth.

479,471. WARDROBE-BED. ISRAEL C. SMITH and EDWARD E. EMERSON, Grand Rapids, Mich. Filed May 20, 1891. Serial No. 393,457. (No model.)

Claim.—1. A combined and convertible long-filler and short-filler cigar-bunch machine, comprising, in combination with the bunch-rolling mechanism, an initial receptacle for the filler, means for reciprocating the said receptacle between its long-filler-receiving position and its discharge position in the machine, feed mechanism for short-filler over the path of the receptacle, and detachable means for actuating the said feed mechanism at proper intervals, whereby the machine may be employed for forming cigar-bunches with either or both long-filler and short-filler tobacco, substantially as described.



2. A combined and convertible long-filler and short-filler cigar-bunch machine, comprising, in combination with the bunch-rolling mechanism, an initial receptacle for the filler, means for reciprocating the said receptacle between its long-filler receiving position and its discharge position in the machine, and feeding mechanism for short-filler above the said discharge position of the receptacle, whereby the machine may be employed for forming cigar-bunches with either or both long-filler and short-filler tobacco, substantially as described.

3. A combined and convertible long-filler and short-filler cigar-bunch machine, comprising, in combination with the bunch-rolling mechanism, an initial receptacle for the filler, detachable means for reciprocating the said receptacle between its long-filler receiving position and its discharge position in the machine, and feeding mechanism for short filler above the said discharge position of the receptacle, *Claim.*—1. The combination of a dressing-case having horizontal ways near the bottom, horizontally-movable slides engaging said ways, casters beneath the outer ends of said slides, a folding section pivoted upon said slides substantially above said casters, and a vertically-movable case detachably secured to the back of said dresser, said case pivoted to said folding section and resting upon said slides when the bed is closed, substantially as described.

2. The combination of a stationary case, a vertically-movable case detachably connected thereto, a folding section pivoted by vertically-open bearings to said movable case, horizontally-movable slides pivoted to said folding section and supporting said movable case when the bed is closed, and a stop-pin to limit the movement of said case, substantially as described.

3. The combination of a vertically-movable case, a folding section pivoted to the same and balanced thereby, horizontally-movable slides beneath and supporting said vertically-movable case when the bed is closed, outer supporting-legs pivoted to said folding section, a horizontally-movable rod on said folding section, and connecting-rods pivoted to said movable rod and to the said legs and slides, substantially as described.

479,472. CIGAR-BUNCH MACHINE. WILLIAM M. STEBBLE, Chicago, Ill., assignor to Bernard Gradle and Nicolas Strotz, same place. Filed Feb. 12, 1891. Serial No. 381,147. (No model.)

Claim.—1. A combined and convertible long-filler and short-filler cigar-bunch machine, comprising, in combination with the bunch-rolling mechanism, an initial receptacle for the filler, means for reciprocating the said receptacle between its long-filler receiving position and its discharge position in the machine, feed mechanism for short-filler over the path of the receptacle, and detachable means for actuating the said feed mechanism at proper intervals, whereby the machine may be employed for forming cigar-bunches with either or both long-filler and short-filler tobacco, substantially as described.

2. A combined and convertible long-filler and short-filler cigar-bunch machine, comprising, in combination with the bunch-rolling mechanism, an initial receptacle for the filler, means for reciprocating the said receptacle between its long-filler receiving position and its discharge position in the machine, and feeding mechanism for short-filler above the said discharge position of the receptacle, whereby the machine may be employed for forming cigar-bunches with either or both long-filler and short-filler tobacco, substantially as described.

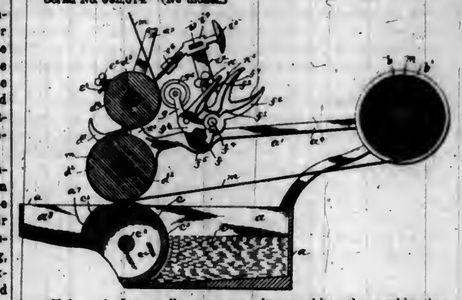
3. A combined and convertible long-filler and short-filler cigar-bunch machine, comprising, in combination with the bunch-rolling mechanism, an initial receptacle for the filler, detachable means for reciprocating the said receptacle between its long-filler receiving position and its discharge position in the machine, and feeding mechanism for short filler above the said discharge position of the receptacle,

whereby the machine may be employed for forming cigar-bunches with either or both long-filler and short-filler tobacco, substantially as described.

4. In a cigar-bunch machine, the combination, with the bunch-rolling mechanism, of an initial receptacle for the filler, a reservoir for filler-tobacco, provided with an opening in its lower side, a chute extending from said opening and terminating over the receptacle, valve mechanism at the said opening to discharge at intervals filler from the reservoir upon the chute, a deflector upon the chute for dividing and distributing the filler in the said receptacle, and a discharger operating to transfer the filler from the receptacle to the bunch-rolling mechanism, substantially as described.

5. In a cigar-bunch machine, the combination, with the bunch-rolling mechanism and initial receptacle for the filler, of mechanism above the receptacle, operated from the driving-power of the machine to feed the filler at intervals to the receptacle, consisting of a reservoir having an opening in its lower side, a chute extending from said opening and terminating over the receptacle, a valve at the said opening, comprising a box having a passage through it provided with an auxiliary valve for controlling the size of the passage and movable into and out of the said opening, whereby the passage is filled through its upper end as the box enters the reservoir and discharged through its lower end as the box advances out of the reservoir, a deflector upon the said chute for dividing and distributing the filler in the said receptacle, and a discharger operating to transfer the filler from the receptacle into the bunch-rolling mechanism, substantially as described.

6. In a cigar-bunch machine, the combination, with the bunch-rolling mechanism and initial receptacle for the filler, of mechanism above the receptacle, operated from the driving-power of the machine to feed the filler at intervals to the receptacle, consisting of a reservoir having an opening in its lower side, a valve in said opening, comprising a box having a passage through it, with an auxiliary valve for controlling the size of the passage, and having a wing-plate b^5 extending into the reservoir and forming a false bottom therein, the box being operated to reciprocate into and out of the said opening, whereby the passage is filled through its upper end as the box enters the reservoir and discharged through its lower end as the box advances out of the reservoir, and stirring mechanism in the reservoir, substantially as and for the purpose set forth.



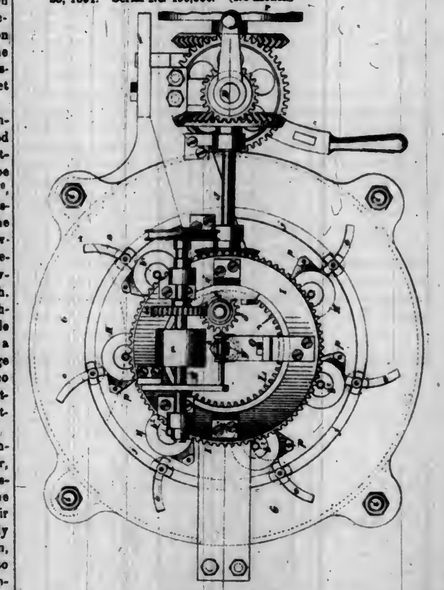
7. In a cigar-bunch machine, the combination, with the bunch-rolling mechanism and final receptacle for the bunch, of a movable carrier operated from the driving-power of the machine to transfer the bunch from the bunch-rolling mechanism to the final receptacle and comprising a frame provided with a stationary and a pivotal jaw, the jaws affording between them a receptacle for the bunch, a spring upon the frame maintaining the jaws normally closed, a projection upon the pivotal jaw, and a stationary stop in the path of the said projection, whereby the pivotal jaw is opened by contact of its projection with the said stop and closed by the spring in the movement of the carrier, and ejecting mechanism, substantially as described, for discharging the bunch from the carrier into the final receptacle, as set forth.

8. In a cigar-bunch machine, the combination, with the bunch-forming mechanism, carrier R, and ejector, of a vertically-disposed mold-board T, a frame in which the mold-board is yieldingly supported at its lateral edges to move freely in an upward direction and be resisted in its movement in a downward direction, a guide-wheel c^{10}, bearing against the front side of the mold-board, and intermittent raising mechanism for the mold-board, comprising a pawl to engage the mold-board at its cavities and a rock-shaft with which the pawl is pivotally connected, actuated from the driving power of the machine to reciprocate the pawl and raise the mold-board the distance of one cavity with each operation, substantially as and for the purpose set forth.

9. In a cigar-bunch machine, the combination, with the bunch-rolling mechanism and driving-power of the machine, of a receptacle for the filler, mounted upon a movable carrier reciprocating across a vertical plane between the long-filler-feeding position and the discharge position of the receptacle, and feed mechanism for short-filler tobacco above the said discharge position of the receptacle, automatically actuated as the receptacle nears the discharge position to feed short-filler to the receptacle, substantially as described.

10. In a cigar-bunch machine, the combination, with the bunch-rolling mechanism, the initial receptacle upon a reciprocating carrier, the reservoir for short-filler tobacco, and intermittingly-operating discharge mechanism therefor, all operated from the driving-power of the machine, and the chute extending downward from the said reservoir over the path of the reciprocated receptacle, of a valve W, normally blocking the lower end of the chute and provided with a projection, which extends normally into the path of the reciprocating carrier to be actuated by the movement thereof to open the valve W, substantially as and for the purpose set forth.

479,473. MACHINE FOR PASTING, CUTTING, AND TRIMMING WALL-PAPER. LOUIS STOCK, Columbus, Ohio. Filed May 15, 1891. Serial No. 392,614. (No model.)



Claim.—1. In a wall-paper-preparing machine, the combination, with a paste-tank *a*, a roll-carrying frame arising therefrom, and a paper-reel journaled in said frame, of a paste-roll journaled in said tank, a feed-roll d^3, movably journaled, as described, above said paste-roll, and a roll d^4, journaled above said feed-roll, substantially as described.

2. In a wall-paper-preparing machine, the combination, with a paste-tank *a*, a roll-carrying frame arising therefrom, a paper-reel journaled in said frame, and a paste-roll journaled in said tank, of a feed-roll d^3, movably journaled, as described, above said paste-roll, a roll d^4, journaled above said feed-roll, and one or more trimming-wheels *g*, having their cutting-edges adjustably supported against the periphery of the roll d^3, substantially as and for the purpose specified.

3. In a wall-paper-preparing machine, the combination, with a paste-tank *a*, a roll-carrying frame arising therefrom, a paper-reel journaled in said frame, and a paste-roll journaled in said tank, of a feed-roll d^3, movably journaled, as described, above said paste-roll, a roll d^4, journaled above said feed-roll, the hinged bracket f^3, rising from the upper portion of the frame, a horizontally-sliding knife-block on said bracket, and a cutting disk or knife supported thereby, said disk being adapted to be made to bear upon the periphery of the roll d^3, substantially as and for the purpose specified.

479,474. ROTARY BRAIDING-MACHINE. HENRY W. STRUSS, New York, N. Y., assignor to Marie F. Struss, same place. Filed Sept 25, 1891. Serial No. 406,800. (No model.)

Claim.—1. The combination of the cam-plate B and mechanism, substantially as described, for rotating the same, said cam-plate hav-

ing interlocking undulating grooves *b d*, with the stationary plate G, having annular slot *j* and cross-slots *o*, and with means for holding spools F suspended below the cam-plate, thread-guides A, projecting from the cam-plate through the annular slot *j*, and with the swiveled carriers *l m n*, whose lower portions are fitted into the grooves *b d*, while their upper portions enter the traversing slots *o*, and with thread-guides *p*, all arranged for operation substantially as herein shown and described.

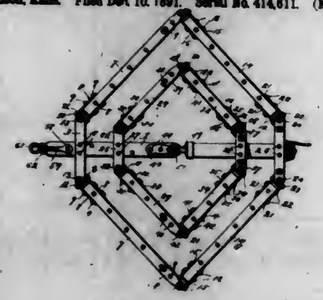
2. The combination of the stationary plate G, having annular slot *j* and cross-slots *o*, with the rotating cam-plate B, having intersecting undulating grooves *b d*, and with spool-carriers held in said grooves and cross-slots, and lower spool-carriers *g*, all arranged for operation substantially as herein shown and described.

3. The combination of the cam-plate B, arranged to receive upwardly-projecting spools H and downwardly-projecting spools F on its opposite sides, with mechanism for traversing one set of spools and rotating the other set of spools around the axis of said cam-plate, substantially as herein shown and described.

479,475. PUZZLE. LOUIS F. STUTZ, Washington, D. C. Filed Apr. 21, 1892. Serial No. 430,054. (No model.)

Claim.—1. The herein-described game or puzzle, illustrating the discovery of America, and comprising a globe or curved surface and ships or travelers having a loose sliding connection therewith and movable thereon, substantially as set forth.

3. The herein-described game or puzzle, consisting of a globe provided with the representations of two continents or countries and with an intervening space representing the ocean, undercut or equivalently-shaped intersecting grooves in the said space, and ships engaging said grooves and movable therein, substantially as set forth.



3. A game or puzzle consisting of a globe having intersecting grooves and ships or travelers engaging said grooves and movable therein by their gravity, as the globe is manipulated, over the surface of the globe, substantially as set forth.

4. A game or puzzle consisting of a hollow globe having intersecting grooves, an opening into the interior of the globe, having a cover or plug, and detachable ships or travelers adapted to engage said grooves or be stored within the globe, substantially as set forth.

5. A game or puzzle consisting of a suitable base adapted to be manipulated or tilted by hand, and having an undercut groove or slit, a traveler engaging the groove, and a separate weight in the inner or wider part or space of the groove and adapted by such manipulation to be moved to actuate the traveler, substantially as set forth.

6. The herein-described game or puzzle, consisting of a globe having grooves leading in a direction which is not desired to be pursued, travelers adapted to follow said grooves by their gravity as the globe is manipulated, and intersecting grooves meeting the first-mentioned grooves at an angle and leading to the desired destination, substantially as set forth.

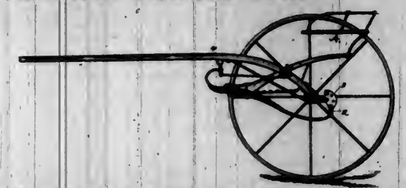
479,476. HARROW. AUGUST H. TEICHNER and PAUL H. TEICHNER, Atchison, Kans. Filed Dec. 10, 1891. Serial No. 414,611. (No model.)

Claim.—1. A harrow comprising a harrow-frame composed of a front section, a rear section detachably connected to the front section, a bar or rod sliding in the rear section and detachably connected to the front section, and a flexible connection attached to said rod or bar and detachably connected to the rear section, substantially as set forth.

2. A harrow comprising a front section, a rear section detachably connected to the front section, a longitudinal center bar for the front section, a tubular longitudinal center bar for the rear section, a rod or bar located within the tubular center bar and detachably connected to the rear end of the front center bar, and a flexible connection attached to the rear end of the rod or bar and detachably connected to the rear end of the rear center bar, substantially as set forth.

3. A harrow composed of a number of bars constituting the outer harrow-frame section, having relatively vertical and horizontal pivotal movements, and a number of similar bars constituting inner harrow-frame sections and having, also, relatively vertical and horizontal pivotal movements, the said bars being so connected as to form front and rear sections and said sections being detachably connected to each other, substantially as set forth.

479,477. BAND-CUTTER AND FEEDER FOR THRASHING-MACHINES. JACOB W. TURNER, Van Wert, Ohio, assignor of one-half to Theodore Clapper. Filed Jan. 26, 1891. Serial No. 379,109. (No model.)



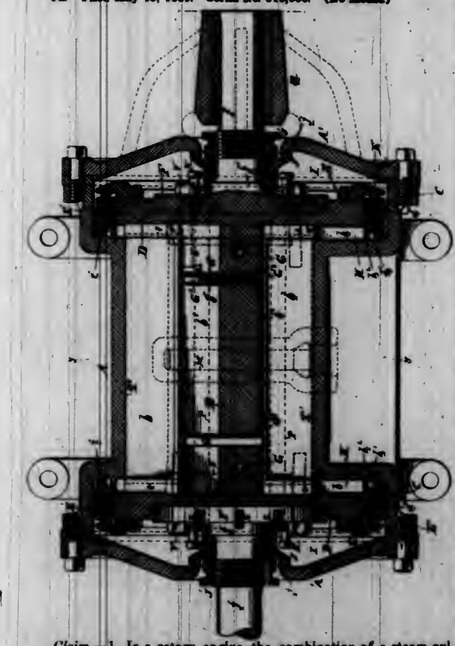
Claim.—1. In a band-cutter and feeder, the combination, with the carrier-belt and cutter, of the lateral distributers A', disposed over each side of the carrier-belt and suspended from a link Z, freely mounted in one end of an adjustable lever Y and carrying plates C, provided with sleeves D', fitting loosely over crank-shafts E', journaled in bearings on the feeder-frame, and gearing for rotating said crank-shafts, substantially as described.

2. In a band-cutter and feeder, the combination, with the carrier-belt and cutter, of lateral distributers, each consisting of a frame A', formed at its lower end with curved teeth B' and suspended by a link Z from a vertically-adjustable lever Y, a plate C, secured to each of said distributers and provided with a sleeve D', crank-shafts mounted in bearings on the feeder-frame, and gearing for actuating said crank-shafts, the sleeves D' being loosely mounted on said crank-shafts, whereby a reciprocatory vibrating movement in a line transverse to the carrier-belt is imparted to the distributers, substantially as described.

3. The combination, with the carrier-belt and cutter, of the lateral distributers A', suspended over each side of the carrier-belt by a link Z, carried by a vertically-adjustable lever Y and having secured thereto plates C', provided with sleeves D', loosely mounted on crank-shafts E', journaled in bearings on the feeder-frame, the holdback-fingers M', suspended transversely over carrier-belt by a link L', carried by a vertically-adjustable lever K' and having secured thereto plates P', provided with sleeves R', loosely mounted on a crank-shaft S', journaled in bearings in the feeder-frame, and gearing for rotating said crank-shafts for imparting a reciprocatory vibrating movement to said distributers and holdback-fingers, substantially as described.

4. The combination, with the carrier-belt and cutter, of the spreading-fingers, each consisting of two curved arms united at their tops by an eye and connected together in pairs by a link engaging said eyes, said link being loosely connected at its center to one end of an adjustable lever, plates secured to said curved arms and provided with sleeves, rock-shafts secured in bearings on the feeder-frame and passing through said sleeves, and gearing for rotating said rock-shafts, whereby each pair of spreading-fingers has imparted to it a reciprocatory vibrating movement, substantially as shown and described.

479,478. ROAD-CART. JOSEPH C. VALENTINE, Watertown, N. Y. Filed Oct. 22, 1891. Serial No. 409,526. (No model.)



Claim.—1. In a two-wheeled vehicle, thills and springs at their forward ends loosely secured thereto and at their rear ends loosely and adjustably secured to the rearwardly-extending shank.

2. In a two-wheeled vehicle, thills, rearwardly-extending shanks, springs at their forward ends loosely secured to the thills and at their rear ends loosely secured to said shank by means of a vertical plate, and the vertical plate, as set forth.

3. In a two-wheeled vehicle, the thills, rearwardly-extending shanks, springs at their forward ends secured to the thills by means of a double shackle, a rod connected to the lower end of the said shackle, and means for securing its other end rigidly at a point rearwardly, a vertical plate having openings in its periphery secured to the rear end of the shanks, and the shackle connecting the plate to the rear end of the spring, as set forth.

479,479. ROTARY ENGINE. EDWARD WALDRON, Philadelphia, Pa. Filed May 15, 1889. Serial No. 310,800. (No model.)

Claim.—1. In a rotary engine, the combination of a steam-cylinder formed with shaft-bearings at each end, a rotary drum and pistons of a length equal to the length of the cylinder, a steam-tight packing between the ends of the drum and cylinder, a shaft at each end supported in said bearings and having a flanged head bolted to the respective ends of the drum and supporting it, cylinder-heads for each end of the cylinder, and a rotatable steam-tight packing encircling the shafts between their heads and the respective cylinder-heads through which the shafts extend.

2. In a rotary engine, the combination of the cylinder having heads at each end provided with apertures of larger diameter than the shaft-sections of the engine, a rotary drum and pistons secured to the shaft-sections, sleeves surrounding the shaft-sections and movable longitudinally thereon and forming annular steam-tight rotary joints with the inner faces of the cylinder-heads, packing between the sleeves and shaft-sections, glands screwed upon the shaft-sections to keep the packing in place, and springs to press the sleeves outward against the inner faces of the cylinder-heads.

3. In a rotary engine, a cylinder having its inner surface formed of concentric and eccentric parts arranged alternately about the axis of rotation of the shaft, and steam inlet and exhaust ports arranged diametrically opposite and of different lengths, in which the exhaust-port occupies a space more than ninety degrees, in combination with a rotary shaft and piston carried with the shaft and sweeping the interior face of the cylinder.

4. In a rotary engine, a cylinder having two oppositely-arranged concentric parts T T' of different radii and two opposite cam or eccentric parts T^2 T^2, connecting said concentric parts and respectively provided with steam and exhaust ports, in which the exhaust-port consists of two oblique ports substantially covering the width of the cylinder, in combination with traveling pistons moving about a fixed axis and sweeping the interior surface of the cylinder.

5. In a rotary engine, the combination of a cylinder having concentric and eccentric parts, substantially as set out, and provided with steam and exhaust ports arranged in the eccentric parts diametrically opposite and in which the adjacent edges of the two ports are separated a distance corresponding to ninety degrees and in which the exhaust-port is of greater length than the steam-port, with a rotary drum arranged within the cylinder, and rotary movable pistons arranged diametrically in pairs and movable in races formed in the drum.

6. In a rotary engine, the cylinder having an interior surface made cam or eccentric shaped, in combination with a drum provided with piston-races arranged within said cylinder and of substantially equal length with the cylinder, pistons for said drum, removable heads for the ends of said drum to hold the pistons against longitudinal movement, and two shafts having heads and arranged one at each end and bolted to the drum, whereby the shaft at one end can be removed and the pistons withdrawn without removing the drum.

7. In a rotary engine, the cylinder having interior concentric and eccentric shaped surfaces arranged alternately about its interior circumference and parallel end surfaces, in combination with a rotary drum and reciprocating pistons, a head bolted to each end of the drum, having radial slots, and packing-rings carried by said heads, having piston guide-pieces fitting said slots and movable to and from the end surfaces of the cylinder.

8. In a rotary engine, the cylinder having interior concentric and eccentric shaped surfaces arranged alternately about its interior circumference and parallel end surfaces, in combination with a rotary drum and reciprocating pistons, a head bolted to each end of the drum, having radial slots, and packing-rings carried by said heads, having piston guide-pieces fitting said slots and movable to and from the end surfaces of the cylinder, and springs supported by the heads to force said rings against the end surfaces.

9. In a rotary engine, the cylinder having interior concentric and eccentric shaped surfaces arranged alternately about its interior circumference and parallel end surfaces, in combination with a rotary drum and reciprocating pistons, a head bolted to each end of the drum, having radial slots, and packing-rings carried by said heads, having piston guide-pieces fitting said slots and movable to and from the end surfaces of the cylinder, the said rings having a thin annular contact-rim, and guide-races for the pistons.

10. In a rotary engine, the cylinder having interior concentric and eccentric shaped surfaces arranged alternately about its interior circumference and parallel end surfaces, in combination with a rotary drum and reciprocating pistons, a head bolted to each end of the drum, having radial slots, and packing-rings carried by said heads, having piston guide-pieces fitting said slots and movable to and from the end surfaces of the cylinder, the said rings being formed with a thin annular contact-rim having a steam-lubricating groove and recess leading from the interior of the cylinder to its contact-surface.

11. In a rotary engine, the cylinder having interior concentric and eccentric surfaces arranged alternately about its interior circumference and parallel end surfaces, in combination with a rotary drum within the cylinder, provided with reciprocating pistons, end heads for said drum rotating with it and provided with V-shaped guide notches or slots in their interior surfaces, and packing-rings encircling said heads, provided with V-shaped pieces forming races for the pistons and fitting in said notches or slots in the drums.

12. In a rotary engine, a cylinder having its inner surface formed

of concentric and eccentric parts arranged alternately about the axis of rotation of the shaft, and steam inlet and exhaust ports arranged diametrically opposite, in which the exhaust-port extends over a space of more than ninety degrees, in combination with a rotary shaft and four pistons arranged at angles of ninety degrees and carried with the shaft and sweeping the interior face of the cylinder.

13. In a rotary engine, the combination of the cylinder having heads at each end, a rotary drum and pistons within the cylinder, a shaft projecting from the drum through the head, a stuffing box or sleeve surrounding the shaft, a packing between the shaft and said box or sleeve, and springs to press the box or sleeve against the interior surface of the head and make a steam-tight rotary joint.

14. In a rotary engine, the combination of the cylinder having heads at each end, a rotary drum and pistons within the cylinder, a shaft projecting from the drum through the head, a stuffing box or sleeve surrounding the shaft, a packing between the shaft and said box or sleeve, and springs to press the box or sleeve against the interior surface of the head and make a steam-tight rotary joint, and screws, substantially as shown, to hold said box or sleeve to the drum and shaft when the cylinder-head is removed.

15. In a rotary engine, the combination of the cylinder having heads at each end, a rotary drum and pistons within the cylinder, a shaft projecting from the drum through the head, and a box or sleeve carried with the rotating shaft and forming a steam-tight joint between the shaft and cylinder-head.

16. In a rotary engine, the combination of the cylinder having heads at each end, a rotary drum and pistons within the cylinder, a shaft projecting from the drum through the head, a box or sleeve J, encircling the shaft and having an annular flange forming a steam-tight rotary joint *j* with the cylinder-head, a packing between the box or sleeve and shaft, and a packing gland or ring for said box or sleeve.

17. In a rotary engine, the combination of the cylinder having an interior made of concentric and eccentric parts, with a rotary drum located therein and formed with radial races for the pistons provided with enlargements or channels at the bottom entirely across the drum for the ready escape of water and steam from under the pistons when moving inwardly to the ends of the drum, and pistons movably supported and made steam-tight in said races.

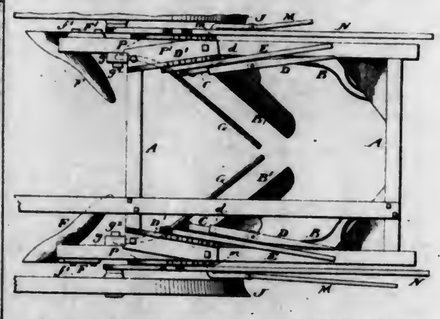
18. In a rotary engine, the combination of the cylinder having an interior made of concentric and eccentric parts, with a rotary drum located therein and formed with radial races for the pistons, provided with enlargements or channels at the bottom entirely across the drum for the ready escape of water and steam from under the pistons when moving inwardly to the ends of the drum, and pistons for said races, formed with grooves on their ends for the escape of the water and steam from the ends of the races to the exhaust-port.

19. In a rotary engine, a cylinder having an interior made of concentric and eccentric shaped parts and parallel end surfaces, in combination with a rotary drum of greater length than the interior surface of the cylinder and of greater diameter on its ends than at the middle and formed with radial piston-races, heads for said drum, pistons working in the races of said drum, and a packing or skeleton ring encircling said heads of the drum and formed with guide or race pieces for the pistons, extending inward toward the enlarged diameters of the drum and moving longitudinally to make a tight joint with the end surfaces of the cylinder.

20. In a rotary engine, the cylinder having an interior surface consisting of eccentric and concentric parts and parallel end surfaces, in combination with a rotary drum, pistons and heads therefor, and encircling packing-rings for said heads, having irregular contact-surfaces at their outer portions, consisting of a thin annular rim, and outwardly-extending parts arranged at intervals about the circumference and having steam-spaces in them for making a steam-tight joint with the end surfaces and allowing of ample lubrication.

21. In a rotary engine, the cylinder having a concentric and eccentric shaped interior, substantially as shown, and parallel end surfaces, in combination with a rotary drum, pistons and heads therefor, and encircling packing-rings for said heads, an irregular contact-surface for making a steam-tight joint with the end surfaces and allowing of ample lubrication, said surface consisting of a narrow annular rim, and guide-pieces for the pistons, said guide-pieces projecting beyond the annular rim and formed with steam-spaces extending beyond the said rim.

22. In a rotary engine, the cylinder having interior concentric and eccentric surfaces arranged alternately about its interior circumference and parallel end surfaces, in combination with a rotary drum within the cylinder provided with reciprocating pistons, end heads for the said drum, rotating with it and provided with V-shaped guide notches or slots in their interior surfaces, and packing-rings encircling said heads, provided with V-shaped pieces forming races for the pistons and fitting in said notches or slots in the drums, and springs to force said rings against the end surfaces of the cylinder.



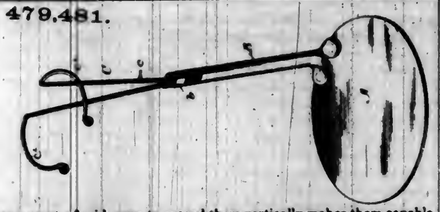
23. In a rotary engine, a cylinder having its interior surface made of eccentric and concentric parts, in combination with a rotary drum having radial piston-races, radially-reciprocating pistons working in said races, and distance-rods formed of the tubes G', heads G^2, and internal spring *g*, acting to separate the tubes and heads for keeping the pistons out against the cylinder-surfaces.

24. In a rotary engine, the cylinder having an interior made concentric and eccentric and in which said parts each occupy ninety degrees and are arranged alternately and formed with steam and exhaust ports arranged on diametrically-opposite and eccentric sides, and also having grooves S on the end edges of the cylinder and of a length corresponding to the exhaust-port and in which the exhaust-port occupies more space than ninety degrees, extending upon the larger concentric part, in combination with a rotating drum having radial races arranged at ninety degrees apart, and radially-reciprocating pistons for said races, having end grooves opening into the grooves S in the cylinder to relieve the water and steam under the piston before the steam in the cylinder back of the piston is exhausted.

25. In a rotary engine, a cylinder having its inner surface formed of concentric and eccentric parts arranged alternately about the axis of rotation of the shaft, and steam inlet and exhaust ports arranged diametrically opposite, in which the exhaust-port extends over a space of more than ninety degrees and the steam-port a space of less than ninety degrees, in combination with a rotary shaft and four pistons arranged at angles of ninety degrees and carried with the shaft and sweeping the interior face of the cylinder, whereby two spaces between the pistons may be exhausting while only one is receiving steam and the pistons over the exhaust are relieved before moving on the eccentric part of the cylinder.

26. In a rotary engine, a cylinder having its interior composed of alternate concentric and eccentric parts and in which the concentric parts are alternately of different diameters, a steam-port arranged in one of the eccentric parts and an exhaust-port arranged in the alternate eccentric part and being of a length equal to that of the eccentric part and part of the concentric part, in combination with a rotating drum having its axis arranged concentric with the concentric parts of the cylinder and provided with piston-races separated a number of degrees corresponding to that of the concentric and eccentric parts of the cylinder, and reciprocating pistons carried by the drum and adapted to sweep the interior of the cylinder, the whole operating to exhaust the steam from back of the pistons before the said pistons reach the eccentric portion of the cylinder, and thereby reduce the friction and wear upon the engine and allowing a higher speed to be attained.

479,480. BEAN-HARVESTER. WILLIAM H. WILDER, Caledonia, N. Y. Filed Sept. 24, 1891. Serial No. 406,706. (No model.)

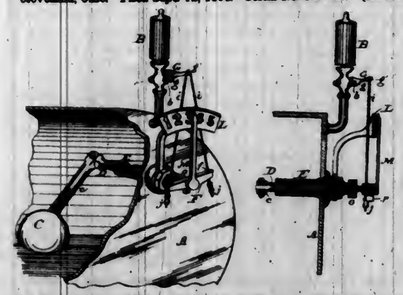


Claim.—1. In bean-harvesters, the root-cutter standard B, having an integral share B' at one end and at the other two counterbracing branches hinged separately to the frame at *b b*, the hinges being in a plane parallel to the edge *b'* of the share, whereby the share B' may not be turned out of a horizontal plane.

2. The combination, with the share-shank B, the end-pivoted rod C, and the lift-lever E, of the secondary lever D and rack D', the said lever D being pivoted to lift-lever E and provided with a pin *d*, which passes through lever E into the notches of rack, as and for the purpose set forth.

479,481. DOLL-SUPPORT. ALFRED B. WILLCOX, Chicago, Ill., assignor of two-thirds to Mary L. Butler and S Ella Geer, same place. Filed Feb. 29, 1892. Serial No. 423,309. (No model.)

Claim.—1. The combination, with a suitable base and a standard thereon, provided with a fixed guide, of a pair of vertically-movable spring-arms extending upward through said guide and adapted to be sprung away from each other above the same, whereby the upward



479,481.

movement of said arms to extend them vertically makes them capable of a wider separation laterally, substantially as described.

2. The combination, with a base and standard supported thereby, provided with a suitable guide, of a spring-clasp composed of a piece of metal bent upon itself to form a double portion adapted to slide up and down in said guide, and two oppositely-arranged arms extending from the tops of the respective members of said double portion, substantially as described.

479,482. HIGH AND LOW WATER ALARM. ALLEN J. WRIGHT, Cleveland, Ohio. Filed Sept. 12, 1891. Serial No. 405,562. (No model.)

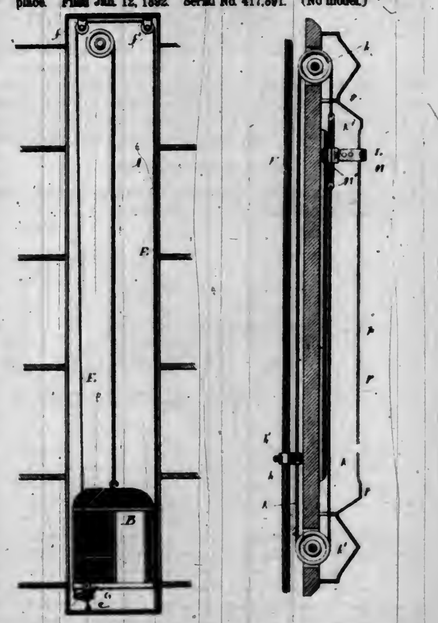
Claim.—1. In a high and low water alarm, the combination, with the whistle having steam connection with the boiler, of a lever adapted to actuate the whistle-valve, a rock-shaft extending through the boiler-shell and actuated by a float within the boiler, a rigid transverse arm on the outer end of said shaft, rods or their equivalent connected with the whistle-actuating lever and having their threaded lower ends passing through the ends of said transverse arm, and nuts on said rods below said arm substantially as described.

2. The combination of the whistle having steam connection with the boiler and having a lever adapted to actuate the whistle-valve, a rock-shaft extending through the boiler-shell and having a float laterally attached thereto within the boiler and a transverse arm rigidly attached thereto outside the boiler, threaded rods or their equivalent connecting the whistle-actuating lever with the transverse arm of the rock-shaft and having adjusting-nuts on their lower ends below said arm, an indicator-scale, and an index secured to said rock-shaft, substantially as described.

3. The combination of the rock-shaft having a transversely-attached float within the boiler and a transverse arm outside the boiler, the sleeve passing through the boiler-shell and having at each end bearings for said shaft, the whistle communicating through said sleeve with the interior of the boiler and having a lever to actuate the whistle-valve, the threaded rods or their equivalent connected at their upper ends to the whistle-actuating lever and passing through slots in the ends of said transverse arm of the rock-shaft, and the adjusting-nuts threaded upon said rods below the transverse arm, substantially as described, and for the purpose set forth.

4. The combination of the rock-shaft with float and transverse arm, the sleeve passing through the boiler-shell and having at each end bearings for said shaft, the whistle communicating through said sleeve with the interior of the boiler and having a lever to actuate the whistle-valve, the threaded rods or equivalent connected at their upper ends to the whistle-actuating lever and passing through slots in the ends of the transverse arm of said rock-shaft and having adjusting-nuts below said arm, the indicator-scale, and the index secured to said rock-shaft, all combined and operating substantially as described.

5. In a high and low water alarm, the combination, with the alarm whistle, of the lever pivoted thereto and adapted to actuate the whistle-valve, the rods or their equivalent connecting said lever with the transverse arms of a rock-shaft extending through the boiler-shell and actuated by a float within the boiler, and the adjusting-nuts threaded on said rods below the transverse arms and adapted to operate the whistle-lever when the shaft rocks in either direction, substantially as described.



6. In a high and low water alarm, the combination, with the whistle having steam connection with the boiler, the lever adapted to actuate the whistle-valve, and a rock-shaft having laterally-attached float within the boiler and transverse arms outside the boiler, of the adjustable connection between the whistle-lever and each of the rock-shaft arms, whereby the amount of fluctuation in the water-level necessary to sound the alarm may be varied at will, substantially as described.

479,483. CAR-COUPLING. STRAM W. WRIGHT, Eden, Ala. Filed Mar. 3, 1892. Serial No. 423,626. (No model.)

Claim.—In a car-coupling such as described, the combination, with the draw-head and the hook or coupling-head pivoted therein to swing horizontally, of the weighted locking-dog pivoted in the top of the draw-head and free to hang in the path of the rear end of the hook, the ears on the rear side of the locking-dog, the link connected with said ears and passing out through the top of the draw-head, and the housing for the locking-dog, substantially as described.

479,484. INDICATOR FOR ELEVATORS. EDWARD WILDE, Chicago, Ill., assignor to the Elevator Supply and Repair Company, same place. Filed Jan. 12, 1892. Serial No. 417,891. (No model.)

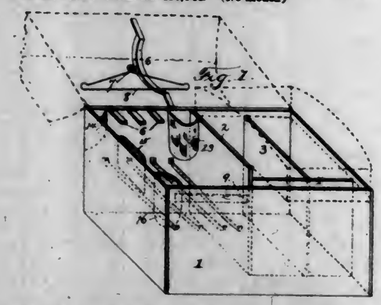
Claim.—1. An indicator mechanism for elevators, comprising an indicator-working cable sustained in a manner permitting its working length to be varied, suitable indices connected with said cable, a grooved drum or pulley engaging with said cable to vary its working length, and a stop adjacent one end of said drum or pulley to determine the position of the indicator-working cable with respect thereto, substantially as described.

2. An indicator mechanism for elevators, comprising an indicator-working cable, a spirally-grooved differential drum over which said cable passes and by means of which the working length of said cable can be varied, and a stop adjacent one end of said differential

drum for determining the position of the indicator-working cable thereon, substantially as described.

3. An indicator mechanism for elevators, comprising an indicator-working cable, suitable indices with which said cable is connected, an elevator-car, a spirally-grooved drum or pulley over which said indicator-working cable passes, said drum or pulley having shallower grooves adjacent its larger end, and a stop adjacent the larger end of said drum for determining the position of the cable with respect thereto, substantially as described.

4. An indicator mechanism for elevators, comprising the combination, with a suitable device—such, for example, as an indicator-rod for effecting the movement of the indices—of an index-plate, a pointer, a suitable slip-joint connection between said pointer and the indicator-rod, and a stop for arresting the indicator-pointer, substantially as described.



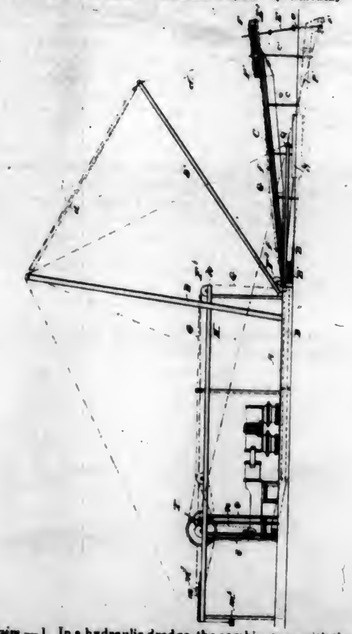
5. An indicator mechanism for elevators, comprising the combination, with a suitable device—such, for example, as an indicator-rod for effecting the movement of the indices—of an index-plate, an indicator-pointer, a cord connecting said indicator-pointer with the indicator-rod, and a slip-joint connection between said cord and the indicator-pointer, and a stop for arresting the movement of the indicator-pointer, substantially as described.

6. An indicator mechanism for elevators, comprising the combination, with a suitable device—such, for example, as an indicator-rod for effecting the movement of the indices—of an index-plate, an indicator-pointer, a cord for connecting said indicator-pointer with the indicator-rod, said cord having its ends suitably connected together, whereby it will serve to shift the indicator-pointer in both directions, and a slip-joint connection between said indicator-pointer and said cord, and suitable stops for arresting the movement of said indicator-pointer, substantially as described.

7. An indicator mechanism for elevators, comprising the combination, with a suitable device—such, for example, as an indicator-rod for effecting the movement of the indices—of an index-plate, an indicator-pointer, a cord K, having its ends connected by a rod K', said indicator-pointer being clamped to said rod K' in a manner permitting it to slip thereon, and stops for arresting the movement of said indicator-pointer, substantially as described.

8. An indicator mechanism for elevators, comprising the combination, with a suitable device—such, for example, as an indicator-rod for effecting the movement of the indices—of an index-plate, an indicator-pointer, a bar M', guide rods N for said bar, provided with stops *n*, a clamp-plate M, carrying said indicator-pointer, a friction-ring O, a rod K', and a cord K, connected with the indicator-rod, substantially as described.

479,485. TRUNK. PHILOMENA B. YARDER, Helena, Mont. Filed Jan. 21, 1892. Serial No. 418,841. (No model.)



Claim.—1. In combination with a trunk-body, cross-bars supported thereon, extending up into the cover and provided with coat-stretchers, substantially as described.

2. In combination with a trunk-body, cross-bars extending up into the cover, each having one end hinged to the trunk and its other end resting on a cleat attached thereto, substantially as described.

3. The combination of a trunk having front, back, and end walls and partitions 2, 3, and 4, the last two partitions being slightly lower than the partition 2, with the tray 5 resting on partitions 3 and 4 and held against moving toward the coat-compartment by said partition 2, substantially as described.

4. As an improved article of manufacture, a trunk constructed substantially as herein shown and described, comprising a coat-receptacle provided with arched supports for the coats, partitions 2, 3, and 4, a tray resting on said partitions 3 and 4, and pockets 13, 14, 15, and 16, constructed and arranged substantially as shown and described.

479,486. HYDRAULIC DREDGE. CALEB H. BOOTH, Dubuque, Iowa. Filed Jan. 8, 1892. Serial No. 417,412. (No model.)

Claim.—1. In a hydraulic dredge, the combination, with the barge and supporting-jib and a suction-pipe, of a curved bell-mouth for the pipe, arranged to have a slight axial movement, a stirrer at the mouth, means for actuating the stirrer, and moving means connected with the sides of the bell-mouth, extending out laterally therefrom, substantially as described.

2. In a hydraulic dredge, the combination, with the suction-pipe having a bell-mouth arranged to have a slight rotary axial movement and a stirrer at the end thereof, of ropes or the equivalent attached to the sides of the mouth and extending in opposite directions substantially on a horizontal plane obliquely to the suction-pipe, and means for moving the ropes, substantially as described.

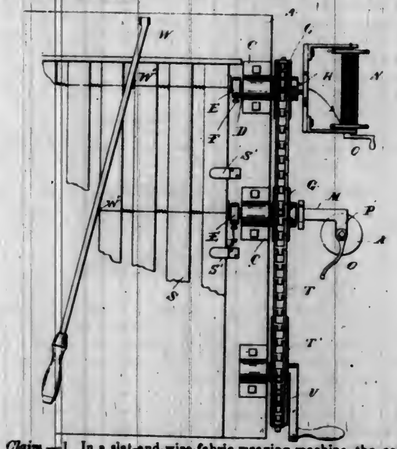
3. In a hydraulic dredge, the combination, with the barge, of the suction-pipe, a curved bell-mouth arranged to have a slight rotary movement, a stirrer, means for actuating the stirrer, booms hinged to the barge and extending horizontally and at an incline therefrom, ropes passing over the outer ends of the booms and attached to the sides of the bell-mouth, and means for winding the ropes up, substantially as described.

4. In a hydraulic dredge, the combination, with the suction-pipe having a curved bell-mouth thereon arranged to have a slight rotary movement, of a stirrer at the mouth thereof and drawing means on the sides of the mouth of the suction-pipe extending out substantially on a horizontal plane to create a side draw when the suction-pipe is to be moved, substantially as described.

5. In a hydraulic dredge, the combination, with a barge, a supporting-jib, and a suction-pipe having a flexible section, of means for raising and lowering the pipe, a bell-mouth arranged at an angle to the pipe and allowed a slight rotary axial movement, a stirrer at the mouth, booms extending out horizontally from the corners of the barge, winding-drums on the barge, and ropes on the drums extending out to the ends of the horizontal booms and back to the mouth of the suction pipe, to which they are attached, substantially as described.

6. In a hydraulic dredge, the combination, with the barge, a supporting-jib, and a suction-pipe, of a stirrer for the suction-pipe, a grooved wheel on the supporting-jib, a shaft for said wheel connected with the stirrer, an endless cable wound on the wheel, two wheels arranged at the inner end of the supporting-jib, a superstructure on the barge, wheels on the structure, having their peripheries arranged directly over the wheels on the inner end of the supporting-jib, and means for driving the cable, substantially as described.

7. In a hydraulic dredge, the combination, with the barge, supporting-jib, and suction-pipe, of a stirrer on the pipe, an endless cable for actuating the stirrer, a grooved wheel over which the cable passes located at the end of the jib, a grooved wheel on the barge, over



which the opposite end of the cable passes, means for taking up the slack in the cable, a friction-disk having connection with a suitable motive power, and means engaging the disk and connected with the shaft of the wheel on the barge, substantially as described.

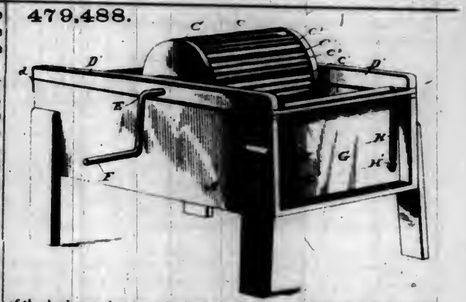
8. In a hydraulic dredge, the combination, with a barge, a supporting-jib, and a suction-pipe, of a curved bell-mouth on the pipe, arranged to have a slight axial movement, a stirrer at the mouth of the pipe, means for actuating the stirrer, ropes secured to the sides of the mouth of the suction-pipe, pulley-blocks arranged beyond the barge on a plane substantially horizontal with the deck thereof and over which the ropes pass, winding-drums on the barge, with which the inner ends of the ropes are connected, and friction-wheels connected with the shafts of the drums and actuated by the stirrer-actuating means, substantially as described.

9. In a hydraulic dredge, the combination, with the suction-pipe, of a curved bell-mouth on the pipe, arranged to have a slight axial rotary movement, a stirrer at the mouth, means connected with the sides of the mouth for drawing the same horizontally in the arc of a circle, drums to which said drawing means are attached, shafts on said drums, friction-wheels on the ends of said shafts, gearing for actuating the stirrer, friction-wheels actuated by said gearing, and means for forcing said friction-wheels into engagement, substantially as described.

10. In a hydraulic dredge, the combination, with the suction-pipe, a stirrer at the end thereof, means for actuating the stirrer, and ropes connected with the mouth of the suction-pipe, of drums for winding said rope and means for actuating the drums, consisting of flexible shafts, friction-disks on the shafts, friction-wheels normally out of contact with said disks, means for actuating said friction-wheels, and levers for forcing the friction-disks into contact with the friction-wheels, substantially as described.

479,487. SLAT-AND-WIRE-FABRIC-WEAVING MACHINE. MARVIN A. CADWELL, Lansing, Mich. Filed Mar. 18, 1892. Serial No. 425,376. (No model.)

Claim.—1. In a slat-and-wire-fabric-weaving machine, the combination of the frame, the bearings thereon, and the twister-wheels journaled in said bearings, such wheels being composed of the outer tubes D, collars E at one end of the tubes, sprocket-wheels G at the opposite ends of the tubes, and twister-heads I, secured in the forward ends of the tubes, substantially as described.



2. In a slat-and-wire-fabric-weaving machine, the combination of the frame, the bearings thereon, the twister-wheels journaled therein and comprising the sleeves D, the collars E at the forward end, the sprocket-wheels G at the rear ends of the bearings, the twister-heads I, detachably secured at the forward end, the frames M, secured to the rear end, having the offset portions P, and the wire-spools N, journaled in said offsets, substantially as described.

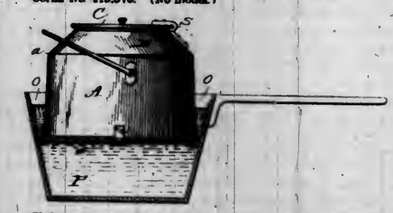
3. In a slat-and-wire-fabric-weaving machine, the combination, with the twister head and frame, of the spring-arm V, arranged in front of the twister-head to press the wire to the head, substantially as and for the purpose described.

479,488. WASHING-MACHINE. ZACHARIAH T. CHAMBERS, California, Mo. Filed Feb. 26, 1892. Serial No. 422,969. (No model.)

Claim.—The herein-described washing-machine, the same comprising, in combination, the body portion of the machine, the corrugated roller journaled therein at substantially the longitudinal center

479,488.

of the body portion near its bottom, the frame D', hinged at one of its ends to the body portion, the cylinder C, journaled in said frame and having corrugated periphery and radial openings provided with an operating-crank, and the spiral springs H, secured at their upper ends to the under side of the end strip of the frame and at their lower ends having hooks, as described, whereby the said springs may be detachably connected with the body portion of the machine, substantially as described.



479,489. PROCESS OF ENRICHING LEAD-FUMES. ARTHUR CRAFUTD and MALVERN W. ILES, Denver, Colo. Filed Mar. 22, 1892. Serial No. 426,067. (No specimens.)

Claim.—1. The described process, consisting in screening and saving the metallic fumes and solid particles from lead-reducing furnaces, mixing with said fumes sulphide of silver, and then igniting the fumes to obtain the mixture of lead and silver compounds in a solid state.

2. The described process, consisting in screening and saving the metallic fumes and solid particles from lead-reducing furnaces, spreading sulphide of silver between layers of such fumes, and igniting the fumes to obtain the mixture of lead and silver compounds in a solid state.

3. The described process, consisting in smelting argentiferous lead ores, screening and saving the metallic fumes and solid particles driven off by the furnace, mixing with the fumes thus collected sulphide of silver, igniting the mixture to bring it to a solid condition, and charging the mixture after ignition into the furnaces.

479,490. KETTLE-COVER. NATHAN COSMAN, Seattle, Wash., assignor of one-half to O. P. Wegener, same place. Filed Dec. 17, 1891. Serial No. 416,373. (No model.)

Claim.—1. A kettle cover having a lower bearing or bearings to fit against the interior of the kettle-walls, with openings around the lower part of the cover adjacent to said bearings, the sides of the cover inclining inwardly and upwardly from the lower bearings, and a top for the cover, substantially as described.

2. A kettle-cover having a series of clips on its lower edge for supporting the same and a wire supported by said clips, substantially as described, and for the purpose set forth.

3. A kettle-cover having clips secured to its lower edge and a pivoted top, said cover being inclined from its upper to its lower part, substantially as described.

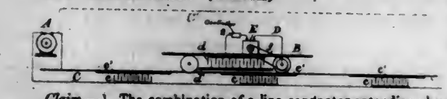
4. A kettle-cover having the supporting means at its lower edge to hold the same slightly from the sides of the kettle and having the truncated upper portion with the top therefor, substantially as described.

5. In combination, a kettle having flaring sides, the cover of less diameter adapted to fit therein and having the bearings at its lower edge to fit against the inner walls of the kettle to hold the cover away from the walls and to provide a space between, and the top for the cover, substantially as described.

6. In combination, the kettle, the cover of less diameter adapted to fit within the kettle and to be supported at its lower edge against the inner walls thereof to form a cooler-chamber O between it and the kettle and having about its lower edge narrow openings connecting

the chamber O with the interior of the kettle, and a top for the cover, substantially as described:

479,491. RAILROAD-RAIL BENDER. WILLIAM H. COWELL, Logan, Ohio. Filed Apr. 18, 1892. Serial No. 429,630. (No model.)



Claim.—The combination of the frame and its two cross-bars, one of which is hollow and has an opening with curved sides, the toothed slide in such hollow bar, the links secured to the bar, the spring at the rear of the bar, the forked lever secured to the slide, and the lever to hold the toothed slide, as set forth.

479,492. CORSET-STEEL CLASP. LYDIA A. DAVIS, Atwood, Ill. Filed Apr. 26, 1892. Serial No. 430,684. (No model.)

Claim.—A corset-fastening comprising two similarly-constructed plates, each of which is formed with a large slot having a smaller slot extending therefrom into a nose, and lips at the rear of said plates with which said noses engage, the opposite sides of said plates being formed with shouldered portions to guide and limit the movement of each nose inward, substantially as described.

479,493. ELECTRIC RAILWAY. MARK W. DEWEY, Syracuse, N. Y., assignor to the Dewey Corporation, same place. Filed July 24, 1891. Serial No. 400,587. (No model.)

Claim.—1. The combination of a line conductor extending along the path over which a vehicle moves, a source of irregular or alternating electricity connected to the line, a condensing plate or strip upon the vehicle, carried in inductive proximity to said conductor, and an electric motor on the vehicle, connected to the condensing plate or strip and with the vehicle for moving the same.

2. In an electric railway, the combination of a line conductor extending along the railway, a source of irregular or alternating electricity connected to the line, a condensing plate or strip upon the vehicle, carried in inductive proximity to said conductor, and an electric motor on the vehicle, connected with the condensing plate or strip and with the vehicle for moving the same.

3. The combination of a vehicle, a line conductor parallel to the path over which the vehicle moves and in static inductive proximity to a plate or strip of conducting material upon the vehicle, means for alternately charging the line with positive and negative electricity at a fixed station, a conductor on the vehicle, connected to the vehicle plate or strip, and an electric motor on the vehicle in the vehicle-conductor and arranged to propel the vehicle.

4. The combination of a vehicle, two line conductors parallel to the path over which the vehicle moves, a source of irregular or alternating electricity at a fixed station and connected to and between said lines, two condensing plates or strips upon the vehicle, carried in inductive proximity to said conductors, and an electric motor on the vehicle, connected to and between the condensing plates or strips and arranged to propel the vehicle.

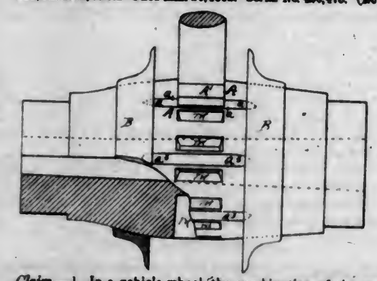
5. The combination, in an electric railway, of an open-circuit line conductor having a condensing-surface, a condensing plate or strip upon a car, carried in inductive proximity to said conductor and connected with a rail, a source of alternating currents at a fixed station connected to the line, and an electric motor on the vehicle, connected to the condensing plate or strip and with the vehicle for moving the latter.

6. In an electric railway, the combination of a vehicle, two condensing-strips a distance apart and parallel to the railway, a source of irregular or alternating electricity at a fixed station and connected to and between said strips, two condensing plates or strips upon the vehicle, parallel with the former strips and carried in inductive proximity thereto, and an electric motor on the vehicle, connected to and between the plates or strips thereon and arranged to propel the vehicle.

7. In an electric railway, the combination of a vehicle, a source of irregular or alternating current, an electric condenser extending along the railway and connected to the source, an electric motor on the vehicle, arranged for propelling the same, and an electric condenser carried on the vehicle in inductive proximity to the former condenser and connected to the motor.

8. In an electric railway, the combination of a source of irregular or alternating current at a fixed station, a conductor connected to the source and extending along the railway, a plurality of condensers connected to the conductor and having condensing-plates parallel to the railway, an electric motor on the vehicle, arranged for propelling the same, and an electric condenser carried on the vehicle and having a condensing-plate parallel to and adapted to be moved in inductive proximity to the former plates successively and electrically connected to the motor.

9. In an electric railway, the combination of a source of irregular or alternating current at a fixed station, line conductors connected to the terminals of the source and extending along the railway, a plurality of condensers connected to each conductor and having condensing-plates parallel to the railway, an electric motor on the vehicle, arranged for propelling the same, two electric condensers carried on the vehicle and each having a condensing-plate parallel to and adapted to be moved in inductive proximity to the plurality of condensing-plates of the condensers connected to one of the line conductors, and electric connections between the vehicle-condensers and the motor.

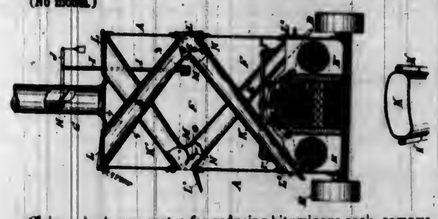


10. In an electric railway, the combination of a source of irregular or alternating current at a fixed station, line conductors connected to the terminals of the source extending along the railway and open-circuited at the distant end thereof, a plurality of condensers distributed at intervals along the way and connected to each conductor, condensing-plates parallel to the railway and connected to the condensers, an electric motor on the vehicle, arranged for propelling the same, two electric condensers carried on the vehicle, a condensing-plate parallel to and adapted to be moved in inductive proximity to the plurality of condensing-plates of the condensers connected to one of the line conductors, and electric connections between the vehicle-condensers and the motor.

479,494. MILK-COOLER. WILLIAM C. EBERHARDT, Plymouth, Wis. Filed Sept. 18, 1891. Serial No. 406,162. (No model.)

Claim.—The milk-cooler consisting of a series of connecting-chambers on the inside of which are horizontal plates or sheets secured by braces to the side of the chambers and having a narrow space between them and the inner surface of the chambers, a case inclosing the strainer and extending over the upper side of the top chamber, a water-tank connected by a tube with the lowest chamber, and a cylindrical outer case extending above the cooling-chambers, the whole resting on a base adapted to be fitted upon a milk-can, as set forth.

479,495. VEHICLE-WHEEL. THOMAS F. FOLEY and JOHN R. FOLEY, Jackson, Mich. Filed Mar. 26, 1892. Serial No. 426,473. (No model.)



Claim.—1. In a vehicle-wheel, the combination of the spokes S, gained out substantially as described, the pintles A, adapted to fit into the opening through the spokes and provided with a portion extending beyond the spokes when in position, said extended portion being

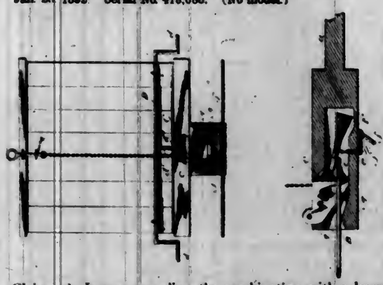
provided with an inclined upper surface, and the hub-bands B B, substantially as and for the purpose set forth

2. In a vehicle-wheel, the combination of the gained-out spokes S, the pintles A, adapted to fit into the opening through said spokes and provided with a portion which shall extend beyond the spokes when the pintle is in position, said extended portions having inclined upper surfaces, said pintles being provided with spurs *a''* along its lower surface, and the hub-bands B B, substantially as shown and described.

479,496. APPARATUS FOR REDUCING BITUMINOUS ROCK. ARCHIBALD FORD, Golden Gate, Cal. Filed Feb. 3, 1892. Serial No. 420,194. (No model.)

Claim.—1. An apparatus for reducing bituminous rock, comprising a fire-chamber, a compartment arranged above and communicating with said fire-chamber, wherein the products of combustion are diffused, and a series of substantially vertically-disposed retorts arranged in said compartment and extending through the same.

2. In an apparatus of the character described, the combination, with the heating-chamber, of downwardly-inclined retorts extending vertically through said chamber and tapering toward their lower ends.

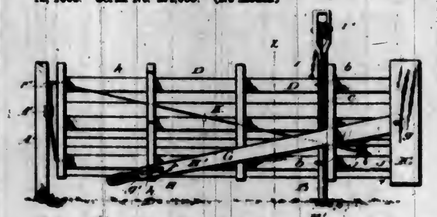


3. The combination, with the heating-chamber, of a series of bent tubular retorts extending through the said chamber in a substantially vertical position.

4. The combination of bent inclined tubular retorts and breaking-bars in the angles thereof, substantially as set forth.

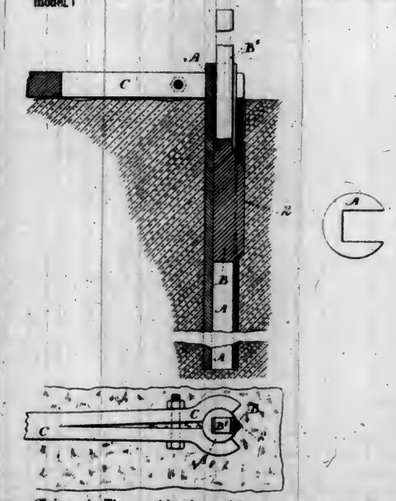
5. The combination of bent inclined retorts, bars in the bends thereof, and stirrers working in connection with said bars, substantially as set forth.

6. The combination of a fire-chamber, retorts above the same, and air-pipes arranged on the fire-chamber connected with the retorts, substantially as and for the purposes set forth.



479,497. CAR-COUPLING. WILLIAM R. GARNER, Chicago, Ill. Filed Jan. 20, 1892. Serial No. 418,683. (No model.)

Claim.—1. In a car-coupling, the combination, with a draw-head having a fulcrum B therein, of a link, a hook pivoted in said draw-head and operating in a slot therein to engage with a link inserted in said draw-head, said link being adapted to force the hook against the front of said draw-head, a weighted lever pivoted within the draw-head in rear of the hook and having its free end extending forwardly to engage with the link to raise or lower the same, and means for operating said lever, substantially as described.



2. In a car-coupling, the combination, with a draw-head having an enlargement B, which converges to a sharp edge to form a fulcrum, a hook pivoted in lugs on the top of the draw-head and arranged to bear against the front thereof, said hook operating in a slot in the draw-head to engage with the link inserted therein and adapted to be drawn by said link against its pivot and the front of the draw-head, a rock-shaft D, having an extension *d'*, a chain connecting the extension and the hook, whereby the latter may be released from engagement with the link, a rock-shaft F, secured on the draw-head and having a short bar *e*, projecting outward therefrom, and a chain connecting said bar and the free end of the weighted lever to operate the same, substantially as described.

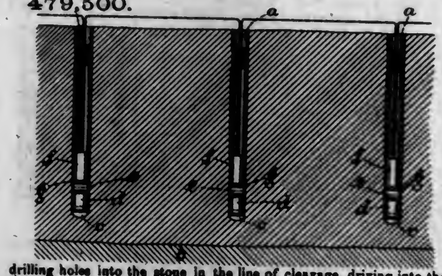
479,498. GATE. DANIEL GREISINGER, Teegarden, Ind. Filed Mar. 12, 1892. Serial No. 424,683. (No model.)

Claim.—The combination, with the gate and the balance at one end, of the vertical post on which the gate is pivoted to swing, the upright C, held to said post by rings, a pulley on said post, a lever pivoted on the balance and passed through a slot in the said upright C, a chain connecting the lever and gate and passed over the said pulley, and means for holding the lever in its different vertical planes, as set forth.

479,499. CHANNELING-TOOL FOR ROCKS. GEORGE M. GITHENS, Brooklyn, N. Y. Filed Sept. 19, 1891. Serial No. 406,253. (No model.)

Claim.—1. The combination, with a channeling-tool having one projecting cutting-edge, of a guide-bar having a longitudinal channel at one side thereof and adapted to pass into a drill-hole, the channeling-tool projecting from the slot of the guide-bar and bearing at the other side against the interior of the guide-bar, the channeling-tool having a shank extending to the top of the drill-hole, so as to be driven into the hole in channeling the side thereof, substantially as set forth.

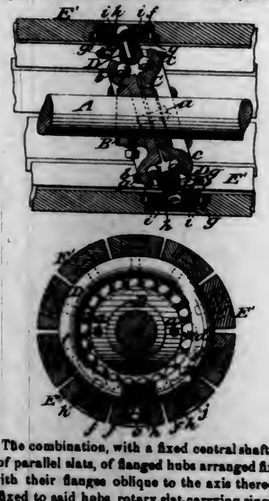
2. The guide-bar having a cylindrical exterior surface and a longitudinal channel in one side thereof, in combination with a channeling-tool fitting loosely into the channel of the guide-bar and having a projecting cutting-edge at one side and bearing at the other side against the bottom of the groove in the guide-bar, substantially as set forth.



479,500. BLASTING STONE. GEORGE M. GITHENS, Brooklyn, N. Y. Filed Jan. 2, 1892. Serial No. 416,756. (No specimens.)

Claim.—1. The method herein specified of splitting stone, consisting in drilling a hole into the stone to the place where the cleavage is to be commenced, then driving a straight-edged chisel into the stone at the bottom of the hole to start a fracture in the line of cleavage, and then continuing the separation by pressure within the hole, substantially as set forth.

2. The method herein set forth of splitting stone, consisting in drilling holes into the stone in the line of cleavage, driving into the stone at the bottom of each hole a chisel to start the fracture in the line of cleavage and continuing the splitting action by wedges within the bottoms of the holes, substantially as set forth.



3. The method herein set forth of splitting stone, consisting in

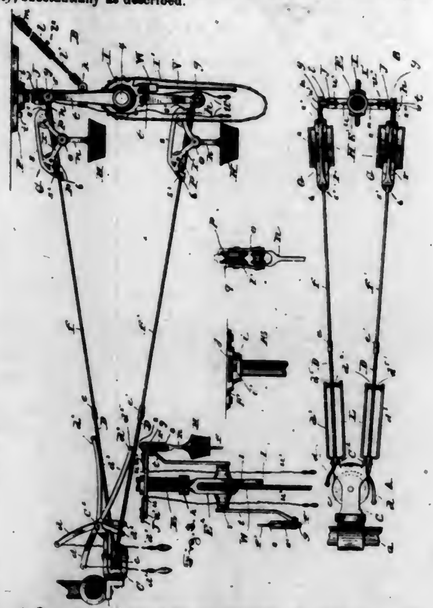
479,500.

drilling holes into the stone in the line of cleavage, driving into the stone at the bottom of each hole a chisel to start the fracture in the line of cleavage, and introducing into such holes wedges and explosive material to act on such wedges and split the stone, substantially as set forth.

479,501. CLOTH-STRETCHING MACHINE. CALVIN L. GODDARD, New York, N. Y. Filed Mar. 10, 1892. Serial No. 424,423. (No model.)

Claim.—1. The combination, with a fixed central shaft and a surrounding series of parallel slats, of flanged hubs arranged fixedly upon the said shaft with their flanges oblique to the axis thereof, flanged annular disks affixed to said hubs, rotary slat-carrying rings arranged between the flanges of said hubs and disks, and loose washers interposed between said rotary rings and the flanges of said hubs and disks, substantially as herein described.

2. The combination, with a fixed central shaft and a surrounding series of parallel slats, of hubs having concave flanges arranged fixedly upon said shaft with the said flanges oblique to the axis thereof, annular disks having concave flanges affixed to said hubs, rotary slat-carrying rings arranged between the flanges of said hubs and disks, a loose washer composed of series of balls interposed between said rotary rings and the concave flanges of said hubs and disks and retained by the concavity of said flanges, substantially as herein described.



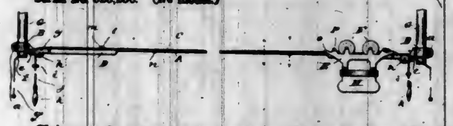
3. The combination, with the stationary shaft and the oblique heads affixed thereto, of a slat-carrying ring arranged to rotate about said heads, ball-headed pins inserted in said ring, and slats having concave sockets for the reception of the ball-heads of the pins, substantially as herein set forth.

479,502. STORE-SERVICE APPARATUS. JOHN H. GOODFELLOW, Lansingburg, N. Y., assignor, by mesne assignments, to the Lamson Consolidated Store Service Company, of New Jersey. Filed Sept. 7, 1889. Serial No. 323,267. (No model.)

Claim.—1. In a cash and parcel carrier apparatus, the combination, with two ways and a carrier adapted to move on each of said ways, of two pivoted arms, each of said arms supporting one end of each way, a pulley for supporting the opposite ends of the ways, means for moving said arms to change the inclination of the respective ways, and a flexible connection attached to the ends of the ways, substantially as specified.

2. In a cash and parcel carrier apparatus, the combination, with two ways and a carrier adapted to move on either of the ways, of two pivoted arms suitably mounted and supported so as to alternately raise and lower the two ways connected thereto, a suitably-mounted pulley serving as an intermediate support at the opposite terminus of the ways, whereby the movement of the arms will cause each way to move bodily over the pulley, and suitable operating appliances to revolve the crank-shaft to alternately change the position of each way for the purpose of causing the carrier or carriers to gravitate in either direction, substantially as described.

3. A store-service apparatus consisting of a way pivotally connected to and supported by an arm secured to a shaft journaled in a suitable support and the other end supported by a pulley, suitable connecting devices for holding the way taut against the action of the arm, a carrier on the way and means for holding it near the lever, means for contacting the carrier and imparting a motion thereto upon the arm moving upwardly, and a catch retaining the said arm in a raised position, whereby the carrier will be impelled along the way by gravity, substantially as described.



4. In a cash and parcel carrier apparatus, the combination, with a cash and parcel carrier, of an extensible support therefor consisting of a pair of crooked arms, one of which is pivotally connected to the carrier-frame, so as to swing loosely therefrom in the line of travel, and the other rigidly connected to the receptacle, and a connecting-link having its opposite ends pivotally connected to the free ends of the said arms and adapted to move thereon at right angles to the line of travel, said arms being so constructed and arranged that when the receptacle is elevated the pivotal connections of the receptacle arm and link will be at a point past the vertical line of the opposite pivotal point, whereby the receptacle will be retained in a raised position, substantially as described.

5. In a cash and parcel carrier apparatus, the combination of a way supported at one end by a pivoted arm and the opposite end supported by a pulley, a spring connected to the said pulley, causing the latter to take up the said way, a sprocket-wheel and chain for operating the lever to change the inclination of the way, and a latch for locking the arm in any desired position, substantially as described.

6. In a cash or parcel carrier apparatus, the combination, with two connected pivoted arms, of a horizontally-pivoted bracket having a vertically-pivoted pulley therein, and a way passing around the said pulley and having its opposite ends secured to the said arms, and means whereby the said arms may be alternately raised and lowered, substantially as described.

7. In a cash or parcel carrier apparatus, the combination, with a horizontal shaft, of two arms extending therefrom in opposite directions, a sprocket-wheel mounted on the said shaft, a way having its opposite ends secured to the ends of the said arms, a pulley around which the central portion of the way passes, and spring-actuated pressed bars extending contiguous to the paths of the ends of the said ways when elevated and adapted to engage the carriers thereon or to make contact with the said carriers and to impart a movement thereto, and a chain passing over the said sprocket-wheel, whereby the ends of the said way may be alternately raised or lowered by revolving the said shaft, substantially as described.

479,503. STORE-SERVICE APPARATUS. JOHN H. GOODFELLOW, Lansingburg, N. Y., assignor, by mesne assignments, to the Lamson Consolidated Store Service Company, of New Jersey. Filed Sept. 7, 1889. Serial No. 323,268. (No model.)

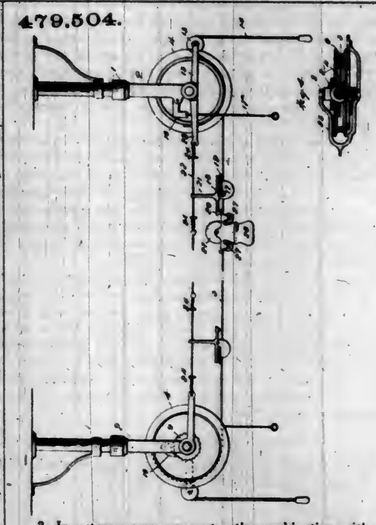
Claim.—1. In a store-service apparatus, the combination, with a fixed track extending from station to station, of an elastic treadway having its one end secured to the said track, means for distending the said treadway parallel to the said track, a carrier adapted to rest on the track and treadway, and means carried by the said treadway for engaging the carrier, substantially as described.

2. In a store-service apparatus, the combination, with a fixed track extending from station to station, of an elastic treadway secured to the said track, a carrier adapted to travel on the said track and treadway, means for distending the end of the said treadway in a line parallel with the track, a stop i, limiting the contraction thereof, and means carried by the end of the said treadway for engaging the carrier, substantially as described.

3. In a store-service apparatus, the combination, with a fixed track, of a carrier adapted to travel thereon, an elastic treadway supported by the said track and carrying the said carrier, means upon the end of the said treadway adapted to engage the said carrier, and a pulley over which a continuation of the said treadway passes in a line parallel to the line of the track, substantially as described.

4. In a store-service apparatus, the combination, with a fixed track extending from station to station, of an elastic treadway secured to and upon the said track and carrying means adapted to engage a carrier, a carrier adapted to rest on the said treadway, and means whereby the ends of the said treadway may be distended parallel to the line of the track, and a stop whereby the contraction of the said treadway will be suddenly limited, substantially as described.

5. In a store-service apparatus, the combination, with brackets, of a fixed track extending between the said brackets, an elastic treadway upon the said track and having means adapted to engage a carrier, a carrier adapted to travel over the said elastic treadway, a pulley mounted in each of the said brackets, over which the ends of the said treadway extend in a line parallel to the line of the track, stops i, whereby the contraction of the said treadway may be suddenly stopped, and pawls whereby the said ends may be retained in their extended position, substantially as described.

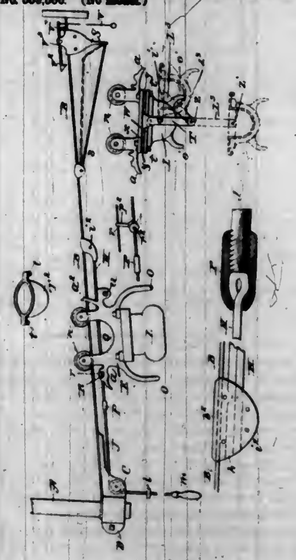


6. In a store-service apparatus, the combination, with a fixed track extending from station to station, of a carrier adapted to travel on the said track, an elastic treadway supported by the said track and carrying the said carrier, means for extending the end of the said elastic treadway in a line parallel to the line of the track, and a catch mounted upon the end of the said treadway and adapted to automatically engage the carrier and to become automatically disengaged therefrom upon the contraction of the elastic treadway, substantially as described.

479,504. STORE-SERVICE APPARATUS. JOHN H. GOODFELLOW, Lansingburg, N. Y., assignor, by mesne assignments, to the Lamson Consolidated Store Service Company, of New Jersey. Filed Oct. 17, 1889. Serial No. 327,386. (No model.)

Claim.—1. In a store-service apparatus, the combination, with two normally-balanced spring-pulleys, one at each station, the said pulleys being concentrically mounted upon fixed supports, of a wire-way extending from station to station and passing around the periphery of the said pulleys to which it is attached, a carrier mounted upon the said way, and means whereby the said way may be wound upon one of the said pulleys against the tension of the opposite pulley, substantially as described.

2. In a store-service apparatus, the combination, with two antagonistic spring-pulleys, one at each station, of a way extending therebetween and passing over and secured to the said pulleys, a carrier moving on the said way, a follower secured to the way near each end thereof and having a catch adapted to engage the said carrier, means for winding the way upon one of the said pulleys against the tension of the opposite pulley, and detents adapted to trip the catch of the said followers upon the way resuming its normal position, substantially as described.

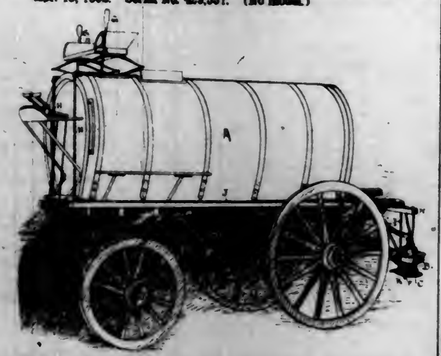


479,504.

3. In a store-service apparatus, the combination, with two antagonistic spring-pulleys, one at each station, of a way extending therebetween and passing over and secured to the said pulleys, a carrier moving on the way, a follower secured to the way near each end thereof and having a latch adapted to engage the said carrier, a pull-cord passing around each of the said pulleys in directions opposite to that of the cable, a clutch adapted to engage each of the pulleys, and a detent adapted to disengage the latch on each follower from the carrier upon the follower reaching the forward limit of its movement, substantially as described.

4. In a store-service apparatus, the combination, with the longitudinally-movable way and with a carrier moving thereon, of a clip secured to the said way, a lever pivoted in the said clip and having its one arm engaging the said carrier, and a stop adapted to retract another arm of the said lever when the way has reached the end of its movement, whereby the carrier will be disengaged, substantially as described.

479,505. STORE-SERVICE APPARATUS. JOHN H. GOODFELLOW, Lansingburg, N. Y., assignor, by mesne assignments, to the Lamson Consolidated Store Service Company, of New Jersey. Filed July 22, 1890. Serial No. 359,586. (No model.)



Claim.—1. In a store-service apparatus, the combination, with a track and a carrier adapted to travel thereon, of a propelling means consisting of an elastic cord or band having one end clipped to the track, means secured to the motor to check, engage, and hold the carrier, a traveling guide secured to said motor, and means for tensioning the motor to create power to impel the carrier over the track, substantially as specified.

2. In a store-service apparatus, the combination, with a track and a carrier provided with a wheel, of an elastic cord connected to the track at one end and to a support at the other to form a stop at an angle to the track and in line therewith, said wheel adapted to engage said elastic cord and distend the same out of its normal position, and a suitable catch for holding the carrier against the tension of the cord, whereby when released the cord will set the carrier in motion and resume its normal position, substantially as described.

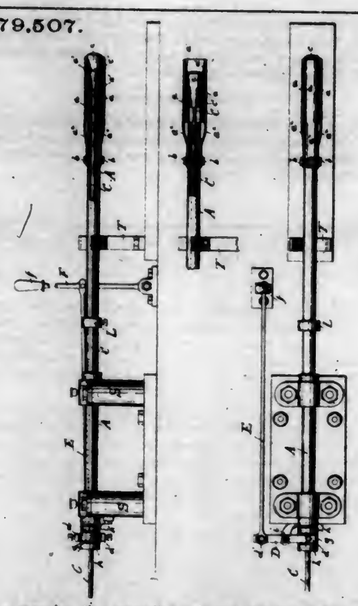
3. In a carrier for store-service apparatus, the combination, with a carrier-frame having bearing-wheels journaled therein, of a receptacle hung from the said frame by pivoted arms, the arms being folded back upon themselves upon raising the said receptacle, and a downwardly-pressed plate yieldingly secured to the under surface of the frame and adapted to be raised by the receptacle when in a raised position and to hold the said receptacle in that position by its resistance to the initial horizontal component of the circular motion of the receptacle, substantially as described.

479,506. SPRINKLER. JOHN B. HAMERLY, South Bend, Ind. Filed Apr. 15, 1892. Serial No. 429,331. (No model.)

Claim.—1. In a sprinkler B, having a transverse issue-slot, a severed ring C, adjustable to cover said slot more or less at will, said ring being adapted by resiliency to clasp said cylinder tightly, and means whereby the ends of said ring may be forced apart to loosen the same and cause it to slide easily.

2. In a sprinkler B, having a transverse issue-slot, a severed ring C, adjustable to cover said slot more or less, said ring being adapted by its resiliency to clasp said cylinder, and means whereby the severed ends of said ring may be forced apart to loosen it upon said cylinder, and means whereby the driver while upon his seat may operate the device for separating the ends of said ring and moving it upon said cylinder.

3. In a sprinkler B, having a transverse issue-slot, and elastic severed ring C, adapted by its resiliency to clasp said sprinkler B, the lever F, placed between the ends of said ring to force the same apart, and a system of rock-shafts and connecting-rods whereby the driver while on his seat may operate said ring to shift its adjustment as to said issue-slot.



4. In a sprinkler-head B, having a transverse issue-slot, a severed ring C, a supplemental spring L, a lever F, and rock-shafts and connecting-rods whereby the driver while on his seat may operate said ring, as set forth.

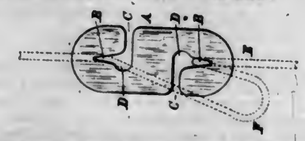
479,507. APPARATUS FOR MANUFACTURING METAL TUBES. EDMUND F. HARTSHORN, of Newark, assignor to Stewart Hartshorn, Short Hills, N. J. Filed June 10, 1891. Serial No. 396,753. (No model.)

Claim.—1. In an apparatus for soldering shade-rollers, in combination, the tube A, supported at one end and near the middle and adapted to turn in its bearings, provided with the expansible ends *a a*, the rod C, having the conical head *c* engaging the expansible ends, and means for moving and holding the rod within the tube at any position, whereby the ends are caused to expand and are held fixed at any degree of expansion, substantially as described.

2. In combination, the tube A, adapted to turn in its bearings and provided with the expansible ends *a a*, the rod C, having the conical

479,507.

head *c* engaging the expansible ends, and the fixed collars *h h'*, the pivoted arm D, engaging at one end with the loose collar *g* and at the other end with the rod E, and the rod E, arranged to be moved by the lever F, substantially as and operating in the manner described.

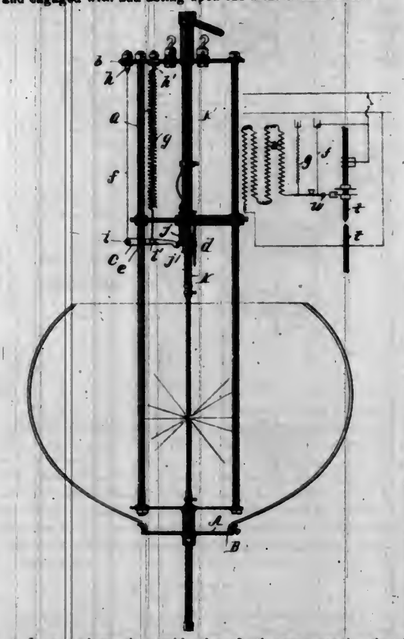


479,508. ART OF PRINTING. WILLIAM F. HERALD, New York, N. Y. Filed Jan. 20, 1892. Serial No. 418,645. (No model.)

Claim.—1. The method of obtaining a printing-surface herein described, which consists in superposing independent thin sheets of metal and a matrix material, impressing character-dies successively into the metal sheets, and stripping apart the said sheets, as set forth.

2. The method of obtaining a metallic relief-printing surface herein described, which consists in superposing two thin sheets of annealed copper and a matrix card-board, impressing successively and by sudden impacts character-dies into the copper sheets, and then stripping apart the said sheets, as set forth.

479,509. CORD-ADJUSTER FOR ELECTRIC LAMPS. JOHN W. HEAPHY, JR., Rochester, N. Y., assignor to Fred G. Kimman, same place. Filed Nov. 11, 1891. Serial No. 411,610. (No model.)



Claim.—The herein-described cord-adjuster for electric lamps, consisting of a plate or bar of suitable material having lateral throats provided with enlarged mouths communicating with an enlarged opening for the passage of a cord said opening having a tapering recess with a transverse dimension less than that of a throat to receive and hold the cord, substantially as set forth.

479,510. ELECTRIC-ARC LAMP. WILLIAM E. IRISH, Cleveland, Ohio. Filed May 4, 1892. Serial No. 431,795. (No model.)

Claim.—1. In an arc lamp, the combination, with the movable electrode, of separate clutches thereon and independently movable to positions parallel or inclined to each other, a thermo-expansive electric conductor, and means for communicating the motions of said conductor to the said clutches.

2. In an arc lamp, a single expansible conductor capable of expansion under the passage of the current and acting with a spring to control two independent clutches, one of which tends to raise and support the carbon and the other to lower the carbon while partially supporting it against falling by gravity.

3. In an arc lamp, the combination of a movable electrode, tubes loose thereon, springs partially resisting the motion of the tubes in a direction parallel to the electrode, a fulcrumed lever engaged with the upper end of the lower tube and with the lower end of the upper tube, and a thermo-expansive electric conductor and spring both under tension and engaged with and acting upon the arms of said lever.

4. In an arc lamp, the combination of a thermo-expansive electric conductor, a longitudinally extensible and compressible spring, a rod *a*, forming a part of the frame of the lamp, a lever fulcrumed thereon and pivoted at different points to said conductor and spring, adjusting-screws fastened to said rod and to said conductor and spring, a movable carbon or carbon-holder, and a clutch for said carbon or carbon-holder engaged with said lever.

5. In an arc lamp, the combination of a thermo-expansive electric conductor normally under tension, a spring under tension and reacting against the tension of said conductor, a lever whose arms are pivoted to said conductor and spring and forked at one end, a movable electrode, flanged and movable tubes upon the electrode and so engaged with said fork that the lower tine thereof is below the lower flange and the upper tine between the two flanges, and springs resisting the action of said tubes.

6. In an arc lamp, the combination of a thermo expansive electric conductor, a movable carbon or carbon-holder, tubes loose upon the carbon or carbon-holder, flanges respectively on the lower end of the upper tube and on the upper end of the lower tube, rods parallel to the carbon and passing loosely through said flanges, springs on said rods and pressing upon said flanges, and means engaged with said conductor and with said flanges for communicating motion from said conductor to said tubes.

479,511. NUT-LOCK. CHARLES IVES, Clinton, N. Y. Filed Oct. 26, 1891. Serial No. 409,790. (No model.)

Claim.—1. The combination of fish-plates, each having a longitudinal rib thereon, perforations for bolts therein in line with the ribs, a bolt having recessed head adapted to engage the rib on one plate, a lock-body having a groove adapted to engage the rib on the other plate and a dovetailed projection from the side, a nut, and a locking-piece adapted to engage on the dovetailed projection and abut against the side of the nut, substantially as set forth.

2. The combination, with a bolt and nut, of a lock-body adapted to engage the surface on which it rests and provided with dovetailed projection to one side of the surface on which the nut engages the lock-body, and a locking-piece adapted to engage on the dovetailed projection and abut against the side of the nut, substantially as set forth.

3. The combination, with a bolt having a head adapted to engage the surface with which it contacts and prevent rotation thereof, of a nut and nut-lock consisting of a body portion adapted to engage the surface on which it rests and having a dovetailed projection to one side of the body on which the nut engages, a locking-piece adapted to engage on the dovetailed projection, and a pin for securing the body and locking-piece together, substantially as set forth.

4. The combination, with a rail, of fish-plates 2 2, having ribs 2^a, a bolt 3, having a head 4 with recess 4^a, a nut 5, lock-body 6, having a groove 6^a and dovetailed projection 6^b, and a locking-piece 7, which abuts against the side of the nut, and pin 8, substantially as set forth.

479,512. METHOD OF CONVERTING MESQUITE-BEANS. THOMAS H. JACOBS, San Antonio, Tex. Filed Feb. 16, 1892. Serial No. 421,737. (No model.)

Claim.—The herein-described method of producing flour from the mesquité-bean, which consists, first, in a preliminary drying of the bean as a whole to eradicate moisture; second, breaking the thus-dried bean into short pieces to render it more readily affected by the heat and uniformly roasted; third, roasting the broken particles to render friable or more brittle; fourth, grinding the mass, and, fifth, separating the powdered bean and outer pod from the hull, these steps being carried out in the order named, substantially as and for the purpose specified.

479,513. NEWSPAPER-FILE. CHARLES H. JAENICKE, Eagle Pass, Tex. Filed Jan. 16, 1892. Serial No. 418,232. (No model.)

Claim.—The combination, with a standard formed at or near its upper and lower ends, respectively, with a suitable perforation extending through the same from the back to the front thereof, of springs arranged upon the back of the standard, one near each end thereof and each formed at its free end with an eye registering with said respective perforations of the standard, and a binder-rod disposed upon the side of the standard opposite that upon which the springs are located and having its ends extended or bent inwardly, with the lower end thereof passing loosely through the perforation near the lower end of the standard and connected loosely with the eye of the lower spring, the upper end of said binder-rod passing loosely through the perforation near the upper end of the standard and also through the eye of the upper

spring and provided at such end with a thumb nut or cap for releasably securing the end of said rod to the spring, substantially as and for the purpose set forth.

479,514. CHICKEN-COOP. ANDREW H. KINDLE, Versailles, Mo., assignor of one-half to Charles H. Mason, same place. Filed Nov. 17, 1891. Serial No. 412,206. (No model.)

Claim.—1. The herein-described knockdown chicken-coop, the same consisting of a base, ends hinged thereto and having laterally-projecting pins at their free corners, staples in the edges of the base, a top having spring-loops at its corners, and sides hinged to the edges of said top and having eyes passing over said staples, as and for the purpose set forth.

2. The herein-described knockdown chicken-coop, the same consisting of a base, ends hinged thereto and having laterally-projecting pins at their free corners, a top having spring-loops at its corners adapted to engage said pins, and also having hooks adapted to engage the upper edges of the ends, and sides hinged to the edges of said top and detachably secured to the edges of the base, as and for the purpose set forth.

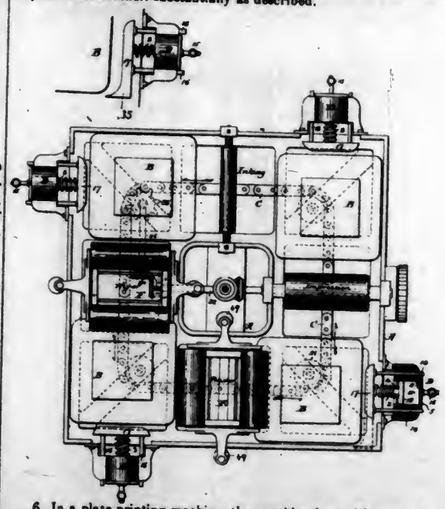
3. The herein-described knockdown chicken-coop, the same consisting of a base having staples in its edges and hooks in its upper face, ends hinged to said base and having laterally-projecting pins at their free corners, a top having spring-loops at its corners and small hooks at its ends detachably engaging said pins and the upper edges of said ends, said upper edges taking under the hooks in the base when the ends are folded, doors in the top, sides hinged to the edges of said top, and eyes carried by the free edges of the sides and passing over said staples in the base, as and for the purpose hereinbefore set forth.

479,515. OLIVE DYE. RICHARD LAUCH, Elberfeld, Germany, assignor to the Farbenfabriken, vormals Fr. Bayer & Co., same place. Filed Nov. 18, 1891. Serial No. 412,312. (Specimens.) Patented in France Dec. 2, 1887, No. 187,365.

Claim.—1. The process of producing a new coloring-matter, which consists in reacting with one molecule of tetrazo-diphenyl upon one molecule of salicylic acid and one molecule of alpha-naphthylamine, treating said product with fuming sulphuric acid, diazotizing the thus-obtained sulphonated product, combining the so-formed diazo compound with one molecular proportion of the sodium salt of dihydroxy-naphthaline monosulpho-acid, and treating the dye-stuff thus obtained with fuming sulphuric acid.

2. The new dye-stuff hereinbefore described, which forms in a dry state a grayish-black powder difficultly soluble in cold water and more easily in hot water and soluble in diluted solutions of sodium carbonate, with olive color, which latter becomes brownish red by adding sodium carbonate in excess, soluble in soda-lye and ammonia, with brownish-red color, from which on the addition of acids a grayish-green fine precipitate separates, the liquid becoming almost colorless; in concentrated sulphuric acid it dissolves, with violet color, that turns green by adding water, but after some time a blackish-green precipitate separates and the liquid becomes almost colorless, and it dyes unmordanted cotton olive in alkaline-soap baths.

479,516. PLATE-PRINTING MACHINE. HOMER LEE, New York, N. Y. Filed Sept. 12, 1887. Serial No. 249,535. (No model.)



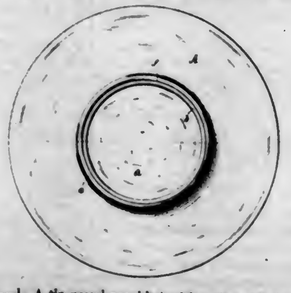
Claim.—1. The combination, with the polygonal bed or plank, of the pneumatic cushioning apparatuses having valves for varying their effect and each located at the end of the different planes of movement of the plank to contact with a different one of the sides of the plank as it travels in a polygonal path, substantially as described.

2. In a printing-machine wherein the bed or plate travels in a polygonal path, the combination, with the bed, of a buffer located at the point of the change in the direction of the bed and having a curved guiding-face, substantially as described.

3. The combination, in a plate-printing machine, of a traveling bed carrying the plate, an inking apparatus, a wiper for removing the ink from the surface of the latter, and a moving polisher arranged at an angle to the longitudinal axis of the wiper, substantially as described.

4. The combination, in a plate-printing machine, of a traveling bed carrying the plate, an inking apparatus, a wiper having a moving cloth for removing the ink from the surface of the plate, and a polisher arranged at an angle to the longitudinal axis of the wiper, substantially as described.

5. The combination, in a plate-printing machine, of a traveling bed carrying the plate, an inking apparatus, and a plurality of moving wipers with their longitudinal axes arranged at different angles with respect to each other, substantially as described.



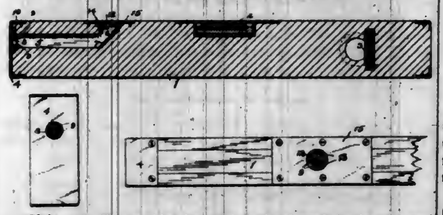
6. In a plate-printing machine, the combination, with two independent mechanical wipers, of a moving bed or plank carrying a plate moving under and in contact with each of said wipers and means for causing the plank to change its presenting or forward end after passing one wiper and before reaching the other, substantially as described.

7. In a plate-printing machine, the combination, with a moving bed or plank carrying a plate, of two mechanical wipers and means for moving the wipers in paths across the surface of the plate at an angle to each other, substantially as described.

8. In a plate-printing machine, the combination of two elliptically-moving wipers and a mechanically-moving plate with means for causing the plate after passing under one of said wipers to change its direction at right angles to its first movement before passing under the other wiper, substantially as described.

9. In a plate-printing machine, the combination of two mechanically-moved wipers having progressively-moved cloths and a mechanically-moved plate with means for causing the plate after passing under one of said wipers and cloths to change its direction at right angles to its first movement before passing under the other wiper and cloth, substantially as described.

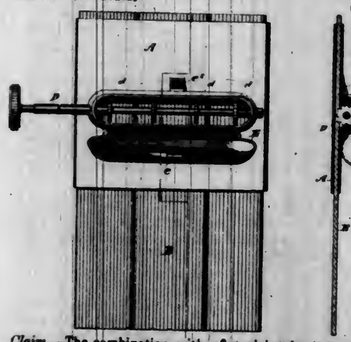
479,517. ANTI-RUST VESSEL. GEORGE W. LEE, Clifton Springs, N. Y. Filed Mar. 18, 1892. Serial No. 425,478. (No model.)



Claim.—1. A tin vessel provided with a sheet of zinc having its edges bound or covered with a strip of tin firmly pressed thereon and forming with said zinc sheet a piece or part separate from the vessel, said piece or part thus constructed being secured to the vessel, substantially as shown and described.

2. A vessel formed with a sheet of zinc having its edges bound with a strip of tin firmly secured thereto, as by pressure, the tin and zinc parts together constituting a rigid piece or part separate from the vessel and secured to the latter, said vessel being formed with an inclosing bead for the rigid piece or part, substantially as shown and set forth.

3. A sheet of zinc having its edge covered or bound with a strip of tin rigidly pressed thereon, the parts together constituting a rigid piece, the strip of tin being folded or doubled at one side of the zinc sheet to form a smooth edge and left raw at the other side of the zinc, said rigid piece being soldered to the bottom or wall of a tin vessel with the smooth edge of the tin strip turned from the contiguous part of the vessel, substantially as shown.

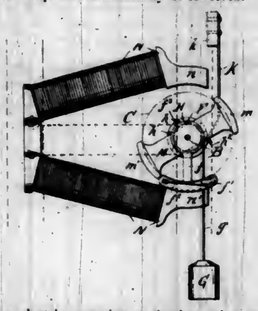


479,518. LEVELING-INSTRUMENT. CHARLES H. LOCKWOOD, Rochester, N. Y., assignor of one-half to Joseph A. Begy, same place. Filed Dec. 12, 1891. Serial No. 414,855. (No model.)

Claim.—1. The combination, with the level-stock having the passages arranged at right angles to each other and the mirror arranged at the intersection of the passages, of the two open rings having supporting-stems, one ring being arranged in each passage, substantially as described.

2. The combination, with the level-stock having the passages arranged at right angles to each other and the mirror arranged at the intersection of the passages, of the two open rings, each having supporting-stems on opposite sides thereof arranged in the passages, the stems of the rings being arranged at right angles to each other, substantially as described.

479,519. WICK-TUBE. JAMES D. LUTHER, Brooklyn, assignor to Luther & Lederbos, New York, N. Y. Filed Jan. 25, 1892. Serial No. 419,119. (No model.)



Claim.—The combination, with a flat wick-tube A, provided with a side opening, of a wick-ratchet D, projecting through said opening, and a hollow cap E, pivoted to the wick-tube, and a catch e^4, all said parts being arranged so that said cap when closed will contact with the wick-tube and house the projecting parts of the ratchet, substantially as described, and for the purposes set forth.

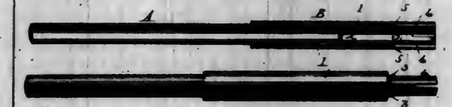
479,520. ELECTRIC SELF-WINDING CLOCK. MALCOLM MACKELLAR and GEORGE D. WEAVER, Reading, Pa. Filed Aug. 12, 1891. Serial No. 402,421. (No model.)

Claim.—1. In an electric actuating mechanism for clocks, the combination, with the clock-train and the electro-magnet, of the oscillating armature loosely mounted upon one of the train-arbors and attached directly to the actuating-weight and through a pawl-and-ratchet connection to the clock-train, and means for automatically making and breaking the circuit, all arranged and adapted to operate substantially as set forth.

2. The combination, with a clock-movement, of an electric actuating mechanism consisting of electro-magnet N N, armature M, carrying pulley F and pawl f' and loosely mounted on the arbor of ratchet-wheel C, circuit-closer H, with projections h and h' engaging a projection of the armature, as described, and a contact-spring K, all arranged and adapted to operate substantially as set forth.

3. In an electric actuating mechanism, substantially as described, the circuit-closer H, having insulations h^2 and h^4 with intermediate contact-surface h^3, in combination with the contact-spring K and means for automatically moving the circuit-closer, substantially as and for the purpose set forth.

4. In an electric actuating mechanism, substantially as described, the circuit-closer H, having a notch h^3 depressed below the insulated face of the circuit-closer, in combination with a contact-spring having an end k' adapted to firmly engage said notch, whereby perfect contact is secured and the movement of the circuit-closer retarded.

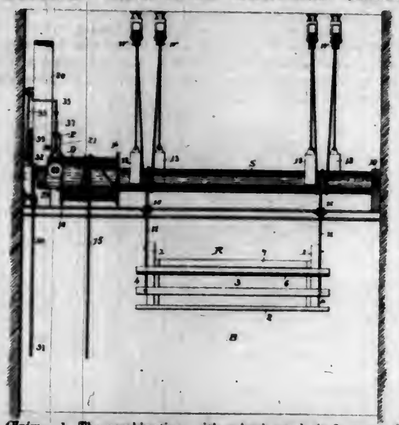


479,521. SPIRIT-LEVEL FOR MEASURING-TAPES. ERNEST MCCULLOUGH, San Francisco, Cal. Filed Apr. 6, 1891. Serial No. 387,867. (No model.)

Claim.—1. The spirit-level, with the clamps E attached to the opposite sides of the base, substantially as described, and for the purposes specified

2. A spirit-level with a spring-clamp at each end and attached on opposite sides of the base for application to tapes and other measuring devices, substantially as described, and for the purposes specified.

479,522. PENHOLDER. GEORGE MCELWAIN, Chicago, Ill., assignor of one-half to Julian Kune, same place. Filed Jan. 18, 1892. Serial No. 418,400. (No model.)

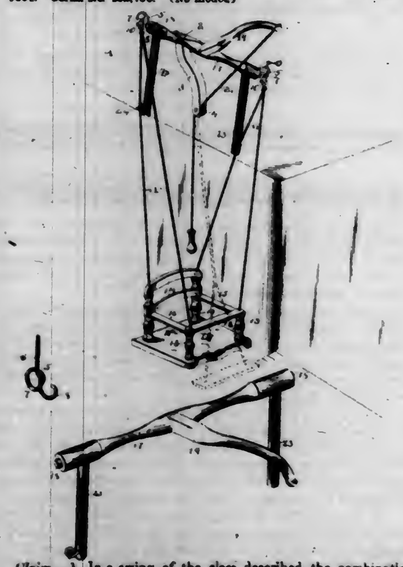


Claim.—1. In a penholder, the combination, with the stem, of the sleeve mounted thereon to slide backward and forward, said sleeve constructed and arranged to positively eject the pen on its forward movement and to permit the discharge of the same on its rearward movement, substantially as described.

2. In a penholder, the combination, with the stem provided near its forward end with a slot, of a sleeve surrounding the stem and a transverse pin fixed to the sleeve and extending through the slot normally midway between its ends, whereby the sleeve may be moved to the rear and expose the forward end of the stem and also moved forward beyond the same.

3. In a penholder, the combination, with the stem provided near its forward end with a shoulder, of a longitudinally-sliding sleeve mounted on said stem and provided near its forward end with the interior shoulder, said sleeve constructed and arranged to positively eject the pen on its forward movement and to permit the discharge of the same on its rearward movement, substantially as described.

4. In a penholder of the type herein described, the combination, with the stem having its forward end reduced to form an annular shoulder, of the sleeve mounted on said stem to slide backward and forward, said sleeve enlarged interiorly near its forward end to form an annular shoulder, substantially as described.



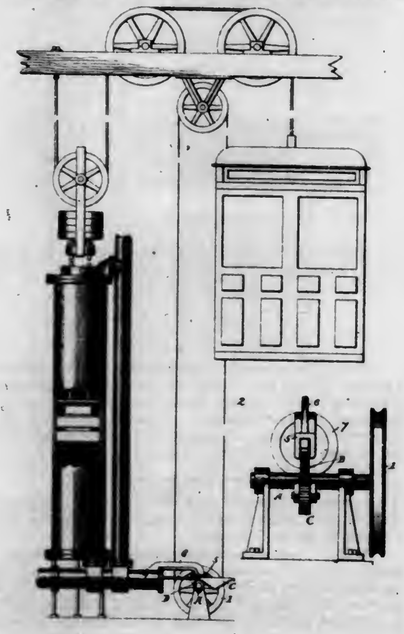
479,523. SUSPENDED RACK. JAMES J. NEWBERRY, Round Mountain, Ala. Filed Nov. 30, 1891. Serial No. 413,589. (No model.)

Claim.—1. The combination, with a horizontal shaft, means for turning the same, a suspended rack, and ropes leading therefrom to and around the shaft, of a ratchet on the shaft, a weighted and pivoted pawl engaging said ratchet, a bell-crank lever pivoted at its angle above said pawl, one end being connected therewith, an upright rod having a handle at its lower end and a crank at its upper end, its body being mounted in bearings, and a link connecting said crank with the other end of said bell-crank lever, as and for the purpose set forth.

2. The combination, with a rack located in a store, a horizontal shaft mounted in bearings in the room above, ropes leading from said rack through the ceiling and around the shaft, counterbalancing-weights on the other ends of said ropes, and an operating-rope leading to the store for turning the shaft, of a ratchet on the shaft, a pawl engaging the same, a bell-crank lever having one end connected to said pawl, a vertical rod mounted in bearings and having a handle at its lower end in the store and a crank at its upper end, and a link connecting this crank with the other end of the bell-crank lever, as and for the purpose hereinbefore set forth.

479,524. SWING. JACOB H. NICHOLSON, Roanoke, Va., assignor to the Roanoke Wood Novelty Company, same place. Filed Aug. 15, 1891. Serial No. 402,738. (No model.)

Claim.—1. In a swing of the class described, the combination, with the depending standard secured to a ceiling and provided with a pulley, the hooks arranged at opposite sides of the standard, rings removably mounted in the hooks, and ropes depending from the rings and connected with the seat, of a rock-shaft removably mounted in bearings at the inner sides of the hooks, a central rock-arm extending forwardly from the shaft, a propelling-rope connected to the end of the rock-arm and passing rearwardly over the pulley of the standard, from which latter it depends, and opposite rock-arms depending from the ends of the rock-shaft and removably connected with opposite seat-suspension ropes, substantially as specified.



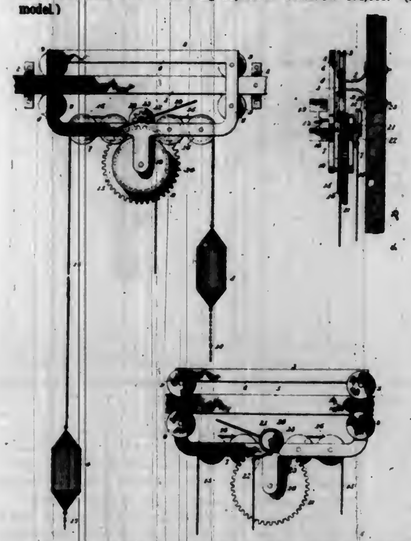
2. In a swing of the class described, the combination, with the securing-plate connected with the ceiling and having the depending bifurcated standard provided with a grooved pulley, the opposite hooks arranged at equidistant sides of the standard and consisting of the shank portions, the coiled hooks beyond the same and terminating in the bearing eyes, the rings mounted in the hooks, the opposite pairs of ropes depending from the rings, and the seat supported at the lower end of the ropes, of the transverse rock-shaft terminating in bearings removably mounted in the bearing-eyes of the hooks, the centrally-located and forwardly-disposed rock-arm projecting from the shaft, the propelling-rope connected to the front end of the arm, passed rearwardly over and depending from the grooved pulley, and terminating in a pull, the opposite rock-arms depending from the rock-shaft near the ends thereof and disposed at a right angle to the central rock-arm, and the coiled hooks extending from the lower ends of the end rock-arms and removably engaging with the rear ropes, substantially as specified.

479,525. ELECTRIC CONDUCTOR. FREDERIC A. C. PERRINE, Trenton, N. J., assignor to the John A. Roebling's Sons Company, same place. Filed Sept. 23, 1891. Serial No. 406,562. (No model.)

Claim.—1. The combination, with a single-strand conductor twisted to spiral form, of a covering of paper or other suitable material applied about the conductor and supported on the exterior lines of the spiral to form air-spaces between the conductor and covering, substantially as described.

2. The combination, with a flat conductor twisted to spiral form, of a covering of paper or other suitable material applied about the conductor and supported on the edges of the conductor to form air-spaces between the conductor and covering, substantially as described.

479,526. MECHANICAL MOVEMENT. GEORGE H. REYNOLDS, New York, N. Y., assignor, by mesne assignments, to the National Company, Chicago, Ill. Filed Mar. 4, 1892. Serial No. 423,781. (No model.)



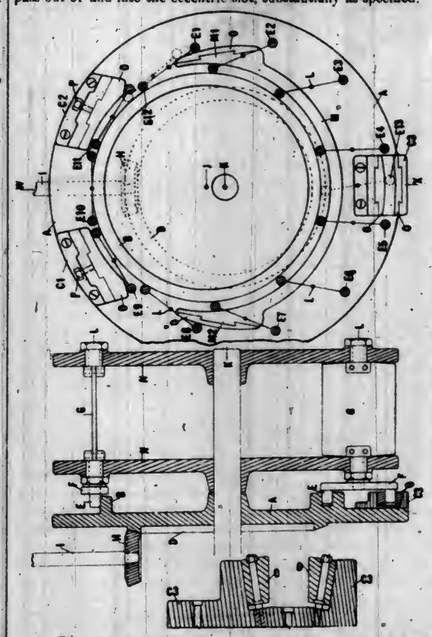
Claim.—1. A mechanical movement consisting of a shaft, a pinion secured to and arranged at one side of the axis of said shaft with the periphery intersecting said axis, and a rack engaging said pinion, substantially as set forth.

2. The combination of a shaft, a regular pinion carried by said shaft at one side of the axis thereof, a rack engaging with said pinion, and a guide arranged to hold the pinion and rack in gear, substantially as set forth.

3. The combination, in a mechanical movement, of a shaft, a regular pinion carried at one side of the axis of said shaft, and a rack having two inclined toothed edges and gearing with said pinion, substantially as described.

479,527. FIRE-ESCAPE. CHARLES R. RICE and LEWIS R. MCDONALD, Little Rock, Ark. Filed July 29, 1891. Serial No. 401,063. (No model.)

Claim.—In a fire-escape, the combination of a track-bar, a car or hanger provided with rollers and mounted on the track-bar and provided with a depending extension, a large pulley 14, journaled on the lower end of the extension, the two pairs of small pulleys arranged at opposite sides and above the large pulley 14 and the inner pulleys of each pair having their inner sides located directly over the large pulley 14, a cable passing under the large pulley 14 and converging at the top of the same and passing over the small pulleys, the latter causing the cable to bind against the large pulley 14 and to produce friction and to retard rotation, baskets secured to the ends of the cable, and means for controlling the descent of the baskets, substantially as described.



479,528. FEATHERING PADDLE-WHEEL. GEORGE T. RIGGS, Plainfield, N. J. Filed Oct. 14, 1891. Serial No. 408,713. (No model.)

Claim.—1. The combination, with a shaft and wheel, of buckets pivoted to the wheel and having their edges equidistant at each side of the pivots, a cross-arm connected with a pivot of each bucket and two crank-pins near the ends of such arm, and a cam-slot eccentric to the axis of the wheel, receiving the respective crank-pins, such slot being open at one side and provided with stationary auxiliary guides for moving the respective crank-pins out of and into such eccentric slot, substantially as specified.

2. The combination, with the shaft and wheel, of buckets pivoted to the wheel and having their edges equidistant at each side of the pivots, a cross-arm connected with a pivot of each bucket and two crank-pins near the ends of such arm, a cam-slot eccentric to the axis of the wheel, receiving the respective crank-pins, such slot being open at one side and provided with stationary auxiliary guides C' C^2 for moving the respective crank-pins out of and into such eccentric slot, and the guiding-cam C^3, substantially as specified.

3. The combination, with the shaft and wheel, of buckets pivoted to the wheel and having their edges equidistant at each side of the pivots, a cross-arm connected with the pivot of each bucket and two crank-pins near the ends of such arm, a cam-slot eccentric to the axis of the wheel, which slot receives the respective crank-pins and is open at one side, and stationary auxiliary guides having separate removable faces for moving the respective crank-pins as they pass out of and into the eccentric slot, substantially as specified.

4. The combination, with the shaft and wheel, of buckets pivoted to the wheel and having their edges equidistant at each side of the pivots, a cross-arm connected with the pivot of each bucket and two crank-pins near the end of such arm, a cam-slot eccentric to the axis of the wheel, which slot receives the respective crank-pins and is open at one side, stationary auxiliary guides having adjusting-screws, and separate removable faces for moving the respective crank-pins as they pass out of and into the eccentric slot, substantially as specified.

5. The combination, with the shaft and wheel, of buckets pivoted to the wheel and having their edges equidistant at each side of the pivots, a cross-arm connected with a pivot of each bucket and two crank-pins near the ends of such arm, a plate surrounding the wheel-shaft and having a cam-slot eccentric to the axis of the wheel, and mechanism for turning the plate and the parts carried by it, the slot receiving the respective crank-pins and being open at one side, and auxiliary guides connected to the plate and moving the respective crank-pins out of and into such eccentric slot, substantially as specified.

6. The combination, with the shaft and wheel, of buckets pivoted to the wheel and having their edges equidistant at each side of the pivots, a cross-arm connected with the pivot of each bucket and two crank-pins near the ends of such arm, a cam-slot eccentric to the axis of the wheel and having a removable facing at one side of the slot, the slot being open at one side, and auxiliary guides for moving the respective crank-pins out of and into the eccentric slot, substantially as specified.

7. The combination, with the shaft and wheel, of buckets pivoted to the wheel, crank-arms connected with the buckets, and a plate having an eccentric cam-slot and a circular wheel, the periphery of which forms the inner side of the eccentric cam-slot, substantially as set forth.

479,529. BASKET HANDLE OR CARRIER. SAMUEL F. ROBBINS, Langhorne, Pa. Filed Dec. 10, 1891. Serial No. 414,563. (No model.)

Claim.—The handle for baskets and the like, composed of two pieces of wire, one of which is bent to form two diverging arms, the

point of divergence of which is bent laterally in parallel lines and spirally wound around one end of the other wire, the latter comprising a third diverging arm, all said arms being provided with hooks or basket-engaging portions at their outer extremities, substantially as described.

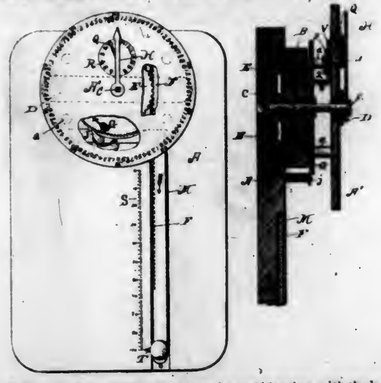
479,530. FLOATING FIGURE. EDWARD P. ROBERTS, Cleveland, Ohio. Filed Oct. 5, 1891. Serial No. 407,719. (No model.)

Claim.—1. As a new article of manufacture, a receptacle, a fluid contained therein, a hollow body submerged in said fluid having an orifice through which the fluid may flow into and out of said body, a substance contained in said body which is adapted to chemically combine with said fluid and generate a gas whereby the fluid is expelled from said body, and automatically-acting means for periodically permitting the escape of the gas and consequent readmission of the fluid, whereby said body automatically rises and falls in said fluid, substantially as set forth.

2. The combination of a receptacle and a fluid contained therein with a hollow buoyant body having two orifices, one in its lower end and one in its upper end, an automatically-closing valve adapted to close the upper orifice, and a substance contained in said body adapted to chemically combine with said fluid and produce a gas, and means for opening said valve, substantially as and for the purpose specified.

3. The combination of a receptacle and a fluid contained therein with a hollow buoyant body having two orifices, one in the lower part and one in the upper part, a valve adapted to close the upper orifice, a float attached to said valve, and a substance contained in said body adapted to chemically combine with said fluid and produce a gas, substantially as and for the purpose specified.

4. The combination of a receptacle and a fluid contained therein with a hollow glass figure having a bifurcated lower end, thereby forming two legs, said figure having one orifice in its upper end and another in one leg, a float-valve adapted to close the upper orifice, and a substance contained in the imperforate leg which is adapted to chemically combine with the said fluid and produce a gas, substantially as and for the purpose specified.

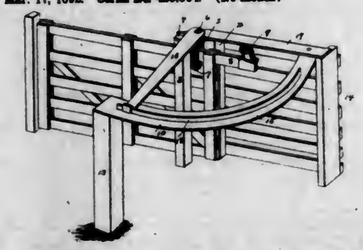


5. The combination of a receptacle and a fluid contained therein with a hollow glass figure having its lower part non-transparent, said figure having two openings, one in the lower and one in the upper part, a float-valve adapted to close the upper opening, and a substance contained in said figure adapted to chemically combine with said fluid and produce a gas, substantially as and for the purpose specified.

6. The combination of a receptacle and a fluid contained therein with a hollow buoyant body having two orifices, one in the upper part and one in the lower part, a valve adapted to close said upper orifice, a stem to said valve extending out through said orifice, an adjustable stop adapted to be engaged by the outward extension of said valve, whereby the valve is opened, and a substance contained in said body adapted to chemically combine with said fluid and produce a gas, substantially as and for the purpose specified.

7. The combination of a receptacle and a fluid contained therein with a hollow buoyant body having two orifices, one in its upper and one in its lower end, a valve adapted to close said upper orifice, having a stem extending out through said orifice, a stop arranged to be engaged by the outward extension of said valve when the final outlet of the upper orifice is above the level of said fluid, and a substance contained in said body adapted to chemically combine with said fluid and produce a gas, substantially as and for the purpose specified.

8. A hollow buoyant body having two orifices, one in the upper part and one in the lower part, and a substance contained in said body and adapted to chemically combine with a fluid in which the body may be placed and generate a gas, combined with a float-valve adapted to close the upper orifice, substantially as and for the purpose specified.

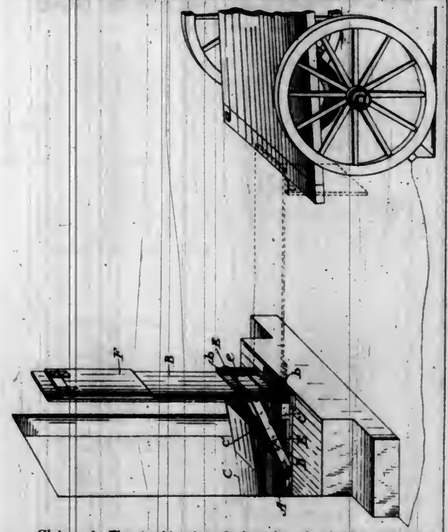


479,531. ADDING-MACHINE. RINALDO S. ROBERTSON, Artondale, Wash. Filed Oct. 16, 1891. Serial No. 408,589. (No model.)

Claim.—1. In an adding-machine, the combination, with the body, the dial mounted on the body and having a series of numbers arranged in a circle, the axle carrying a hand adapted to swing upon the outside of the dial, and the ratchet-wheel G, fixedly mounted upon the axle, of a drum loosely mounted on the axle and carrying a pawl adapted to engage and rotate the ratchet-wheel G in one direction, a pinion fixedly connected to the drum, the scale S, and the longitudinally-movable rack-bar engaging the pinion of the drum and carrying a finger or index, substantially as and for the purpose set forth.

2. In an adding-machine, substantially as described, the combination, with the body, the dial mounted on the body and having a series of numbers arranged in a large circle and a series of numbers arranged in a smaller circle, the axle carrying a hand adapted to swing upon the outside of the dial, the shaft 1, carrying a hand adapted to swing upon the outside of the dial, a sprocket-wheel fixed on said shaft, and the ratchet-wheel G, fixedly mounted upon the axle and carrying a depending lug adapted to engage the teeth of the sprocket-wheel, of the drum loosely mounted on the axle and carrying a pawl adapted to engage and rotate the ratchet-wheel G in one direction, a pinion fixedly connected to the drum, the scale S, and the longitudinally-movable rack-bar engaging the pinion of the axle and carrying an indicator, substantially as and for the purpose set forth.

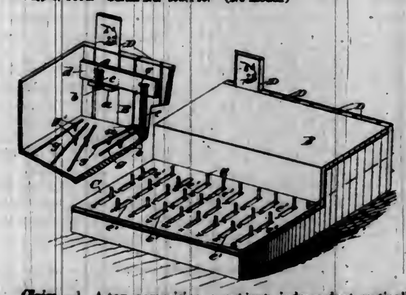
479,532. GATE. WILLIAM H. H. SALLEE, Rutledge, Mo. Filed Mar. 17, 1892. Serial No. 425,304. (No model.)



Claim.—1. The combination of a gate, a swiveled hanger having a roller supporting the gate, a swiveled roller mounted at the inner end of the gate and extending upward therefrom, and a curved track-bar arranged to be engaged by the swiveled roller, substantially as described.

2. The combination of a gate, a swiveled hanger having a roller supporting the gate, a straight track-bar disposed in a line with the gate, a curved track-bar extending from the rear end of the straight track-bar, and a swiveled caster mounted on the inner end of the gate and projecting upward and adapted to engage the lower faces of the track-bars, substantially as described.

3. The combination of a gate, a swiveled hanger provided with a roller and supporting the gate, a swiveled caster mounted on the inner end of the gate, a straight track-bar extending from and arranged in a line with the gate, the frame comprising the curved track-bar provided with a flange, the vertical post supporting the outer end of the curved track-bar, and a brace 16, having one end secured to the curved track-bar and bracing the same, substantially as described.



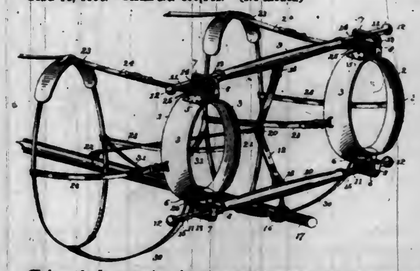
479,533. DRAWBRIDGE FOR SIDEWALKS, &c. JOHN F. SCHULTE, Brooklyn, N. Y. Filed Jan. 25, 1892. Serial No. 419,116. (No model.)

Claim.—1. The combination of a base-board, a bridge connected thereto to swing in a vertical plane, a foot-board, means to elevate said foot-board, and connections between said foot-board and said bridge, substantially as shown and described.

2. The combination of a base-board, a bridge connected thereto to swing in a vertical plane, a foot-board, a spring interposed between the base-board and the foot-board, arms pivotally connected to the base-board and having a sliding connection with the bridge, and links connecting the foot-board with the arms, substantially as shown and described.

479,534. TOY. GEORGE W. SHAMAN, Jr., Allegheny, Pa. Filed Aug. 4, 1891. Serial No. 402,146. (No model.)

Claim.—1. A toy comprising a cabinet, independent vertically-movable picture-slides therein, a contractile spring for each slide that elevates the slide, a set of reciprocating trigger-rods for each slide, adapted to hold it depressed and release it when all the rods of a set are moved, and a letter for each rod, substantially as described.



2. The combination, with a cabinet and a series of independent picture-slides vertically movable therein, of a transverse cross-bar in the cabinet, a contractile spring for each slide, connecting it with the cross-bar and adapted to separately move its connected slide, a set of connectible reciprocating trigger-rods for each slide, which release if when all the rods for a slide are retracted, and an appropriate designating-letter for each trigger-rod, substantially as described.

3. The combination, with a cabinet, a series of independent picture-holding slides vertically and separately movable therein at one end of the cabinet, and a transverse bar in the cabinet near the slides, of a contractile spring for and connecting each slide with the cross-bar and normally elevating said slide, a set of longitudinally-movable trigger-rods for each slide, together adapted to hold the slide depressed and its spring stretched until all the rods of a set are retracted, and an alphabetic letter for each rod of a set that in proper order indicates the name of the pictured representation on the slide, substantially as described.

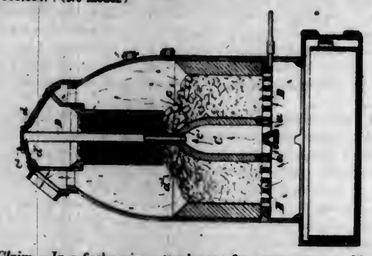
4. The combination, with a cabinet having an elevated rear section and a lower front section having a series of slots in its top wall, a series of picture-holding slides vertically movable on the rear wall of the cabinet, and a horizontal cross-bar in the cabinet and near the slides, of a spring for each slide, connecting it and the cross-bar, and a set of detent trigger-rods for each slide, extended from the slots in the cabinet-wall to engage ledges on the lower end of the slides, each rod being designated by a letter of the alphabet and each set of rods adapted to hold a slide depressed and its springs stretched, substantially as described.

5. The combination, with a cabinet having an elevated rear section and a lower front section having a series of slots in its top wall, a series of picture-slides vertically movable on the rear wall of the cabinet, each slide provided with a forwardly-projecting transverse ledge at its lower end, and a horizontal cross-bar in the cabinet, near the slides and above the ledges, of a retracting-spring connecting each slide with the cross-bar, a set of longitudinally-movable trigger-rods for each slide, adapted to loosely engage its ledge, supplementary rods for some of the trigger-rods, and a designating-letter for each main trigger-rod, substantially as described.

479,535. DRAFT-YOKE. CHARLES W. SNEDEKER, Marbletown, N. Y., assignor of one-half to Edward W. Ostrander, same place. Filed Sept. 18, 1891. Serial No. 406,142. (No model.)

Claim.—1. In a neck-yoke, the combination, with the opposite collars provided at their upper and lower sides with transverse keepers and with swiveled hooks located upon the front ends of the keepers, of upper and lower yoke-bars having their ends located in said keepers and provided with a series of perforations for engaging the hooks, a draft-strap connecting the bars, and draft devices leading from the strap, substantially as specified.

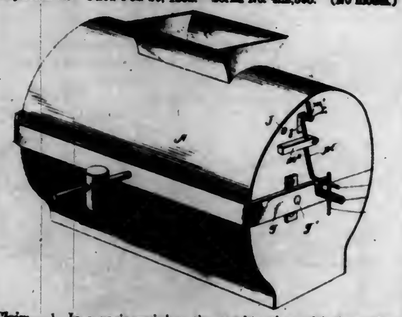
2. In a neck-yoke, the combination, with the opposite collars provided at their upper and lower ends with transverse keepers, of upper and lower yoke-bars connected together and reduced at their ends for movement within the keepers, said lower yoke-bar being provided at its edge with notches for engaging the edge of the keeper when the yoke-bar is turned, and a draft-pole-receiving eye on the center of said yoke-bar, substantially as specified.



3. The combination, with the opposite collars and their keepers, the latter provided at their opposite edges and near their front ends with recesses, of the connected draft-bars flattened near their ends to fit loosely in the keepers and at their ends provided with knobs or heads, in rear of which perforations are formed, and hooks swiveled on the front ends of the keepers and removably engaging said perforations, substantially as specified.

4. In a neck-yoke, the combination, with the opposite collar-sections, a clasp at the lower ends, and a hinge at their upper ends, the latter having a pintle, of upper keepers pivoted upon the pintles of the hinges, a lower pair of keepers pivoted to the lower ends of the collars, yoke-bars loosely connected with the keepers, and draft connections between the bars, substantially as specified.

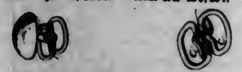
5. In a neck-yoke, the combination, with the opposite collars provided at their upper and lower sides with transverse keepers and with swiveled hooks located upon the keepers, of upper and lower yoke-



bars having their ends located in said keepers and provided with a series of perforations for engaging the hooks, substantially as specified.

479,536. FUEL-SAVING ATTACHMENT FOR STOVE-GRATES. ARTHUR STOCKER, Forest House, Pa. Filed June 11, 1891. Serial No. 395,897. (No model.)

Claim.—In a fuel-saving attachment for stoves, the combination of a stove-body having a shaking-grate and an upwardly-projecting conical shell connected to the central or middle portion of the grate and provided in its apex with a tapered hole or seat c', a tube D, tapered at its lower end d^2, seated in the tapered hole or seat c' of the conical shell and extending up through the fuel-magazine, and a slide-valve d^3, connecting with the top plate of the stove and adapted to open and close the upper end of the tube D, substantially as specified.

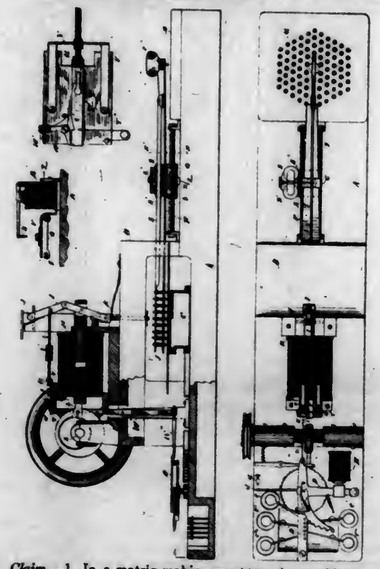


479,537. ROTATING GRAIN-WEIGHER. WILLIAM SWARTOUT, Reynolds, Ill. Filed Feb 26, 1892. Serial No. 422,895. (No model.)

Claim.—1. In a grain-weigher, the combination, with the casing, of the partitioned counterbalanced revolvable cylinder supported within said casing and provided with opposite locking-lugs at each end of the openings therein, dogs pivotally secured in each end of said casing and engaging in front of and behind said lugs, locking and trip pins connected with the front set of dogs and projecting through the ends of the casing, shouldered levers engaging said trip-pins, and means for automatically operating said levers, substantially as set forth.

2. In a grain-weigher, the combination, with the casing having slots in the opposite ends thereof, of a weighted yoke fulcrumed to said casing, a revolvable partitioned cylinder supported upon said yoke within the casing and provided with opposite locking lugs or blocks at each end of the openings therein, locking-dogs pivoted at opposite ends of said casing and engaging in front of and behind said lugs, locking and trip pins secured to the front set of dogs and projecting through the slots in the ends of the casing, opposite trip and lock levers pivoted to the opposite ends of said casing and provided with lower outwardly-extending operating-arms, upper shoulders and over-balancing-weights normally throwing said shoulders under said locking and trip pins, and devices for operating said trip-levers from the cylinder-shaft, substantially as set forth.

479,538. BUTTON-FASTENER. JEROME C. TOWNSEND, Minneapolis, Minn. Filed Apr. 28, 1892. Serial No. 430,467. (No model.)



Claim.—1. A button-fastening approximately in the form of a figure 8, having a central bar and free ends bent to the center of the fastening and approximately parallel with the central bar, substantially as described.

2. A button-fastener approximately in the form of a figure 8, having a central bar flattened on each side and free ends bent in to the center parallel to the said central bar, each of said free ends being flattened upon one side and rounded on the outer faces, substantially as described.

3. A fastening device approximately in the form of the figure 8, with a central bar having a central bend or loop therein, the free ends of the fastening extending parallel with the central portion and having corresponding bends formed therein, substantially as described.

479,539. MATRIX-MAKING MACHINE. CHARLES L. TRAVIS, Minneapolis, Minn., assignor to the Minneapolis Electro Matrix Company, same place. Filed Jan. 16, 1890. Serial No. 337,093. (No model.)

Claim.—1. In a matrix-making machine, the combination, with the character-selecting key, a die-carriage, and die-depressing device, of a locking device for said die-carriage adapted to be brought into operation to lock said carriage in a given position by the depression or manipulation of the key and to be unlocked by the operation of the depressing device, as set forth.

2. In a matrix-making machine, the combination, with the combined die-carriage and character-key, of the matrix-feed mechanism controlled by said key, the die-depressing device controlled by said feed mechanism, and a locking device for retaining the matrix and the selecting-die at the printing-point, the said locking device being dependent for such operation upon the action of the character-key and for its release upon a movement of the depressing device necessary to make a completed impression.

3. In a matrix-making machine, the combination, with the combined die carriage and character-key, of the matrix-feed controlled from said key, the die-depressing device controlled from said matrix-feed, and a common automatic lock for securing the matrix and the selected die at the printing-point until a completed impression is made controlled to lock from said key and to unlock from said die-depressing device.

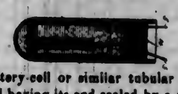
4. In a matrix-making machine, the combination, with the die-carriage, of an electrically-controlled lock for said carriage, electrically-controlled feed and impression devices, electric connections for said electric devices, and circuit-controlling mechanism for said connections.

5. In a matrix-making machine, the combination, with the die-carriage, of an electrically-controlled lock for said carriage, electrically-controlled matrix-feed and die-impression devices, electric connections for said electric devices, a hand circuit-controller for initiating the movement of said electric devices, and an automatic circuit-breaker operated from the die-impression device for breaking the circuit at the completion of the impression.

6. In a matrix-making machine having electrically-controlled feed and impression devices, the combination, with the die-aligning and character-selecting key-lever controlling the feed and impression device circuits, of an electro-magnet in circuit with the die-depressing device adapted to lock said key-lever in contact, and an automatic circuit-breaker operated by the die-depressing device for releasing the lock, substantially as and for the purpose set forth.

7. In a matrix-making machine, the combination, with the electrically-controlled impression device, of an automatic circuit-breaker under the control of the impression device comprising a pair of contacts inseparable until the impression device has made a complete stroke and returned to its normal position, substantially as and for the purpose set forth.

8. In a matrix-making machine, the combination, with the die-depressing device and an electro-magnet for controlling the same, of an automatic circuit-breaker comprising a pair of shifting contacts controlled by the impression device normally in circuit with said magnet and inseparable until the depression device has made a complete stroke and returned to its normal position, substantially as and for the purpose set forth.



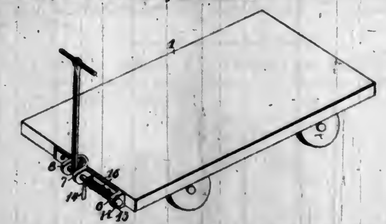
9. In a matrix-making machine, the combination, with the electrically-controlled feed and impression devices, of an automatic circuit-breaker in the impression-device circuit, comprising a pair of shifting contacts under the control of the impression device normally in contact, a retaining device for engaging one of said contacts at the limit of the die-stroke, and a trip actuated from the feed for releasing said plate after the circuit is opened elsewhere.

479,540. ELECTRIC SIGNALING DEVICE FOR FIRE-HOSE. JOHN C. WHARTON and JAMES W. BRAID, Nashville, Tenn. Filed Nov. 11, 1891. Serial No. 411,614. (No model.)

Claim.—The combination, with a hose, a play-pipe, and the couplings thereof, of an internal conductor connected to the members of the couplings, the external bands 9 10, seated directly upon the coupling members and insulated therefrom, another band 16, insulated from the play-pipe and carrying a transverse contact-maker 19, which operates through aligned openings in the band 16 and its insulation 17 to make contact with the coupling member to which the play-pipe is connected, another internal conductor connected to the insulated bands 9 10, the short bridge-pieces between the bands 9, 10, and 16 on the couplings and the play-pipe, a signal, and a battery, substantially as and for the purpose described.

479,541. SEALED BATTERY-CELL OR SIMILAR ARTICLES. CHARLES WILLIS, Baltimore, Md. Filed Apr. 30, 1892. Serial No. 431,248. (No model.)

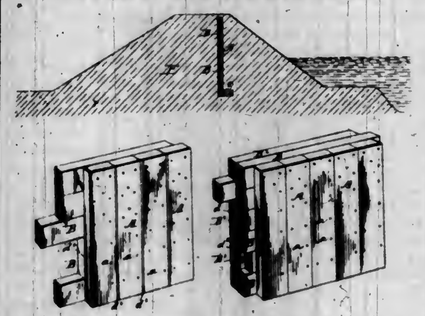
Claim.—1. A battery-cell or similar tubular article of glass or similar fragile material having its end sealed by a plug of plastic material which expands on setting, placed inside the end of the tube a sufficient distance to remove the strain of the expansion of the plastic material from the edges of the tube, whereby the breakage of the tube by such expansion is prevented, substantially as described.



2. A battery-cell consisting of a tube of glass or similar fragile material containing the battery elements, said tube being permanently closed at one end and sealed at the open end by a plug of plastic material which expands on setting, said plastic material being packed about the conductors and placed inside the end of the cell a sufficient distance to remove the strain of the expansion of the plastic material from the edges of the cell, whereby the breakage of the cell by expansion is prevented, substantially as described.

479,542. TRUCK-HANDLE SUPPORT. CHARLES F. WOERNER, St. Louis, Mo., assignor of one-half to Louis C. Koch, same place. Filed Mar 21, 1892. Serial No. 426,703. (No model.)

Claim.—1. A device for holding truck-handles in an elevated position, having a bolt adapted to be held in its normal position by means of a spring, behind which the said handle is adapted to be located, substantially as described.

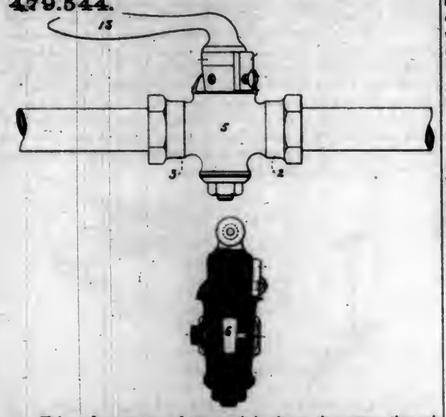


2. A device for holding truck-handles in an elevated position, consisting of a casting having a curved portion, such as 3, into which the said handle is adapted to be placed, a bolt carried by said casting for holding the said handle within said curved portion, and a spring for holding the said bolt in a locked position, substantially as described.

3. A device for holding truck-handles in an elevated position, consisting of a casting, such as 2, having a curved portion 3, ears formed integrally with the said casting, a bolt, such as 10, adapted to move in said ears, a head formed on said bolt and provided with projections, such as 12, adapted to be received by corresponding depressions 13, formed in one of the said ears, a handle fixed to the said bolt for operating the same, and a coil-spring encircling said bolt and interposed between one of the ears and the said handle for holding the same in a locked position, substantially as described.

4. A device for holding truck-handles in an elevated position, consisting of a casing adapted to be secured to one end of the truck, a curved portion 3, formed with the said casting, openings 5, formed in the same, through which screws are adapted to be passed for securing the same to said truck, ears, such as 6, 7, and 8, formed with the said casting and provided with horizontal openings 9, a bolt 10, adapted to be passed through said openings, a head 11, formed on said bolt and provided with projections 12, depressions 13, formed in one side of the said ears 6 and adapted to receive the said projections, a handle 14, fixed to said bolt, and a coil-spring encircling said bolt and interposed between the ears 6 and the said handle for preventing the said bolt from turning and holding the same in a locked position in front of the truck-handle, substantially as described.

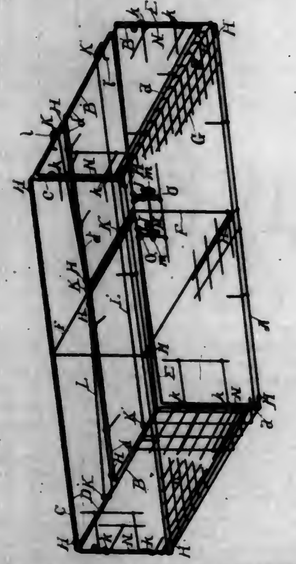
479,543. DAM OR LEVEE. CHARLES E. WRIGHT, Vicksburg, Miss. Filed June 15, 1892. Serial No. 436,840. (No model.)



Claim.—1. In combination with an earthen embankment, a bulk-head buried therein and consisting of a series of standing boards having their edges in close contact with each other and a series of horizontally-laid boards having their edges superposed and in contact and nailed to the standing boards, substantially as described.

2. In combination with an earthen embankment, a bulk-head buried therein and consisting of a series of standing boards having one of their edges beveled and laid against the adjacent standing board, with cement along said beveled edge, and a series of horizontally-laid boards having their edges superposed and nailed to the standing boards, substantially as described.

3. In combination with an earthen embankment, a bulk-head buried therein and consisting of a series of standing boards having their edges in close contact with each other, a series of horizontally-laid boards having their edges superposed and one of said edges beveled, cement along said edge, and cleats inclosing said cement, with nails or their described equivalents uniting the standing boards to the horizontal boards, substantially as described.

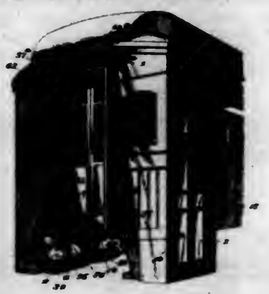


479,544. WASTE AND STOP COCK. GEORGE H. BAILEY and THOMAS GRACE, Pittsburg, Pa., assignors to the Bailey Farrel Manufacturing Company, same place. Filed Aug. 20, 1891. Serial No. 404,054. (No model.)

479,544.

Claim.—In a waste and stop cock having a plug rotary through an arc of ninety degrees, a slot 6, extending through the plug, a passage 7, leading therefrom substantially at right angles, opposite water connections 2 3, and a hole 8, formed in the shell of the cock substantially at right angles to the line of the water connections and capable of registering with the slot 6, the combination, with such plug, of a detachable and adjustable handle, a collar set on a plug and movable therewith, said collar having a tongue adapted to be moved separately from the handle and adjusted in either of two positions ninety degrees apart, and stops on the shell to limit the motion of the tongue, substantially as and for the purposes described.

479,545. SHIPPER'S FOLDING CRATE OR COOP. CHARLES F. BAYER, Murrietta, Cal. Filed Sept. 26, 1891. Serial No. 406,770. (No model.)



Claim.—1. In a folding crate, the combination set forth of the bottom member, the front and rear wall members hinged thereto, the ends and partition hinged to the bottom member and provided with the upwardly-projecting fastening-loops, the lid comprising the back member hinged to the rear-wall member and the front lid member hinged to the back lid member, and the fastening-rod adapted to be inserted through the fastening-loops above the back and front members when the crate is in its erect position.

2. The combination set forth of the several hinged wire-netting members specified, the fastening-rods L L' and pins M N, and suitable staples J J' and fastening-loops K K' *k*, arranged, as specified, to receive the fastening-rods L L' and pins M N to secure the parts in position when set up erect in crate form, and also so arranged, as specified, that when the several parts are folded together the staples J J' will pass through the meshes of the wire-netting, as set forth, to allow the fastening-rods to be passed therethrough to secure the members of the crate in their closed position.

3. A crate comprising the combination of the wire-netting, bottom, front, rear, top, and end members arranged to fold upon each other, the lid-fastening hasps hinged to the top, and the staples projecting from the front member and arranged to receive the lid-fastening hasps when the crate is in its upright position and to project upward through other members of the crate when folded to receive the fastening-rods to secure the crate in its folded position, and such fastening-rods.

479,546. VESTIBULE-CAR. EDGAR H. BUCKLEY, Elkhart, Ind. Filed Jan. 13, 1891. Serial No. 377,616. (No model.)

Claim.—1. In a vestibule-car, the combination, with the folding doors having the vertical hinge-rods extending through bearing-plates at their upper and lower ends and provided with arms or levers near their lower ends, of an intermediate lever and links connecting the ends of said lever with the arms at the lower ends of the hinge-rods, substantially as and for the purpose set forth.

2. In a vestibule-car having the steps arranged inside the end walls, the combination of the folding doors having the vertical hinge-rods provided with levers at their lower ends, connections between the said levers, and the casings having the sliding removable bottom plates, substantially as and for the purpose set forth.

3. In a vestibule-car, the combination, with the steps arranged inside the end walls, of the trap-doors arranged to close in the direction of said end walls and adapted when open to form railings or side guards for the said steps, substantially as set forth.

4. In a vestibule-car having the steps arranged inside the end walls of the car and the inwardly-folding doors arranged at the lower ends of said steps, the trap-doors arranged to fold against the said folding doors and to retain the latter in a closed position, substantially as set forth.

5. In a vestibule-car, the combination of the folding doors, the trap-door, a sliding latch mounted in a recess in one of the folding doors and adapted to be engaged by the trap-door, a spring to actuate said latch, and a lock having a vertically-sliding bolt to engage a recess in the upper side of said latch, substantially as set forth.

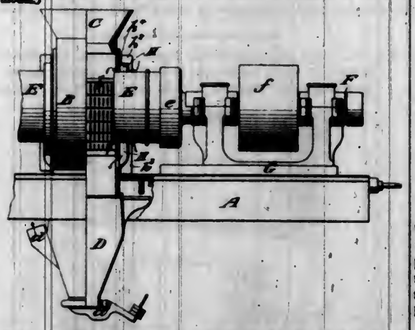
6. In a vestibule-car having the steps, the trap-doors provided with treadles near their inner ends and with operating-levers at the outer ends of their hinge-rods, substantially as and for the purpose set forth.

7. In a vestibule-car having the side strips and the folding doors arranged at the lower ends of said strips, a trap-door arranged to cover the said steps and to close against the said folding doors, and locking mechanism for connecting the latter with the said trap-door, substantially as set forth.

8. In a vestibule-car, the combination of the longitudinally-movable spring-actuated buffer-stem with the buffer-plates mounted adjustably at the front ends of said stems, substantially as set forth.

9. The combination, with the longitudinally-movable buffer-springs having horizontally-recessed and vertically-perforated heads, of the vertically-adjustable buffer-plates having series of laterally-extending vertically-perforated ears or lugs, substantially as and for the purpose set forth.

10. The combination, with the longitudinally-movable buffer-stems, of the adjustable and detachable buffer-plates having laterally-extending vertically-perforated ears or lugs, and forwardly-extending beveled pins and provided with recesses in their under edges, substantially as set forth.

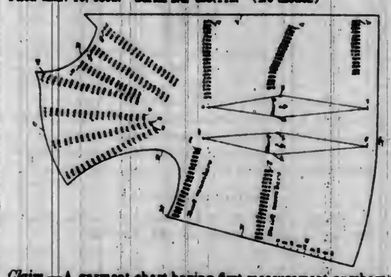


11. The combination, with the longitudinally-movable buffer-stems, of the bearing-plates attached to the front sides of the cross-sills of the car and the adjustable and detachable buffer-plates, substantially as set forth.

12. In a vestibule-car having the end walls inclosing the side steps, the door-frames arranged in said end walls and provided at one side with U-shaped catches attached to flexible curtains wound upon spring-actuated rollers and at the other side with flanges having heads to engage said U-shaped clasps, substantially as set forth.

13. In a vestibule-car, the connecting door-frames, the meeting faces of which are provided on one side of the vertical center, and spring-rollers having flexible curtains provided with catches at their outer edges and at the other side of the vertical center with flanges having heads to engage said catches, substantially as and for the purpose set forth.

14. A vestibule-car having end walls provided with door-frames, in combination with flexible connections mounted on spring-rollers at one side of the vertical center of said door-frames and automatic couplings on the other car to engage the said flexible connections when the cars come in contact, said automatic couplings being adapted to become automatically disconnected when the cars are pulled apart, substantially as set forth.



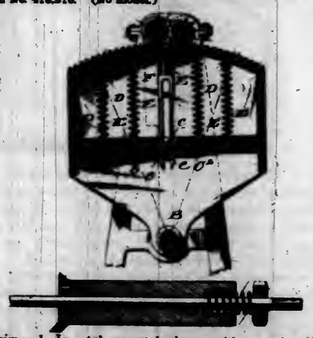
479,547. DUST-GUARD FOR ATTRITION-MILLS. TALMADGE BLAIR, Brewster, N. Y. Filed Dec. 9, 1891. Serial No. 414,497. (No model.)

Claim.—1. The combination, with the casing and bushing of an attrition-mill, of a chamber exterior to the casing and communicating with the space which surrounds the bushing between it and the casing, and an exhaust-conduit in communication with the chamber, substantially as set forth.

2. In combination, the mill-casing, the bushing, and the guard-plates forming, in connection with the casing and bushing, an annular dust-receiving holder surrounding the bushing in proximity to the casing, and means for removing the dust from the casing, substantially as set forth.

479,548. DRESS-CHART. JESSIE BLANARD, Fort Recovery, Ohio. Filed Mar. 16, 1892. Serial No. 425,112. (No model.)

Claim.—A garment-chart having first-measurement numbers and perforations contiguous thereto arranged in series, said first-measurement numbers indicating the number of inches in a measurement taken from the neck-joint, around over the shoulder, and up under the arm to the place of beginning.



479,549. DRINKING-FOUNTAIN FOR FOWLS. FREDERICK G. BONFORD, Cleveland, assignor of one-half to John H. Werner, Canton, Ohio. Filed Nov. 2, 1891. Serial No. 410,706. (No model.)

Claim.—In a drinking-fountain, the combination, with a supporting-bar having a top or canopy, of a ring on its lower end provided with internal screw-threads, a removable cup supported in said ring by said screw-threads, and an inverted bottle supported in the canopy, its open mouth resting in the bottom of said cup, substantially as described.

479,549.

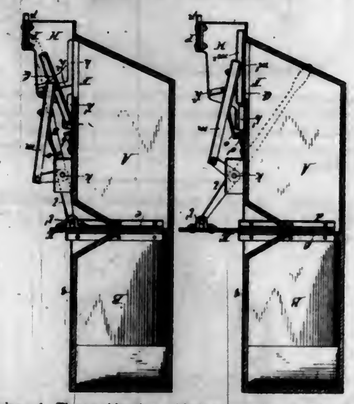
479,550. MACHINE FOR STRIPPING AND BOOKING LEAF-TOBACCO. CHARLES BOWMAN, Hanover, Pa. Filed Jan. 16, 1892. Serial No. 418,218. (No model.)

Claim.—1. In a tobacco-stripping machine, a pivotally-mounted table having arc-shaped tops and centrally-arranged cutting-plates, with a passage between them, rotary cutting-disks over the central part of the table and acting in conjunction with the cutting-plates, the rollers, and winding-drums, and pieces of canvas, and means operatively connecting the disks with the table, and means on the tops for holding them step by step as they are depressed, as set forth.

2. In a tobacco-stripping machine, a pivotally-mounted table having arc-shaped tops and centrally-arranged cutting-plates, with a passage between them, rotary cutting-disks over the central part of the table and acting in conjunction with the cutting-plates, the rollers, and winding-drums, and pieces of canvas, means operatively connecting the disks with the table, and springs for yieldingly supporting the said table-tops, and means on the tops for holding them step by step as they are depressed, as set forth.

3. In a tobacco-stripping machine, a pivoted table having depressible arc-shaped tops, cutting-plates centrally arranged, rotary disks acting in conjunction with the cutting-plates over the center of the table, means operatively connecting the disks with the table, the winding-drums G', and rollers I, the pieces of canvas, and the means connecting the same at one end to the table-tops and at the other end to the rollers, and means on the tops for holding them step by step as they are depressed, as set forth.

4. The combination, with the pivoted table having centrally-arranged cutting-plates and depressible arc-shaped tops, of the rollers, and winding-drums and rotary cutting-disks, means operatively connecting the disks and table, whereby the disks are actuated through the movement of the table, and the pieces of canvas secured to said tops and to the rollers, and means on the tops for holding them step by step as they are depressed, as set forth.



5. The combination, with the pivoted table having depressible arc-shaped tops, of the springs supporting said tops, guides for the springs, the partition having an opening for the passage of the bifurcated post, and the notched bifurcated post carried by the top, as set forth.

6. The combination, with the pivoted table having depressible arc-shaped tops and the cutting-plates, of the springs supporting the tops, the partition, the notched bifurcated posts carried by the tops, the rotary cutting-disks, and means operatively connecting the disks and table, whereby the disks are actuated through the movement of the table, as set forth.

7. The combination, with the pivoted table and its depressible top, of the partition beneath the top and means for holding the top step by step as it is depressed, as set forth.

8. The combination, with the pivoted table having separated tops, with a passage between them, of the stripping mechanism and a disk arranged above said passage to guide the separated stem out of the machine, as set forth.

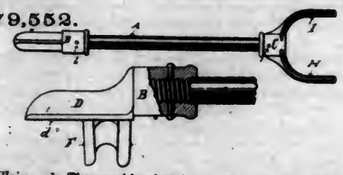
479,551. GRAIN-MEASURE. LEVI BROSSON, Buffalo, N. Y., assignor of one-half to the Pitts Agricultural Works, same place. Filed Mar. 28, 1892. Serial No. 426,690. (No model.)

Claim.—1. The combination, with the measuring-chamber having inlet and discharge openings, of a cut-off gate applied to said inlet-opening, a sliding discharge-gate applied to said discharge-opening and capable of moving vertically and outwardly away from said opening, and actuating devices connecting said gates, whereby one gate is opened when the other is closed, substantially as set forth.

2. The combination with the measuring-chamber having inlet and discharge openings, of a cut-off gate applied to said inlet-opening, vertical ways arranged on the measuring-chamber and having outwardly-extending branchways, a sliding discharge-gate applied to the discharge-opening of the measuring-chamber and having studs or projections moving in said ways, and actuating devices connecting the cut-off and discharge gates, substantially as set forth.

3. The combination, with the measuring-chamber having inlet and discharge openings, of a cut-off gate applied to said inlet-opening, vertical guideways arranged on opposite sides of said discharge-opening and having outwardly-extending branchways, a discharge-gate applied to said discharge-opening and provided at its upper end with studs or projections arranged in the upper portions of said vertical ways, and studs or projections arranged below its upper end and moving in the lower portions of said inclined ways and their outwardly-extending branchways, and actuating devices connecting the cut-off and discharge valves, substantially as set forth.

4. The combination, with the measuring-chamber having an inlet-opening at its top and a discharge-opening on one side near its bottom, of a cut-off gate applied to said inlet-opening, a discharge-gate applied to said discharge-opening, a rock-shaft supported on the measuring-chamber, an elbow-lever mounted on said shaft and having its upper arm attached to the cut-off gate, and a rod connecting the lower arm of said lever with the discharge-gate, substantially as set forth.

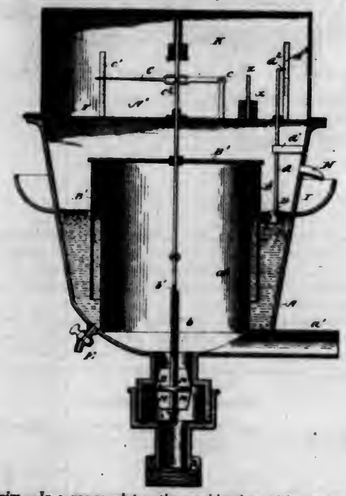


5. The combination, with the measuring-chamber having inlet and discharge openings, of a cut-off gate applied to said inlet-opening, vertical ways arranged on said measuring-chamber and having outwardly-extending branchways, a sliding discharge-gate applied to said discharge-opening and having guide-studs moving in said ways, a rock-shaft supported on the measuring-chamber, an elbow-lever mounted on said shaft and having its upper arm attached to the cut-off gate, and a rod connecting the lower arm of said lever with the sliding discharge-gate, substantially as set forth.

6. The combination, with the measuring-chamber having inlet and discharge openings, of a cut-off gate applied to said inlet-opening, upright plates arranged on opposite sides of the discharge-opening and having upright ways provided with inclined branchways, a discharge-gate having studs moving in said ways, a rock-shaft, an elbow-lever mounted on said shaft and having its upper arm connected to the cut-off gate, and a rod connecting the lower arm of said elbow-lever with the sliding discharge-gate, substantiallyas set forth.

7. The combination, with the measuring-chamber having an inlet-opening at its top and a discharge-opening on one side thereof, of a cut-off valve applied to said inlet-opening, an upwardly-sliding gate applied to said discharge-opening, a bag-support arranged below and in front of said discharge-opening, and actuating devices connecting the cut-off and discharge gates, substantially as set forth.

479,552. RAILWAY-TRACK GAGE. ELMER E. BUCHWALD, Erie, Pa. Filed Jan. 9, 1892. Serial No. 417,592. (No model.)



479,552.

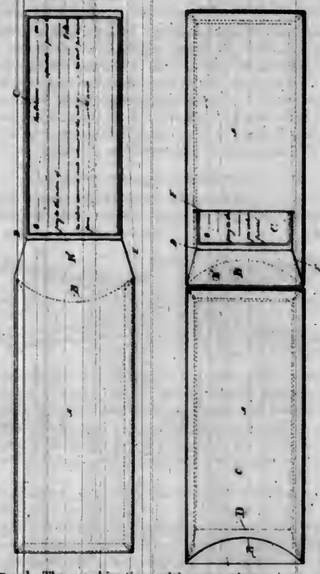
Claim.—1. The combination, in a railway-track gage, of gage-heads, as B and C, connected together by means of a section of pipe screwed into sleeves or collars on said gage-heads, horizontal arms, as D and H I, on said gage-heads, the bearing-faces *d* and *h h* of which are on a horizontal line with or slightly below the sleeves or collars on the gage-heads, with a double-faced lug F G projecting downwardly from the face *d* of the horizontal arm D, and lugs J J, projecting downwardly from the faces *h h* of the horizontal-curved arms H I, substantially as and for the purpose set forth.

2. The combination, in a railway-track gage, consisting of heads, as B and C, permanently connected by a pipe-section A, with horizontal arms on the gage-heads, as D and H I, the bearing-faces, as *d* and *h*, of which are on a plane with or slightly below the lowermost parts of said gage-heads, a vertical double-faced lug, as F G, on the arm D of the gage-head B, and vertical lugs, as J J, on the arms H I on the gage-head C, substantially as and for the purpose set forth.

479,553. GAS-GOVERNOR. SAMUEL G. CABELL, Washington, D. C., assignor, by mesne assignments, to the Quincy Gas Economiser Company, Quincy, Ill. Filed Feb. 11, 1892. Serial No. 421,206. (No model.)

Claim.—In a gas-regulator, the combination, with a main casing having a liquid-reservoir and inlet and outlet openings, of a counter-balancing hood, a plug-valve having an area less than that of the vertical passage, the valve being flexibly connected to the hood and having wings to guide it through the passage, so that it may be readily inserted to and withdrawn from position through the top of the casing, and indicating devices connected to the valve for indicating the position of said valve relatively to its seat, substantially as described.

479,554. SPOOL-HOLDER. ESTHER CARPENTER, Helena, Mont. Filed May 12, 1892. Serial No. 432,734. (No model.)



Claim.—1. In combination, a yoke-piece, a spindle hinged thereto, a fixed jaw rigidly secured to the yoke-piece, and a spring-actuated movable jaw pivotally secured to the fixed jaw, substantially as herein set forth.

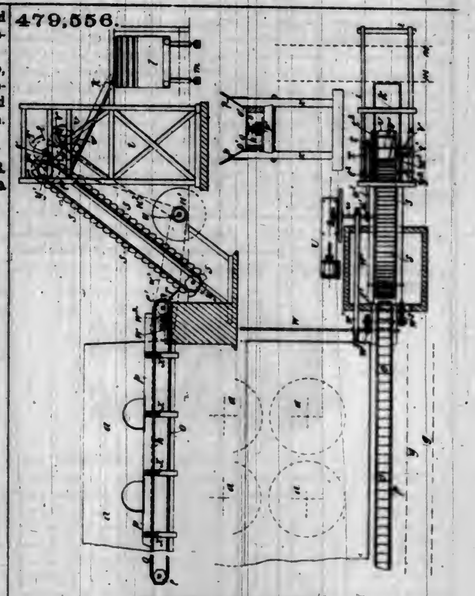
2. In combination, a yoke-piece having a spindle hinged thereto, a fixed jaw rigidly secured to the yoke-piece, and a spring-actuated movable jaw pivoted to the fixed jaw and having an eye for the passage of thread, substantially as herein set forth.

3. In combination, a yoke-piece having a spindle hinged thereto, a cutter on the yoke-piece, a fixed jaw rigidly secured to the yoke-piece, and a spring-actuated movable jaw pivoted to the fixed jaw and having an eye for the passage of thread, substantially as herein set forth.

479,555. COMBINED PROMISSORY NOTE AND ENVELOPE. CHARLES CARROLL, New Orleans, La. Filed Aug. 15, 1891. Serial No. 402,783. (No specimens.)

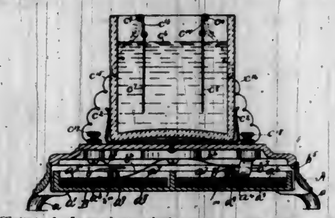
Claim.—1. The combination, with a promissory note, of an envelope or pocket having an intervening flap by which the note is connected therewith, adapted to form a receptacle for the collateral and note, substantially as described and shown.

2. The combination, with a promissory note, of an envelope or pocket connected therewith, adapted to form a receptacle for the collateral and note, having a slit in the body thereof through which the outer part of the note is inserted, substantially as described and shown.



3. The combination, with a promissory note, of an envelope or pocket having an intervening flap by which the note is connected therewith, formed with reduced portions, substantially as described and shown.

4. The combination, with a promissory note, of an envelope or pocket connected therewith, having a slit in the body thereof through which the outer part of the note is inserted, and a separating-line of perforations between the note and the envelope or pocket, substantially as described and shown.



479,556. APPLIANCE FOR LOADING COKE. ARTHUR M. CHAMBERS and THOMAS SMITH, Chapeltown, England. Filed Aug. 4, 1891. Serial No. 401,694. (No model.)

Claim.—An apparatus of the class herein described, comprising the longitudinal trough *p*, fixed in front of a series of coke-ovens, angle-irons *o' o'*, arranged within the said trough, the horizontal traveling platform of plates partly supported upon the angle-irons *o' o'* and carried by the endless chain A, anti-friction rollers mounted beneath the said traveling platform and partly supporting the latter, the drums over which the endless chain passes, the shaft *w*, geared to one of the said drums and also to the steam-engine U, the chute *r* to conduct the coke from the horizontal carrier to the inclined carrier, with the upwardly-inclined carrier to receive the coke from the horizontal platform of plates, drums over which the said carrier passes, a drum *v*, having curved partitions to receive the coke from the inclined carrier and lower it onto the screen *k*, the shaft T, geared to the shaft of the upper drum of the inclined carrier, the gear-wheels f^6 and f^7, communicating motion from the inclined carrier to the drum *v*, and the engine U, connected by the belt u^6 with the shaft T, substantially as described.

479,556.

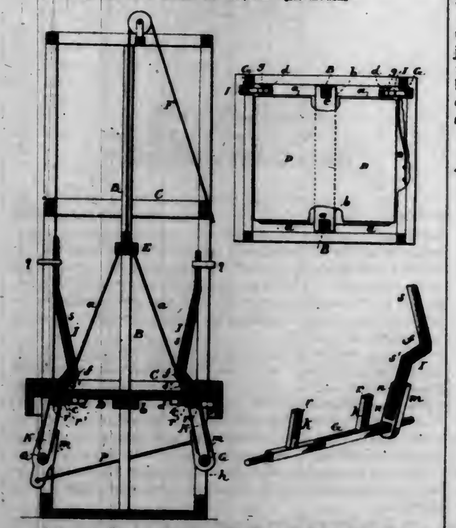
479,557. ELECTROPLATING TOY APPARATUS. EDWARD A. CLARK, Boston, Mass. Filed Mar. 16, 1892. Serial No. 425,064. (No model.)

Claim.—1. In an electroplating toy apparatus, the combination of the following instrumentalities, viz: a battery-containing base provided with a cover, contact-arms secured to the under side of the cover and co-operating with the positive and negative poles of the battery contained in said base, a jar or vessel attached to the cover on its upper side and adapted to contain an electrolytic solution, electrodes suspended within the said jar or vessel, and conductors connecting the said electrodes with the contact-arms on the under side of the cover, substantially as described.

2. In an electroplating toy apparatus, the combination of the following instrumentalities, viz: a battery-containing base provided with a cover, contact-arms secured to the under side of the cover and co-operating with the positive and negative poles of the battery contained in said base, a holder attached to the cover on its upper side, a jar or vessel detachably secured in said holder and adapted to contain an electrolytic solution, electrodes c^1 c^2, suspended in said solution, supports for said electrodes, and conductors connecting the said electrodes with the contact-arms on the under side of the cover, substantially as described.

3. In an electroplating toy apparatus, the combination of the following instrumentalities, viz: a battery-containing base consisting of the frame A, provided with the detachable cover b^4, a battery containing cell supported within said base and provided with two batteries, each consisting of two metal plates and interposed electrolytic material, contact-arms b^6 b^7 b^8, attached to the under side of the cover and co-operating with the positive and negative poles of the said batteries, binding-posts secured to the upper side of the cover and electrically connected to the contact-arms b^7 b^8, a jar or vessel attached to the upper side of the cover and provided with electrodes c^1 c^2, and conductors connecting the said electrodes with the said binding-posts, substantially as described.

4. In an electroplating toy apparatus, the combination of the following instrumentalities, viz: a battery-containing base consisting of



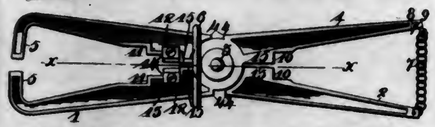
the frame A, provided with the detachable cover b^4, a battery-containing cell supported within said base and provided with two batteries, each consisting of two metal plates and interposed electrolytic material, contact-arms b^6 b^7 b^8, attached to the under side of the cover and co-operating with the positive and negative poles of the said batteries, binding-posts secured to the upper side of the cover and electrically connected to the contact-arms b^7 b^8, a holder attached to the upper side of the cover, a jar or vessel detachably secured in said holder, electrodes c^2 c^3 in said jar or vessel, supports for said electrodes, extended over the jar or vessel, and conductors connecting the said supports to the binding-posts, substantially as described.

479,558. OIL-BURNER. JOHN F. COATES, Terre Haute, Ind., assignor of five-sixths to Leo J. Weinstein, Edward Weinstein, and Isaac Pechheimer, same place. Filed Jan. 28, 1892. Serial No. 419,600. (No model.)

Claim.—In an oil-burner, the combination of a cylindrical body having an enlarged blast-receiving chamber or dome at one end, a dome-shaped tapering combustion-chamber located in the opposite end of said body and terminating in a flared mouth or orifice at the ignition end of the burner, an intermediate tubular passage between and connecting said chambers and provided with opposite intersecting spiral atomizing-grooves winding through said tubular passages and opening into said opposite chambers, an oil-supply pipe projecting within said blast-chamber and terminating at the center of the inner end of said tubular passage, and a suitable blast, substantially as set forth.

479,559. ELEVATOR. CHARLES W. COLLINS, Granite, Mont. Filed Apr. 19, 1892. Serial No. 429,774. (No model.)

Claim.—1. The combination, with the main frame of an elevator-well, of two opposite shafts having bearings in said frame, opposite chairs rigidly attached to said shafts, opposite arms provided with inwardly-projecting offsets and rigidly connected with said shafts, a cage provided with hoisting mechanism and constructed to impinge against said offsets and press outward said opposite arms, and devices for pressing inward said arms and chairs, substantially as and for the purposes described.



2. The combination, with a main frame, of the opposite shafts G, shoes *m*, rigidly connected therewith, arms I, provided with offsets *f* and rigidly and adjustably secured to said shoes, chairs *k*, rigidly secured to said shafts, devices for pressing inward said arms and chairs, a cage provided with a platform, and arms projecting from said platform and provided with bearing-pieces in position to impinge against the offsets of arms I, substantially as set forth, for the purposes described.

479,560. HEEL FOR BOOTS OR SHOES. NATHANIEL S. DRAKE, Pittsfield, N. H. Filed Feb. 8, 1892. Serial No. 420,180. (No model.)

Claim.—As an improved article of manufacture, a heel-blank comprising a block or plug having a shoulder b^3 and an inner concave heel-seat depression b^3, skeleton lifts of varying widths surrounding said block or plug, and one or more tread-lifts applied to the block or plug and secured by fastenings passing through the tread-blanks and skeleton lifts outside of the edges of the block or plug, said skeleton lifts being arranged to bring the greatest body of leather toward the tread of the heel-blank, substantially as described.

479,561. COMBINATION WIRE-FENCE TOOL. STEPHEN M. FORBES, St. Louis, Mo. Filed Mar. 7, 1892. Serial No. 424,041. (No model.)

Claim.—1. The improved wire-fence tool comprising pivoted members 1 and 2, having opposite clamping-jaws 15 15 located adjacent to the fulcrum thereof and the adjacent ends of said members at one end of the tool turned inwardly to form opposite lugs 5 5, and a chain 7, adapted for connection with the ends of the members at the end of the tool opposite the ends carrying said lugs, substantially as described.

2. The improved wire-fence tool comprising two members pivoted together at approximately the center and formed at two of their adjacent ends with inturned opposing lugs, said members being provided with clamping-jaws 15, recesses 10 and 11, and cutters 12, a clamping-loop 6, embracing said members, and a chain 7 for connecting the ends of the members opposite said inturned lugs, all arranged substantially as and for the purpose set forth.

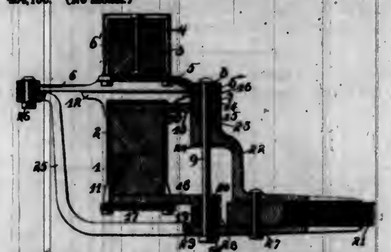
479,562. MACHINE FOR CLEANING AND PEELING VEGETABLES. FREDERIC GROSS, Naples, N. Y. Filed Nov. 18, 1891. Serial No. 412,282. (No model.)

Claim.—1. The herein-described machine, consisting of a containing-vessel, a shaft mounted within said vessel and provided with polygonal bars, a frame or spider also mounted within the vessel and provided with polygonal bars, and gearings, substantially such as described and shown, for causing the two sets of bars to travel about the shaft simultaneously in opposite directions.

2. In a vegetable-peeling machine, the combination of a containing-vessel, polygonal bars located near the walls of said vessel, a rotary shaft, and polygonal bars carried by said shaft and adapted to move past the polygonal bars placed near the walls of the vessel.

3. In combination with a vessel provided near its walls or surface with polygonal bars or ribs, a rotary frame and yielding polygonal bars carried by said frame and adapted to move past the polygonal bars placed near the walls or surface of the vessel.

4. In combination with vessel A and with grooved, fluted, or polygonal bars *i*, shaft C, provided with slotted bars E and F, polygonal bars G, extending between the bars E and F, and springs *g*, bearing against the bars G and affording a yielding support therefor.



5. In combination with vessel A, shaft C, and slotted bars E F, polygonal bars G, extending between the bars E F, and clamping-screws A, serving to hold the bars G with any required degree of friction.

6. In combination with vessel A and shaft C, horizontal bars E F, and polygonal bars G, the bar F having its upper face beveled or inclined to pass beneath and lift the vegetables within the vessel.

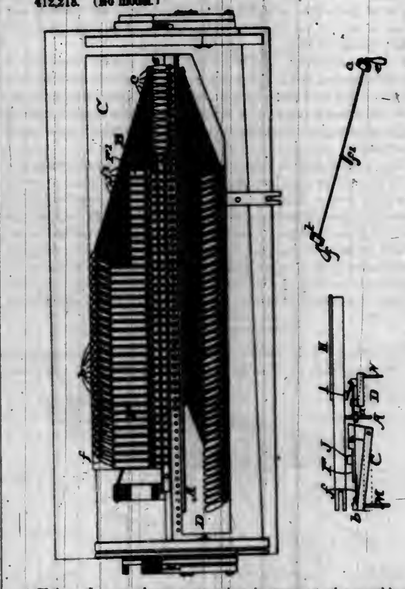
7. The herein-described machine for washing and peeling vegetables, consisting of vessel A, provided with cover B, shaft C, located centrally within said vessel, bars E F, carried by shaft C, polygonal bars G, extending between the bars E F, spider I, loosely mounted upon shaft C and provided with bars *i* and annular gear-ring *j*, pinion J, and gear-wheel K, for imparting motion to the spider and the bars *i*, all substantially as set forth.

8. In a machine for peeling vegetables, the combination, with a containing-vessel, of a rotary frame within the vessel and yielding polygonal bars carried by said frame and adapted to act upon and remove the skin from the vegetables.

479,563. FIFTH-WHEEL. WILLIAM J. HUBER, St. Louis, Mo., assignor of two-thirds, by mesne assignments, to the St. Louis Carriage Manufacturing Company, same place. Filed Mar. 8, 1892. Serial No. 424,136. (No model.)

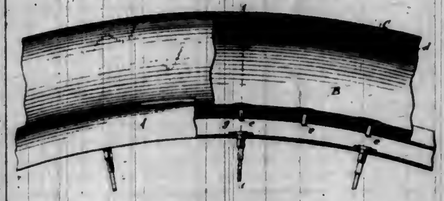
Claim.—1. As an improvement in fifth-wheels of the class described, the combination, with the head-block, axle-bed, axle, and reach, of a plate 5, secured to the head-block and carrying the circular plate 6, said plate 5 being provided with a rearward extension 6*, having in the under side of its free end a socket 7, a plate 10, secured to the axle-bed and provided at its ends with bearings 12 and centrally with a rearwardly-projecting extension 13, carrying upwardly and downwardly projecting extensions 14 and 15, respectively, a rearwardly-projecting plate 17, provided at its free end with a downwardly-projecting extension 19, a reach-iron 22, provided in its upper end with a socket 23, a brace 25, provided with an upward extension 28, formed with a socket 29, the free end of said brace being bolted to the circular plate 6, and a king-bolt 9, passing through the bearings of the plates 5, 10, and 17 and the brace 25, all arranged and adapted to operate substantially as and for the purpose set forth.

2. A fifth-wheel having plates, such as 10 and 17, attached to the axle and axle-bed, respectively, the upper of which is provided with two conical-shaped projections projecting in opposite directions, a downwardly-projecting conical-shaped extension formed on the lower of said plates, a brace carried by the reach and provided with a conical-shaped socket adapted to receive the lower of said conical-shaped projections, a reach-iron secured to the upper surface of the said reach and provided with a conical-shaped socket which is adapted to receive the downwardly-projecting socket carried by the plate 10, and a plate 5, secured to the front block 3 and provided with a conical-shaped socket adapted to receive the upper projecting conical-shaped extension carried by the said plate 10, substantially as described.



479,564. TROUSERS. SUMNER A. ISAACSON, Boston, Mass. Filed Mar. 30, 1892. Serial No. 426,719. (No model.)

Claim.—Trousers comprising in their construction a waistband pocket or hem and a gore at the back, a belt formed of two parts arranged in said pocket or hem, the rear ends of the two parts being reduced to form narrow tongues, one of which passes through a slot near the rear end of the other part, the extreme rear ends of the tongues being attached to the trousers material each side of the gore,

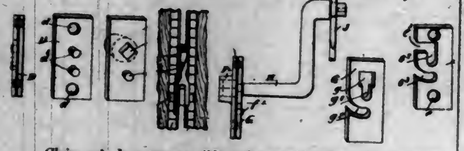


and means for adjustably securing the front ends of the two parts of the belt together, as set forth.

479,565. REED-ORGAN. JOHN H. LANE, Cleveland, Ohio, assignor to Franklin L. Raymond, same place. Filed Nov. 17, 1891. Serial No. 412,218. (No model.)

Claim.—In a reed-organ or other instrument, the combination, with a double-octave attachment, of the half-levers F and rollers B, provided with the middle arm f^3, substantially as and for the purpose set forth.

479,566. VEHICLE-WHEEL. BENJY G. LATTA, Friendship, N. Y. Filed Jan. 16, 1892. Serial No. 418,263. (No model.)



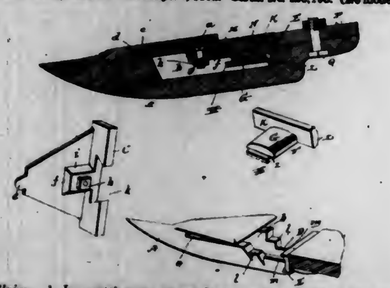
Claim.—1. A pneumatic tire consisting of an inner inflatable air-tube and a flexible envelope having overlapping edges, one of said edges being provided at intervals with studs or projections and the other with openings which receive said studs or projections, whereby the overlapping edges are united and positively held against longitudinal displacement on each other, substantially as set forth.

2. The combination, with a wheel-rim provided in its face with openings or recesses, of an inflatable tire composed of an inner air-tube and an envelope having its edges separably united by studs or projections which enter the openings of the rim, substantially as set forth.

3. The combination, with a wheel-rim having a concave face pro-

vided with openings or recesses, of an inflatable tire composed of an inner air tube or chamber and a surrounding envelope having overlapped edges separably united by studs or projections which enter the openings of the rim, substantially as set forth.

479,567. TRANSOM-LIFTER. JAMES M. MADDOX, Birmingham, Ala. Filed Aug. 5, 1891. Serial No. 401,743. (No model.)

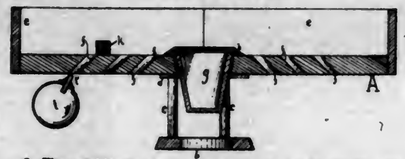


Claim.—1. In a transom lifter, the combination, with a pivoted transom, of guide-pins projecting from the ends of the transom and working in ways in the frame in which the transom is pivoted, substantially as described.

2. The combination, with a transom and the frame in which it is hung, of plates secured in the frame and provided with vertical slots and with curved slots below the vertical slots and plates secured to the ends of the transom, said plates being pivoted in the vertical slots and having projecting pintles extending into the curved slots, substantially as described.

3. In a transom-lifter, the combination, with a transom having one end pivoted, as described, and having the opposite end provided with a plate with a squared opening therein and a projecting pintle thereon, of a plate secured in the door-frame opposite the transom-plate, said plate having a squared opening in its upper end with a vertical slot beneath the opening, and a curved slot to receive the pintle of the transom-plate, a crank mounted in the vertical slot of the frame-plate and having a squared end extending into the opening of the transom-plate, and means for turning the crank, substantially as described.

479,568. HARVESTER-CUTTING APPARATUS. GOTTLIEB MINCHLER, Rock Island, Ill. Filed Apr. 7, 1892. Serial No. 428,193. (No model.)

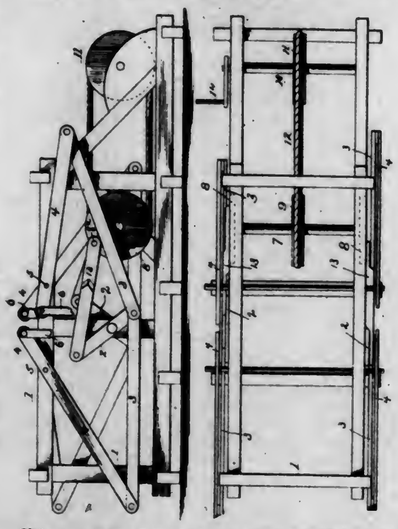


Claim.—1. In a cutting apparatus for harvesters, the combination, with a guard-finger recessed, as described, of a lower cutting-knife, a block secured to the under side thereof and adapted to enter the recess of the guard-finger, and also having a dovetail recess to engage the lugs or shoulders of said finger, and a locking-key having its horizontal portions provided with a lip or projection to enter the recess in the guard-finger and within the dovetailed recess of said block or head, and also having a cross branch, so as to be interposed between the rear edge of the lower cutting-knife and the finger-bar, substantially as specified.

2. The guard-finger recessed, as described, and having the shoulders in rear of the knife-slot and also having the vertically-disposed curved wall or flange in rear of the recess, in combination with the lower knife, the cross bar or block secured to the rear under side thereof and having a dovetail recess to engage said shoulders or lugs of the guard-finger, and the key having its horizontal branch rabbeted in its under longitudinal sides and recessed so as to form a projection at its forward end and also having the transverse branch beveled on its rear side, said key being interposed between the block or head carrying the lower knife and the rear curvilinear wall or flange of the finger-bar, so as to lock said branch forwardly in its seat, substantially as specified.

479,569. GAME-BOARD. EDWIN L. MCCONAUGHY, Philadelphia, Pa. Filed Sept. 17, 1891. Serial No. 406,018. (No model.)

Claim.—1. A game-board having a flat top, a border-wall, numerous air-shafts extending upward through the board to its upper surface and all inclined toward the goal, so that when one of the objects is displaced by an air-jet it will be likely to fall in front of another of the numerous air-shafts with which the surface is covered and so be in position for another play unless it is forced into the central goal on the first play, substantially as described.

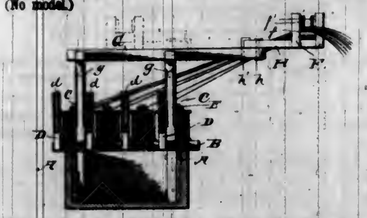


2. The combination of a game-board having a flat top, a border-wall, a central removable depressed cup, and many air-shafts extending upward through the board in an oblique direction, all inclined toward the center, so as to direct the air-jet from the ball-blower toward the objects to be blown into the central goal, with the blocks to be blown by the air-jet, substantially as described.

3. The combination, in a game-board, of a table having a flat top without grooved paths, a border-wall, a central removable depressed cup, and many air-shafts extending upward through the board, all inclined toward the goal, with a fixed pedestal or support to elevate the table for the purpose of allowing of the introduction of the blower underneath the board, and a hollow gum ball-blower, and blocks on the upper surface, substantially as set forth.

4. The combination, in a game-board having a flat top free from grooved paths or many-cupped stations, a central removable depressed cup with a solid bottom for receiving the numerous blocks to be blown into it by air-jets from the many oblique air-shafts that extend upward through the board and converge toward the center, with the blocks on the upper surface, substantially as set forth.

479,570. MOTOR. ROBERT F. NICHOLS, Sr., Alturas, Cal. Filed Oct. 8, 1891. Serial No. 408,184. (No model.)



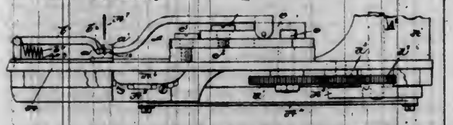
Claim.—1. In an apparatus for actuating pump-pistons and the like, the combination, with the main frame and a piston-rod, of the lever 4, pivotally connected to the frame at an intermediate point in its length and pivotally connected at its upper end to the piston-rod, the vibrating lever 2, pivotally connected to the frame at an intermediate point of its length, a link 3, connecting the lower ends of the levers 2 and 4, a transverse rotary shaft carrying a crank-wheel 8 at one end, a pitman 13, pivotally connected at one end to the crank-wheel 8, off the center thereof, and pivotally connected at its opposite end to the upper end of the vibrating lever 2, and a suitable means for rotating the rotary shaft carrying the crank-wheel, substantially as specified.

2. In an apparatus for actuating pump-pistons and the like, the combination, with the main frame and two piston-rods, of the levers 4, pivotally connected to the frame at an intermediate point in their length and pivotally connected at their upper ends to the piston-rods, the vibrating lever 2, pivotally connected to the frame at an intermediate point of its length, the links 3, connecting the lower end of the lever 2 and the lower ends of the levers 4, a transverse rotary shaft carrying a crank-wheel 8 at one end, a pitman 13, pivotally connected at one end to the crank-wheel 8, off the center thereof, and pivotally connected at its opposite end to the upper end of the vibrating lever 2, and a suitable means for rotating the rotary shaft carrying the crank-wheel, substantially as specified.

3. In an apparatus for actuating pump-pistons and the like, the combination of the main frame, the transverse shafts 7, journaled in the main frame and carrying fixed pulleys, a crank-wheel 8, fixed on the ends of the respective shafts 7, the levers 4, pivotally connected to the main frame on opposite sides of each crank-wheel, the piston-rods pivotally connected to the upper ends of the levers 4, the vibrating levers 2, pivotally connected to the main frame on opposite sides of each crank-wheel, the links 3, connecting the lower ends of the levers 2 and the lower ends of the levers 4, the pitmen 13, pivotally connected at one end to the crank-wheels 8, off the center thereof, and pivotally connected at their opposite ends to the upper ends of the vibrating levers 2, the drive-shaft 10, arranged between the shafts 7 and carrying a pulley-wheel, an endless belt taking around the pulley-wheel of the shafts 7 and 10, and a suitable means for rotating said shafts 10, substantially as and for the purpose set forth.

479,571. WIRE-DISTRIBUTER FOR WIRE FENCES. HENRY C. PRATT, Canandaigua, N. Y. Filed Nov. 12, 1891. Serial No. 411,717. (No model.)

Claim.—1. A wire-distributer provided with rows of spool-supports located in different transverse planes and a delivery-guide and open slotted wire-guides secured in position intermediate the spool-supports of the row adjacent to the delivery-guide, substantially as described.



2. In a wire-distributer, the combination, with the spool-supports and open slotted guides extending above the tops of the spools, of the elevated delivery-guide, a support for the same, and adjusting means for securing said guide rigidly in relation to said support in different positions, substantially as described.

3. In a wire-distributer, the combination, with the spool-supports, of the delivery-guide, a support for the same, and securing means for holding said guide normally in fixed relation to its support, but permitting it to yield when engaged by an obstacle, substantially as described.

4. In a wire distributer, the combination, with the spool-supports, of a delivery-guide, a support for the same, said guide being pivotally secured to said support, and a retaining device adapted to hold said guide normally in fixed position with its support by frictional contact with a part connected with said guide, whereby said guide is permitted to disengage said retaining device and swing on said pivot when engaged by an obstacle, substantially as described.

5. In a wire-distributer, the combination, with the spool-supporting spindles, of the elevated supporting-bar, the supplemental arm pivotally connected thereto intermediate its ends, the hook-bolt frictionally engaging one end of said supplemental arm, and the delivery-guide secured to the other end of said arm, substantially as described.

479,572. SEWING-MACHINE FOR FINISHING BUTTONHOLE-PIECES. JOHN REECE, Boston, Mass. Filed Sept. 5, 1887. Serial No. 248,857. (No model.)

Claim.—In a sewing-machine for stitching thrum ends, the combination of the following instrumentalities, viz: a feeding device arranged above the bed-plate and to engage the material, a vertically-reciprocating eye-pointed thread-carrying needle and complemental stitch-forming devices, devices to actuate the said feeding and stitch-forming devices to form an overseaming or zigzag stitch, a work-holder movable longitudinally in a horizontal plane, and a guide-block supported on the bed-plate and having a longitudinal groove or recess within the path of the needle and above the cloth-plate and disposed thereto so that a line perpendicular to the base of said groove is parallel with the cloth-plate, the said horizontally-movable work-holder bending the material into the groove or recess of the said guide-block, thus enabling the needle at one thrust to enter and pass out from the material at the same side and between the right face of the material and the stay-cord and thrum ends, the needle at another thrust or descent passing the material outside the stay-cord and thrum ends and making a stitch to cross and hold the stay-cord and thrum ends in place, substantially as described.

479,573. CORSET. LEWIS SCHIELE, New York, N. Y. Filed Apr. 4, 1892. Serial No. 427,664. (No model.)

Claim.—In a corset, the front edges of the two parts constructed each part with a stay at the meeting edge and with a second stay parallel therewith, but distant therefrom, so as to leave a flexible portion between the two stays of each part, combined with a series of studs on said flexible portion of one part and corresponding series of sockets on the said flexible portion of the other part, substantially as described.

479,574. CORSET. LEWIS SCHIELE, New York, N. Y. Filed Apr. 4, 1892. Serial No. 427,665. (No model.)

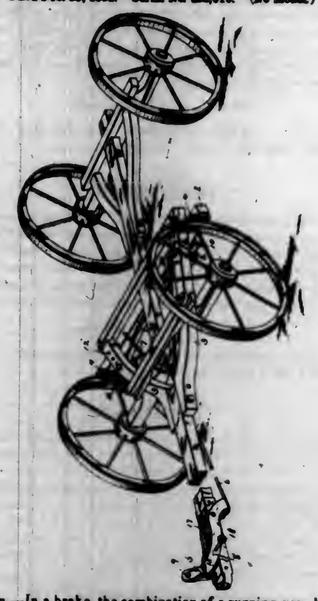
Claim.—A corset having the parts adapted to meet at the front, one part at the front having a stay A at the edge, and a second stay B distant therefrom and parallel therewith, so as to leave a flexible portion C between the two stays, the other part constructed with flexible straps projecting therefrom, the said straps on the one part and the flexible portion on the other part provided the one with studs and the other with corresponding sockets, the said sockets being adapted to set upon the studs and engage therewith, substantially as and for the purpose described.

479,575. SPOON-BAIT. GARDINER M. SKINNER, Clayton, N. Y. Filed Dec. 10, 1890. Serial No. 374,135. (No model.)

Claim.—1. A draw-wire for a trolling spoon-bait, consisting of a single piece of wire bent to form a closed eye at the top and bent at the bottom to form a ring closed by the crossing of the wire, and bent to form the outwardly-projecting angles above the ring and having a hook upon its free end detachably engaging with the main wire, as set forth.

2. A draw-wire for a trolling spoon-bait, consisting of a single piece of wire provided with a closed eye at the top and bent at the bottom to form a ring, then crossed and bent outwardly on both sides, then bent inwardly and again crossed, then bent outwardly on both sides, and then bent inwardly, the free end being bent to form a hook adapted to fit over the body of the wire detachably, as set forth.

3. A draw-wire for a trolling spoon-bait, consisting of a single piece of wire provided with a closed eye at the top and bent at the bottom to form a ring, then crossed and bent outwardly on both sides, then being inwardly and again crossed on the opposite side to the first crossing, then bent outwardly on both sides, and then bent inwardly with a hook upon the free end adapted to fit over the body of the wire detachably, as set forth.



479,576. LETTER-BOX. JAMES SPEAR, Philadelphia, Pa. Filed Nov. 19, 1891. Serial No. 412,490. (No model.)

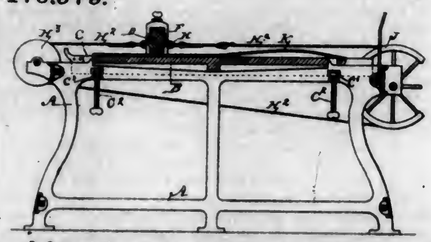
Claim.—A mail-box having separate compartments, a casing at

the top and side of the upper compartments, forming with the back walls of said compartments a throat to said lower compartment, a door for said throat above said compartments, said throat entering said lower compartment at the rear portion of the top thereof, and said lower compartment extending in rear of the upper compartments, said parts being combined substantially as described.

479,577. AUTOMATIC BRAKE. JERRY M. STOUT, Howe's Valley, Ky. Filed Feb. 26, 1892. Serial No. 422,810. (No model.)

Claim.—In a brake, the combination of a running-gear having its front bounds provided with perforations, keepers arranged on the lower faces of the front bounds and provided with perforations, and a plate arranged at the front end of the tongue and provided with a projection, of a brake-bar arranged in the keepers and provided with brake-shoes, a spring centrally secured to the brake-bar and having its ends arranged in the keepers, pins arranged in perforations of the front bounds and the keepers to regulate the tension of the spring, and a brake-lever having a longitudinal opening to receive the tongue and fulcrumed on the same and connected with the brake-bar and provided at its upper end with a latch to engage the said projection, substantially as described.

479,578. SAFETY-GUARD FOR SCARF-PINS, STUDS, &c. WARREN R. TROTT, Brooklyn, N. Y. Filed Nov. 12, 1891. Serial No. 411,692. (No model.)



Claim.—A safety guard for securing scarf-pins, studs, brooches, and similar articles, consisting of a plate having a slot in one end, an eye attached to one side of said plate, and a spring-snap attached to the other side of the plate and extended normally across said slot to engage and fasten the shank of a pin or stud passed through the slot, substantially as described.

479,579. PRINTING-PRESS. AUGUSTUS W. VADNER, Stuart, Iowa. Filed July 23, 1891. Serial No. 400,519. (No model.)

Claim.—1. In combination with the bed of a printing-press, a tympan-frame having its parallel side portions formed of curved elastic material and the lower end of the tympan pivotally connected with a part of the press, to operate in the manner set forth, for the purposes stated.

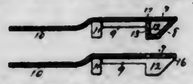
479,579.

2. In a printing-press, in combination with a bed and a supporting-frame, tracks adjustably connected with the sides of the frame, a cylinder carried in bearings fixed to said tracks, means for securing an adjustable pressure between the cylinder and the bed, means for reciprocating the cylinder over the bed, and a tympan-frame having elastic curved sides pivotally connected with the said tracks, for the purposes stated.

3. A hand printing-press consisting of a supporting-frame A, a bed B, adjustable tracks C, a roller D, frames F, the adjustable blocks F^3, portions F^2, projecting from the frames, having the guide-wheels F^4 journaled therein, a connecting-bar H, a belt H^3, a belt-wheel H^2, and a crank-wheel J, adapted to admit the belt, and the tympan K, constructed and combined, substantially as described, to operate in the manner set forth, for the purposes stated.

479,580. SOLUBLE CHOCOLATE. SERVETUS T. ASHOR, Brooklyn, N. Y. Filed Feb. 6, 1892. Serial No. 420,555. (No specimens.)

Claim.—1. A cake composed of chocolate, cream, and sugar and having incorporated therewith such an additional amount of sugar as will render the cake readily disintegrable in water, substantially as described.



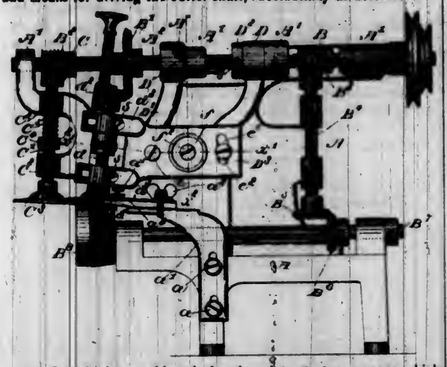
2. A cake composed of chocolate, cream, and sugar and having incorporated therewith such an additional amount of sugar as will render the cake readily disintegrable in water and provided with a protective coating.

3. A cake composed of chocolate, cream, and sugar and having incorporated therewith such an additional amount of sugar as will render the cake readily disintegrable in water and provided with a protective crystalline saccharine coating.

479,581. PROCESS OF MAKING SOLUBLE CHOCOLATE. SERVETUS T. ASHOR, Brooklyn, N. Y. Filed Feb. 6, 1892. Serial No. 420,554. (No specimens.)

Claim.—The process of forming a chocolate compound readily soluble in water, which consists in first making a paste of chocolate or cocoa, cream, and sugar, then incorporating an additional amount of sugar, molding to form cakes, immersing such cakes in a thick sirup to obtain a crystalline coating, and then drying the cakes, as set forth.

479,582. SHEET-METAL LATCH-BOLT. HOWARD D. ALLEN, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Feb. 1, 1892. Serial No. 419,856. (No model.)



Claim.—The herein-described latch-bolt, consisting of a main portion having side wings 12, bent up from a connected back, and an angular finishing-piece set in between said wings and secured to said back, substantially as described, and for the purpose specified.

479,583. LEATHER-SKIVING MACHINE. CHARLES H. BAILEY, Boston, Mass. Filed Mar. 17, 1892. Serial No. 425,341. (No model.)

Claim.—1. In a leather-skiving machine, the following instrumentalities, viz: a rotatable support or feed-wheel, a cutter-shaft provided with a disk cutter, a rotating driving-shaft, gearing between it and the cutter-shaft to rotate the latter, a swing-frame in which the cutter-shaft has its bearings, and bearings for the said swing-frame, parallel to the center of rotation of the said work-support or feed-wheel, the frame being hung from said bearings and about which it is free to be oscillated as a center, as and for the purposes set forth.

2. In a leather-skiving machine, the main shaft, its attached bevel-gear, a swing-frame composed of a hanger and bearings therefor concentric to said main shaft, whereby said hanger is free to be oscillated about the center of rotation of the said main shaft, and of a bearing-plate D^2, pivotally connected therewith, of a work-support, a cutter-shaft mounted in bearings in the said bearing-plate, a disk cutter attached to said cutter-shaft, and a bevel-gear on said cutter-shaft in mesh with the bevel-gear on the driving-shaft, and devices to adjust the said swing-frame about the center of rotation of the main shaft, the center of rotation of the cutter-shaft being always radial to the center of rotation of the driving-shaft, substantially as and for the purposes set forth.

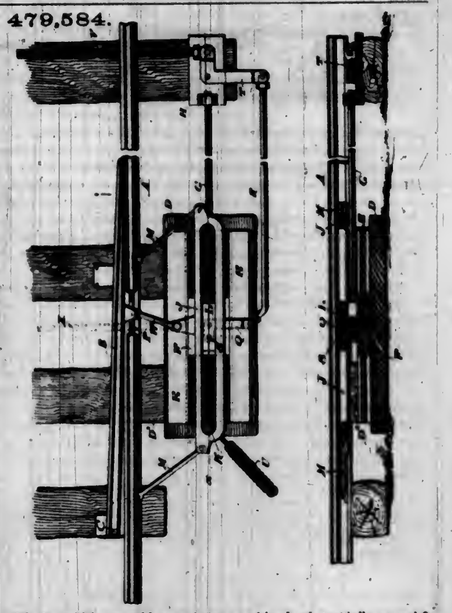
3. In a leather-skiving machine, the bearing-plate, means to support it, a shaft mounted in bearings on the said bearing-plate, and adjustable caps for the said bearings, and a disk cutter on said shaft, combined with set-screws and adjustable stops for said to act upon said caps, whereby wear on the cutter-shaft may be compensated for, and means for driving the cutter-shaft, substantially as described.

4. In a skiving-machine, the bearing-plate, the hanger upon which it is adjustably mounted, the cutter-shaft having a disk cutter and a bevel-gear, means to rotate the said shaft, a collar on the cutter-shaft, a slide-plate pronged to embrace the cutter-shaft, a threaded spindle to adjust the slide-plate, and devices to compensate for wear between portions of the spindle and the bearing-plate, substantially as described.

5. In a skiving-machine, the hanger, means to support it, and the bearing adjustably mounted thereon and adapted to receive and support the cutter-shaft, and means to rotate said shaft, combined with a hollow screw, and an abutment against which the inner end of the set-screw acts, and a set-screw extended through the said hollow screw, to operate substantially as described.

6. In a skiving-machine, a driving-shaft and bearings therefor, combined with a cutter-shaft, its cutter, and bearings therefor pivotally supported to rotate about the axis of rotation of the driving-shaft, whereby the axis of said cutter-shaft is made to intersect and adapted to be radially adjustable about the axis of the said driving-shaft, and actuating connections between said driving and cutter shafts, substantially as described.

479,584. OPERATING MECHANISM FOR RAILWAY-SWITCHES. ARTHUR BURBY, Philadelphia, Pa. Filed Aug. 22, 1891. Serial No. 403,411. (No model.)



Claim.—1. A movable track-rail, a bar linked to said track-rail and to a fixed support, a block movable on and controlled by said bar, a movable support, and a lever fulcrumed to said movable support and connected with said block, said parts being combined substantially as described.

2. The combination of a movable support, a lever pivoted thereto, a slotted bar, a block movable in said slot and pivoted to said lever, parallel arms connected to said bar, and an expansible and contractile rod G, connected with said movable support and said lever, substantially as described.

3. The combination of a movable track-rail, a main rail, a base with guides thereon, a block movable in said guides and having one end of a rod connected therewith, the other end of the said rod having a fixed connection, a lever pivoted to said block, an operating-rod connected with said lever, a slotted bar connected by parallel arms of equal length to said main rail and by a pivoted bar to said movable track-rail, and a block fitted and moving in said slotted bar and pivotally connected to a limb of the said lever, substantially as and for the purpose described.

4. A compensator for the operative mechanism of a switch, semaphore, gate, &c., consisting of a block fitted and freely moving in suitable stationary guides, thereby forming a movable fulcrum, a lever mounted on said fulcrum, a rod connected therewith, and a rod secured to said block of substantially equal length to the rod connected with the said lever, said parts being combined substantially as and for the purpose set forth.

479,584.

5. A movable track-rail, a main rail, a bar connected with said main and movable track-rails and adapted to operate the latter, a fixed base with a block movable thereon, an elbow-lever pivoted to said block and to a second block guided on said bar, an operating-rod connected with said angle-lever, and a compensating rod, of substantially equal length to the said operating rod, secured at one end to said first block and at its other end having a stationary support, said parts being combined substantially as described.

479,585. HEAD-REST. ROBERT R. CHERRINGTON, Hyde Park, Mass. Filed Oct. 12, 1891. Serial No. 408,419. (No model.)

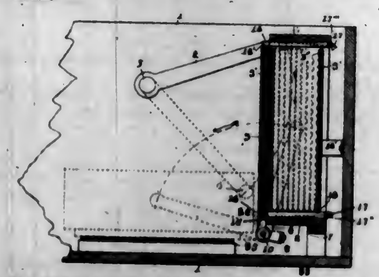
Claim.—1. In a head rest, a recessed base-block, risers or supports at each side thereof, and a top cushion supported by said risers or supports, combined with upholstery, as a^2, with which the recess in the base-block is filled, substantially as described.

2. The recessed base-block and upholstery with which said recess is filled and two yielding risers or supports *b*, one at each side of said block, combined with the strip *c*, connecting the upper ends of said risers, upholstery *g*, and a covering *g'*, inclosing said upholstery and the risers or supports to form a top cushion, said covering being secured at its lower edge to the base-block, substantially as described.

3. The recessed base-block and upholstery with which said recess is filled and two spring acting risers or supports *b*, one at each side of said block, and the strip *c*, connecting the upper ends of said risers, combined with side cushions or rolls *f*, upholstery *g* between them, and the covering *g'*, inclosing said rolls and upholstery and extended over the risers to the base-block and secured thereto at its lower edge, substantially as described.

479,586. HOT-AIR REGISTER. RICHARD S. T. CHEEK, Elizabeth, N. J. Filed Dec. 22, 1890. Serial No. 376,444. (No model.)

Claim.—1. In a hot-air register, the combination, with a support-



479,586.

ing-frame having an angularly-recessed boss, of slats pivoted to said frame, a governing-rod pivoted eccentrically to said slats, an operating-lever pivoted to the governing-rod, a screw-pivot passed through the supporting-frame and the shank of the operating-lever, a nut engaging said screw-pivot, and a centrally-perforated sheet-metal box passed over said screw-pivot and lying between the operating-lever and the nut within the recessed boss of the supporting-frame, said box having upturned flanges embracing the sides of the nut and a concentric flange on its under side, substantially as described.

2. In a hot-air register, the combination of a supporting-frame having an angularly-recessed boss, slats pivoted to said frame, a governing-rod pivoted eccentrically to said slats, an operating-lever pivoted to the governing-rod, a screw-pivot passed through a slot in the supporting-frame and the shank of the operating-lever, a nut engaging said screw-pivot, and a centrally-perforated sheet-metal box passed over said screw-pivot and lying between the operating-lever and the nut and seated in the recessed boss of the supporting-frame, said box having upturned flanges embracing the sides of the nut and provided upon its under side with a central bushing surrounding the screw-pivot and a raised concentric flange exerting a frictional action on the operating-lever, substantially as described.

479,587. MAGAZINE-CAMERA. STEPHEN C. FAY and HENRY WILLIS, Rochester, N. Y. Filed Jan. 16, 1892. Serial No. 418,286. (No model.)

Claim.—1. The combination, in a camera, of the case, the plate-transferring frame, the magazine-holder, the shaft secured in the case, both the frame and the holder being pivotally supported by arms on the shaft and adapted to be rocked by said shaft in the same direction, with mechanism for independently turning said holder on its arm-pivots, whereby opposite sides of the holder can be successively brought in contact with the frame, substantially as set forth.

2. The combination, in a camera, of a case, the plate-transferring frame, the magazine holder, the shaft secured in the case, both the frame and holder being pivotally supported by arms on the shaft and adapted to be rocked by said shaft in the same direction, with mechanism for independently turning said holder on its arm-pivots, whereby opposite sides of the holder can be successively brought in contact with the frame and support 7, substantially as set forth.

3. The combination, in a camera, of the pivoted plate-transferring frame, the magazine-holder pivotally supported in swinging arms, said arms, devices for turning the holder on its pivotal supports in the arms, spring-catches secured in the holder to engage the edges of the front and rear plates, and a spring-follower to push the plates through the magazine-holder, substantially as set forth

4. In a camera, the combination of a case, a magazine-holder provided with arms pivotally connected thereto near its top and to the case of the camera, and a rocking shaft provided with arms pivotally connected to said holder near the center of its sides, whereby said holder can be simultaneously lowered and turned on a longitudinal axis, substantially as set forth.

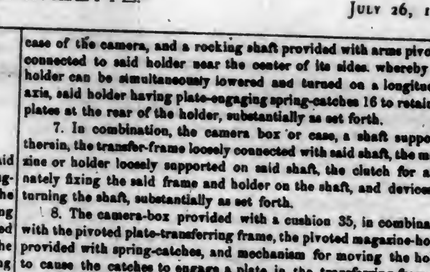
5. In a camera, the combination of a case, a magazine-holder provided with arms pivotally connected thereto near its top and to the case of the camera, and a rocking shaft provided with arms pivotally connected to said holder near the center of its sides, whereby said holder can be simultaneously lowered and turned on a longitudinal axis, said holder having plate-engaging spring-catches 17, substantially as set forth.

6. In a camera, the combination of a case, a magazine-holder provided with arms pivotally connected thereto near its top and to the case of the camera, and a rocking shaft provided with arms pivotally connected to said holder near the center of its sides, whereby said holder can be simultaneously lowered and turned on a longitudinal axis, said holder having plate-engaging spring-catches 17 to retain the plates at the rear of the holder, substantially as set forth.

7. In combination, the camera box or case, a shaft supported therein, the transfer-frame loosely connected with said shaft, the magazine or holder loosely supported on said shaft, the clutch for alternately fixing the said frame and holder on the shaft, and devices for turning the shaft, substantially as set forth.

8. The camera-box provided with a cushion 35, in combination with the pivoted plate-transferring frame, the pivoted magazine-holder provided with spring-catches, and mechanism for moving the holder to cause the catches to engage a plate in the transferring-frame at rest upon the cushion, substantially as set forth.

9. The transfer-frame provided with spring-catches, each having an inclined projection 17′ and extension 17‴, in combination with the magazine-holder having studs 17‴ on its rear arranged to engage said extensions and move the spring-catches when the holder is placed upon the frame, and devices for bringing the frame and said holder together successively on opposite sides of the latter, whereby said spring-catches are first made to engage a plate in front of the holder and whereby said studs subsequently release the catches, substantially as set forth.



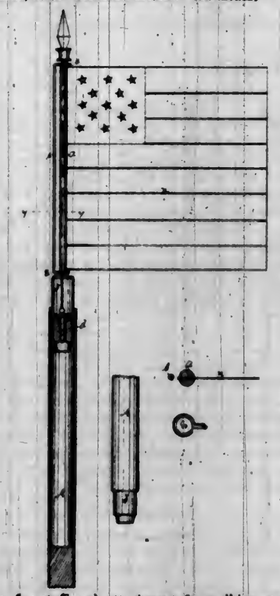
479,588. HANDLE FOR WASH-BOILERS. JAMES I. FLANAGIN, Philadelphia, Pa. Filed Mar. 5, 1892. Serial No. 423,554. (No model.)

Claim.—1. A handle for a wash-boiler, consisting of ears with sockets at their ends and adapted to be secured to said boiler, a grip with its ends fitting in said sockets, and a rod extending through openings in the said grip and sockets and having angular limbs at its ends outside of said sockets extending over the ears and embracing the same and are fixed thereto, substantially as described.

2. A handle for a boiler, consisting of metallic ears formed of open sides having sockets at their ends, a hollow wooden grip with its ends fitting in said sockets, and a rod passing through said grip and sockets and having limbs at its ends extending along the open sides and rigidly secured thereto, said parts being combined substantially as described.

479,589. FLOUR-BOLT. CLARK S. FULLER, Lafayette, Ind., assignor, by mesne assignments, to the Geo. T. Smith Middlings Purifier Company, Jackson, Mich. Filed July 27, 1883. Serial No. 102,042. (No model.)

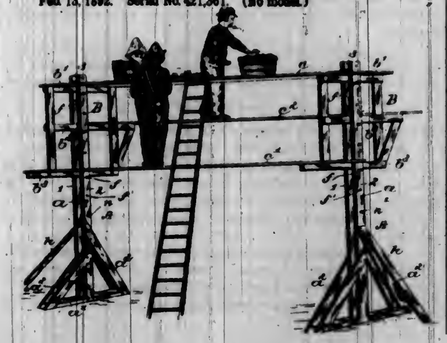
Claim.—1. In a flour-bolt, the combination of reel-heads, longitudinal ribs connecting the reel-heads, a bolting-cloth supported upon the reel-heads and by the longitudinal ribs intermediate of the reel-heads and having an uninterrupted inner surface, and lifting plates or buckets mounted within the reel and having their outer edges out of contact with the bolting-surface, substantially as set forth.



2. In a flour-bolt, the combination of a rotary reel having an uninterrupted inner surface, a deflector within the reel adapted to direct material to the bolting-cloth, and a series of intermediate longitudinal lifting plates or buckets secured to and revolving with the reel, their outer edges slightly separated from the bolting-surface, substantially as set forth.

3. A flour-bolt provided with a series of elevators arranged inside of the cloth with their outer edges at short distances from the cloth, in combination with a deflector which projects above the axis of the bolt and extends downward into close proximity to the bolting-cloth, whereby it is adapted to receive material taken up by the elevators and discharge the same upon the bolting-cloth, substantially as set forth.

4. In a flour-bolt, the combination of a rotating reel having an uninterrupted inner surface and a series of elevators arranged inside of the cloth and supported from the reel-heads, their outer edges at short distances from the adjacent bolting-cloth, substantially as set forth.



5. In a flour-bolt, the combination, with a bolting-reel provided upon its inner surface with a series of elevators, of a single deflector suspended from the reel-shaft with its lower edge below the axis of the reel and in close proximity to the elevators on the upward moving side of the reel and having its opposite edge above the axis of the reel and in close proximity to the elevators on the downward moving side of the reel, substantially as set forth.

479,590. COMBINED CANE AND FLAG. EDGAR GASH, Macomb, Ill. Filed Mar. 26, 1892. Serial No. 426,451. (No model.)

Claim.—In a flag-staff and attachment for walking-canes, the flag-staff *a*, in two parts composed of two half-round spring-metal rods, the slotted reversible ferrule J, rigidly attached to the lower end of the staff, the upper end of the staff being securely attached to a spear-head or ornament, and the guide-frame *e*, having eyes *e e*, which are fitted loosely around the staff at each end, substantially as shown and described, and for the purpose set forth.

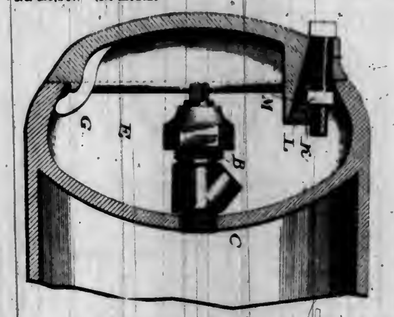
479,591. SCAFFOLD. FRANK B. GILBRETH, Boston, Mass. Filed Feb. 13, 1892. Serial No. 421,361. (No model.)

Claim.—1. A scaffold having a central platform and two platforms arranged at different levels on opposite sides of and below said central platform, substantially as and for the purposes set forth.

2. A scaffold comprising a single line of standards and supporting-frames thereon carrying two platforms at different levels and upon opposite sides of the said standards and a third platform located above the said platforms, substantially as described.

3. A scaffold comprising a series of horses, each having a single vertical standard, a series of frames carried by and adjustable on said standards, each frame having three platform-supports arranged each at a different level, one of the supports being above and between the other two, substantially as described.

4. In a scaffold, a horse having a vertical standard composed of two members secured to each other and constituting a single standard, and a frame supported entirely by said standard and fitted to move vertically between and guided by said members, the said frame having supports for three platforms arranged at different levels, substantially as described.



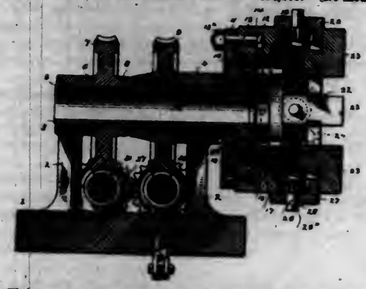
5. A scaffold comprising a series of horses, each having a single vertical standard, and a series of platform-supporting frames carried by and adjustable on said standards, each supporting-frame having supports for two or more platforms arranged at different levels, substantially as described.

6. In a scaffold, a series of horses arranged in line, each having a single vertical standard, a platform-supporting frame carried solely by each standard, and a lifting-jack sustained by a pin inserted in the standard and acting against and to lift the supporting-frame carried by said standard, substantially as described.

7. In a scaffold, a series of horses having vertical standards comprising two members each, platform-supporting frames arranged between said members and supported by pins extending through said members, combined with lifting-jacks for the said frames, arranged between the members of the said standards and supported upon pins passed through said members, substantially as described.

8. In a scaffold, a series of horses comprising vertical standards, feet *a′*, and diagonal braces a^3, and platform-supporting frames carried by said standards, combined with the end braces *h*, hinged to the ends of the diagonal braces a^3, whereby they may be turned upwardly against the standards or outwardly against the braces, substantially as described.

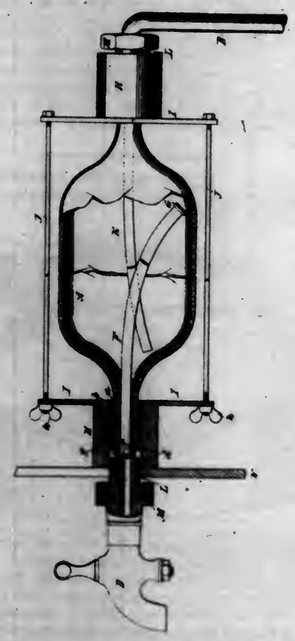
479,592. SHIPPING-FLASK FOR ANHYDROUS AMMONIA. THEODORE J. GOLDSCHMID, Philadelphia, Pa. Filed Mar. 17, 1892. Serial No. 425,247. (No model.)



Claim.—1. A shipping-flask for anhydrous ammonia, provided with a cap for closing the valve-chamber thereof and a bolt and nut for tightly holding said cap in position on the flask, the nut being within said chamber resting on an inclined guide and the head of the bolt outside of the cap, said parts being combined substantially as described.

2. A shipping-flask for anhydrous ammonia, provided with a cap for closing the valve-chamber thereof, said cap having an opening and an inclined guide, in combination with a bolt in said opening and a nut on said bolt, the nut resting on said guide and when screwed up tightening against the rim of the flask, substantially as described.

3. A shipping-flask for anhydrous ammonia, having a cap closing the valve-chamber thereof, said cap having an opening, a channel continued inwardly therefrom, and an inclined guide in said channel, a bolt in said opening, and a nut on the bolt resting on said guide, said parts being combined substantially as described, whereby said bolt engages with the rim of the flask through the medium of said nut, as stated.

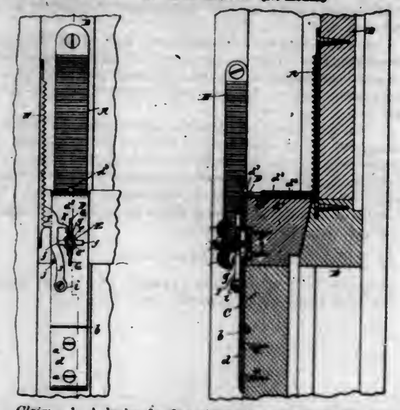


4. A shipping-flask for anhydrous ammonia, having a cap for closing the valve-chamber thereof, said cap being provided with a bolt, a nut, and a lug for tightening the same on the rim of the flask, substantially as described.

479,593. MECHANICAL MOVEMENT. JAMES GREGORY, Bridgeport, Conn. Filed Dec. 7, 1891. Serial No. 414,365. (No model.)

Claim.—A mechanical movement consisting of a power-shaft having a worm 32 and a gear 31, a slide carrying a shaft having a worm 36, and a gear meshing with gear 31 and adapted to slide longitudinally of said gear, a shaft carrying a gear engaging worm 32, and a sleeve adapted to oscillate on said shaft and carrying a gear-engaging worm 36, so that normally said shaft and sleeve will rotate together, but when the slide is moved the sleeve will be oscillated on the shaft and its movement either accelerated or retarded relatively to said shaft.

479,594. BEVERAGE APPARATUS. ALBERT HILDEBRANDT, Brooklyn, N. Y. Filed Dec. 24, 1891. Serial No. 416,083. (No model.)

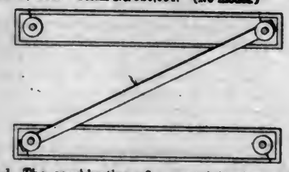


Claim.—1. The combination of the receptacle A, having open necks *a a*, sleeves H H, fitting over said necks, rod J, connecting said sleeves, and means for connecting said sleeves with a pipe and faucet, respectively, substantially as described.

2. The combination of the receptacle A, having open necks *a a*, sleeves H H, having internal flanges *d*, washers *c c*, fitting between said necks and said flanges, and means for connecting said sleeves with an induction-pipe, a faucet, or the like, and with rods J for holding the sleeves H upon the necks *a a*, substantially as described.

3. The combination of the receptacle A, having open necks *a a*, sleeves H H thereon, flanges *d d* in said sleeves, tubes E F, passing through said sleeves and having flanges *f*, tubes L L, screwing into the sleeves H H and pipe B, and a faucet or the like connecting with said tubes L L, substantially as described.

479,595. SASH-FASTENER. GEORGE G. HOPKINS, Brooklyn, N. Y. Filed Mar. 24, 1892. Serial No. 426,196. (No model.)



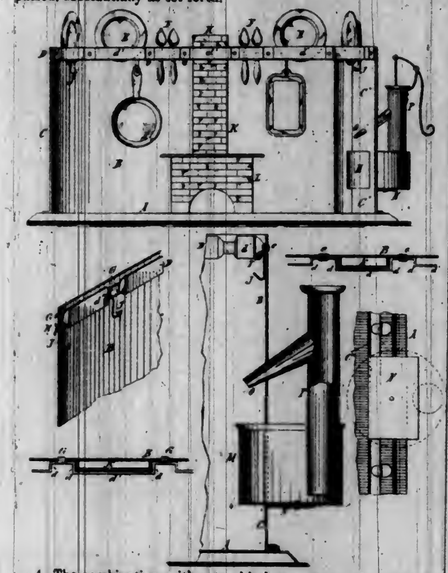
Claim.—1. A device for fastening sashes to each other in varying positions, consisting of a ratchet-strip, as A, adapted to be secured to one sash, a suitable detent, including an adjustable part d^3 and adjusting-screw d^2, adapted to be secured to the other sash and to engage with such ratchet-strip A, and a suitable device, as the projections *f f*, adapted to hold the part d^3 in engagement with the ratchet-strip A at any desired point, substantially as described and shown.

2. In a device for fastening sashes to each other and to the window-casing, a ratchet-strip A, secured to one sash, a detent adapted to engage with such ratchet-strip A, and a locking device, as the projections *f f*, moving on the stem E, adapted to hold the detent in engagement with the strip A, in combination with a suitable ratchet-strip, as H, disposed on the window-casing, and a suitable locking device adapted to engage with the ratchet-strip H and to be held in engagement therewith by the projections *f f*, substantially as described.

3. A sash-fastening device adapted to secure a window-sash rigidly in position at varying points in the window-casing, consisting of a ratchet-strip H and a suitable toothed lever I, adapted to engage therewith, disposed on the sash-frame, in combination with a ratchet-strip A, disposed on the other sash-frame, and a suitable detaining device adapted to secure the sashes to each other at varying positions of such ratchet-strip A, and a locking device, as the projections *f f*, moving upon the stem E, substantially as described.

479,596. THERMO-ELECTRIC ELEMENT. CHARLES W. IDEN, New York, N. Y., assignor to the Thermo Electric Company, same place. Filed Nov. 11, 1889. Serial No. 329,931. (No model.)

Claim.—1. The combination of a containing-box, a metal cast therein, and two pole-pieces, of different metal from that in the box, cast therein at or about the extremities of the same, substantially as described.



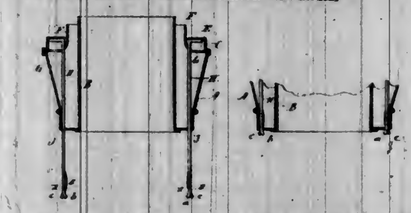
2. The combination of the iron box, the compound of zinc and antimony cast therein, and the pole-pieces made of another metal and cast in the ends of said zinc and antimony, substantially as described.

479,597. TOY KITCHEN AND STOVE. JULIUS JABSEN, Rutherford, N. J. Filed Jan. 28, 1892. Serial No. 419,517. (No model.)

Claim.—1. The combination, with the walls of a toy kitchen or stove, of sheet-metal strips bent to have offsets forming pockets for plates or spoons, which strip is fastened to the inner surfaces of the walls of the kitchen by mechanical fastening devices, substantially as set forth.

2. The combination, with a toy kitchen or stove, of a sheet-metal strip bent to have offsets forming pockets for plates and spoons and provided with tongues projecting from the edges of those parts of the strips between the pockets, which tongues are passed through slots in the walls of the toy kitchen or stove and bent over, substantially as set forth.

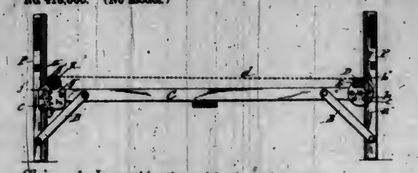
3. The combination, with a toy kitchen or stove, of a sheet-metal strip bent to have offsets forming pockets for plates and spoons and provided with tongues projecting from the edges of those parts of the strips between the pockets, which tongues are passed through slots in the walls of the toy kitchen or stove and bent over, and suspending-hooks passed through the same slots through which the tongues are passed, substantially as set forth.



4. The combination, with a toy kitchen or stove, of a strip bent to have offsets between which pockets for plates and spoons are formed, which strip is fastened to the upper edge of the rear wall of said toy kitchen or stove, and a chimney having its upper end passed through one of said pockets, substantially as set forth.

5. The combination, with a toy kitchen or stove having part cut in one side wall and bent outward and downward to form a bracket, of a water-receptacle resting on said bracket.

6. The combination, with a toy kitchen or stove having part of one side wall cut to form a bracket, of a water-receptacle part of which is projected through said opening into the interior of the kitchen, which water-receptacle rests upon and is connected with said bracket, substantially as set forth.



7. The combination, with a toy kitchen having part of one side wall cut and bent downward and outward to form a bracket, of a water-receptacle resting on said bracket and a spout passed through said wall of the kitchen above said receptacle, substantially as set forth.

479,598. LAMP-BURNER. JOSEPH JAUCH, Meriden, Conn., assignor to The Bradley & Hubbard Manufacturing Company, same place. Filed Nov. 23, 1891. Serial No. 412,771. (No model.)

Claim.—In a lamp-burner, the combination of the body of the burner constructed with holes J through its base with a chimney-holder adapted to rest upon the said body and provided with rods H, corresponding to and extending downward through said holes J, the lower ends of the said rods split to form two or more fingers, the said fingers bent to form notches by which the said rods may engage the burner when in the up position, substantially as described.

479,599. FOLDING BED. WINFIELD KELSEY, Kansas, N. Y., assignor to Fannie R. Kelsey, same place. Filed Jan. 18, 1892. Serial No. 418,365. (No model.)

Claim.—1. In combination with the side rail, the post provided with a vertical guide-groove, a metal plate rigidly attached to the side rail and provided with a lug extending into said guide-groove, and a brace pivotally connected at opposite ends to the post and side rail and guiding the post to its folded position, as set forth.

2. In combination with the side rails and cross-bar attached to the ends of said rails, the posts provided with vertical grooves and metal plates attached to the side rails and provided with lugs extending into the grooves of the posts and with abutments engaging the aforesaid cross-bar, as set forth.

3. In combination with the side rails and cross-bar attached to the ends of said rails, the posts provided with vertical grooves and metal plates attached to the side rails and provided with lugs extending into the grooves of the posts and with hooks holding down the outer portions of the cross-bar, substantially as described and shown.

4. In combination with the side rails and cross-bar attached to said rails, the posts provided with vertical grooves and metal plates provided with lugs extending into said grooves and with abutments engaging the inner side of the cross-bar and with hooks holding down the outer portion of said cross-bar, substantially as described and shown.

5. In combination with the side rail C, the posts P P, provided with the vertical grooves *a a*, the plates *b b*, fastened to opposite ends of the side rail and provided with the lugs *c c*, extending into said grooves, the braces B B, pivotally connected to the posts and side rails and guiding said posts into their folded positions, the projections *e e* on the side of the side rail, and the safety-hooks *f f*, projecting from the posts and engaging said projections to retain the posts in their erect positions, all constructed and combined to operate substantially as described and shown.

479,600. BEAN-HARVESTER. JOSEPH F. KING, Montalvo, Cal., and SAMUEL B. STOKELY, Kansas City, Mo., assignors to the Eagle Manufacturing Company, Davenport, Iowa. Filed Mar. 4, 1892. Serial No. 423,766. (No model.)

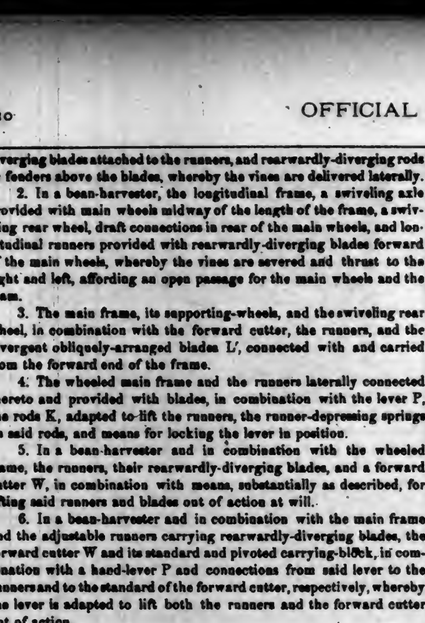
Claim.—1. In a bean-harvester, a wheeled propelling-frame, longitudinal vertically-movable runners connected therewith, rearwardly-

diverging blades attached to the runners, and rearwardly-diverging rods or feeders above the blades, whereby the vines are delivered laterally.

2. In a bean-harvester, the longitudinal frame, a swiveling axle provided with main wheels midway of the length of the frame, a swiveling rear wheel, draft connections in rear of the main wheels, and longitudinal runners provided with rearwardly-diverging blades forward of the main wheels, whereby the vines are severed and thrust to the right and left, affording an open passage for the main wheels and the team.

3. The main frame, its supporting-wheels, and the swiveling rear wheel, in combination with the forward cutter, the runners, and the divergent obliquely-arranged blades L', connected with and carried from the forward end of the frame.

4. The wheeled main frame and the runners laterally connected thereto and provided with blades, in combination with the lever P, the rods K, adapted to lift the runners, the runner-depressing springs on said rods, and means for locking the lever in position.



5. In a bean-harvester and in combination with the wheeled frame, the runners, their rearwardly-diverging blades, and a forward cutter W, in combination with means, substantially as described, for lifting said runners and blades out of action at will.

6. In a bean-harvester and in combination with the main frame and the adjustable runners carrying rearwardly-diverging blades, the forward cutter W and its standard and pivoted carrying-block, in combination with a hand-lever P and connections from said lever to the runners and to the standard of the forward cutter, respectively, whereby the lever is adapted to lift both the runners and the forward cutter out of action.

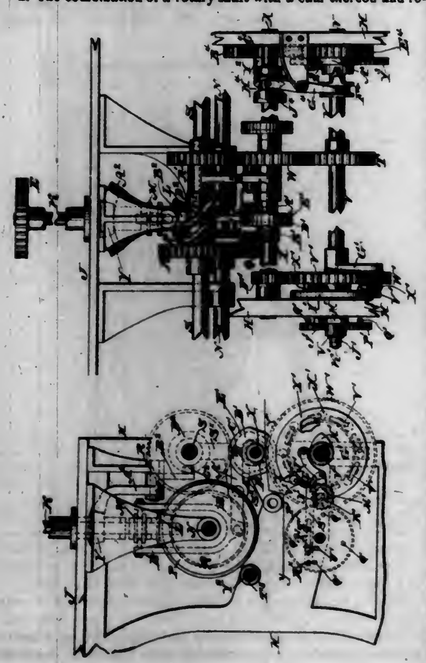
479,601. KNITTING-MACHINE. MICHAEL KIRSHNER, Philadelphia, Pa. Filed Jan. 24, 1891. Serial No. 378,950. (No model.)

Claim.—1. A knitting-machine having a cam-cylinder with a gear-wheel, a shaft with a gear engaging the cam-cylinder gear-wheel, a bevel gear-wheel loosely mounted on said shaft, the bevel gear-wheel Y, loosely mounted on said shaft and having mechanism to reciprocate the same, a clutch on said shaft and rotatable therewith, a main driving-shaft, a train of gearing connected with said driving-shaft and said first bevel gear-wheel, an oscillating lever adapted to shift said clutch, a cam for operating said lever, a wheel loosely mounted on the driving-shaft and adapted to operate the said cam and carrying pins with connected levers, a spring-bar and a disk controlling said levers, and a rotary wheel operated by the rotation of the driving-shaft and provided with pins for actuating the said spring-bar, said parts being combined substantially as described.

2. The combination of a rotary shaft with a cam thereon and rotary therewith, a gear-wheel loosely mounted on said shaft and provided with levers connected with pins movable in openings in said wheel, an arm projecting from said shaft and adapted to engage a projecting pin on said wheel, a pivoted lever with a pawl, the ratchet-wheel M', having the connected gear-wheel N', the gear-wheel P', having pins projecting therefrom, a spring-controlled bar with projections adapted to be engaged by said pins on the last-mentioned gear-wheel, and a cam with an attached gear engaging with the first-mentioned gear-wheel, substantially as described.

3. In a knitting-machine, a needle-cylinder with needles movable therein, a main driving-shaft, a cam-cylinder with an oscillating cam, rotary rings with pins thereon, disks engaged by said pins, and pivoted levers connected therewith, said parts being combined substantially as described.

4. A knitting-machine having a needle-cylinder with needles provided with double heels, oscillating rings, disks engaged by said rings, and levers connected to said disks, one of each of the levers engaging a single needle and alternately engaging the two heels thereof to raise and lower the same, thereby automatically throwing out of and into action needles of the needle-cylinder required to be lifted out of the way of the cam-cylinder during the forming of a pocket in a tubular piece of fabric, said parts being combined substantially as described.



5. A knitting-machine having a needle-cylinder with needles therein, oscillating rings having suitable supports and provided with pins, disks with recesses in which said pins engage, so as to rotate the said disks, arms connected with said disks, levers attached to said arms which engage the needles, and mechanism, substantially as described, for operating said rings, said parts being combined as stated.

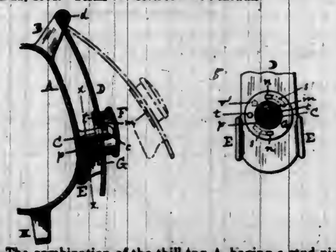
6. The combination of a needle-cylinder with needles movable thereon, rings having projecting pins and movable on suitable supports, pivoted disks with recesses in which said pins move, arms connected to said disks, levers connected to said arms and having their ends adapted to engage the said needles, a cam-cylinder with mechanism, substantially as described, for oscillating the same, and mechanism for imparting a motion to said rings, so as to move said pins from one disk to the adjacent one during an oscillation of the cam-cylinder, substantially as described.

7. The combination of a rotary shaft, a segmental piece with toothed rims, two gear-wheels of equal diameters, two sets of pinions, each pinion being of one-half the diameter of one of the said gear-wheels, and two rotary shafts, each having a pinion to engage with one of the first-mentioned gear-wheels and with one pinion of the corresponding set of pinions, said segmental piece having one of its rims engaging one pinion of one of said sets of pinions and another rim engaging the gear-wheel pertaining to the other set of pinions, substantially as described.

8. The combination of a rotary shaft, mechanism, substantially as described, for moving said shaft endwise in its bearings at intervals of time, a bifurcated segmental piece secured on said shaft and having toothed rims, two gear-wheels of equal diameters, and two sets of pinions, each pinion of one-half the diameter of one of the gear-wheels, and two rotary shafts having pinions meshing with said gear-wheels and sets of pinions, substantially as and for the purpose set forth.

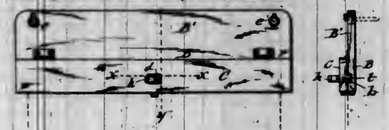
9. The combination of a main driving-shaft, a train of gearing, a bifurcated segment secured to the shaft of the last wheel of said train and having triple gear-rims, two rotary gear-wheels suitably journaled, two shafts having gear-wheels thereon and engaging said rotary gear-wheels, and two trains of gearing between said first-mentioned gear-wheels, one wheel of each train meshing with the gear-wheel on the corresponding shaft, one rim of said triple gearing engaging alternately with the two trains and each of the other rims being adapted to engage with the rotary gear of its respective train, substantially as described.

479,602. TANK. HYMEN L. LIPMAN, Philadelphia, Pa. Filed Jan 14, 1892. Serial No. 418,048. (No model.)



Claim.—1. A tank having a post with grooves on its opposite sides and a series of bent side pieces with their ends in said grooves, and a bottom secured to the lowest piece of said series, said parts being combined substantially as described.

479,602.

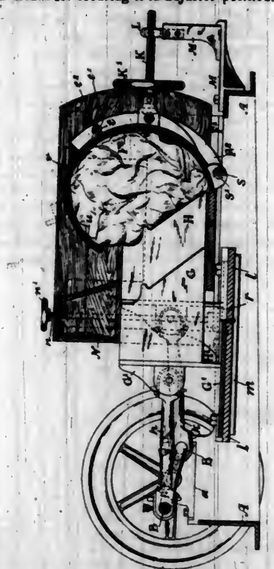


2. A tank formed of a post having grooves on its opposite sides, a series of curved or bent boards, each having its ends held in said grooves and its horizontal edges tongued and grooved with the adjacent board, and a bottom seated in a recess in the lower board, said post having its lower end extending below the lower board, said parts being combined substantially as described.

479,603. THILL-TUG. NATHAN F. MATHEWSON, Providence, R. I. Filed Oct. 22, 1891. Serial No. 409,508. (No model.)

Claim.—The combination of the thill-tug A, having a stud-pin C, with a slot *c*, a clasp D, pivotally mounted on projections of said tug and provided with an aperture *p*, slots *s*, and holes *v v'*, the knob F, having the interior locking-piece *m*, adapted to enter the slot *c*, the spring-washer G, connected with said knob F by rivets *n* through the slots *s*, and a tent *t*, attached to said washer and engageable with said holes *v v'*, substantially as specified.

479,604. BILL-FILE. SIDNEY B. MEREDITH, Oneida, N. Y. Filed Mar. 28, 1892. Serial No. 426,671. (No model.)



Claim.—1. The improved bill-file consisting of the base B and the clamping-plate C, provided with a tongue-and-groove joint on their gripping-faces, and a clamp or clamps locking the plate C on the base, as set forth.

2. A bill-file consisting of the base B and the clamping-plate C, provided with a tongue-and-groove joint on their gripping-faces, a staple on said base, and a hook on the clamping-plate, adapted to engage and release the said staple, substantially as described and shown.

3. A bill-file consisting of the base B, formed with the groove *b*, opening *c* in said groove, and with the upward extension B', the plate C, hinged to said base and provided with the tongue *f* and opening *d*, the pin *e*, attached to the base transverse of the opening *c*, and the hook A, pivoted to the plate C and extending through the opening *d*, substantially as described and shown.

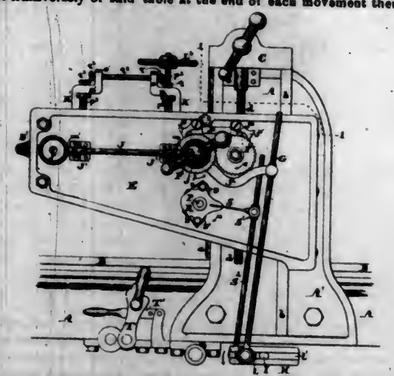
479,605. FULLING-STOCK. JOHN H. MITCHELL and ISAAC MITCHELL, Brockholes near Huddersfield, England. Filed Mar. 21, 1892. Serial No. 425,779. (No model.)

Brief.—The invention includes a fulling-mill having beaters reciprocating longitudinally on a bed adjustable in order to vary the width of the chamber in which the cloth is fulled. This chamber has a yielding top and a pivoted adjustable end frame, the latter being provided with means for securing it in adjusted position.

Claim.—1. In a fulling-machine, the combination, with the bed, the crank-shaft carried by the bed, and the feet reciprocated by the said crank-shaft, of the box adjustable longitudinally on the bed and provided with a clamping device, the curved end frame pivoted in the said box and provided with a clamping-bolt, and a screw connected with the bed and with the end frame and adapted to be revolved to adjust the position of the said box and also the position of the said end frame with respect to the said feet, substantially as set forth.

2. In a fulling-machine, the combination, with the bed and the box longitudinally adjustable on the bed, of the curved end frame pivoted in the box and provided with a clamping device, a bracket secured to the bed behind the end frame, a nut pivoted in the said bracket, and a revoluble adjusting-screw pivoted to the said end frame and engaging with the said nut, substantially as set forth.

3. In a fulling-machine, the combination, with the reciprocating feet, of the box, the curved end plate pivoted in the lower part of the box and provided with a clamping-bolt, the curved lid hinged to the upper part of the said end plate and extending part way over the said feet, and the cover supported over the said feet and adapted to prevent the material from lodging on top of them, substantially as described and shown.



479,606. METAL-PLANING MACHINE. GEORGE F. MCINDOE, Boston, Mass., assignor of one-half to James W. McIndoe, same place. Filed Nov. 5, 1891. Serial No. 410,904. (No model.)

Claim.—1. In a metal-planing machine, the combination, with the ordinary uprights and vertically-movable cross-head mounted thereon, of two side arms secured to and movable with said cross-head, a second cross head or bar secured to the ends of said side arms with its dovetailed slide facing toward said ordinary cross-head, tool supporting and manipulating mechanism carried by and adjustable on said cross head and bar, two cutting-tools carried by the central member of said tool-supporting mechanism, said tools being arranged with their cutting-points facing in opposite directions, a pair of feed-screws for moving said tools and tool-supporting mechanism transversely of the work-supporting table, said screws being connected together so as to be operated in unison, a toothed wheel secured to one of said screws, an elbow-lever mounted loosely on said screw and carrying a reversible pawl to engage said wheel, a second toothed wheel engaging said first-mentioned wheel, a lever mounted loosely on the axis of said second wheel and carrying a reversible pawl to engage the teeth of said wheel, a link connecting the two pawl-carrying arms, the rod G, and the oscillating bar H.

2. In a metal-planing machine, the combination, with the reciprocating table of an ordinary planer and any suitable gearing for op-

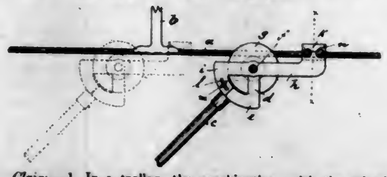
erating said table, of the cross-heads D D', the brackets or side arms E E, the duplicate sliding plates g and g', mounted on said cross-heads, the duplicate plates K and K', pivoted upon and clamped to the plates g and g', the duplicate plates L and L', fitted to and movable vertically on the plates K and K', the screw-shafts p^3 and p^3, connected together by the gears q, q', q^3, and q^3 and the shaft q^4, the hand-wheel L^3, the frame M, pivoted upon and clamped to the plates L L', the tool-holder N, pivoted to the frame M, the cutting-tools O and O', each provided with a slot near its upper end, the screws v and v' for adjusting said tools vertically, and means having provision for feeding said tools and their holders transversely of the table and moving the tool-holder about its pivotal support at the end of each movement of said table.

3. In a metal-planing machine, the combination, with the reciprocating work-supporting table and a cutting tool or tools constructed and arranged to act upon the work during each movement of said table, of the feed-screw i, the toothed wheel F, secured thereon, the elbow-lever j^3, the pawl j^3, carried by said lever, the rod G, the oscillating bar H, the toothed wheel F', the lever j^4, the link j^5, and the pawl j^3, all constructed, arranged, and operating to feed said cutting-tool transversely of said table at the end of each movement thereof.

4. In a metal-planing machine, the combination, with the reciprocating work-supporting table, of a pivoted tool-holder, a tool or tools having two cutting-edges facing in opposite directions, the toothed rod or bar w^2, connected to said tool-holder, the toothed shaft P, engaging said toothed bar, the sleeve P', movable endwise on said toothed shaft and forming a bearing for the toothed rod or bar w^2, the forked stand P^2, secured to and movable with the tool-holder-supporting slide, and a ratchet and-pawl mechanism constructed and arranged to impart an intermittent partial rotation of said shaft about its axis alternately in opposite directions, one of said partial rotations taking place at each reversal of the motion of said table.

5. In a metal-planing machine, the combination, with the reciprocating work-supporting table, of a pivoted tool-holder, a cutting tool or tools having two cutting-points facing in opposite directions, a toothed rod or bar connected to the movable end of said tool-holder, the toothed shaft P, engaging said toothed bar, the sleeve P', mounted upon said toothed shaft and movable transversely of said table with the tool-holder, the ratchet-wheel R, secured on said shaft, the pawl-carrying plate R', the pawls y and y', the spring-arm S, secured to said pawl-carrying plate, the rod S^2, the oscillating bar H, and the two pawl-controlling pins 5 5, set in the side bracket E in positions to hold the pawls y and y' out of engagement with the teeth of the wheel R when the pawl-carrying plate is in the center of its vibratory motion, substantially as described.

479,607. TRIAL-FRAME FOR OPTICIANS. ANGUS G. MCKENZIE, Boston, Mass. Filed Sept. 14, 1891. Serial No. 405,613. (No model.)

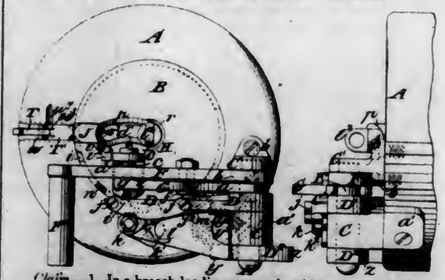


Claim.—1. In a trial-frame, the combination, with the rims of the frame, of parallel fingers fixed to each rim and offset therefrom on opposite sides thereof to co-operate at their free ends with the side of a lens-holder and its handle and retain the lens-holder between said free ends and rim, the end of the space between each finger and attached rim forming a limiting-stop for the handle of the lens-holder, said holder being thereby retained in position at several isolated and independent points, substantially as described.

2. The frame having rims provided with a concaved stop or projection g and an outwardly-yielding curved finger attached at one end to and offset from said frame, combined with a lens-holder having a handle, said holder being retained in place in the space between the inner side of the free end of the offset finger and adjacent portion of the rim and resting in the concaved stop, to operate substantially as described.

3. The frame having rims provided with concaved stops g and projections h and a connected yielding finger on the front and rear of each rim, said fingers being offset from the rims and parallel to each other and to the plane of the rims, the inner sides of the free ends of said fingers, and the adjacent portions of the rims, with the stops g and projections h forming a series of separate and independent retaining-points for the lens-holders, substantially as described.

479,608. TROLLEY. FREDRICK F. POOLE, Newark, N. J. Filed May 11, 1892. Serial No. 432,593. (No model.)



Claim.—1. In a trolley, the combination, with the wheel, the axle, and its support, of spring-plates adjustably secured to the sides of said support and fulcrumed on the axle, and metal blocks arranged on said springs and adapted to touch beyond but in the center line of the wheel, substantially as described, and for the purposes set forth.

2. In a trolley, the combination, with the wheel, the axle, and its support, of spring-plates fulcrumed at the said axle and provided with an elongated curved slot, a set or binding screw passing through said slot and adapted to secure said spring-plates to the said support, and metal blocks arranged on and adapted to be held together by said spring-plates, substantially as described, and for the purposes set forth.

3. In a trolley system, the combination, with the wire, of a wheel adapted to roll on the under side of said wire, an axle, a forked support for said axle, said support being provided with a segmental portion, metal blocks arranged beyond the wheel and above the wire and adapted to form a channel for said wire, and means for adjustably securing said metal blocks to the support, substantially as described and set forth.

479,609. BREECH-LOADING CANNON. SAMUEL SEABURY, U. S. Navy. Filed Apr. 12, 1892. Serial No. 428,753. (No model.)

Claim.—1. In a breech-loading cannon in which the breech-block has both a turning movement on its axis and a backward-and-forward movement, the combination, with such a breech-block, of a pivot attached to the breech of the cannon and a breech-block retractor connected with the said block and having a slotted connection with said pivot, whereby it is capable not only of a turning movement on said pivot for retracting the said block from the gun and inserting it therein, but also of a movement across the face of the breech for the purpose of turning the said block on its axis, substantially as herein set forth.

2. In a breech-loading cannon in which the breech-block has both a turning movement about its axis and a backward-and-forward movement, the combination with such breech-block, of a pivot attached to the breech of the cannon, a breech-block retractor having at one end a slotted connection with such pivot, and a connecting-piece having a pivotal connection with the other end of said retractor and a separate pivotal connection with the breech-block, substantially as and for the purpose herein set forth.

3. In a breech-loading cannon in which the breech-block has both a movement about its axis and a direct backward-and-forward movement, the combination, with such breech-block, of a fulcrum-pin attached to the breech of the gun, a lever working on said fulcrum-pin and carrying a second pin, and a retractor consisting of a cam-plate connected pivotally with the breech-block and engaging with said fulcrum-pin and said second pin for the two purposes of producing the movement about the axis and the direct forward-and-backward movement of the breech-block by the movement of said lever, substantially as herein set forth.

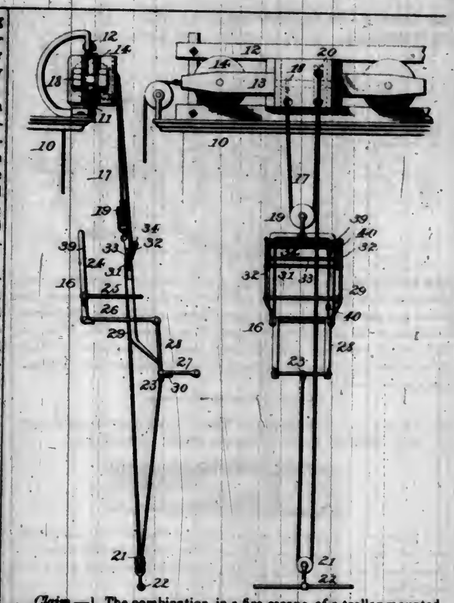
4. In a breech-loading cannon in which the breech-block is withdrawn in a rearward direction, the combination, with the breech-block carrier hinged to the breech of the cannon, of a hand-lever attached to the breech to move independently of the carrier and carrying a pin or stud, and a swinging retractor connected with the breech-block and having a pivotal connection with the breech, on which pivotal connection it works independently of the hand-lever and carrier and having a direct engagement with said pin or stud on the hand-lever, substantially as herein set forth.

5. In a breech-loading cannon in which the breech-block has both a movement about its axis and a backward-and-forward movement, the combination of a breech-block carrier hinged to the breech of the cannon, a lever and a fulcrum-pin for the same attached to the breech, and a retractor consisting of a cam-plate connected to the breech-block and engaging with said lever for the purposes of retracting it from the breech into the carrier and of pushing it from the carrier into the breech, substantially as herein set forth.

6. In a breech-loading cannon in which the breech-block has a turning movement about its axis and a direct backward-and-forward movement, the combination of a fulcrum-pin attached to the breech of the cannon, a lever working on said fulcrum-pin and carrying a second pin, a breech-block retractor consisting of a cam-plate having two slots, by one of which it engages with said second pin and by the other with said fulcrum-pin, and a connecting-piece having a pivotal connection with the breech-block and a separate pivotal connection with the breech-block retractor, substantially as herein set forth.

7. The combination, with the breech of the cannon, the breech-block capable of moving backward and forward therein, the swinging breech-block carrier, and the locking-hook l on the breech, of the locking-latch, consisting of a pivot k, arranged lengthwise of the tray of the carrier and having at its ends catches k' k^2 to engage, respectively, with the said locking-hook l, and with a notch n' in the breech-block by a movement transverse to the tray, substantially as herein set forth.

8. The combination, with the gun and the breech-block fitted to turn on its axis therein and the firing-pin passing through the block, of a connecting-piece attached to said block for turning it and provided with a cam for engaging with and cocking the firing-pin, substantially as herein set forth.



9. In a breech-loading cannon in which the breech-block has a turning movement on its axis and in which there is a firing-pin passing through said breech-block, the combination, with a cam plate or bar and means of moving the same across the breech for turning the latter, of a connecting-piece between the said plate or bar and the breech-block and the firing-pin, the said connecting-piece having a pivotal connection with the breech-block and a separate pivotal connection with the said cam plate or bar and having on it a cam for engaging with the firing-pin for the purpose of cocking the said pin, substantially as herein set forth.

10. The combination, with the breech-block and the firing-pin passing through the same, of the projection o' on the firing-pin and the spiral guide o^3, provided in the breech-block to receive said projection for the purpose of preventing the firing-pin from turning with the breech-block, substantially as herein described.

11. The combination, with the screw breech-block, the sear fitted radially to said block, and the connecting-piece attached to the breech-block for turning the latter, of the locking-piece v^2 v^3, fitted to the breech-block to engage with the sear for locking the same and to be disengaged by said connecting piece in the act of screwing up the breech, substantially as herein set forth.

12. The combination, with the breech-face provided with a radial groove and with a groove w^4 communicating with said radial groove, of the trigger T, trigger-slide T', and their connecting-pin w, all arranged within said radial groove with the said pin held in place by said groove, substantially as herein described.

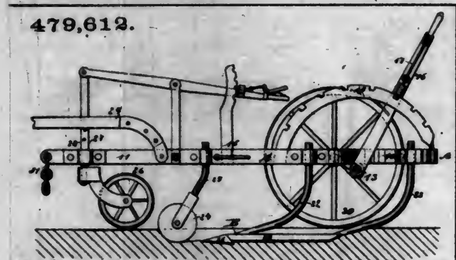
479,610. FIRE-ESCAPE. THEODORE R. WOODWARD, Norway, Pa. Filed Mar. 30, 1892. Serial No. 427,068. (No model.)

Claim.—1. The combination, in a fire-escape, of a trolley mounted on rails attached to a house, an escape chair having a pulley attached to it, a rope or chain attached at one end to the trolley and passing down around the said chair-pulley, thence up over a pulley in the trolley, and thence downward and with a return-bend extending again upward and attached at its other end to the chair, there being another pulley on a handle and mounted in the return-bend of the rope, substantially as described.

2. The combination, in a fire-escape, of a chair-back, arms, a bottom, a front, and a step, all hinged together, the front being provided with a stop-lug for the step, and a main brace hinged to the arms and bottom and extending below the latter and forward as a brace for the front, substantially as described.

3. The combination, in a fire-escape, of a chair having a main brace extending up beside the arms and a brake pivoted in the main brace and comprising three cross-bars, one of which is the pivot-pin, one on the binder of the brake and the other on the handle, substantially as described.

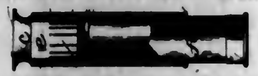
479,611. CANE-CUTTER. FREDERICK R. ALEXANDER, Brooklyn, N. Y. Filed Aug. 18, 1891. Serial No. 402,968. (No model.)



Claim.—1. A cane-cutter comprising a longitudinally-bored stock 10, having an attaching-shank 11 and cut away or reduced between its ends, as shown, a ∩-shaped knife 17, embracing with its longitudinal edges the cut-away part of the shank, its concave cutting-edge being opposite the adjacent concave portion of the bore and forming an oval passage in connection therewith, said knife being adapted to impart a half-oval form to the flat side of the cane, and a clamping device securing the cutter to the stock, substantially as set forth.

2. A cane-cutter comprising a longitudinally-bored stock 10, having an attaching-shank and reduced or cut away between its ends, as shown, a ∩-shaped knife embracing the cut-away portion of the shank with its longitudinal edges and having its inner concave cutting-edge opposite the adjacent concave portion of the bore and forming an oval passage in connection therewith, parallel clamping-plates 15 at opposite sides of the stock and having flanges 16 overlapping the longitudinal edges of the cutter, and the securing-bolts 18, substantially as set forth.

479,612. WEED-CUTTER. GROSVENOR S. ANDRUS, Walla Walla, Wash. Filed Nov. 10, 1891. Serial No. 411,590. (No model.)



Claim.—A weeding or cultivating machine comprising the frame A, formed of a bar or strap of metal bent into a horizontal oval or

479,612.

open form at the rear and having its ends brought together in front thereof to form the straight forward section 11, a cutter beneath the frame and having three upward-curved posts, the side post 23 of which is clipped to the ends of the oval part of the frame and the front post 22 of which is secured to the straight portion 11, supporting-wheels for the frame, and means for adjusting the frame vertically, substantially as set forth.

479,613. CARTRIDGE-LOADER. FRANK R. BALDWIN, Jersey City, N. J. Filed Apr. 6, 1892. Serial No. 428,087. (No model.)

Claim.—1. A cartridge-loader having a concentric inward projection near its upper end and provided with vertical flexible fingers in planes coincident with the body of the loader and extending below said projection.

2. A cartridge-loader having a concentric seat near its upper end and an annular chamber below said seat provided with parallel walls.

3. A cartridge-loader having a concentric inward projection near its upper end and an annular chamber below said projection provided with parallel walls, the inner one of which is resilient.

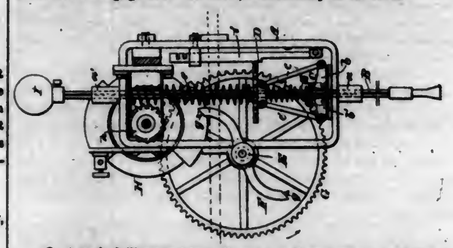
4. A cartridge-loader having a concentric seat and flexible fingers provided with rounded and inwardly-bent ends to embrace and protect the broken end of a cartridge while loading.

5. A cartridge-loader having a bell mouth terminating in an annular contraction forming a throat of a diameter about equal to the inside of the cartridge, a concentric collar forming a seat for the end of a cartridge, and a flexible guard for the upper end of the cartridge.

6. A cartridge-loader having a bell mouth, and a chamber having a shoulder or seat and vertical and parallel walls to receive the end of a cartridge, the inner one of said walls being flexible.

479,614. QUOIT-PEG. FLEMING A. O'R. BERESFORD, Mutford, England. Filed Jan. 19, 1892. Serial No. 418,561. (No model.)

Claim.—1. The combination, with a peg provided with a chamber and a central hole *d* at its top, of a flexible measuring device carried in the said chamber and adapted to be drawn out through the said central hole, whereby the distances of surrounding objects from the peg may be measured, substantially as set forth.



2. The combination, with a hollow peg provided with a central hole *d* at its top, of a flexible measuring device provided with the plug *g* and the swivel *f* and adapted to be drawn out of the peg through the said central hole, substantially as and for the purpose set forth.

3. The combination, with a peg provided with a chamber and a central hole *d* at its top, of a flexible measuring device carried in the said chamber and adapted to be drawn out through the said central hole, and a cap fitting over the top of the peg and protecting the projecting end of the said measuring device, substantially as set forth.

479,615. ROCK-DRILL. PERLEY P. BELT, Waco, Tex., assignor to Frank Osborn, Twin Lakes, Colo. Filed Oct. 3, 1891. Serial No. 408,133. (No model.)

Claim.—1. In a rock-drill, the combination of the drill-rod, a tappet-plate placed loosely on the drill-rod, clutch mechanism connected with the tappet-plate for engaging the drill-rod, a spring for impelling the drill-rod, a cam provided with conical ends for lifting the tappet-plate, and the guide *i*, substantially as specified.

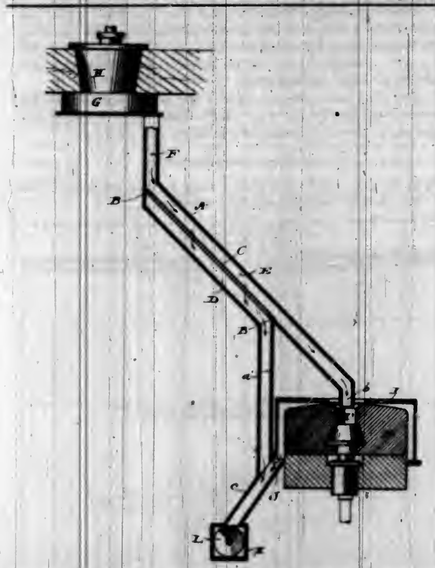
2. In a rock-drill, the combination, with a frame and a drill-rod sliding and rotating freely in the frame, of a tappet-plate having a slotted edge and sliding freely on the drill-rod and held from turning thereon, a friction-clutch carried by the said tappet-plate to raise the drill-rod, a vertically-extending guide-bar adapted to engage the slotted edge of the tappet-plate and prevent it from rotating during its entire throw, and a rotary tappet, the arms of which engage the lower side of the plate to raise it and also to rotate it when the guide-bar is out of engagement therewith, substantially as set forth.

3. A rock-drill comprising a frame, a drill-rod turning and sliding freely therein, a tappet-plate sliding freely on the rod and held against turning thereon, a plate C beneath the tappet-plate, and through which the drill-rod freely passes, a clutch-lever pivoted to the plate C to engage the drill-rod, a link *e*, connecting the clutch-lever and tappet-plate, a spring on the rod between the two plates, a spring on the rod between the upper part of the frame and upper side of the tappet-plate, a vertically-extending guide-bar pivoted at its lower end to the frame to swing inward into engagement with the slotted edge of the tappet-plate and extending upward as far as the upward throw of the tappet-plate, and a rotary tappet, the arms of which engage the under side of the tappet-plate, substantially as set forth.

4. In a rock-drill, the combination of a revoluble drill-rod B, a radially-slotted tappet-plate D, a clutch mechanism C, attached to the tappet-plate, the guide *i*, and the cam F, provided with the conical ends *g*, substantially as specified.

5. In a rock-drill, the combination, with the drill-rod B, of the radially-slotted tappet-plate D, clutch-levers *b b'*, connected with the tappet-plate, the spring *d*, and the cam, provided with conical ends *g*, for lifting the tappet-plate, substantially as specified.

479,616. COMBINED SCRUBBING AND SWEEPING MACHINE. GEORGE M. BENNETT, Burlington, Iowa. Filed Mar. 21, 1891. Serial No. 385,846. (No model.)



Claim.—1. A portable scrubbing and sweeping machine consisting, essentially, of the perforated wheeled casing having the interior receptacle, the brush having the polygonal core and the alternative bristles and moppers, which are secured to the angles or corners of said core and lie tangentially to the axis of the same, and means for positively rotating the brush, substantially as described.

2. In a portable scrubbing and sweeping machine, the brush consisting of the polygonal core 2 and the alternate moppers and bristles 4 3, secured to said core at its angles or corners and arranged tangentially to the axis of the same, substantially as and for the purpose described.

3. In a portable scrubbing and sweeping machine, a brush comprising a polygonal core having the longitudinal recesses in its faces near the corners or angles thereof, the battens secured in said recesses and having the series of tangential bristles united thereto, and the flexible tangential mopper-strips fastened to the core between the series of bristles, substantially as described.

479,617. SEPARATOR FOR CRUSHED CEMENT, &c. JOSEPH B. BERTHELET, Milwaukee, Wis. Filed Nov. 30, 1888. Serial No. 292,176. (No model.)

Claim.—1. The combination, in a separating apparatus, of a finisher, a chute having two outlets, one of which delivers to the eye of the stone in said finisher and the other to the outlet of the same, and a screen placed within the said chute and extending over the second-named outlet of said chute, substantially as set forth.

2. The combination, in a separating apparatus, of a crusher and a finisher, and a chute interposed between said crusher and finisher, said chute being arranged at an angle of practically fifty degrees and divided into an upper and a lower channel by a screen, with an independent spout leading from each channel, one of said spouts leading to said finisher and the other spout leading to the outlet of said finisher, substantially as set forth.

479,618. METALLIC FRAME FOR WAGONS. WILLIAM P. BERTENDORF, Davenport, Iowa. Filed Dec. 24, 1891. Serial No. 416,021. (No model.)

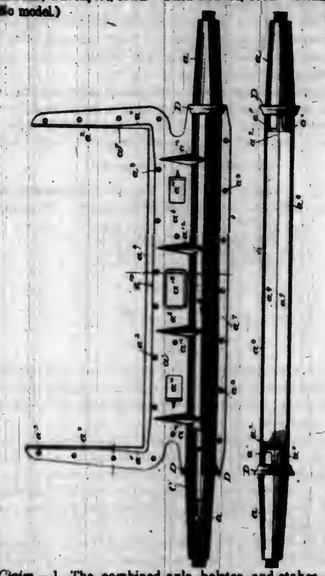
Claim.—1. A combined wagon-axle and sand-board consisting of two complementary parts, each formed from a single sheet of metal and the two united, substantially as described.

2. A sheet-metal axle consisting of two semi-tubular sections having their ends welded together in the form of conical spindles and the intermediate portions riveted together.

3. A combined axle and sand-board consisting of two complementary parts, each formed from a single sheet of metal, one edge bent into semi-tubular form and the opposite edge bent to form one side of the sand-board.

4. In a sheet-metal axle, the two longitudinal complementary parts, in combination with the internal strengthing-sleeves C, extending from the spindle into the main body.

5. The combined axle and sand-board consisting of the two longitudinal complementary parts united face to face, vertical depressions being formed in their proximate faces to provide a king-bolt opening F.



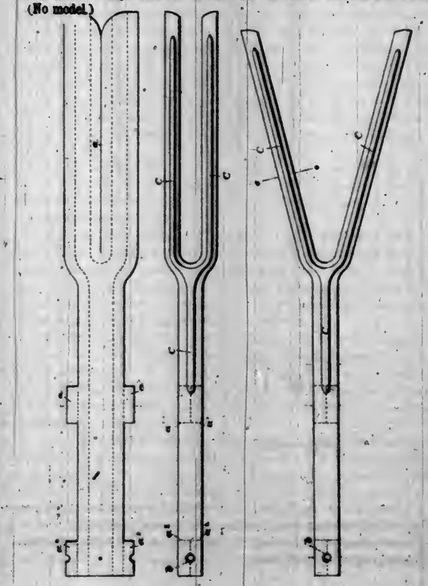
6. The sheet-metal axle consisting of longitudinal members, one having tubular necks or rivets raised therefrom and projected through and fastened to the other member.

7. The combined axle and sand-board consisting of the two complementary sheet-metal parts, substantially as described, united face to face and provided with corrugations E.

8. In a combined axle and sand-board, the complementary sheet-metal parts united face to face and provided with openings a^4, having the lips a^5 turned outward therefrom in opposite directions to receive the sway-bar.

9. The blank for an axle and sand board, consisting of a sheet-metal plate having substantially the outline shown in Fig. 1, with end projections *a a* to form complementary parts of the spindles and the side extension *a'* to form a complementary part of the sand-board.

479,619. METALLIC FRAME FOR WAGONS. WILLIAM P. BERTENDORF, Davenport, Iowa. Filed Dec. 24, 1891. Serial No. 416,022. (No model.)



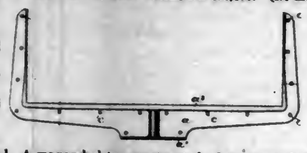
Claim.—1. The combined axle, bolster, and stakes consisting of two longitudinal complementary parts formed from sheet metal and united face to face, substantially as described and shown.

2. The tubular axle, the bolster integral therewith, and the standards integral with the bolster, said parts constructed substantially as described.

3. In a wagon, the tubular axle, the flanged bolster, and the flanged standards rising from the bolster, said parts constructed of two complementary sheet-metal members.

4. The herein described blank, having substantially the outline shown in Fig. 1, with the extensions *a a*, the portion *a'*, and the extensions a^3.

479,620. METALLIC FRAME FOR WAGONS. WILLIAM P. BERTENDORF, Davenport, Iowa. Filed Jan. 15, 1892. Serial No. 418,134. (No model.)



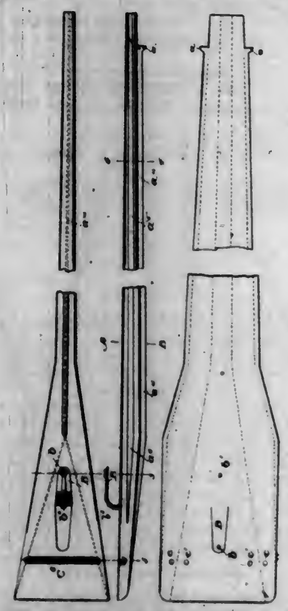
Claim.—1. The combined wagon reach and hounds constructed as herein described and comprising a single hollow reach and diverging hollow hounds integral therewith.

2. As a new article of manufacture, the combined wagon reach and hounds constructed as shown and described and comprising a single semi-tubular reach and diverging semi-tubular hounds integral with the reach.

3. The combined wagon reach and hounds constructed as shown and described and comprising a single reach and diverging hounds integral therewith, the reach being tubular at points to afford bearings for the king-bolt and sway-bar and semi-tubular at all other points.

479,621. WAGON-BOLSTER. WILLIAM P. BETTENDORF, Davenport, Iowa. Filed Jan. 15, 1892. Serial No. 418,135. (No model.)

Claim.—1. A wagon-bolster constructed of two complementary sheet-metal plates secured together face to face and having their upper and lower edges bent outward to form bearing-surfaces, substantially as shown and described.



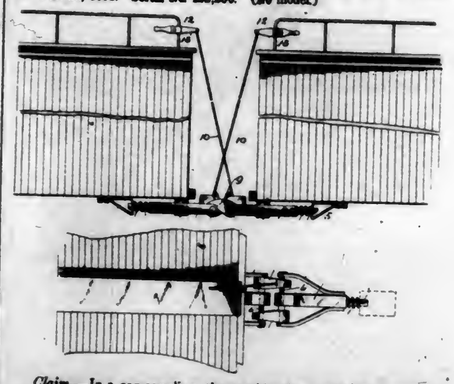
2. A wagon-bolster with standards at its ends, composed of two complementary sheet-metal halves, each consisting of a single piece of sheet metal flanged longitudinally and bent upward at the ends.

3. The sheet-metal bolster consisting of the two united sheet-metal members, each flanged at the base and at the top and upturned at the ends to form standards.

4. The sheet-metal bolster consisting of the two longitudinal sheet-metal members joined face to face, each member having a top flange extending horizontally outward and turned downward at the outer edge.

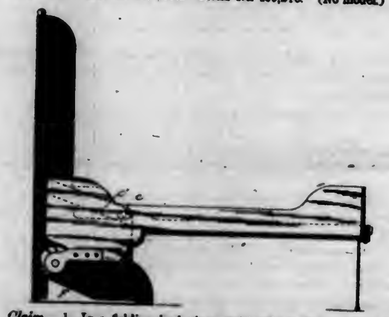
5. A sheet-metal wagon-standard consisting of two members of L form in cross-section, joined face to face.

479,622. METALLIC WAGON-TONGUE. WILLIAM P. BETTENDORF, Davenport, Iowa. Filed Jan. 15, 1892. Serial No. 418,136. (No model.)



Claim.—1. A wagon-tongue formed of sheet metal, the front or pole portion bent into tubular form and the rear portion flat and of a width and shape to fit between the front hounds of the wagon, substantially as shown and described.

2. A wagon-tongue formed of sheet metal, the front or pole portion bent into tubular form and the rear portion flat, of size and shape to fit between the front hounds of the wagon, and having downturned edges with openings therein for the reception of the cross-bolt, substantially as shown and described.



3. A sheet-metal wagon-tongue having an integral hammer-strap formed by bending up a strip of metal severed along its longitudinal edges and at one end, substantially as shown and described.

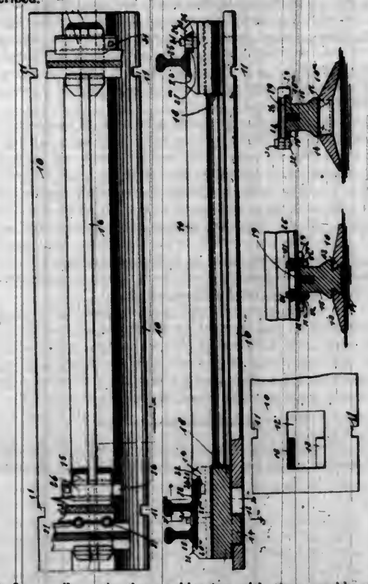
479,623. CAR-COUPLING. ADAM BITTNER, Custer, Ill. Filed Feb. 20, 1892. Serial No. 422,236. (No model.)

Claim.—In a car-coupling, the combination, with the draw-bar, of the tranverse rod projecting laterally from each side thereof, the curved bars connecting the ends of said bar with the draw-bar, the beveled hook pivoted to said rod, and the connecting-rod and lever, substantially as described.

479,624. WARDROBE-BEDSTEAD. ADELBERT M. BRAINARD, Chicago, Ill. Filed Oct. 19, 1891. Serial No. 409,210. (No model.)

Claim.—1. In a folding bed, the combination of a rigid casing, a secondary frame jointed thereto near the base to turn outward and downward, and a bed-frame hinged to the secondary frame at or near the foot end.

2. In a folding bed, the combination of a rigid casing, a secondary frame supported on a movable bearing near the base of the casing and adapted to turn outward and downward, and a bed-frame hinged to the secondary frame above the movable support of the latter.

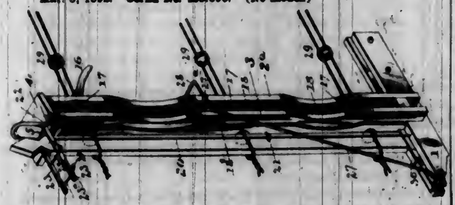


3. The casing, the gravitating head-board, the secondary frame connected with the casing by the vertically and horizontally moving pivots, the bed-frame hinged at its foot end to the secondary frame, and the tracks to sustain the head end of the bed-frame.

4. The casing, in combination with a secondary frame jointed thereto to swing from a vertical to a horizontal position, a gravitating weight on which it acts, a bed-frame jointed at its foot end to the secondary frame, and an inclined track on which the head of the bed-frame travels as the bed is extended for use.

479,625. RAILWAY-TIE. ALBERT G. BUDINGTON, Austin, Tex. Filed Mar. 3, 1892. Serial No. 423,606. (No model.)

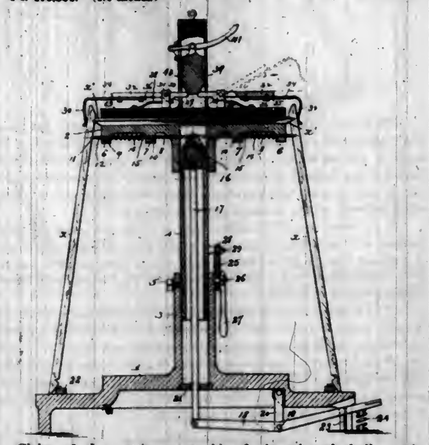
Claim.—1. A railway-tie comprising a base-plate having slots in the bottom near its opposite ends, which slots have at their outer ends converging walls, chairs having dovetailed blocks on their under sides to fit between the converging walls of the base-plates, said chairs having their upper surfaces recessed to receive the rails, a tie-bar extending between the chairs and secured thereto, and fastening devices to secure the rails to the chairs, substantially as described.



2. The combination, with the base-plate and the detachable chairs secured thereto and having grooves in their upper ends and transverse recesses to receive the rails, of tie-bars extending between the chairs and having their upper portions shaped to enter the grooves, the ties having recesses to register with the chair-recesses, and a fastening device to secure the rails to the tie-bar and chairs, substantially as described.

3. In a railway-tie, the combination, with the movable chairs having dovetailed recesses in their upper surfaces, and the detachable tie-bars adapted to be secured to the rails and having recesses to register with the chair-recesses, of binding-keys adapted to enter the recesses of the chairs and tie-bars and clamp the flanges of the rails, and means for fastening the keys in place, substantially as described.

4. The combination, with the recessed chairs and tie-bars, of binding-keys adapted to fit the rail-flanges and to enter the recesses, said keys having flanges at one end and holes to receive fastening-bolts at the opposite end, substantially as described.



479,626. MACHINE FOR WIRING FENCE-PICKETS. WILLIAM CALLAWAY, Sr., Knox, assignor to Frank B. Yarbro, Kewanna, Ind. Filed Mar. 5, 1892. Serial No. 423,890. (No model.)

Claim.—1. In a fence-wiring machine, the combination, with the base, the uprights, the block at the top, having a slot or notch therein, the gage consisting of the bent metal rod pivoted to said block and having the two arms provided with a series of apertures, the adjustable spacing-rod for said apertures, and the vertical guide-wires, of the twisters having peripheral cogs, the endless chain engaging therewith, the screw-bolts intermediate of the center and end twisters for holding the chain in engagement with the cogs, and means for actuating the twisters, substantially as described.

2. In a fence-wiring machine, the combination, with the base, the uprights, the block at the top, having a slot or notch therein, the vertical guide-wires, the twisters having peripheral cogs, the endless chain, the screw-bolts, and the sleeves loosely mounted thereon, of the gage consisting of the bent metal rod pivoted to said block, having the two arms provided with a series of apertures, the adjustable spacing-rod for said apertures, the spring-gage plate secured to the base, and the rod for limiting the movement of the picket being wired, substantially as described.

479,627. SETTING-UP AND FORMING MACHINE FOR BARRELS, &c. HENRY CAMPBELL, Baltimore, Md., assignor to the Campbell Barrel Machine Company, same place. Filed Oct. 29, 1891. Serial No. 410,206. (No model.)

Claim.—1. In a setting up machine for barrels and similar articles, the combination of a stand, a support for the barrel-head carried thereby, and outwardly-directed radially-movable pins having points adapted to engage the staves, substantially as set forth.

2. The combination of the stand, means for supporting the barrel-head, radially-movable parts having outwardly-directed points for engaging the staves, and means for retracting said parts, substantially as set forth.

3. The combination of the table, the clamp 13 opposite thesame and adapted to secure the barrel-head, pins 8 for engaging the staves, springs 14, connected with said pins, the cone 16, engaging the pins, and means for moving the latter, substantially as set forth.

4. The combination of a support for the head, radially-movable parts having points for engaging the staves, means for retracting said parts, and movable fingers adapted to hold the staves against the head and in engagement with said points, substantially as set forth.

5. The combination, with a support for the head, of upwardly and downwardly movable pivoted arms mounted thereon and fingers adapted to engage the outer faces of the staves and carried by and longitudinally adjustable on said arms, substantially as set forth.

6. The combination, with the weight or clamp 13, of the arms 32, pivotally mounted thereon, fingers 30, adjustable on said arms, and means for operating and holding the arms, substantially as set forth.

7. The combination, with the weight 13, of the arms 32, having projections 37, springs 38, engaging the latter, fingers 30, carried by the arms, and the slide 35 for depressing the inner ends of the latter, substantially as set forth.

8. In a barrel-setting-up machine, the combination, with the stand, of pivoted and vertically-oscillatory fingers mounted above and adapted to pass down over and engage the outer sides of the upper ends of the staves, means for individually supporting said fingers, and an actuating device or mechanism for simultaneously disengaging them from the staves, substantially as set forth.

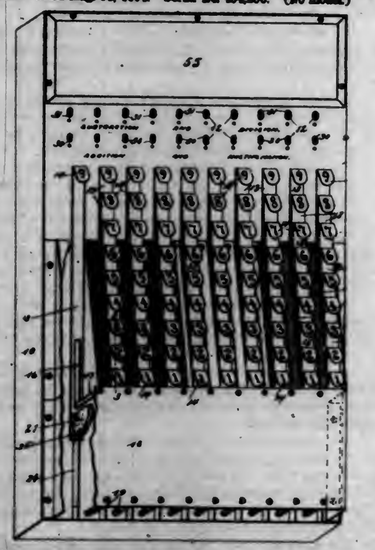
9. The combination of a table, a clamp opposite to the same and adapted to secure the barrel-head, pins having outwardly-directed points radially movable and adapted to engage the inner faces of the staves, springs for moving said pins radially in one direction, and means for moving and holding said pins against the action of the springs, substantially as set forth.

10. In a barrel-setting-up machine, the combination of means for holding the barrel-head, a series of pivoted and vertically-oscillatory arms adapted to come down toward the ends of the staves as the latter are put in place, and inwardly-operating spring-fingers carried by the arms, substantially as set forth.

11. In a barrel-setting-up machine, the combination of a means for holding the barrel-head, a support for the lower ends of the staves, and upwardly and downwardly movable holders or fingers independ-

ent of each other, supported above the said head-holding means and adapted to be brought down over and outside of the upper ends of the staves, substantially as set forth.

479,628. LAST. JOHN R. CASS, Brooklyn, N. Y. Filed Feb. 25, 1892. Serial No. 422,757. (No model.)



Claim.—1. In a last, the combination, with a vertically-apertured and longitudinally-slotted last-stock, of a cap-plate imposed on the comb of the last-stock, a pendent socket-tube, two longitudinally-extended wings integral therewith, a latch-dog for an instep-block, pivoted to the cap-plate, and transverse pins or screws passing through the stock and both wings, substantially as described.

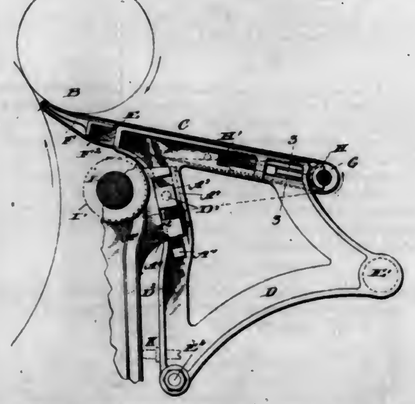
2. In a last, the combination, with a stock and an instep-block thereon, of a cap-plate on the comb of the stock, a latch-dog pivoted in a slot on the cap-plate and adapted to latch into a recess in the top of the instep-block, and a spring pressing the dog toward said recess, substantially as described.

3. In a last, the combination, with a last-stock, an instep-block thereon, and a cap-plate held on the comb of the stock by wings on a socket-tube, and pins passing through the stock and wings, of a latch-dog pivoted between depending ears and in a slot in the cap-plate and adapted to enter a recess in the top of the block, and a plate-spring secured by one end in a groove of the last-stock and pressing the heel of the latch-dog, substantially as described.

479,629. CALCULATOR. CHARLES H. CLARRIDGE, Libertyville, Iowa. Filed Aug. 31, 1891. Serial No. 404,350. (No model.)

Claim.—1. A calculator comprising a base-plate having rows of holes therein, number-wheels pivoted on the base-plate and having numerals to register with the holes, rack-bars geared to the number-wheels, rows of numbered finger-keys adapted to move upon the base-plate, a sliding abutment arranged at the end of each of the finger-keys, and elbow-levers pivoted in the abutments and having their inner ends connected with the rack-bars, substantially as described.

2. A calculator comprising a plate having holes therein, number-wheels pivoted on the plate and having numbers to register with the holes, rack-bars geared to the number-wheels, sliding abutments arranged beneath the rows of keys and connected by lever mechanism with the rack-bars, and a series of numbered finger-keys arranged in rows to press upon the sliding abutments, the keys having longitudinal slots of dissimilar lengths and limiting-pins extending through the slots, substantially as described.



3. In a calculator, the combination, with the revoluble number-wheels having a gear mechanism to revolve them, of cams secured to the wheels and provided with shoulders on one side, movable rack-bars adapted to operate the wheels, spring-pressed carrier-bars adapted to engage a cam of one wheel and a rack-bar of a wheel in advance of it, and a releasing device to limit the movement of the carrier-bars, substantially as described.

4. In a calculator, the combination, with the rows of number-wheels and the movable rack-bars adapted to operate the wheels, of cams secured to the wheels and provided on one side with a shoulder, movable spring-pressed carrier-bars having their ends in engagement with the cams, sleeves mounted on the carrier-bars and adapted to overlap the rack-bars, a spring-pressed catch to fasten the carrier-bars and sleeves together, and an automatic releasing device for the catch, substantially as described.

5. A calculator comprising a base-plate, rows of keys held to slide on the base-plate, said keys having outwardly-bent and numbered ends, sliding abutments mounted on the base-plate below each vertical row of keys, elbow-levers pivoted in the abutments, movable rack-bars carried by the elbow-levers, numbered wheels geared together and held to turn opposite holes in the base-plate, said wheels having a ratchet connection with the rack-bars, cams on the number-wheels, spring-pressed carrier-bars held to slide on the base-plate, each carrier-bar being adapted to engage a cam on a number-wheel and the rack-bar in advance of it, and a device for releasing the carrier-bars and limiting their movement, substantially as described.

6. The combination, with the number-wheels having cams on their back and the rack-bars geared to the number-wheels, of spring-pressed carrier-bars held to slide near the rack-bars, the carrier-bars having bent ends to engage the cams, sleeves mounted on the carrier-bars and adapted to engage the rack-bars, and a releasing device to free the rack-bars and carrier-bars, substantially as described.

479,630. MECHANICAL FEEDING DEVICE. ALLEN COMLING, Chicago, Ill. Filed Dec. 29, 1891. Serial No. 416,415. (No model.)

Claim.—1. The combination, with a primary feed-roll and its supporting mechanism, of an endless apron having its supporting mechanism mounted independently of that of said feed-roll and adapted to support the apron with relation to the feed-roll with variable surface contact, the apron-guiding devices remaining relatively unchanged, substantially as specified.

2. The combination, with a primary feed-roll, of an endless apron having oppositely-located apron supporting and guiding mechanisms, and a framework for supporting said apron and its said mechanisms mounted adjustable to and from and independently of the said feed-roller, substantially as specified.

3. The combination, with a primary feed-roll, of an endless apron, oppositely-located apron guiding and directing mechanisms, a framework for supporting said mechanisms, and means for adjusting said framework toward and along the active surface of said feed-roll, substantially as specified.

4. The combination, with a roll and an endless apron and with its moving and guiding mechanisms, of a framework for the support and operation of said mechanisms, said framework being mounted for bodily and pivotal movement, substantially as specified.

5. The combination, with a feed-roll or its equivalent and with an endless apron and of means for supporting said apron with one end higher than the other, of a pivoted framework, adjustable bearings for the pivots, and means for changing the position of the framework with relation to its points of support, substantially as specified.

6. The combination, with a pair of feed-rolls, of a bed adapted to be projected between said rolls, an endless apron mounted on the bed, with one end higher than the other, and means for simultaneously supporting and moving the bed inwardly and upwardly, substantially as specified.

7. The combination of a feed-roll and an endless apron mounted on a movable apron-supporting bed having a curved extension, which said apron surrounds, and means for moving the bed inwardly and upwardly with relation to the feed-roll, as set forth.

8. The combination, with a feed-roll and an endless apron, of the bed having a curved extension at one end and a roller for supporting the apron and means for adjusting the bearings and said roller at the other end, a framework for supporting said bed, and means for moving the framework simultaneously upward and inward, substantially as specified.

9. The combination, with a feed-roll and an endless apron, of a bed terminating with an extension and provided with an apron tightening and carrying roller, and a framework adapted by adjusting devices for upward and inward movement toward said roll, substantially as specified.

10. The combination, with a feed-roll and an endless apron, of a bed having suitable apron supporting and moving devices and a framework mounted for upward and inward movement toward said roll and having a tie-bar and rod, substantially as specified.

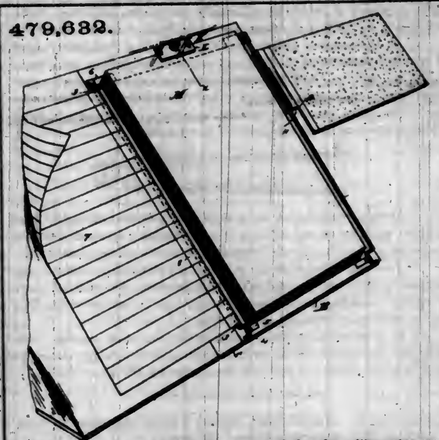
11. The combination, with the primary feed-rolls of the machine and an endless apron, of a bed having apron supporting and moving devices mounted independently of a feed-roll and means for changing the vertical and longitudinal position of the bed with relation to the said primary rolls of a machine, substantially as specified.

12. The combination of a feed-roll and an endless apron, a bed having a curved extension, a roller, and a frame having a sliding box in each side thereof, an adjusting-screw for each box, a supporting sliding block on each side of the frame, and brackets adapted to support the framework and provided with adjusting-screws, substantially as specified.

13. The combination, with a feed-roller or its equivalent and an endless apron, as C, of the bed, as E, terminating at one end in a bent plate and provided at or near its other end with a roller, as G, and with a roller, as J, movably connected with the bed outside of the point of contact of the roller J with the apron, substantially as specified.

479,631. SHAFT-SUPPORT FOR VEHICLES. HENRY L. CORDNEY, Mount Union, Iowa. Filed Feb. 24, 1892. Serial No. 422,661. (No model.)

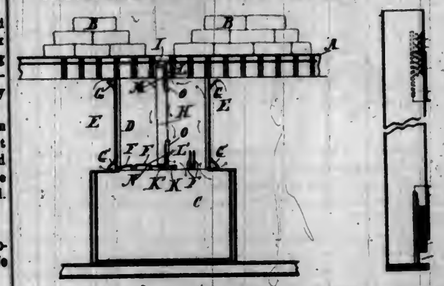
Claim.—1. In a combined anti-rattler and shaft-support, the combination of a spring-body having two arms, one of which extends up and is provided with a curved flattened portion and a flattened portion adapted to lock a coupling-bolt in place, the other arm being provided with a loop, substantially as described.



2. A combined anti-rattler and shaft-support consisting of the coiled spring having two arms, one longer than the other, the shorter arm being provided with a flattened curved portion adapted to bear against the thill-eye and a flattened portion at right angles thereto adapted to bear against the coupling-pin, while the longer arm near its free end is bent at an angle and thence back at right angles to itself, whereby a loop g^3 is formed, the center of which is directly in line with the main body of said arm, in combination with the plate I, having a notch in its forward edge in which said short arm rests, whereby the whole is held in proper position.

479,632. WRITING-TABLET. CALVIN D. CRANE, Dayton, Ohio. Filed June 22, 1891. Serial No. 397,066. (No model.)

Claim.—1. As an improved article of manufacture, a writing-tablet consisting of a base, a screw-threaded post and pillars carried by the base, a thumb-nut on the post, a clamping-plate on the pillars and engaged by said nut, writing-sheets held by the clamping-plate, a wire attached to the base on each side of the writing-paper and detachable, a writing-guide consisting of a sheet ruled on both sides and carried by one of said wires, and a blotter carried by the other wire.



2. As an improved article of manufacture, a paper-holder or clamp

479,632.

consisting of a base and a screw-post carried thereby, pillars also carried thereby, a clamping-plate sliding on the pillar and having an open slot at one edge, and a thumb-nut grooved to receive the plate and fitted to said slot and mounted upon said post.

479,633. REFRIGERATOR. AVERYL I. DREYER, Whitewater, Wis. Filed Dec. 10, 1891. Serial No. 414,568. (No model.)

Claim.—1. A refrigerator comprising an ice-room arranged to hold a supply of ice, a cold-air room below the ice-room, a series of tanks suspended in the cold-air room from the floor of the ice-room and opening at the top into the ice-room, so as to be readily filled with ice therefrom, apertures in the walls of the tanks in the cold-air room near its floor and ceiling, respectively, cold-storage rooms in the same horizontal plane and adjoining the cold-air room, into which passages closed by doors open from the cold-air room near the floor and ceiling, respectively, a freezing-room below the cold-air room, and passages closed by doors through the floor of the cold-air room into the freezing-room below, the latter passages being arranged, respectively, near to and at a distance from the tanks suspended in the cold-air room, substantially as described.

2. In a refrigerator, an ice-chamber, a cold-air room below the ice-chamber, a tank suspended in the cold-air room from the floor of the ice chamber, into which it opens at its top, which tank is adapted to be filled from the top with a freezing mixture, a series of openings near the top of the tank, adapted to permit the passage of air from the room into the tank, tongues punched from the wall of the tank in forming the opening, which tongues are bent inwardly obliquely at their upper attached edges, whereby the tongues are adapted to guard and partially cover the openings, so as to prevent the passage outwardly from the tank of the mixture within and to carry the drip on the interior of the tank inwardly into the tank away from the openings, and a screen over an aperture in the lower part of the tank, substantially as described.

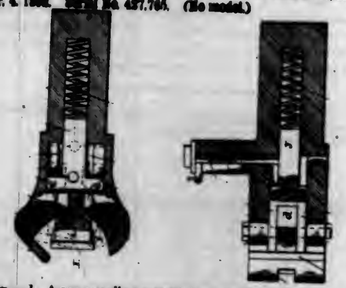
479,634. MANDREL. WILLIAM O. DUNN, Newark, N. J. Filed Feb. 6, 1892. Serial No. 420,574. (No model.)

Claim.—1. The improved mandrel for turning eccentric-rings, which consists in a tapering mandrel having at its opposite ends rotatively-adjustable end centers for the lathe, substantially as set forth.

2. The improved mandrel consisting of a tapering body portion provided at the opposite ends with laterally-sliding end centers for the

lathe, arranged in rotatively-adjustable end pieces, said end pieces, and means for holding the same, substantially as set forth.

3. In combination with the tapering mandrel, end pieces arranged at opposite ends of said mandrel and rotatively adjustable in relation to the said mandrel, and transverse center-bearings arranged in passages in said end pieces, a wedge or key for holding said center-bearings in place, and means for holding the rotative end pieces in fixed relation to the mandrel, substantially as set forth



4. In combination with the mandrel, an end piece having a shank adapted to be set or secured in said mandrel and a transverse sliding center-bearing to receive the lathe-center, substantially as set forth.

5. In combination with the mandrel, an end piece rotatively adjustable in its relation to said mandrel, a catch to hold said end piece as adjusted, a sliding center-bearing, and a key for holding said sliding center-bearing, substantially as set forth.

6. In combination with the mandrel, an end piece rotatively adjustable in its relation to the mandrel and a center-bearing piece adjustable in its relation to said end piece, substantially as set forth.

479,635. CAR-COUPLING. SAMUEL B. DOVER, Adairsville, Ga. Filed Apr. 4, 1892. Serial No. 427,706. (No model.)

Claim.—1. A car-coupling comprising a draw-head, an operating-bar moving longitudinally therein, and a jaw pivoted between its ends to the front end of the said draw-head, the said bar having a recess in its side for the reception of the inner end of the said jaw, substantially as set forth.

2. A car-coupling comprising a draw-head, an operating-bar moving longitudinally therein and provided with a laterally-extending projection, and a jaw pivoted between its ends to the outer end of the draw-head, the inner end of the said jaw being rounded upon its outer side, and with which the said lateral projection engages, substantially as described.

3. A car-coupling comprising a draw-head, an operating-bar moving longitudinally therein, two jaws being each pivoted between their ends to opposite sides of the outer end of the draw-head, the inner ends of the said jaws engaging the said bar to be operated thereby, and a lock for the said bar, substantially as specified.

4. A car-coupling comprising two jaws pivoted at opposite sides of its front end, one jaw extending inward farther than the other, and a means for operating the two jaws to throw them inward when engaged by the jaw or jaws of an adjoining car, substantially as set forth.

5. A car-coupling comprising a draw-head, a jaw pivoted therein, a locking-bar for the jaw, a projection upon the draw-head having a vertical pin-opening and a slot communicating with the said opening extending longitudinally of the said projection, and a locking-pin which moves in the said opening, the pin having an arm which extends laterally therefrom and moves in the said slot, substantially as specified.

479,636. HAND-DRUM. EDWARD H. DROOP, Washington, D. C. Filed May 3, 1892. Serial No. 431,730. (No model.)

Claim.—1. A hand-drum having a rim, a head, and a projecting handle and provided with a hammer arranged within its rim and free to vibrate in contact with the head of the drum as the latter is vibrated, substantially as set forth.

2. A hand-drum comprising a thin tambourine-like drum provided within its rim with a hammer free to vibrate in contact with the head of the drum as the latter is vibrated, substantially as set forth.

3. A hand-drum having a rim, a head, and a handle by which it may be vibrated, a hammer free to vibrate in contact with the head of the drum as the latter is vibrated, and a snare which may be set into and out of contact with the head, substantially as set forth.

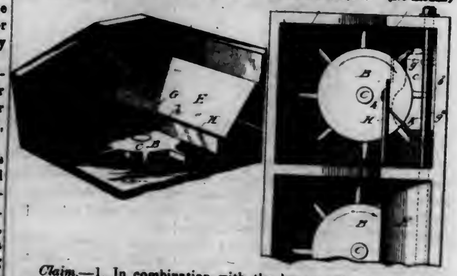
4. A hand-drum provided with a hammer free to vibrate in contact with its head and having a snare which may be adjusted into and out of contact with its head, substantially as set forth.

5. A hand-drum having a handle by which it may be vibrated, a hammer free to vibrate in contact with its head, and a snare adjustably connected with its rim, whereby it may be set into and out of contact with its head, substantially as set forth.

6. A hand-drum having a hammer and a snare provided at one end with a crank-like portion journaled to the drum, whereby it may be adjusted into and out of contact with the head, substantially as set forth.

7. A drum having a snare connected adjustably with it and adapted to be adjusted into and out of contact with the head of the drum without detaching or disconnecting said snare from the drum, substantially as set forth.

8. The combination, with the drum, of the snare having a crank-like portion provided with a shaft journaled in the rim of the drum, substantially as set forth.



9. A hand-drum having a vibrating hammer provided with a spring-support adjustable, whereby the hammer may be set to strike in different places, substantially as set forth.

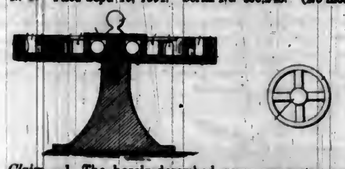
10. In a hand-drum, the combination of the rim and head, the handle secured to said rim, and the hammer arranged within the rim and having a spring-support held by said handle, substantially as set forth.

11. In a hand-drum, the combination of the rim having a tapered socket, the handle having a tapered portion fitted in said socket and provided in its end with a slit, and the hammer having its support held in said slit, substantially as set forth.

12. A hand-drum having a handle provided in its end with a slit and a hammer arranged to vibrate in contact with the drum-head and having its support held in the end slit of the handle, substantially as set forth.

479,637. FERTILIZER-DISTRIBUTER. SAMUEL H. EVERETT, Macedon, N. Y. Filed Feb. 11 1892. Serial No. 421,171. (No model.)

Claim.—1. In combination with the hopper, the peripherally-toothed wheel, the wall or plate E, having an opening through which the wheel works, and the rock-shaft provided with the vertically-movable gate parallel to the said wall or plate to control the size of the opening through which the wheel works.

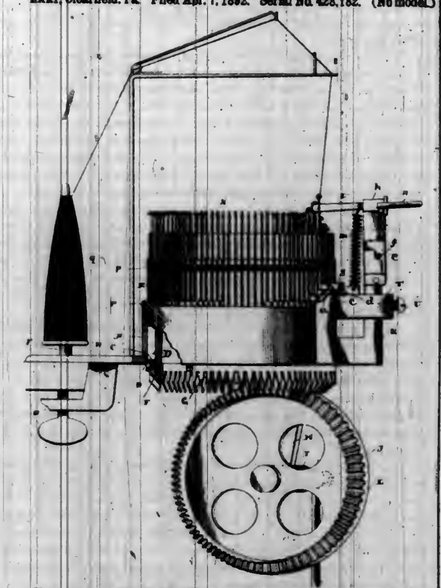


2. In combination with the hopper, the peripherally-toothed wheel, the wall or plate E, having an opening through which the wheel works, the rock-shaft, and the vertically-movable gate above the wheel and parallel to the said wall to control the size of the opening through which the wheel works.

3. In combination with the hopper, the wheel B and the plate E, having an opening over the surface of the wheel, and a reversible cut-off gate H to close the opening above the wheel.

4. In a fertilizer-distributer of the type herein shown, the feed-wheel having peripheral teeth and an overlying plate E, in combination with a hopper having in rear of the plate an outlet-opening *c*, enlarged from one end toward the other.

5. In combination with the feed-wheel having peripheral teeth and an overlying wall or plate E, beneath which the wheel delivers the material, a bottom plate having a discharge-opening *c*, over which the teeth sweep and which is widened at one end to extend beneath the body of the wheel.



479,638. GAME APPARATUS. DENIS L. FALARDEAU, Cohoes, N. Y. Filed Sept. 19, 1891. Serial No. 406,245. (No model.)

Claim.—1. The herein-described game apparatus, comprising a base or support having a vertical pivot or standard, a circular disk or carriage loosely journaled thereon, the dial marked around the marginal edge of said carriage, a ring supported on said dial and forming a series of pockets in said dial, an opening communicating with said pockets, a cap removably supported centrally on said carriage, and the balls or marbles, substantially as specified.

2. The herein-described game apparatus, comprising the base or support having a vertical pivot, a circular rotary carriage loosely journaled on said pivot, a dial bearing a series of indications removably supported on the marginal edge of said carriage, outer and inner rings supported on said carriage, a series of pockets between said rings, a series of openings through said inner rings communicating with said pockets, and a removable cup supported centrally on said carriage and adapted to hold balls or marbles, substantially as specified.

479,639. CIRCULAR-KNITTING MACHINE. JOSEPH E. GEARHART, Clearfield, Pa. Filed Apr. 7, 1892. Serial No. 428,182. (No model.)

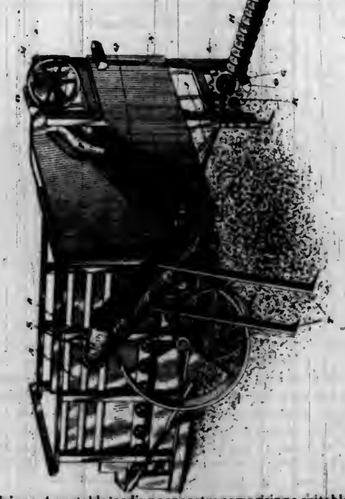
Claim.—1. A circular-knitting machine comprising a base having a depression to form a cam, a cam above the said depression, a latch at the upper end of the said depression, a revoluble cylinder inside of the said cam, and a means for revolving the said cylinder.

2. A circular-knitting machine comprising a base having a depression to form a cam, a vertical support outside of the said cam, and a cam adjustably held upon and at the inner side of the said support by means of a clamp, substantially as specified.

3. A circular knitting machine comprising a base having a vertical portion having a cam, a revoluble cylinder inside of the said vertical portion, carrying needles with shanks, a vertical support outside of the said vertical portion, a standard pivoted or journaled at the upper end of the standard to be reversible, and a spring having one end secured to the inner end of the thread-guide and its opposite end to a portion of the machine.

4. A circular-knitting machine comprising a base having a vertical portion provided with a cam, a revoluble cylinder inside of the said vertical portion, carrying needles with shanks, a means for revolving the cylinder, a vertical support outside of the said vertical portion, a standard pivoted to the upper end of the said support, a thread-guide journaled in the upper end of the said standard, having its inner end formed into a guide and the outer end formed into a handle, stops upon the standard which the handle engages, and a spring secured to the thread-guide for holding it to its proper position and also for holding the said standard inward.

5. A circular-knitting machine comprising a base having a vertical portion provided with a cam-depression, a spring-actuated latch at each end of the said depression, which is normally held at its free end upon the vertical portion, a cam above the said depression, a revoluble cylinder inside of the said vertical portion, carrying needles with shanks, and a means for revolving the said cylinder.



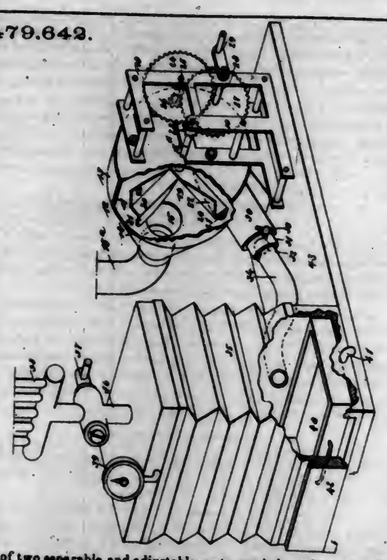
6. A circular-knitting machine comprising a base having a vertical portion provided with a cam, projections at each end of the said cam and outside thereof, latches having arms which are pivoted in the said projections and provided with inclined upper edges, springs for holding the free ends of the latches normally upon the said vertical portion, a revoluble cylinder inside of the said vertical portion, carrying needles with shanks, and a means for revolving the said cylinder.

479,640. COMPOUND FOR PRESERVING THE COLOR OF FINISHING-BRICKS. JACOB D GRAYBILL, Shreveport, La. Filed Apr. 30, 1892. Serial No. 431,353. (No specimens.)

Claim.—1. The compound for preserving the color of finishing-bricks, consisting of the oily and mucilaginous extract of flaxseed, glue, and Japan drier in an aqueous solution or menstruum in or about the proportions described.

2. The compound for preserving the color of finishing-bricks, consisting of the oily and mucilaginous extract of flaxseed, glue, Japan drier, and Venetian red in an aqueous solution or menstruum in or about the proportions described.

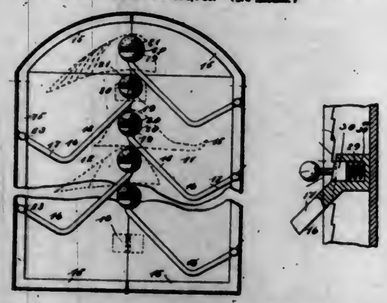
479,641. MACHINE FOR LOADING COAL. JAMES GRIERSON, Toronto, Canada. Filed Dec. 3, 1891. Serial No. 413,906. (No model.)



Claim.—A portable loading apparatus comprising a suitable frame, a horse-power connected thereto, an Archimidean screw H, having its shaft extending under the horse-power and adjustable lengthwise thereunder, the endless chain of buckets N O, the screen Q, and an endless apron-carrier R, a gear-wheel B, receiving motion from the horse-power and driving the screw through the medium of the chain C and gears I, D, E, and F and the endless chain of buckets through the medium of the chain J and gears K L, all constructed and arranged substantially as shown and described.

479,642. ROTARY BLOWER. JOHN HAMILTON, St. John, Canada. Filed Dec. 21, 1891. Serial No. 415,758. (No model.)

Claim.—1. In a ventilating apparatus, the combination, with the fan adapted to rotate, of a casing having an air inlet and outlet and com-



479,642.

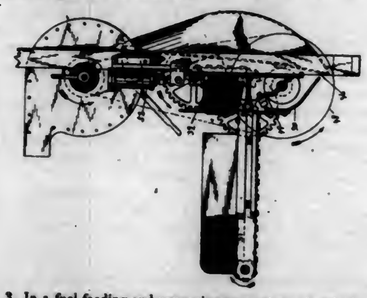
posed of two separable and adjustable parts, one being adapted to slide within the other, as shown and described, whereby the casing is adapted to be enlarged or contracted in size, as specified.

2. In a ventilating apparatus, the rotary fan having blades constructed of three parts or sections, two being in different radial planes and the intermediate one being parallel to the plane of rotation and permanently attached to the others at its opposite edges, as shown and described.

479,643. HAT-CASE. NELLIE F. HURDIS, New York, N. Y. Filed Dec. 14, 1891. Serial No. 414,940. (No model.)

Claim.—1. A hat-case comprising two similar parts hinged together, a vertical frame arranged within the case and extending around the walls thereof, and a series of vertically-adjustable hat-supporting arms arranged one above the other and terminating at their inner ends in hat-hangers, substantially as described.

2. In a hat-case, the combination, with the grooved knobs supported on arms, as described, of horizontally-extending hat-hooks having their inner ends terminating in a band adapted to be secured in the grooves of the knobs, substantially as described.



3. A hat-case provided with an internal frame and a series of vertically-sliding arms mounted adjustably on said frame and provided at their free ends with cushions to which the hats may be pinned, substantially as set forth.

4. A vertically-divided hat-case provided on its inner side with a grooved supporting-frame and a series of vertically-adjustable arms having a pawl-and-ratchet connection at one end with said grooved frame, substantially as set forth.

479,644. PNEUMATIC FUEL-FEEDING APPARATUS FOR STRAW. BYRON JACKSON, San Francisco, Cal. Filed Feb. 16, 1892. Serial No. 422,095. (No model.)

Claim.—1. In a fuel feeding and conveying apparatus as herein described, a traction-engine, and a fan-blower mounted thereon or upon a vehicle drawn thereby, connected to the furnace of the steam-boiler by suitable pipes or conductors and having an inlet, with apparatus for feeding light fuel that can be thus conveyed and supplied to the boiler in quantities as the amount of steam may require, substantially in the manner and for the purpose described.

2. In a fuel feeding and conveying apparatus as herein described, a traction-engine, a fan-blower mounted thereon or on a vehicle drawn thereby, a conducting-pipe connecting the fan-blower with the boiler-furnace, and an inlet-pipe provided with cutting appliances to reduce fibrous fuel to short lengths, so that it may pass the suction and discharge pipes of the fan-blower without clogging the same, in the manner and for the purpose described.

3. In a fuel feeding and conveying apparatus as herein described, a traction-engine, a fan-blower mounted thereon or upon a vehicle drawn behind, a conducting-pipe connecting to the boiler-furnace, a suction-pipe to receive fibrous material, a cutting apparatus to reduce the same, and a rotating endless belt in combination therewith to concentrate and feed the fuel to the cutting apparatus and the suction-pipe of the fan-blower, substantially in the manner and for the purposes described.

4. In a fuel feeding and conveying apparatus as herein described, a traction-engine, a fan-blower mounted thereon or upon a vehicle drawn thereby, a suction-pipe provided with apparatus to cut and reduce the fuel so that it will pass through the pipes, and a discharge-pipe leading to and connected with a closed furnace having no other air-supply than that by which the fuel is conveyed, so that the latter is burned in suspension and the amount of heat and steam is continually as the amount of air and fuel entering together at the suction-pipe, substantially in the manner and for the purposes described.

5. In a fuel feeding and conveying apparatus as herein described, a traction-engine, a fan-blower mounted thereon or on a vehicle drawn thereby, a suction-pipe with appliances for preparing and feeding fuel thereto, and a discharge-pipe leading from the fan blower to a closed boiler-furnace provided with hinged baffling-plates to prevent the fuel while suspended in the air from entering the boiler-flues, substantially in the manner and for the purposes described.

6. In a fuel feeding and conveying apparatus as herein described, a traction-engine, a fan-blower mounted thereon or on a vehicle drawn thereby, a suction-pipe having apparatus to prepare and feed straw or other light fuel thereto, a discharge-pipe for conducting the fuel to the boiler-furnaces, and hinged baffling-plates to prevent the fuel from clogging the flues, the plates hung in an inclined position and provided with an automatic latch, substantially in the manner and for the purposes described.

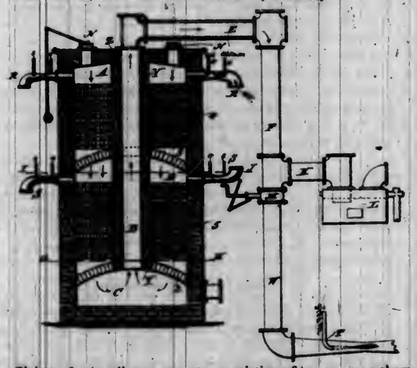
7. In a fuel feeding and conveying apparatus as herein described, a traction-engine, a fan-blower mounted thereon or on a vehicle drawn thereby, a conducting-pipe for conveying straw or other light fuel to the boiler-furnace from a fan blower, and cutting and feeding apparatus, the whole operated by a steam-cylinder connected and driven, as herein described, so that the furnace can be supplied with fuel and air when the traction-engine is standing still, substantially in the manner and for the purposes described.

8. In a fuel feeding and conveying apparatus as herein described, a traction-engine, a fan-blower mounted thereon or upon a vehicle drawn thereby, a conducting-pipe for conveying straw or other light fuel to the boiler-furnace from a fan-blower, cutting and feeding apparatus, and the hinged chute 50, conducting the cut fuel from the knife to the suction-pipe, but easily swung back on the hinges, letting the straw drop out of the mouth of the suction-pipe in case it should become choked, substantially in the manner and for the purposes described.

9. In a fuel feeding and conveying apparatus as herein described, a traction-engine, with a fan-blower mounted thereon or on a vehicle drawn thereby, a conducting-pipe for conveying straw or other light fuel to the boiler-furnace from a fan-blower, cutting and feeding apparatus, and the air-gate 36, fitted to the mouth of the air-pipe, so that when operated in conjunction with the chute 50 the volume of air can be controlled to correspond with the amount of fuel required by the traction-engine boiler, substantially as described.

479,645. ILLUMINATING-TILE. JACOB JACOBS, New York, N. Y. Filed Jan. 19, 1889. Serial No. 296,835. (No model.)

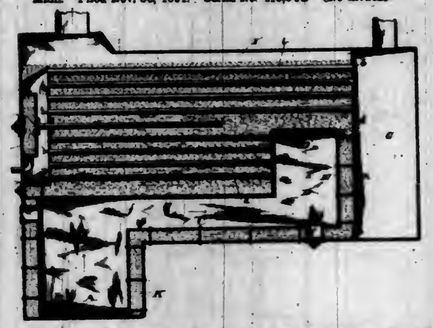
Claim.—1. An illuminating-tile which is composed of a plate or body having lens-receiving openings that are surrounded by downwardly-extending flanges or curbs, in combination with a coating of suitable cement or other like material applied to the under side of such plate or body in the space surrounding the curbs or flanges, substantially as and for the purpose specified.



2. An illuminating-tile which is composed of a plate or body having lens-receiving openings that are surrounded by upwardly and downwardly extended flanges or curbs, in combination with a coating of cement or other like material applied to both sides of said plate in the spaces surrounding the curbs or flanges, substantially as and for the purpose shown.

479,646. ATTACHMENT FOR FEED-BAGS. FRED S. KERR, New York, N. Y. Filed May 22, 1891. Serial No. 393,725. (No model.)

Claim.—The combination, with a neck-strap, a head-strap having its ends attached to the neck-strap, guides secured to the straps at their junction, and a feed-bag, of a strap or rope adapted to support the bag, said strap or rope being passed through the guides and one end firmly attached to the bag, a tension device attached to the opposite end of the rope or strap, which tension device consists of a block having an inner convexed side, an opposite toothed side, and apertures extending from one side to the other and through which the rope is passed, and a link pivoted in the block and adapted for attachment to the bag, as and for the purpose specified.



479,647. GAS-GENERATOR. JOHN J. KIRKHAM, Terre Haute, Ind. Filed June 23, 1891. Serial No. 397,244. (No model.)

Claim.—1. An oil-gas generator consisting of two or more chambers arranged vertically one above the other and communicating with each other, checker-work arranged in each chamber, air-inlets and oil-injectors opening into each chamber above the checker-work, and a central retort or outlet-flue communicating at the bottom with the lowest chamber and passing out through the top of the generator and communicating with the conduit-pipes, substantially as shown and described.

2. An oil-gas generator consisting of a series of vertical chambers each containing a body of checker-work and each having independent oil-injectors and separate air-inlets, a central retort or outlet-flue opening at its lower end into the lowest chamber and passing out through the top of the generator, and a conduit-pipe connecting therewith and having one branch leading to a hydraulic seal and another branch provided with a valve and a suction apparatus, substantially as shown and described.

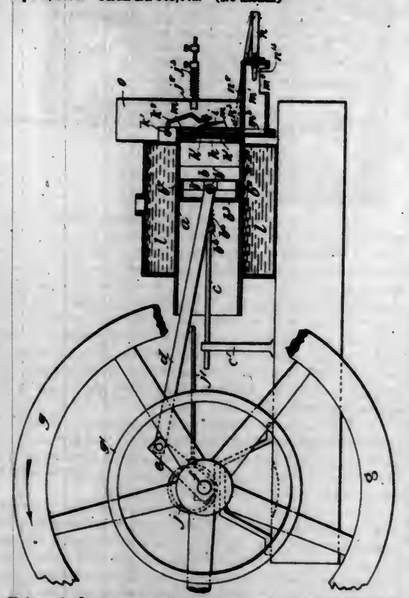
479,648. LOCOMOTIVE-BOILER. LEWIS W. LESTER, Glencoe, Minn. Filed Nov. 30, 1891. Serial No. 413,544. (No model.)

Claim.—1. In a steam-boiler, the combustion-chambers D and F, located at the respective end portions of the boiler, the former being partially inclosed thereby, the external flue C, leading to the chamber D, and the internal flues *a* and *b*, and a smoke-box G, extending along the entire rear of the boiler and into which lead the upper flues, the parts being so arranged that the gases of combustion are caused to pass first from the fire-box externally of the boiler to the chamber D, thence through the flues *a* to the chamber F, and thence through the flues *b* to the smoke-box G, and a mud and heating drum for the feed-water within the chamber F and secured to the front wall thereof, whereby it is subjected on three sides to the gases in said chamber, substantially as specified.

2. A steam-boiler having a combustion-chamber F at its front portion and communicating with the upper and lower flues and a mud and heating drum for the feed-water within said chamber and secured to the front wall thereof, whereby it is subjected on three sides to the gases in said chamber, substantially as specified.

3. A boiler having a combustion-chamber D at its lower rear portion, into which open the lower flues, a smoke-box G, extending across the entire rear of the boiler and separated from the chamber D at its lower portion by a water-chamber forming a part of the water-jacket, an external flue leading from the fire-box to the chamber D, a second smoke or combustion chamber at the front, into which open both the upper and lower flues, and a mud and heating drum for the feed-water in said chamber and secured to the front wall thereof, substantially as specified.

479,649. LINK FOR SLEEVE OR CUFF BUTTONS. PHILIP H. LETTRÉ, North Attleborough, Mass., assignor to T. I. Smith & Company, same place. Filed May 9, 1892. Serial No. 432,267. (No model.)



Claim.—A cuff-fastener consisting of the buttons *b b* and means for connecting said buttons, consisting of a plain symmetrical link open at one side, a spring-barrel sliding on one of the arms of the said link, and a ridge encircling the outer periphery of the barrel and adapted to engage with the edge of the buttonhole to open the link for the insertion of the button, substantially as described.

479,650. FRUIT-PACKER. ANDREW J. LONGENECKER, Elk Grove, Cal. Filed Jan. 16, 1892. Serial No. 418,310. (No model.)

Claim.—The herein-described device for packing fruit, comprising the chambered base or support and the form, said form consisting of the side and end pieces *a a* and *b b*, having each an eye or loop at its lower edge, a continuous angular wire passed through said eye or loop and forming therewith the hinges for said side and end pieces, the horizontal flange on the lower edge of each of said pieces and projecting both inwardly and outwardly therefrom, one of said flanges being hinged to the base or support, and the removable bottom supported on the inward projections of said flanges, substantially as specified.

479,651. ENGINE. ROBERT M. LOWRY, London, England. Filed Sept. 5, 1890. Serial No. 363,972. (No model.)

Claim.—1. In an engine, the combination, with the cylinder having an opening therein, a burner arranged at said opening, a valve for closing said opening, and means for closing said valve, of a spring for opening the valve when the equilibrium between the interior and exterior of the cylinder is established, substantially as set forth.

2. In an engine, the combination, with the cylinder having an opening, the burner arranged at said opening, and a valve for closing said opening, of the eccentric-rod, a spring connected with said rod for closing the valve, and a spring for opening the valve, substantially as set forth.

3. In an engine, the combination, with the cylinder having an opening and a valve for closing said opening, of a spring for holding said valve normally open, and the burner having the opening *k'* arranged opposite the opening in the cylinder, substantially as set forth.

4. In an engine, the combination, with the cylinder having an opening and a valve for closing said opening, of a spring for holding said valve normally open, the burner having an opening arranged opposite the opening in the cylinder, and the auxiliary burner n^3, arranged near the latter opening, substantially as set forth.

5. In an engine, the combination, with the cylinder having an opening and a valve for closing said opening, of the burner having the vertical box *m*, provided with the opening *k'*, arranged opposite the opening in the cylinder, and a semicircular chimney or screen arranged against the box *m* and surrounding the valve and said opening *k'*, substantially as set forth.

6. In an engine, the combination, with the cylinder having an opening, the burner arranged at the said opening, and a valve for closing said opening, of a rod on which said valve is mounted, a crank having a pin on said rod, the eccentric-rod, a spring connecting the eccentric-rod with said pin, and a projection on said eccentric-rod adapted to strike said pin, substantially as set forth.

7. In an engine, the combination, with the cylinder having an opening and a valve for closing said opening, of a burner having the flat box *m*, provided with an opening opposite the opening in the cylinder, substantially as set forth.

8. In motive-power engines, the combination of working cylinder *a*, having one of its ends open to the atmosphere, the single small opening *k* in its other end adapted for the double purpose of admitting flame to the cylinder and exhausting the gas therefrom, a burner-box communicating with said opening *k*, the valve *i*, guarding the opening *k*, means for operating said valve for opening and closing said opening, a burner in said burner-box for supplying flame and heated gas directly to the interior of said working cylinder *a* through the said opening *k*, and a piston located in said cylinder, substantially as set forth.

9. In an engine, the combination of the cylinder *a*, piston *b*, an opening *k* in one end of the cylinder proper and being of smaller diameter than the interior of said cylinder, a valve *i*, means for operating such valves to open and close said opening *k*, and a burner *m* for supplying flame and heated gas to the interior of the cylinder *a* through said opening *k*, said burner being arranged transversely to as contradistinguished from coaxially with said opening, substantially as set forth.

10. In a low-pressure engine, the combination of a cylinder, the piston-body working in said cylinder and having a connecting-rod, the spring-pressed plate b^2, the split rings arranged between said plate and piston-body, and means for operating said piston in the cylinder, substantially as set forth.

479,652. FIELD-RANGE. JOHN MARCER, U. S. Army. Filed Jan. 22, 1892. Serial No. 418,901. (No model.)

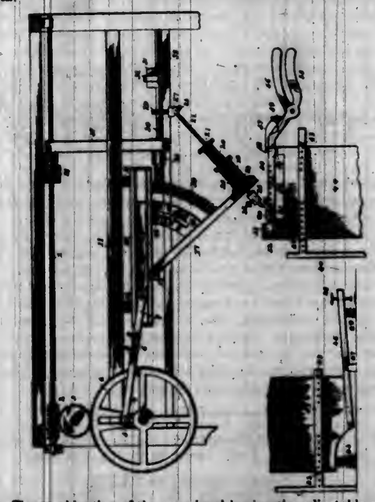
Claim.—1. A field cooking apparatus comprising an outer vessel having pivoted bails at its ends, legs pivoting on the said bails, a cover across which the legs are adapted to fold to engage at their free ends the opposite bails, and a longitudinally-extensible oven and cover, both formed of sliding or telescopic sections adapted to be extended when removed from the outer inclosing vessel and held against accidental extension by said vessel, substantially as set forth.

2. In a field-range, the oven comprising a series of open-topped sliding pan-like sections adapted to fit one within the other and an extensible cover for the oven, substantially as described.

3. In a field range, the oven comprising a series of pan-like sections held to slide one within the other, the sections having extension ends adapted to overlap adjacent sections, and an extensible cover for the oven, substantially as described.

4. In a field cooking apparatus, the oven comprising a series of pan-like sections slidable one within the other and an extensible cover also formed of sections slidable one within the other, the inner longitudinal edges of the middle cover-section having ways 35 and the outer sections having their longitudinal edges bent upon themselves and entering said ways, substantially as set forth.

5. In a field cooking apparatus, the extensible oven formed of sections slidable one upon the other and having an outer vessel to receive them when folded or contracted, a series of transverse spacing-bars 27, a series of pans 26 within the oven and adapted to nest therein, and a series of supports 23 for the oven when extended and adapted to be placed within the outer vessel when the apparatus is knocked down, substantially as set forth.



479,653. CARVING-MACHINE. RUSSELL C. MILLER, Salisbury, Conn., assignor of two-thirds to Morgan Tyler and William W. Keywerth, same place. Filed Apr. 30, 1891. Serial No. 391,116. (No model.)

Claim.—1. In a machine of the class described, the combination of a reciprocating cross-head, a suitable guide for the same, springs interposed between said guide and its support, an arm pivoted to and connected adjustably with said cross-head, and the cutting-tool mounted at the free end of said arm, substantially as set forth.

2. In a machine of the class described, the combination of the reciprocating cross-head, the yieldingly-supported guide for the same, an arm pivoted to and connected adjustably with said cross-head, the socket at the outer end of said arm, and the tool-holder mounted yieldingly in said socket, substantially as set forth.

3. In a machine of the class described, the combination of the reciprocating cross-head, the yieldingly-supported guide for the same, the arm pivoted to and connected adjustably with said cross-head, the tool-holder or cutter-rod journaled at the free end of said arm, and means for imparting an oscillating motion to said cutter-rod, substantially as set forth.

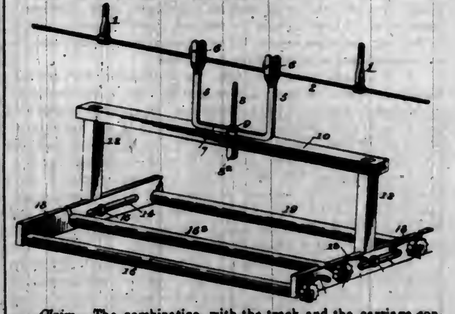
4. The combination of the reciprocating cross-head having a slotted segment, the arm pivoted to said cross-head and having a slotted segment, the clamping-screw connecting the said slotted segments, and the cutter-rod mounted at the free end of said arm, substantially as set forth.

5. The combination of the cross-head having the adjustable arm, the socket at the free end of said arm, the adjusting-screw and bearing mounted in said socket, the cutter-rod extending through said socket and screw and having an annular flange within the socket, the spring arranged in the socket between said flange and the screw, the tool-holder at the lower end of the cutter-rod, and means for imparting to the latter an oscillating or vibrating motion, substantially as set forth.

6. The combination, with the cutter-rod mounted yieldingly in a socket, as herein described, of the collar mounted at the upper end of said rod and having an upwardly-extending finger, a transversely-reciprocating slide having a longitudinal slot receiving said finger, thereby imparting to the cutter-rod an oscillating or vibratory movement, and means for moving the finger in said slot, substantially as set forth.

7. The combination, with the reciprocating cross-head, of the transversely-reciprocating slide having a longitudinal slot, the yieldingly-supported guide for the cross-head, the arm hinged to and connected adjustably with the latter, the socket at the free end of said arm having an adjusting-screw and bearing mounted therein, the cutter-rod extending through said socket and adjusting-screw and bearing and having an annular flange, a spring arranged in the socket and bearing against said flange, a tool-holder at the lower end of the cutter-rod, the collar mounted adjustably at the upper end of the latter, and the finger extending upwardly from said collar through the longitudinal slot in the transversely-reciprocating slide, substantially as and for the purpose set forth.

8. In a machine of the class described, the combination, with the cutter arranged to have a longitudinally-reciprocating and an oscillating or vibrating motion, of the supporting-block mounted adjustably between arms extending forwardly from a suitable upright, a spring supporting said block, a lever connected pivotally with the latter, a spring arranged under the free end of said lever, and an adjusting-screw or gage-screw mounted in the latter to regulate the extent to which the supporting-block may be raised by said lever, substantially as set forth.



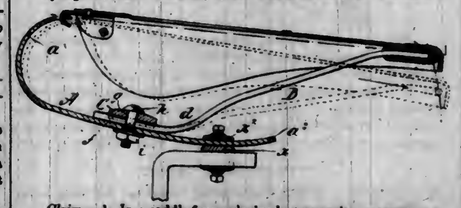
9. The combination, with the supporting-block, of the work-holder connected with said block by a ball-and-socket joint, substantially as set forth.

10. The combination, with the supporting-block having a suitable socket, of the work-holder having a spherical head or ball fitted in said socket and provided at its free end, on its under side, with a semi-spherical supporting-lug, substantially as and for the purpose set forth.

11. The combination, with the vertically-adjustable supporting-block, of the work-holder having a spherical head engaging a socket upon said supporting-block and provided with a semi-spherical supporting-lug, the toothed block mounted adjustably at one end of said work-holder, the toothed dog pivoted at the opposite end of the same, a spring attached to the heel end of said dog, and an angle lever having one arm extended under said dog, the other arm of said lever being extended over the handle of the work-holder, substantially as set forth.

12. In a machine of the class described, the combination, with the cutter mounted to oscillate in a socket carried by a longitudinally-reciprocating cross-head and suitable mechanism for operating said cross-head and cutter, of the vertically-adjustable supporting-block, and the work-holder having a spherical head mounted in a ball-socket upon said supporting-block, and yielding supports for said block, for the guide in which the reciprocating cross-head is mounted, and for the cutter-rod, substantially as and for the purpose set forth.

479,654. QUILTING-FRAME FOR SEWING-MACHINES. GEORGE McN. MOORE and GEORGE W. STEER, Commerce, Tex. Filed Feb. 20, 1892. Serial No. 422,341. (No model.)



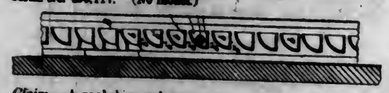
Claim.—The combination, with the track and the carriage consisting of the U-shaped bail formed from a single piece of metal, having the ends bifurcated and provided with grooved wheels or rollers, of the screw-threaded rod having a head at its lower end, passing through an aperture in the bail, the burr or nut consisting of the interiorly-screw-threaded collar, with which said rod engages, the beam having an aperture, through which said rod loosely passes, the depending bars, the side bars, and the rollers, substantially as described.

479,655. WALLET. GEORGE K. MORTON, St. Thomas, Canada. Filed Nov. 27, 1891. Serial No. 413,279. (No model.)

Claim.—As a new article of manufacture, the herein-described wallet, closed at the bottom and ends and open at the top, the sides being flexible and free from flaps and having fastening devices held thereto at the inner surface of each near the top, said fastenings being adapted to engage each other and extending when closed transversely across the interior of the wallet, thus forming a stop for preventing outward movement of the contents of the wallet, the opening at either side of the fastening being directly in line with the interior of the wallet, affording inspection of the contents thereof and permitting entrance of one's fingers in a direct line to the interior for the ready disengagement of the fastening devices while holding securely with the same hand, substantially as described.

479,656. SADDLE FOR VELOCIPEDES. BENJAMIN F. PERT, Springfield, Mass. Filed May 3, 1892. Serial No. 431,666. (No model.)

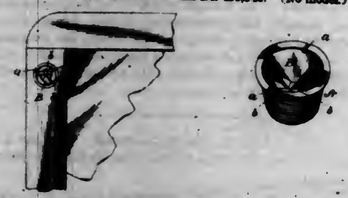
Claim.—1. In a saddle for a velocipede, two spring-support members for the seat-leather, which are united intermediately of the saddle-frame, the one consisting of a single flat strip of spring metal extending forwardly and upwardly and then rearwardly and having its extremity capable of a yielding movement rearwardly and the other



member formed of heavy spring-wire having its intermediate portion of loop form continued in the forwardly-extended legs *d d*, which are extended upon and clamped to the first spring member at the rear of its forward bend, said wire-formed member being inclined from its place of confinement rearwardly and upwardly and adapted to have in its deflection against its spring reaction its rear portion swing both downwardly and rearwardly, thereby assuming a position at an increased distance from the normal position of the extremity of the forward spring-support, substantially as and for the purpose set forth.

2. In a saddle for a velocipede, in combination, the flat spring A, having the upwardly-curved and rearwardly-terminating portion *a* and the member B formed of heavy spring-wire, having its intermediate portion of loop form terminating in the parallel separated legs *d d*, lying upon the flat spring A and having from said place of connection the rearward and upward inclination, the clamping-block C, having its bottom grooved, and the bolt *h* and nut *i* and seat-leather connected to said front and rear spring-supports and adapted on the downward deflection of the latter to have the rear end thereof assume a position farther from the front support for exerting thereon through the seat an increased tension, substantially as described.

3. In a saddle for a velocipede, the combination, with the forward seat-support member A, consisting of a flat spring having an approximately horizontal lower section and the upwardly-curved section *a*, rearwardly terminating and provided with the aperture, as shown, of the rear support B, consisting of a spring-wire formed into the laterally-extended loop with the forwardly-extended legs *d d*, which are connected with said member A and said section B, rearwardly and upwardly inclined, as shown, and the seat-leather supported at its rear by the loop-formed section of the member *b* and having at its forward end the hook *k*, which engages the aperture in the aforesaid section *a*, substantially as described.

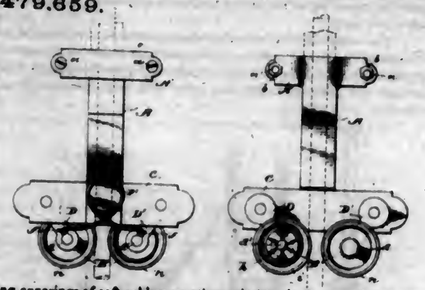


4. In a saddle for a velocipede, the flat strip A, having the upwardly-curved and rearwardly-terminating portion *a* and the member B formed of heavy spring-wire, having its intermediate portion of loop form terminating in the legs *d d*, connected to said forward section and having from said place of connection the rearward and upward inclination, and a seat-leather connected to said front and rear spring-supports and adapted on the downward deflection of the latter to have the rear end thereof assume a position farther from the front support *a* for exerting thereon through the seat an increased tension, substantially as described.

479,657. SASH-BALANCE. GEORGE T. PETERS, Jersey City, N. J., assignor to himself and Clifford Shaw, same place. Filed Apr. 21, 1892. Serial No. 430,117. (No model.)

Claim.—A rack-bar and gear movement composed of a cog-wheel with round or cylindrical spokes and a rack-bar with recesses having a rectilinear bottom edge and a quarter-circular top edge, substantially as described.

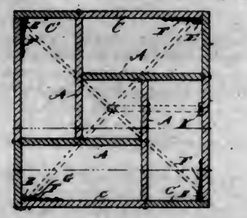
479,658. PENCIL-SHARPENER. WILLIAM A. PHILLIPS, U. S. Army. Filed Apr. 8, 1892. Serial No. 428,349. (No model.)



Claim.—1. The pencil-sharpener consisting of the conical externally-screw-threaded chamber or receptacle having internal pyramid-shaped cutters or blades, substantially as and for the purposes set forth.

2. The pencil-sharpener consisting of the conical externally-screw-threaded chamber or receptacle having its flared or flanged end provided with screw-threaded grooves, said chamber or receptacle having internal pyramid-shaped cutters or blades, substantially as set forth.

479,659. ELECTRIC-ARC LAMP. JONATHAN A. PIERCE, Austin, Minn. Filed Oct. 15, 1891. Serial No. 408,808. (No model.)



Claim.—1. A carbon-feed-regulating device for electric-arc lamps, consisting of the combination, with the bracket A, provided with the cross-bar C, of the swinging arms D and D', pivoted to said cross-bar and provided with pins, the rollers E, journaled on said pins and having coverings of soft rubber or other suitable elastic material to exert a proper yielding pressure or grip action against the carbon electrode, and a spring F for forcing said rollers toward each other.

2. In an electric-arc lamp, the combination, with spring-pressed rollers between which the carbon electrode is placed, of friction-washers between which one of the said rollers is held, a spring for exerting a proper frictional pressure of said washers against said roller, and an adjusting-nut serving to regulate the pressure of the said spring.

3. The combination, with the bracket A, of the swinging arms pivoted thereto and provided with suitable pins, the rubber-covered rollers journaled on said pins, the spring F for pressing said rollers toward each other, and an adjustable tension-spring and friction pads or washers to vary the frictional drag on said rollers.

479,660. FILING-CABINET. HAROLD M. PLIMPTON, Springfield, Ohio. Filed June 8, 1892. Serial No. 435,962. (No model.)

Claim.—1. A filing-cabinet composed of a plurality of vertical partitions arranged about a common center, each partition abutting at its inner edge against the previous adjacent partition and forming an abutment for the succeeding adjacent partition, horizontal partitions dividing the plurality of similarly-arranged compartments into a series of pigeon-holes, and inclosing sides for said partitions, having doors to give access to said pigeon-holes.

2. A filing-cabinet composed of a plurality of uniform vertical partitions symmetrically arranged about a common center, each partition abutting on the previous adjacent one and forming an abutment for the succeeding partition, horizontal partitions secured to said vertical partitions and dividing the compartments into pigeon-holes, substantially as shown and described, inclosing uniform sides for said compartments, having doors to give access thereto, and a locking device to lock said doors simultaneously.

3. A filing-cabinet composed of a plurality of vertical partitions, each partition extending opposite to the previous adjacent one, shelves forming horizontal partitions and secured to said vertical partitions at one side and end, inclosing sides for said partitions, having doors adapted to give access to the pigeon-holes formed thereby, and a locking device to lock said doors simultaneously, consisting of a frame operatively connected to each door to retain the door in its closed position normally, a lever fulcrumed in the cabinet and engaging with said frame to move it into locking position, and a lock proper actuating said lever to maintain said doors locked.

4. A filing-cabinet consisting of vertical partitions and horizontal partitions, the vertical partitions being arranged at right angles to each other, whereby the compartments thus formed are likewise at right angles to each other, substantially as shown and described, and inclosing sides, each side having a door giving access to the series of compartments corresponding thereto, and means to lock said doors in their closed position.

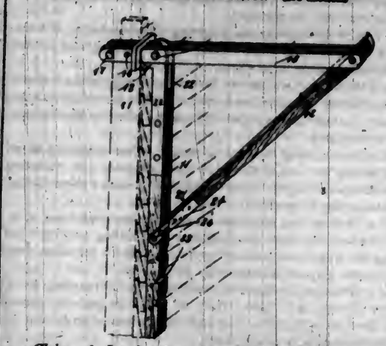
5. A filing-cabinet composed of four vertical partitions extending the length of the cabinet and arranged at right angles to each other in four vertical planes, substantially as shown, a series of horizontal partitions forming shelves and secured to said vertical partitions, substantially as shown, inclosing sides for said partitions, having doors corresponding thereto, a spring-catch and engaging-piece to maintain said doors normally closed, and a lock proper operatively connected with said catches to maintain the doors in their locked position.

6. A filing-cabinet composed of vertical and horizontal partitions, the former arranged at right angles to each other and forming a central compartment and a plurality of outer compartments, inclosing sides for said compartments to constitute pigeon-holes and having doors corresponding thereto, a locking device for said doors, consisting of a frame-work operatively connected to each door and a lock proper to actuate said framework and secure the doors in their locked position, a pivotally-supporting post mounted in said interior compartment and engaged with the cabinet at substantially the center of gravity thereof, and a base to support said post in its upright position.

7. A filing-cabinet composed of vertical and horizontal partitions, the former being at right angles to each other and secured together to form a central axial compartment and a series of outer compartments vertically over each other, inclosing sides for said cabinet, each side having a door for the vertically-arranged series of compartments, a spring-catch mounted on each side of said cabinet, and an engaging-piece on each door to engage with the catch opposite thereto, a frame operatively connected to each catch and movable to and from the same, whereby said catches and doors connected therewith are locked in their closed position, and means to effect the movement of said frame, a supporting-piece in the central compartment, having a bearing at substantially the center of gravity of said cabinet, a pivotal standard engaging with said bearing and mounted on a supporting-base, and means to steady said cabinet in its rotation on said standard above said base.

8. A filing-cabinet composed of vertical and horizontal partitions, the former being at right angles to each other and secured together to form a central axial compartment and a series of outer compartments vertically over each other, inclosing sides for said cabinet, each side having a door for the vertically-arranged series of compartments, a spring-catch mounted on each side of said cabinet, and an engaging-piece on each door to engage with the catch opposite thereto, a frame operatively connected to each catch and movable to and from the same, whereby said catches and doors connected therewith are locked in their closed position, and means to effect the movement of said frame.

9. A filing-case composed of vertical and horizontal partitions forming compartments, the vertical partitions being at right angles to each other and symmetrically arranged about the central axis, inclosing sides for said compartments and doors corresponding thereto, a supporting-standard pivotally engaged with said cabinet at substantially the center of gravity thereof, a base for said standard to maintain the same in its erect position within the central compartment of the cabinet, and rollers between said base and cabinet and adapted to steady the cabinet in its rotation.

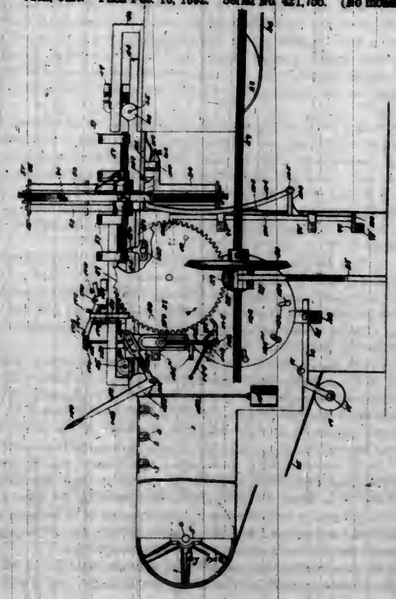


10. A filing-cabinet composed of vertical and horizontal partitions, the former being raised symmetrically about a common center and of substantially the same dimensions and shape, inclosing sides, top, and bottom for said compartments, each of the sides proper having a hinged door for the series of compartments opening on that side of the cabinet, a spring-catch and an engaging-piece for each door, adapted to normally maintain the doors in their closed position, a frame mounted in said cabinet and carrying looped pieces engaging with said catches and adapted to prevent the depression of each catch, a lever fulcrumed in said cabinet and engaging with the frame to tighten said looped pieces on said catches, and the lock proper acting on said lever to lock the catches and doors in their closed position.

479,661. SPADE. PETER POULSON, Somers, Wis. Filed July 14, 1891. Serial No. 399,065. (No model.)

Claim.—In a spade substantially as described, the combination, with the blade provided on its upper edge with an integral socket-neck formed by a front wall and the rearwardly and laterally bent portions and the pedal branches formed integral with the socket-neck and blade and extending laterally and downwardly, the blade, socket-neck, and pedal branches being formed from a single blank having the portions struck therefrom and bent rearwardly and laterally so as to form the pedal branches and the socket-neck, of a handle having its lower portion enlarged and tapered toward its end to conform to the shape of the socket-neck and a suitable means for fastening the handle in the said socket-neck, substantially as specified.

479,662. SCAFFOLD-BRACKET. CHARLES RANDALL, Perry, Me. Filed Jan. 20, 1892. Serial No. 418,606. (No model.)



Claim.—1. In a bracket, the combination, with a bearer adapted to embrace a stud, of an upright having a cam-shaped upper end pivoted to the bearer and a brace pivoted to the outer end of the bearer and engaging the upright, substantially as described.

2. In a bracket, the combination, with a bearer adapted to embrace a stud, of an upright having cam-shaped upper end pivoted in an opening in the bearer and a slotted plate on the bearer and engaged by the cam-shaped end of the upright, substantially as described.

3. The combination, with the bracket having a bearer formed of perforated plates adapted to embrace a stud, a slotted fastening-plate adapted to fit on the inner end of the bearer-plates, said plate having a roughened inner face, and a fastening-pin to enter the holes in the bearer-plates, substantially as described.

4. A scaffold-bracket comprising the bearer formed of parallel plates having perforated inner ends adapted to embrace a stud, a roughened and slotted fastening-plate to fit over the inner ends of the bearer-bars, a pin adapted to extend through the perforations in the bearer-bars, an upright hinged to the bearer near its inner end and provided near its lower end with notches and transverse holes, a brace hinged between the outer ends of the bearer-bars and arranged to project above them, said brace having its lower end shaped to enter the notches, perforated side plates secured to the lower end of the brace and adapted to embrace the upright, and a fastening-pin to extend through the side plates and holes in the upright, substantially as described.

479,663. BRICK-CUTTING MACHINE. HORACE A. RICE, Plymouth, Ohio. Filed Feb. 16, 1892. Serial No. 421,755. (No model.)

Claim.—1. In a brick-cutting machine, a cutting-wheel consisting of a central hub, an outer rim, and cutting devices connecting the hub and rim, substantially as specified.

2. In a brick-cutting machine, a cutting-wheel consisting of a central hub, a surrounding rim, and cutting-wires radiating from the hub to the rim, substantially as specified.

3. In a brick-cutting machine, a rotating cutting device comprising a central disk or wheel mounted upon a shaft, a loosely-detachable surrounding rim, and cutters radiating from the wheel to the rim, substantially as specified.

4. In a brick-cutting machine, a cutting-wheel consisting of an inner hub having an annular flange or disk, an outer rim, radiating cutting-wires connecting the disk and rim, and tension devices for the wires, substantially as specified.

5. In a brick-cutting machine, a cutting-frame comprising an inner disk or wheel, an outer detachable rim, radiating cutting-wires connecting the wheel and rim, and tension devices for the wires, resting upon elastic supports, substantially as specified.

6. In a brick-cutting machine, a cutting-wheel comprising an inner disk or hub mounted upon a shaft, an outer flanged rim, cutters extended between said disk or hub and rim, and securing devices for the cutters, substantially as specified.

7. In a brick-cutting machine, a cutting-wheel comprising an inner disk or hub, an outer flanged rim the edge of which is provided with inclined slots, wire cutters mounted in the slots and having their inner ends secured to the disk, and securing devices for the cutters mounted over the slots upon the rim, substantially as specified.

8. In a brick-cutting machine, a cutter consisting of a hub having a disk, threaded studs projecting from the hub, clamping-nuts mounted on the studs, an outer surrounding rim having openings, wire cutters wound upon the studs and clamped by the nuts and having their outer ends extended through the openings of the rim, L-shaped brackets mounted upon the rim over the openings, eyebolts depending through perforations in the brackets and connected to the outer ends of the wire cutters, and nuts threaded on the outer ends of the eyebolts, substantially as specified.

9. In a brick-cutting machine, a cutting device comprising a wheel mounted upon a shaft ranged longitudinal with the machine, cutting-wires attached to said wheel and extending radially to an outer detachable rim supported by said cutting-wires, and means of automatically rotating the cutting-wheel, whereby the cutting-wires sever the bars of clay, substantially as specified.

10. In a brick-cutting machine, a cutting device comprising an inner hub having an annular flange or rim, an outer rim or wheel, cutting-wires having their inner ends secured to the disk, securing devices for the cutting-wires, attached to the outer rim or wheel, and means of applying tension to the wires, substantially as specified.

11. In a brick-cutting machine, a rotating cutting device comprising an inner hub or wheel mounted upon a shaft ranged longitudinally with the framework of the machine and an outer flanged detachable rim or wheel supported and secured in position by cutters radiating from the inner wheel, to which said cutters are attached at their inner ends, the outer ends of said cutters extending through apertures in the outer rim and connected to devices mounted upon the rim over the apertures for securing the cutters, substantially as specified.

12. In a brick-cutting machine, a cutting device comprising an inner hub or disk, an outer flanged rim having openings or depressions therein, wire cutters mounted within the free ends of the openings and having their inner ends clamped to studs in the disk, and securing and tension devices for the free ends of the cutters mounted upon the rim, in combination with means for automatically rotating said cutting device, whereby the bars of clay are cut into brick, substantially as described.

13. In a brick-cutting machine, the combination, with a series of U-shaped frames 53, radiating from a common point, a shaft at said point, and guide-plates mounted adjustably upon the U-shaped frames, of the hub mounted on the shaft, the rim encircling the hub and located between the plates, and the series of wire cutters connecting the hub and rim, substantially as specified.

14. In a brick-cutting machine, the combination, with a framework and a rotatable cutter mounted at an angle to the same and provided at one side with teeth, of means for feeding a column of clay to the cutter, a vertically-reciprocating trip-rod, a pawl pivoted to the trip-rod and at its free end engaging the teeth of the cutter, and means for raising and lowering the trip-rod, substantially as specified.

15. In a brick-cutting machine, the combination, with the frame and the rotary cutter mounted thereon and at an angle thereto and provided with teeth, of a gear, means for operating the gear, trip-pins on the gear, a reciprocating trip-rod adapted to be engaged successively by the pins, and a pawl pivoted to the trip-rod and engaging the teeth of the rotary cutter, substantially as specified.

16. In a brick-cutting machine, the combination, with the framework, a cutter extending at an angle to the same, and a trip-rod mounted for reciprocation at the side of the frame, of means for intermittingly operating the trip-rod and connections between the rod and cutter for communicating motion from the former to the latter, substantially as specified.

17. In a brick-cutting machine, the combination, with the frame, the rotatable cutter mounted in the transverse opening in the same, and means for operating the cutter and for feeding a column of clay thereto, of a plate yieldingly supported in the table of the machine at the side of the path of the cutter, substantially as specified.

18. In a brick-cutting machine, the combination, with the carriage having the bottom provided with a transverse opening, the rotary cutter, and means for operating the same, of the plate 108, mounted at one side of the cutter and occupying a portion of the opening, the arm 109, supporting the plate, the standard 111, depending from the under side of the bottom and pivotally connected to the arm, and the spring 113, bearing on the rear end of the arm, substantially as specified.

19. In a brick-cutting machine, the combination, with the carriage having the bottom provided with a transverse opening, the rotary cutter, and means for operating the same, of the plate 108, mounted at one side of the cutter and occupying a portion of the opening, the arm 109, supporting the plate, the standard 111, depending from the under side of the bottom and pivotally connected to the arm, the spring 113, connected to the bottom, and the set-screw 112, passing through the rear end of the arm 109 and borne upon by the free end of the spring, substantially as specified.

20. In a brick-cutting machine, the combination, with the front and rear sections of the frame, the feed and delivery belts, and their pulleys mounted in their respective sections, of the intermediate reciprocating carriage, the bottom of which is not equal to the distance between the upper sides of the adjacent pulleys of the two belts, and the intermediate yieldingly-supported roller 185, located in the path of and adapted to be depressed by the rear end of the bottom, substantially as specified.

21. In a brick-cutting machine, the combination, with the framework, the drum journaled at the intermediate portion thereof, the pulley at the front end of the framework, and the endless feed-belt passing around the pulley and drum, of a movable carriage mounted on the framework above the drum, stops on the drum for moving the carriage to the rear, means for returning the carriage at or before the end of its movement, a cutter, and means for operating the cutter during the forward movement of the carriage, substantially as specified.

22. In a brick-cutting machine, the combination, with the framework, the pulley at the front end of the same, the shaft 8, the disks 10, mounted on the shaft, the curved rim-sections 14, and the pairs of opposite segmental plates 13, having slots and adjusting-screws passing therethrough into the disks, said rims being provided with stops 178, of the reciprocating carriage mounted on the framework above the drum, the pawls pivoted to the framework and depending in front of the stops, whereby the carriage is moved to the rear by rotation of said drum, means for raising the pawls out of engagement with the stops, and means for returning the carriage after such raising, substantially as specified.

23. In a brick-cutting machine, the combination, with the framework, the pulley, the drum, the endless feed-belts, and stops mounted upon the periphery of the drum, of the movable carriage mounted on the framework, gravity-pawls pivoted to the carriage and depending into the path of the stops, means for operating the drum, means for elevating the pawls out of engagement with the stops at the end of the rearward movement of the carriage, and means for automatically returning the carriage to its starting-point, substantially as specified.

24. In a brick-cutting machine, the combination, with the framework, the rotatable drum, means for operating the same, and stops upon the drum, of a movable carriage mounted above the drum, pawls on the same for engaging the stops of the drum, rock-arms pivoted on the carriage, connections between the same and pawls, a rotatable gear provided with pins, means for operating the gear in a reverse direction to that of the drum, and an arm depending from the rock-arms into the path of and adapted to be struck by the pins, substantially as specified.

25. In a brick-cutting machine, the combination, with the framework, the drum mounted for rotation therein, means for operating the drum, and a series of stops mounted on the drum, of a carriage mounted for movement on the framework above the drum and having opposite T-shaped standards, angle-levers for each of the standards, a rock-shaft connecting the standards, journaled therein and connected rigidly with the angle-levers, springs for normally depressing the angle-levers, set-screws mounted at opposite sides of the rock-shaft in said angle-levers, links connected to the outer slotted ends of said angle-levers and to the free ends of the pawls, an arm depending from one of the levers, a rotatable wheel having pins for striking the arms, and means for operating the wheel, substantially as specified.

26. In a brick-cutting machine, the combination, with the framework, a cutting medium mounted across the same, a trip-rod, and means upon the rod for operating the cutting medium, of a main shaft, a gear located at the side of the frame, means for communicating motion from the main shaft to the gear, a disk above the gear, provided with a toothed periphery, with the exception of the intermediate plain portions, pins upon the disk for reciprocating the trip, and devices for intermittingly slightly rotating the disk so as to throw its teeth into engagement with the gear, substantially as specified.

27. In a brick-cutting machine, the combination, with the framework, the cutter located across the same, the reciprocating trip, and devices mounted on the trip for operating the cutter at each reciprocation of the trip, of a longitudinal power-shaft, a gear located at one side of the same, a disk supported rotatably above the gear, having a toothed periphery and intermediate plain untoothed portions, pins on the disk for engaging the trip, means for communicating motion from the shaft to the gear, a rod supported at one side of the disk and provided at its lower end with a finger normally out of engagement with the teeth of the disk, and means for intermittingly throwing the finger into engagement with the disk and oscillating the rod, substantially as specified.

28. In a brick-cutting machine, the combination, with the framework, the cutter located across the same, the reciprocating trip, and devices mounted on the trip for operating the cutter at each reciprocation of the trip, of a longitudinal power-shaft, a gear located at one side of the same, a disk supported rotatably above the gear, having a toothed periphery and intermediate plain untoothed portions, pins on the disk for engaging the trip, means for communicating motion from the shaft to the gear, a rod pivotally supported at one side of the disk, a finger or pawl pivoted to the lower end of the rod, a spring for retracting the rod and pawl, a disk located at one side of the lower end of the rod, pins extending from the disk, means for rotating the disk, and an inclined shoulder mounted on the lower end of the rod in the path of the pins, substantially as specified.

29. In a brick-cutting machine, the combination, with the framework, the cutter located across the same, the reciprocating trip, and devices mounted on the trip for operating the cutter at each reciprocation of the trip, of a longitudinal power-shaft, a gear located at one side of the same, a disk supported rotatably above the gear, having a toothed periphery and intermediate plain untoothed portions, pins on the disk for engaging the trip, means for communicating motion from the shaft to the gear, a rod pivotally supported at one side of the disk, a finger or pawl pivoted to the lower end of the rod, a spring for retracting the rod and pawl, a disk located at one side of the lower end of the rod, pins extending from the disk, means for rotating the disk, an inclined shoulder mounted on the lower end of the rod in the path of the pins, and means for throwing the rod into and withdrawing the same from the path of the pins of the disk, substantially as specified.

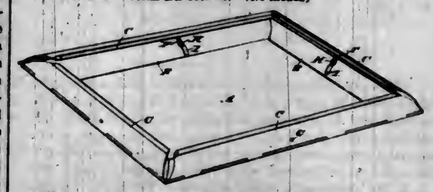
30. In a brick-cutting machine, the combination, with the framework, the cutter located across the same, the reciprocating trip, and devices mounted on the trip for operating the cutter at each reciprocation of the trip, of a longitudinal power-shaft, a gear located at one side of the same, a disk supported rotatably above the gear, having a toothed periphery and intermediate plain untoothed portions, pins on the disk for engaging the trip, means for communicating motion from the shaft to the gear, ways located upon the frame above the last-mentioned disk, a vertically-sliding frame mounted in the ways and provided with a pin and with an open box, obtuse slots formed in the opposite side walls of the box, a pin extending from the frame through the box, a sleeve formed in two sections swiveled together and mounted on the pin for reciprocation, trunnions mounted on the rear section and taking into the slots of the box, a depending rod secured to the front section of the sleeve and provided with a shoulder located in the path of the pins of the disk, a spring for retracting the rod, a pawl pivoted to the lower end of the rod and adapted to engage the teeth of the first-mentioned disk, a spring for elevating said pawl, and an elbow-lever pivoted on the framework terminating at one end in a handle and at the other end in an eye, the latter engaging the pin of the sliding frame, substantially as specified.

31. In a brick-cutting machine, the combination, with the framework, the cutter mounted across the same, and means for feeding clay to the cutter, of the vertically-reciprocating trip, keepers for the same, means for operating the trip and releasing the same, devices mounted on the trip for operating the cutter, and the support 100, pivoted to the bracket 98 and adapted to be swung into and out of the path of the trip, substantially as specified.

32. In a brick-cutting machine, the combination, with the front and rear frame-sections and the opposite pairs of horizontal track-frames 43 of substantial E shape, of the intermediate movable carriage comprising opposite side bars, bearings extending outwardly from the side bars over the lower terminals of the frames 43, rollers journaled in the bearings and bearing against the upper surfaces of the lower terminals of the frames 43, pairs of perforated lugs extending from standards mounted on the side bars opposite the upper terminals of the frames 43, and rollers loosely mounted in the lugs and bearing against the upper terminals of the frames 43, substantially as specified.

33. In a brick-cutting machine, the combination, with the framework, the cutter mounted across the same, and means for feeding clay to the cutter, of a vertically-reciprocating trip, keepers for the same, means for operating the trip and releasing the same, devices mounted on the trip for operating the cutter, and means for regulating the throw of the trip, substantially as specified.

34. In a brick-cutting machine, the combination of front and rear sections having endless carriers mounted thereon, a carriage movably mounted longitudinally between said front and rear sections and having a rotary cutter mounted therein, a wheel having projections extending therefrom, and means for intermittingly communicating motion from the wheel to the cutter, substantially as specified.



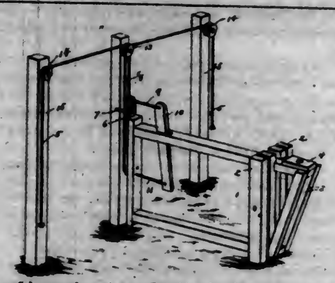
35. In a machine for cutting off brick, the combination of a movably-mounted rotary cutter, the framework having front and rear sections, endless carriers operating in said sections, the intermediate longitudinally-movable reciprocating carriage supporting the rotary cutter, and means for feeding clay to the cutter, substantially as specified.

36. In a machine for cutting off brick, the combination of the framework, the front and rear sections thereof, the drum mounted in the front section, means for expanding and contracting the circumference of the drum adjustably to the length of the brick, the longitudinally-movable carriage mounted on the front and rear sections, and means for operating a cutter upon a bar of clay, whereby the same is cut into brick, substantially as specified.

37. In a machine for cutting off brick, a framework having a front section, an adjustable expansible drum mounted therein, a band-wheel mounted on the shaft carrying the drum, and an endless feed-belt rotating on said drum, in combination with a rear section, a delivery-belt revolving over pulleys mounted within the frame of said rear section, a band-wheel mounted on the shaft carrying one of the pulleys of the delivery-belt, means of revolving the delivery-belt, and a band or belt connecting the band-wheels, and means of applying tension to the band or belt, substantially as specified.

38. In a machine for cutting off brick, a framework, front and rear sections thereof, endless carriers mounted therein, a band-wheel mounted on the shaft of a pulley over which the rear carrier revolves, a band-wheel mounted on the shaft of a pulley or drum over which the front or feed carrier revolves, means of connecting said band-wheels, tension devices for regulating the friction applied to the band-wheels, the carriage mounted on said front and rear sections for reciprocation therein, the rotary cutter mounted within the carriage and at an angle thereto, and means for feeding a bar or bars of clay in the path of the cutter, substantially as specified.

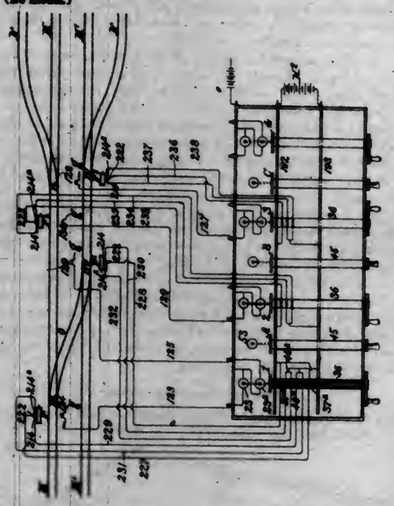
479,664. TRAY. MAX S. ROSENWEIG, New York, N. Y. Filed Nov. 5, 1891. Serial No. 410,979. (No model.)



Claim.—1. A tray provided with inwardly-extending flanges pivoted to the sides of the body of the tray and a support for each of the said flanges to hold the same in an uppermost or extended position, substantially as shown and described.

2. A tray comprising a body, sides extending from the said body, flanges pivoted to the said sides and extending inward, and supports extending between the said flanges and sides to support the former in an extended position, substantially as shown and described.

3. In a tray, the combination, with a body and sides extending therefrom, of flanges pivoted to the upper ends of the said sides and extending inward and a support for connecting each flange with its side, the said support comprising an arm pivoted to the flange and a button pivotally connected with the arm and fitted to slide in the side, substantially as shown and described.



479,665. GATE. JOHN W. RUHL, Millinburg, Pa., assignor of one-half to David L. Ruhl, same place. Filed Mar. 16, 1892. Serial No. 426,139. (No model.)

Claim.—The combination of the posts, a gate pivotally mounted between the posts and provided with a weighted inverted triangular extension projecting rearwardly from it, rigid with it, and forming a part of it, a latch arranged at the front of the gate, a vertically-di-

posed lever fulcrumed on the gate and having its upper end connected with the latch, and operating-ropes connected with the lower end of the lever and adapted to release the latch and lift the gate, substantially as described.

479,666. SWITCH AND SIGNAL APPARATUS. JESSE G. L. SHERWOOD, Edgewood, Pa. Filed June 10, 1891. Serial No. 395,771. (No model.)

Claim.—1. The combination of a fluid-pressure motor for operating a switch or other part or appliance connected with a track and provided with an electrically-controlled valve mechanism with an electrically-controlled lock for locking said valve mechanism and make-and-break mechanisms for controlling the circuits leading to the lock and valve mechanisms of the motor, substantially as set forth.

2. The combination of a fluid-pressure motor for operating a switch or other part or appliance connected with a track and provided with an electrically-controlled valve mechanism with a make-and-break mechanism for controlling the circuits leading to the valve mechanism of the motor and an electrically-operated mechanism for locking the make-and-break mechanism during the operation of the motor, substantially as set forth.

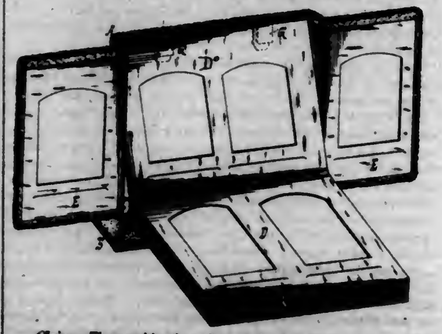
3. The combination of a fluid-pressure motor for operating a switch or some part or appliance connected with a track and provided with an electrically-controlled valve mechanism with an electrically-controlled lock for the valve mechanism of the motor, make-and-break mechanisms for controlling the circuits leading to the lock and valve mechanisms of the motor, and an electrically-controlled mechanism for locking the make-and-break mechanism during the operation of the motor, substantially as set forth.

4. The combination of a series of two or more fluid-pressure motors for operating a series of two or more switches or other parts or appliances connected with a track and provided with electrically-controlled valve mechanisms with electrically-controlled locks for the valve mechanisms and a make-and-break mechanism for controlling the circuits leading to the lock and valve mechanisms of the motors, substantially as set forth.

5. The combination of a series of two or more fluid-pressure motors for operating a series of two or more switches or other parts or appliances connected with a track and provided with electrically-controlled valve mechanisms with a make-and-break mechanism controlling the circuits leading to each of the valve mechanisms of the motors and electrically-operated mechanisms for locking the make-and-break mechanisms during the operation of the motors, substantially as set forth.

6. The combination of a lever for operating the make-and-break mechanism controlling the switch and a lock operated by the lever for preventing a partial forward-and-return movement of the lever, substantially as set forth.

7. The combination of a lever for controlling the movements of the switch, pivotal plates provided with shoulders adapted to engage the latch of said lever and having spurs with inclined faces, spring-actuated plungers adapted to engage said spurs, and a slide arranged between the spurs, substantially as set forth.



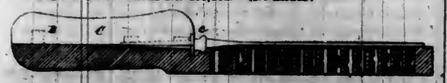
8. The combination of a lever for controlling the movements of the switch, pivotal plates provided with shoulders adapted to engage the latch of said lever and having spurs with inclined faces, spring-actuated plungers adapted to engage said spurs, a slide arranged between the spurs, and a dog operated by the slide and adapted to engage the pivotal plates, substantially as set forth.

9. In combination with a fluid-pressure cylinder and piston, a distributing-valve governing the supply and exhaust pistons to actuate said valve, electrically-actuated valves, each controlling the admission and exhaust of fluid-pressure to and from one side of each of said pistons, and a lock for holding the distributing valve in different positions, substantially as set forth.

10. In combination with a fluid-pressure cylinder and piston, a distributing-valve governing the supply and exhaust, and a locking-pin for holding said valve in different positions, the pin and valve being provided with interlocking projections and recesses, substantially as set forth.

11. In combination with a fluid-pressure cylinder and piston, a distributing-valve governing the supply and exhaust, pistons to actuate said valve, electrically-actuated valves, each controlling the admission and exhaust of fluid-pressure to and from one side of each of said pistons, and an electrically controlled locking device adapted to so engage the distributing-valve as to necessitate a preliminary shifting of the distributing-valve to permit of the withdrawal of the locking device, substantially as set forth.

479,667. PHOTOGRAPHIC ALBUM. GUSTAVE SCHWAB, New York, N. Y. Filed May 3, 1892. Serial No. 431,696. (No model.)



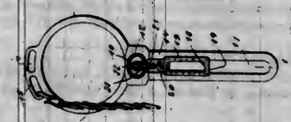
Claim.—The combination of a case having a base, to which it is secured, and a laterally-opening door with a set of downwardly and outwardly opening album-leaves connected at the bottom by flexible strips and adapted to hold photographic or other pictures and a hook-and-socket connection between the back leaf of the set and the back of the case, the hook being free to move up and down in the socket and to be readily removable from the same, substantially as described.

479,668. DIE FOR CUTLERY. THOMAS SHAW, Newark, N. J. Filed July 22, 1891. Serial No. 400,264. (No model.)

Claim.—The combination, with the male die provided with a recess in its wearing-surface and an aperture in said recessed part, of a separate auxiliary die having a part adapted to engage said recess, and a screw-threaded extension adapted to pass through said aperture, and a nut for engaging said extension of the die for clamping it in position in said recess, substantially as described.

479,669. KNIFE-HOLDER. THOMAS SHAW, Newark, N. J. Filed July 22, 1891. Serial No. 400,262. (No model.)

Claim.—1. The herein-described knife-holder with a perforated seat adapted to be engaged by the knife-blade.



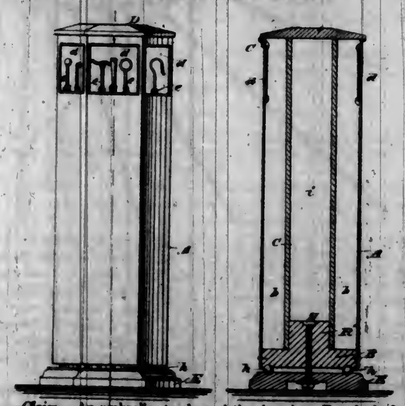
2. The herein-described knife-holder, provided with a perforated seat for the knife-blade and clamping means for engaging other portions of the knife to hold said blade in engagement with said perforated seat.

3. The herein-described knife-holder, provided with a perforated seat for the knife-blade, a recessed portion for the tang and bolster, and the keeper, substantially as described.

4. The herein-described knife-holder, provided with the perforated portion adapted to support the knife-blade and a porous covering engaging said perforated portion of the holder.

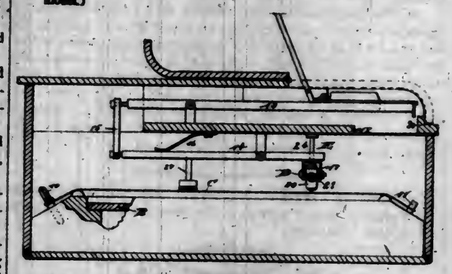
5. The herein-described knife-holder, provided with the perforated portion adapted to support the knife-blade, a porous covering for said perforated part, and the clamping devices for securing said porous covering to said holder.

479,670. BRIDLE-BIT. OLIVER M. SLOAT, Brooklyn, N. Y. Filed Apr. 8, 1892. Serial No. 428,334. (No model.)



Claim.—1. The combination, with the bit having slotted cheek-pieces and a hollow mouth-bar, of rein-eyes held to slide in the cheek-pieces and a spring held within the mouth-bar and secured to the rein-eyes, substantially as described.

2. The combination, with the bit having a hollow mouth-bar and depending slotted cheek-pieces, of rein-eyes held to slide in the cheek-pieces and having hooks at their upper ends and a spring held within the mouth-bar and secured at its outer ends to the hooks of the rein-eyes, substantially as described.

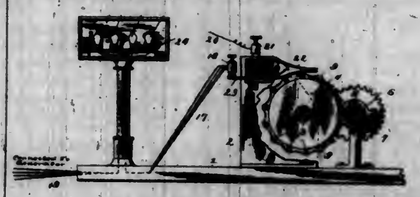


3. The combination, with the bit having depending slotted cheek-pieces and a hollow mouth-bar closed at its ends and with openings on the under side and near the end portions, of rein-eyes held to slide in the cheek-pieces and a spring held in the mouth-bar and having its free ends extending downward through the openings in the mouth-bar and connected with the rein-eyes, substantially as described.

479,671. UMBRELLA-STAND. PETER V. SMITH, New York, N. Y. Filed Sept. 10, 1891. Serial No. 405,288. (No model.)

Claim.—An umbrella-stand consisting in a base E and a body rotating thereon and comprising a bottom block B, having a raised central portion R', a pivot-bolt *g*, connecting the base and block, anti-friction rollers interposed between the adjacent faces of the base and block, the inner case C, receiving at its lower end the portion R', the outer case the lower end of which incloses the block B and having a glazed upper end, and the cover D, closing the compartments formed within said casings, substantially as set forth.

479,672. PICK FOR STRINGED INSTRUMENTS. HENRY G. A. SMITH, Buffalo, N. Y. Filed Dec. 22, 1891. Serial No. 415,850. (No model.)



Claim.—1. In a stringed instrument, the combination, with a key, of a pivoted pick connected to the key and provided with means for holding it in the position to which it has been moved, and a trip mechanism engaging the pick in its upward and downward movements, whereby provision is made for swinging the pick into an inclined position to cause it to slide over and release the string and to restore it to its normal position after it has risen above the string, substantially as described.

2 The combination, with a string stretched to vibrate and a key or lever located adjacent to the string, of a pick pivotally attached to the key or lever, a trip mechanism operating in conjunction with the pick, and a tension device applied to the pick and adapted to hold the pick in a predetermined position during its upward and downward stroke until the trip mechanism restores the pick to its normal position for the next stroke, as and for the purpose set forth.

3. In a stringed instrument, the combination, with a key, of a pivoted and frictionally-held pick connected with the key and provided with a spring-finger and a lip and a trip mechanism engaging the lip of the pick to swing it on its pivot, substantially as herein shown and described.

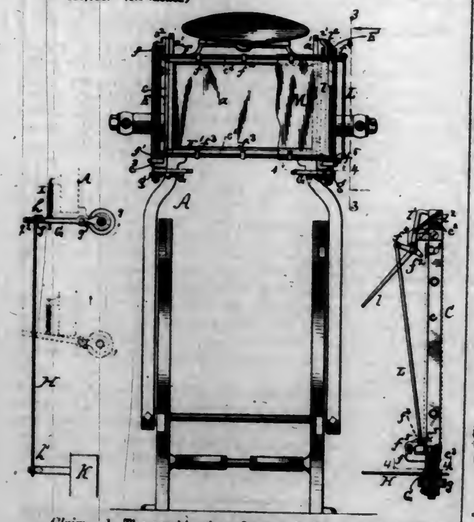
4. In a stringed instrument, the combination, with a key, of a pivoted pick connected with the key and provided with a spring-finger and a lip, a trip mechanism comprising abutments or stops, between which the lip of the pick projects, and means for holding the pick from turning on its pivot only when engaged by the trip mechanism, substantially as herein shown and described.

479,673. APPARATUS FOR PRODUCING VARIEGATED LIGHTS. FRANK J. M. SMITH and WILLIAM J. BRYAN, Chicago, Ill. Filed Jan. 5, 1892. Serial No. 417,071. (No model.)

Claim.—1. The combination, with a series of differently-colored lamps, of a single chamber inclosing all of said lamps and having semi-transparent material on one or more of its sides and means, substantially as described, for automatically bringing said lights into action in combination, whereby said material will transmit colors differing from either of the lamps, as set forth.

2. The combination, with a series of differently-colored electric lamps, of a single chamber inclosing all of said lamps and having semi-transparent material on one or more of its sides, electric circuits for said lamps, and mechanism, substantially as described, for automatically breaking and making said circuits, as set forth.

3. The combination, with a series of differently-colored electric lamps, of a single chamber inclosing all of said lamps and having one or more of its sides covered with semi-transparent material, a series of electric circuits and contacts therefor corresponding to the lamps,



and a revolving cylinder provided with means for automatically closing said circuits, substantially as described.

4. The combination, with a series of differently-colored electric lights, of a single chamber inclosing all of said series of lights, having one or more of its sides capable of transmitting light, a series of electric circuits corresponding to the lamps, and a like series of plates 22 and 23, forming part of said circuits and normally holding them open, and a rotary cylinder provided with teeth to close said circuits and set the lamps in action in different combinations, substantially as described.

5. The combination, with a series of differently-colored electric lights, of a single chamber inclosing all of said series of lights, having one or more of its sides capable of transmitting light, a series of electric lamps inclosed therein, a series of electric circuits corresponding to the lamps, and a like series of plates 22 and 23, forming part of said circuits and normally holding them open, a rotary cylinder provided with teeth to close said circuits and set the lamps in action in different combinations, and means for giving said cylinder an intermittent rotary motion, substantially as described.

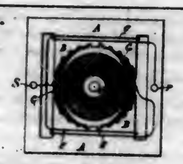
479,674. INKING ATTACHMENT FOR PRINTING-PRESSES.

THOMAS G. SPENCE, Brooklyn, N. Y. Filed Dec. 24, 1891. Serial No. 416,088. (No model.)

Claim.—1. The combination of a type-bed, an attachable frame therefor, a roller at each side of said frame, a ribbon attached to such rollers and extending across the frame, and means, such as described, for intermittently operating said rollers, as set forth.

2. In a printing-press, the combination of the type-frame, the platen, the inking-ribbon extending across the frame between it and the platen, a roller at each end of the ribbon, to which the ribbon is secured, a ratchet-and-pawl mechanism for such roller, and a rod extending therefrom and connected with the platen, whereby after each impression a portion of the ribbon is moved for the next impression, as set forth.

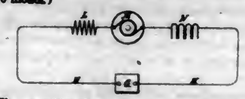
3. In a printing-press, the combination of the type-frame, the platen, an inking-ribbon between them, rollers at the end of such ribbon, and tighteners located at the loose opposite edges of such ribbon, as set forth.



479,675. ALTERNATING-CURRENT MOTOR.

WILLIAM STANLEY, Jr., Pittsfield, Mass., and JOHN F. KELLY, New York, N. Y. Filed Nov. 14, 1891. Serial No. 411,986. (No model.)

Claim.—1. The combination, with the armature of an alternating-current motor and the energizing-coils wound thereon, of a stationary coil closed upon itself and having its conductors or convolutions substantially parallel to those of the armature-coil, whereby the self-induction of the armature will be neutralized, as set forth.

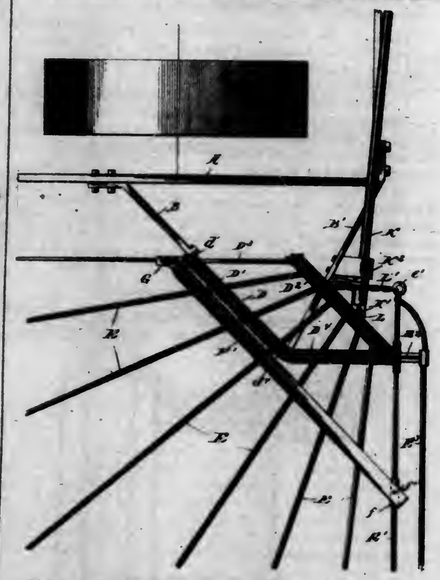


2. The combination, with the armature of an alternating-current motor having a commutator to which the coils wound on the armature are connected, of a stationary coil closed upon itself and having its conductors or convolutions substantially parallel to those of the armature-coil, whereby the self-induction of the armature will be neutralized, as set forth.

479,625.

479,676. ALTERNATING-CURRENT MOTOR.

WILLIAM STANLEY, Jr., and JOHN F. KELLY, Pittsfield, Mass. Filed Mar. 5, 1892. Serial No. 423,822. (No model.)



Claim.—1. The combination, with an electric circuit possessing self-induction, of a source of alternating currents and conducting-plates arranged in couples in an electrolyte and connected in series with the circuit and adapted by adjustment to the electrical conditions of the circuit to neutralize by polarization the electro-motive force of the self-induction in the circuit, as set forth.

2. The combination, with an alternating-current motor and in series with the circuit or circuits of the same, of a polarization-cell adapted to yield an electro-motive force opposite to that of the self-induction of the motor, as set forth.

3. The combination, with an alternating-current motor and in series with the same, of a series of couples of conducting-plates immersed in an electrolyte which does not chemically attack said plates and adapted or proportioned to act as a polarization-cell for neutralizing the electro-motive force of the self-induction of the motor.

479,677. BUNDLE-CARRIER FOR GRAIN-BINDERS.

ANDREW STARK, Chicago, Ill. Filed Jan. 13, 1892. Serial No. 418,494. (No model.)

Claim.—1. In a bundle carrier, a frame having a plurality of carrying arms pivoted to it and extending rearward and stubbleward, the pivotal connections of said arms to the frame being in a line which extends forward and stubbleward oblique to the direction of travel.

2. In combination with a harvester-frame, a bundle-carrier supported thereon, comprising a tilting frame and a plurality of bundle-carrying arms severally pivoted at one end to such tilting frame near the outer forward corner of the harvester-frame and radiating rearward and stubbleward therefrom, substantially as set forth.

3. In combination with a harvester-frame, a bundle-carrier comprising a frame tilting on the harvester-frame over an axis approximately forty-five degrees divergent forwardly and outwardly from the line of travel, and a plurality of bundle-carrying arms pivoted to such tilting frame near the outer forward corner of the harvester-frame and radiating therefrom when the carrier is in position to receive its load, substantially as set forth.

4. In combination with a carrier-frame and the bundle-carrying arms severally pivoted thereto, a bar pivotally connected to one of said arms and having sliding connection with the remainder and with the carrier-frame, and suitable means for swinging the first mentioned arm about its pivot on the carrier-frame, whereby the carrier consisting of said arms may be collapsed, substantially as set forth.

5. In combination with the harvester, a carrier comprising a plurality of arms severally pivoted at one end, a lever-arm E', having its pivot fixed with respect to the pivots of the carrier-arms, the bar F, having a pivot fixed with respect to its distance from the pivot of the lever-arm E' and having a sliding support at a distance from said pivot, and sliding connections with the carrier-arms, substantially as set forth.

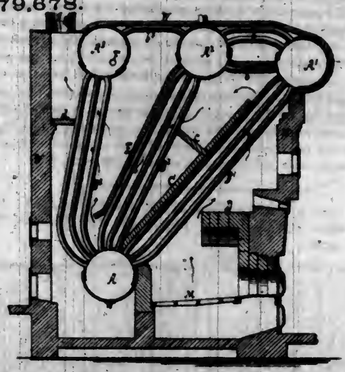
6. In combination with the harvester, a carrier comprising a plurality of arms severally pivoted at one end, a lever-arm E', having its pivot fixed with respect to the pivots of the carrier-arms, the bar F, having a pivot fixed with respect to its distance from the pivot of the lever-arm E' and a sliding support at a distance from said pivot, and sliding connections with the carrier-arms, and a shaft K, journaled on the harvester-frame, having the crank K^3 and a link connection from said crank to the lever-arm E', whereby the rocking of the shaft is adapted to expand the carrier, substantially as set forth.

7. In combination with the carrier-frame having pivotal support upon the harvester-frame and adapted to tilt over such support and comprising the arms adapted to be collapsed by rearward pressure and expanded by the reverse action, the shaft K, journaled on the harvester-frame and having the crank-arm K^3, and the link connections to one of the collapsible carrier-arms, the position of said shaft relatively to the link connection made from its crank to the said carrier-arms being substantially as shown and described, whereby the complete collapse of the carrier causes it to be tilted up, substantially as set forth.

8. In combination with the tilting carrier-frame having collapsible carrier-arms, the shaft K, journaled upon the harvester-frame and having the cranks K' and K^3, connected, respectively, to the carrier-frame and to one of its collapsible arms, the latter connection being flexible and the position of the cranks relative to their connections to the frame and said carrier-arms, respectively, being such that the rocking of the shaft in the direction necessary to permit the tilting of the frame causes the crank K^3 to approach its connection with said carrier-arms, whereby the frame may tilt without collapsing and may be collapsed by rearward pressure upon its arms without regard to its position with respect to tilting, substantially as set forth.

9. In combination with the harvester-frame, the carrier-frame D, pivoted thereto at a line extending forward and stubbleward oblique to the line of travel and adapted to tilt over such pivotal connection, the carrier-arms pivoted to such frame and normally diverging, the bar F, pivotally connected to one of said arms and having sliding connection with the other and with the frame D, the shaft K, journaled on the harvester-frame and having cranks K' and K^3, and the draft-chains L and L', extending from said cranks, respectively, the former to the frame D and the latter to one of said carrier-rods, substantially as set forth.

10. In combination with the collapsible arms of the carrier, the bar F, comprising the upper and lower members, and the oblique webs F^3, connecting them and spaced, as described, to permit the carrier-arms to pass through the bar and swing therein, substantially as set forth.

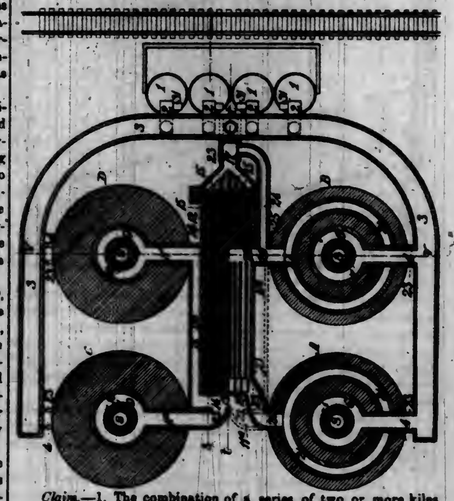


11. In a bundle-carrier, in combination with the collapsing arms, the front guard-arm E^3, attached to and moving with the foremost of said collapsing carrier-arms, substantially as set forth.

479,678. STEAM-BOILER.

ALLAN STIRLING, New York, N. Y., assignor to the Stirling Company, Chicago, Ill. Filed Mar. 24, 1892. Serial No. 426,266. (No model.)

Claim.—1. A water-tube boiler consisting of a single mud-drum A, two elevated steam and water drums A' A^2, having their steam and water spaces respectively placed in communication, the water-tubes B' B^2, extending from the mud-drum to the drums A' A^2, the feed-drum A^3, the water-tubes B^3, extending from the mud-drum to the feed-drum, and the pipes A^3, connecting the feed-drum with one of the steam and water drums, substantially as described.



2. A water-tube boiler consisting of a furnace structure, a single mud-drum A, the elevated steam and water drums A' A^2, having their steam and water spaces respectively placed in communication, two sets of water-tubes B' B^2, directly connected at their upper ends with the steam and water drums and both sets connected at their lower ends with the single mud-drum, the feed-drum A^3, the water-tubes B^3, connecting the feed-drum with the mud-drum, the brick arch D, extending over the fireplace from the wall of the furnace structure close to

the front set of water-tubes B', the fire-brick partition C, inclined between the two sets of water-tubes B' B^2, and the fire-brick partition E, situated between the water-tubes B^3 and B^4, substantially as described.

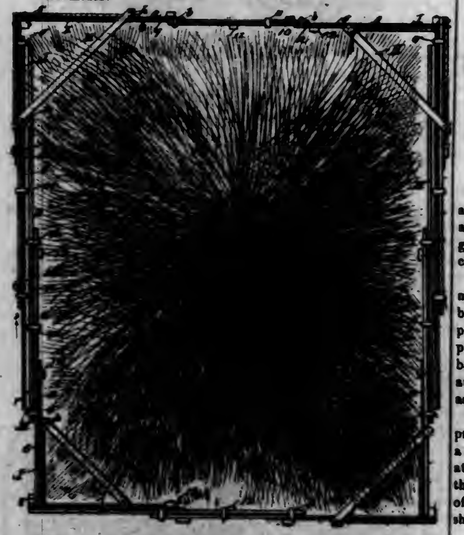
479,679. BRICK-KILN.

WILLIAM SWINDELL, Allegheny, Pa. Filed Jan. 6, 1892. Serial No. 417,163. (No model.)

Claim.—1. The combination of a series of two or more kilns, gas-producers, flues connecting the producers and kilns, and a regenerator having flue connections for air and products of combustion with each of the kilns, substantially as set forth.

2. The combination of a series of two or more kilns, gas-producers, flues connecting the producers and kilns, a regenerator having flue connections for air and products of combustion with each of the kilns, and valves in the flues for the gas, air, and products of combustion, whereby one or more of the kilns may be cut out of operation, substantially as set forth.

3. The combination of a series of two or more kilns, gas-producers, flues connecting the producers and kilns, a regenerator having flue connections for air and products of combustion with the kilns, valves in the flues for the products of combustion, and flues provided with valves for conducting the products of combustion from each kiln direct to the stack, substantially as set forth.



4. The combination of a series of two or more kilns, gas-producers, flues connecting the producers and kilns, a regenerator having flue connections for air and products of combustion with the kilns, valves for opening and closing the air and gas flues of each kiln, and a pipe or flue provided with valves connecting the kilns in pairs at the tops thereof, substantially as set forth.

5. The combination of a series of two or more kilns, gas-producers, flues provided with valves connecting the producers and kilns, a regenerator having flue connections for air and products of combustion with each of the kilns, valves located in said flue connections, a

pipe or flue provided with valves connecting the flues in pairs at the tops thereof, and flues provided with valves for conducting the products of combustion direct to the stack, substantially as set forth.

6. The combination of a series of two or more kilns, gas-producers, flues connecting the producers and kilns, valves for stopping the flow of gas from the producers to the flues, a regenerator having flue connections for air and products of combustion with each of the kilns, a valve interposed between the regenerator and stack, and a flue provided with a valve connecting the stack with the gas-flues at or near their junction with the producers, substantially as set forth.

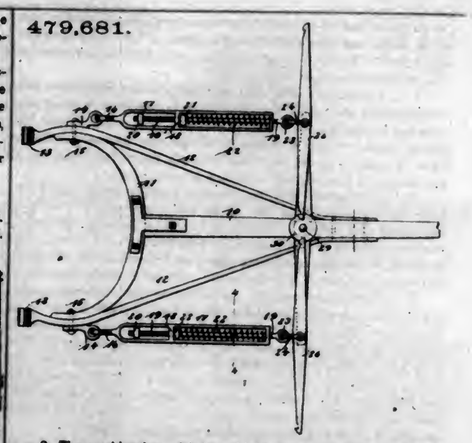
479,680. COLLAPSIBLE FENCE FOR HAY-STACKS. SVEN O. THOMPSON, McPherson, Kans. Filed June 23, 1891. Serial No. 397,207. (No model.)

Claim.—1. A collapsible fence for a hay or straw stack, adapted to yield automatically to external pressure by sliding connections along its sides, so as to contract its area, substantially as described.

2. A collapsible fence for hay or straw stacks, having its sections vertical and connected at the junctional corners and each section made longitudinally extensible and contractible by sliding connections, substantially as described.

3. A rectangular collapsible fence having four upright sides which are joined and braced at the corners and each composed of parallel rails and a bottom board, which sides are each longitudinally adjustable to alter their length, substantially as described.

4. In an expansible and contractible fence, the combination, with four upright panel-sections, each extensible and contractible, of two diagonal horizontal braces at each corner and two diagonal braces for each corner, which are upwardly and outwardly inclined and are attached to the exterior or interior faces of the fence-sections, substantially as described.



5. The combination of four similar fence-sections connected at their ends to produce a quadrangular structure, each section being composed of two parallel rails and a bottom board, each rail and bottom board being made of lapped pieces held loosely together by clip-bands and provided with means to facilitate the longitudinal sliding movement of the clasping clip-bands for the expansion or contraction of the fence-sections, substantially as described.

6. In an expansible and contractible fence, the combination, with the fence-sections that each have lapped rails held movably together by clip-bands, of intermediate channeled bars which are loosely secured to the rails by clip-bands and adapted to extend the length or width of the fence beyond the length of the rails lapped thereon, substantially as described.

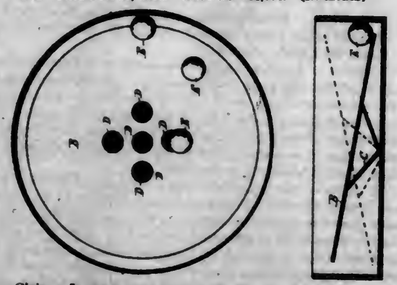
479,681. SPRING DRAFT ATTACHMENT. JOHN F. TIPER, Laverna, Tex., assignor to himself and Robert C. Houston, same place. Filed Feb. 9, 1892. Serial No. 420,888. (No model.)

Claim.—1. The combination, with a pole, of arms having their inner ends pivoted to the pole, singletrees pivoted on the outer ends of the arms, and an independent and yielding connection between each arm and the bow portion of the pole, substantially as described.

479,681.

2. The combination, with the vehicle-pole, of oppositely-extending arms pivoted thereon, singletrees pivoted on the outer ends of the arms, swinging open frames pivoted to a support in the rear of the singletrees, and spring-repressed draw-bars mounted in the frames and connected with the singletrees and arms, substantially as described.

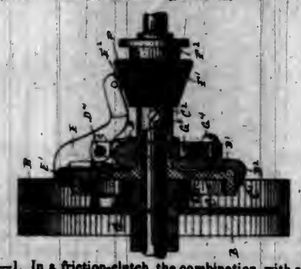
3. The combination, with the vehicle-pole, of swinging arms mounted thereon and extending on opposite sides thereof, curved braces connected with the arms and pivoted to the under side of the pole, singletrees carried by the outer ends of the arms, open frames pivoted to a support in the rear of the arms, spring-repressed draw-bars held to slide in the frames and connected with the singletrees and arms, and stops to limit the movements of the draw-bars, substantially as described.



4. A spring drawing attachment for vehicles, consisting of a frame provided with an eye at one end and with a cross-bar near its center, a draw-bar having one end screw-threaded and provided with an eye at its other end and with a collar at its screw-threaded end, a nut on the draw-bar, and a spring surrounding the draw-bar between one end of the frame and the collar of the draw-bar, substantially as herein shown and described.

479,682. REAMER. JORDAN W. TOMPKINS, Amesbury, Mass. Filed Dec. 17, 1891. Serial No. 415,579. (No model.)

Claim.—The reamer having its bit formed with concavo-convex wings or lips, with their convexities tapering to the point of the bit and rounded outward from and beginning at the inner edges or bases of their concavities, respectively, along oblique or inclined lines diverging from each other upon opposite sides of the bit outward and upward and converging or meeting at the point of the bit, said concavities being presented in opposite directions and having inclined cutting-edges tapering to the point of the bit, substantially as set forth.



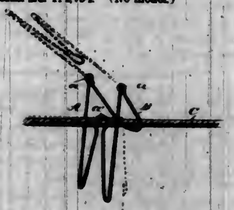
479,683. GAME APPARATUS. EDGAR H. TRUMAN, Wilmington, Del. Filed Nov. 10, 1891. Serial No. 411,538. (No model.)

Claim.—In a game apparatus, in combination with a case or holder, the herein-described circular tilting tablet or disk, provided about

centrally with one or more cavities or pockets adapted to engage one or more balls, substantially as and for the purpose herein set forth.

479,684. FRICTION-CLUTCH. JOSEPH D. WHITCOMB, Worcester, assignor of two-thirds to George Anson Walker, Boston, Mass. Filed Dec. 17, 1891. Serial No. 415,382. (No model.)

Claim.—1. In a friction-clutch, the combination, with a shaft and a pulley running loosely thereon, of a friction-flange attached concentrically to said shaft, a bar extending diametrically across said friction-flange, with one end arranged to press radially against said friction-flange, a lever pivoted at its opposite end, a friction-shoe carried by said lever and arranged to bear on said friction-flange, and connected actuating mechanism by which said lever is rocked and its shoe carried against the friction-flange, substantially as described.



2. In a friction-clutch, the combination, with a shaft and a pulley running loosely on said shaft, of a friction-flange attached to said shaft, a collar D, inclosing the shaft, an arm D′, extending radially from said collar and operatively connected with said pulley, with its free end bearing against the friction-flange, a lever pivoted on the opposite side of said collar, a friction shoe carried by said lever, and a cone sliding on said shaft by which said lever is actuated, substantially as described.

3. In a friction-clutch, the combination, with a shaft and a pulley running loosely on said shaft, of a friction-flange attached to said shaft, clutching mechanism by which said flange is engaged, a radial arm attached to said pulley, and a pivoted link connection between said radial arm and said clutching mechanism as rotated by said pulley, substantially as described.

4. In a friction-clutch, the combination, with a shaft and a pulley running loosely thereon, of a friction-flange attached to said shaft, a collar inclosing said shaft, an arm projecting radially from said collar, with its free end bearing radially against said friction-flange, and a link placed at an acute angle with said arm by which said arm is operatively connected with said pulley and mechanism connected with said arm, whereby its free end is drawn radially against said friction-flange, substantially as described.

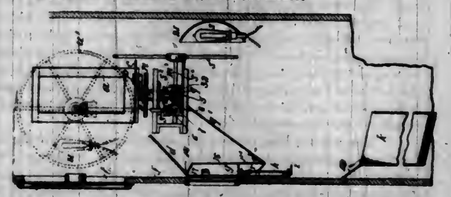
5. In a friction clutch, the combination, with a shaft, a pulley running loosely on said shaft, a friction-flange attached to said shaft and clutching mechanism applied to said friction-flange and operatively connected with said pulley, said mechanism comprising a pivoted lever, of a pinion carried in the end of said pivoted lever and a sliding cone by which said lever is connected, said cone being provided with a series of parallel concentric ribs forming teeth adapted to engage the teeth of said pinion, substantially as described.

479,685. CLOTHES-PIN. ALLAN WATT, Rocky Mount, N. C. Filed Dec. 11, 1891. Serial No. 414,754. (No model.)

Claim.—1. A clothes-pin whose body is formed of an elastic wire bent into the form of the letter W and a top portion or loop, also formed of elastic wire and adapted to receive a clothes-line, and thus secure the pin proper thereto, as shown and described.

2. The improved clothes-pin composed of the elastic bifurcated body A and the elastic top loop B, which is loosely jointed to said body and adapted to resist lateral distension of the latter, as shown and described.

479,686. TOOL-HEATER. ANTON WELLER, Auburn, N. Y., assignor to W. Albertine L. Weller, same place, and Gerhard Weller, Utica, N. Y. Filed Oct. 8, 1891. Serial No. 408,190. (No model.)



Claim.—1. In a tool-heater, the combination, with the burner, of a valve controlling the admission of gas to the burner, means connected with said valve adapted to receive the weight of a tool for moving said valve in one direction, a spring for moving the valve in the opposite direction, and means for adjusting the tension of said spring, substantially as described.

2. In a tool-heater, the combination, with the key seat having a discharge-opening and having a collar for attachment to a supporting-pipe and a key fitting said key-seat, of a burner connected with said key, a spring engaging said burner and holding said key in a position to close the discharge-aperture, a tool-rack secured to said burner, whereby the said burner may be depressed by the weight of a tool into line with the said discharge-opening, and an auxiliary tube extending to a point adjacent to the burner in its lower position for lighting the gas discharged into said burner, substantially as described.

3. In a tool-heater, the combination, with the key-seat having a discharge-passage, of the burner connected to said key and provided with a tool rack, a spring engaging said burner and holding the key normally in a position to close said passage, whereby the burner may be depressed by the weight of a tool on said rack and made to operate said key to open the discharge-passage, an auxiliary tube extending to a point adjacent to the burner in its lower position, and stops for limiting the downward movement of the burner, substantially as described.

479,687. ADVERTISING-CLOCK. FRANZ WELLERA, Sr., FRANZ WELLERA, Jr., and LUDWIG WAGNER, Vienna, Austria-Hungary. Filed July 24, 1891. Serial No. 400,621. (No model.)

Claim.—1. In an advertising apparatus, the combination of the following instrumentalities, to wit: a casing provided with a display-aperture, a rocking support for the cards arranged in rear of said aperture, an inclined rocking table above the rocking support, a holder for the cards proximate to the table, and an ejector for ejecting one card after another from the holder onto the table, for the purpose set forth.

2. In an advertising apparatus, the combination of the following instrumentalities, to wit: a casing provided with a display-aperture, a rocking support for the cards arranged in rear of said aperture, an inclined rocking table above the rocking support, a holder for the cards proximate to the table, an ejector for ejecting one card after another from the holder onto the table, and an intermittingly-operating motor for actuating said devices, for the purpose set forth.

3. In an advertising apparatus, the combination, with a casing provided with a display-aperture, a fixed illuminating device for the same, and an intermittingly-revolving multi-colored light-transmitting medium interposed between the illuminating device and display-aperture, of transparent or translucent advertising-cards, a holder therefor, an intermittingly-moving ejector for ejecting the cards one after the other from the holder, an intermittingly-rocking table to which the

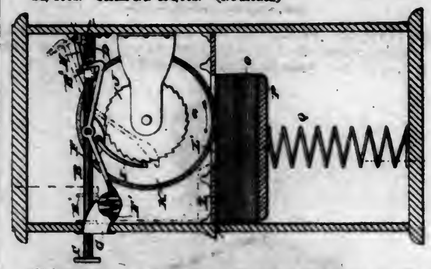
cards are fed, and an intermittingly-rocking support and shifting device interposed between the display-aperture and light-transmitting medium, to which the cards are transferred by the table, for the purpose set forth.

4. In an advertising apparatus, the combination, with a casing provided with a display-aperture, an illuminating device for illuminating said aperture, a revoluble light-transmitting medium divided into sections differing in color interposed between the display-aperture and illuminating device, transparent or translucent advertising-cards, and a holder therefor, of an ejector operating to successively eject the cards from the holder, a receiver and transfer table adapted to receive the ejected cards and operating to transfer the same to a point between the display-aperture and the light-transmitting medium, a shifting device for shifting the cards from said aperture, and an intermittingly-operating motor for actuating said devices, for the purpose set forth.

5. In an advertising apparatus, the combination, with a casing provided with a display-aperture, and illuminating device for illuminating said aperture, a revoluble light-transmitting medium divided into sections differing in color interposed between the display-aperture and illuminating device, transparent or translucent advertising-cards, and a holder therefor, of an ejector operating to successively eject the cards from the holder, a receiver and transfer table adapted to receive the ejected cards and operating to transfer the same to a point between the display-aperture and the light-transmitting medium, a shifting device for shifting the cards from said aperture, and an electrically-controlled and intermittingly-operating motor for actuating said devices, for the purpose set forth.

6. In an advertising apparatus, the combination, with a casing provided with a display-aperture, an illuminating device for illuminating said aperture, a revoluble multicolored light-transmitting medium interposed between the aperture and illuminating device, transparent or translucent advertising-cards, and a holder therefor, of an ejector operating to successively eject the cards from their holder, a receiving and transfer table adapted to receive the cards and operating to transfer the same to a point between the display-aperture and light-transmitting device, a shifting device operating to shift the cards from the aperture, an audible signal, and an intermittingly-operating motor for actuating said devices, for the purpose set forth.

7. In an advertising apparatus, the combination, with a casing provided with a display-aperture and a time-dial and containing a time-movement, of a holder for the cards, an ejector for ejecting said cards from the holder one after the other, a rocking table to which the cards are fed, a rocking support and shifting device in rear of the display-aperture for supporting the cards thereat and shifting the same therefrom, and a motor controlled by the time-movement to intermittingly operate said devices, for the purpose set forth.



8. In an advertising apparatus, the combination, with a casing provided with a display-aperture, a fixed illuminating device, and a multicolored light-transmitting device interposed between the display-aperture and the illuminating device, of a holder for the advertising-cards, located above the display-aperture, a feed-table interposed between the holder and display-aperture, adapted to receive the cards and transmit them to said aperture, feeding mechanism for feeding the cards one after another from the holder to the said table, a shifting mechanism, such as described, for shifting said cards from said aperture, an intermittingly-revoluble driving-shaft, and transmitting mechanism operated by said shaft and operating the revoluble light-transmitting device and the card feeding and shifting devices, substantially as and for the purposes set forth.

9. The means for transferring the advertising-cards to the display-aperture *e* and shifting the same from said aperture, consisting of the table *d*, the rock-shaft 14, carrying said table, the rock-shaft A, carrying the mutilated disks *g i* and having a radial arm *r'* and the crank-shaft g^4, connected with rock-shaft 14 and having a forked crank-arm *r* in engagement with the radial arm *r'* of rock-shaft A, in combination with a revoluble driving-shaft carrying an eccentric connected with the crank-shaft p^3 and operating to impart a rocking motion to said shaft, as described, for the purpose set forth.

10. The means for illuminating the display-aperture *e*, consisting of a lamp and reflector and a circular transparent screen interposed between the lamp and aperture, said screen being divided into sections of differently-colored glass arranged relatively to the lamp to present one of its sections thereto, in combination with an intermittingly-revoluble driving-shaft and transmitting-gear for transmitting a like motion to the screen, for the purpose set forth.

11. The means for intermittingly feeding the transparent or translucent advertising-cards to the receiving and transfer table *d*, consisting of a holder for the cards, having a slot in its opposite lower ends, a pair of ejector toggle-levers *c d'*, adapted to operate in the rear slot of the holder, the intergearing wheels *n* and *n'*, to which the links of the toggle-lever *c d'* are respectively connected, and the bevel-pinion *m'* on shaft of gear *n'*, in combination with the motor-shaft 1, carrying bevel-pinion *m* in gear with pinion *m'*, substantially as described.

479,688. VENDING-MACHINE. GUSTAVUS A. WELLER, La Salle, Ill., assignor of one-half to Charles L. Diesterweg, same place. Filed May 24, 1892. Serial No. 434,162. (No model.)

Claim.—1. A vending-machine comprising a spring-pressed bar a coin-holding lever fulcrumed on the said bar, and a locking-arm pivotally connected with the said lever and adapted to engage the said bar to lock the latter in place, substantially as shown and described.

2. A vending-machine comprising a spring-pressed bar, a coin-holding lever fulcrumed on the said bar, a locking-arm pivotally connected with the said lever and adapted to engage the said bar to lock the latter in place, and a coin-chute opening on the spoon end of the said lever, so that when the coin passes on the latter the arm H disengages the said bar to unlock the latter, substantially as shown and described.

3. In a vending-machine, the combination, with a wheel mounted to revolve and adapted to engage the article to be sold, of a spring-pressed bar mounted to slide and carrying a pawl engaging a ratchet-wheel on the said wheel, a coin-holding lever fulcrumed on the said bar and formed at its front end with a spoon adapted to receive the coin, and a locking-arm pivotally connected with the rear end of the said lever and adapted to engage the said bar to lock the latter in place, substantially as shown and described.

4. In a vending-machine, the combination, with a wheel mounted to revolve and adapted to engage the article to be sold, of a spring-pressed bar mounted to slide and carrying a pawl engaging a ratchet-wheel on the said wheel, a coin-holding lever fulcrumed on the said bar and formed at its front end with a spoon adapted to receive the coin, a locking-arm pivotally connected with the rear end of the said lever and adapted to engage the said bar to lock the latter in place, and a spring-pressed plate carrying the articles to be sold and forcing the uppermost article in contact with the periphery of the said wheel, substantially as described.

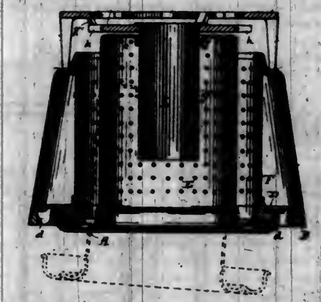
5. In a vending-machine, the combination of a spring-pressed bar provided with a lug and fitted to slide transversely, a pivoted arm adapted to engage the said lug to lock the bar in place, a coin-holding lever fulcrumed on the said bar and pivotally connected at its rear end with the said arm, a fork arranged at the front end of the said lever to receive the coin, a pawl fulcrumed on the said bar, a ratchet-wheel engaged by the said pawl, and a wheel carrying the said ratchet-wheel and adapted to engage with its rim the article to be sold, substantially as shown and described.

479,689. MANUFACTURE OF ROSE OR ORANGE STAINED GLASS. FRANZ WELS, Klostergrab, Austria-Hungary. Filed Jan. 11, 1892. Serial No. 417,676. (No specimens.)

Claim.—1. In the manufacture of colored glass, the herein-described process, which consists in mixing selenium with molten glass, as set forth.

2. In the manufacture of colored glass, the herein-described process, which consists in mixing selenium and cadmium sulphide with molten glass, as set forth.

479,690. OIL AND VAPOR BURNER. WILLIAM H. WILDER, Florence, Mass., and JOHN A. LANNERT and WILLIAM R. JEAVONS, Cleveland, Ohio. Filed Mar. 26, 1892. Serial No. 426,472. (No model.)



Claim.—1. In a burner, the inner tube shouldered at its lower portion to engage the inner wall of the vapor-bowl to hold and secure it to said bowl, substantially as described.

2. In a vapor-burner, the inner perforated tube having the metal at its lower portion bent or formed out of line with the sides of the tube, whereby it engages the inner wall of the vapor-bowl to hold and secure it to said bowl, substantially as described.

3. The burner-bowl and combustion-tubes, the inner tube having its lower extremity enlarged and bearing against the sides of the burner-bowl, and a projection bearing on the upper edge of the bowl, substantially as described.

4. A burner provided with a vapor-bowl and combustion-tubes, the inner perforated tube having an air-deflector formed integral therewith at its top, substantially as described.

5. A burner having perforated combustion-tubes forming a combustion-chamber between them, and the spider having two deflecting-plates one above the other and above the combustion-chamber, substantially as described.

6. The burner-bowl and perforated combustion-tubes, an air-deflector at the top of the inner tube having a central opening, and a flame-deflector supported above said air-deflector, substantially as described.

7. In a burner having combustion-tubes, the inner tube having an air-deflecting partition with a central opening, and a guide for the inner tube supported within said central opening, substantially as described.

8. A vapor burner provided with a combustion-chamber, a flame-deflecting plate having a central opening and an air-supply tube depending from about said opening, and a flame-deflector above said combustion-chamber, substantially as described.

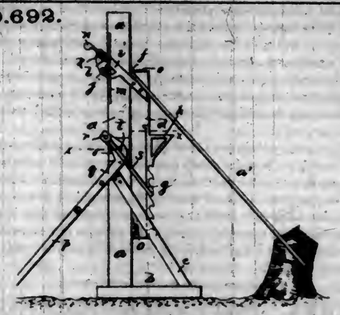
9. A burner having perforated tubes forming a combustion-chamber between them, and the flame-plates, the outer one above and overlapping the lower inner plate and the combustion-chamber, substantially as described.

10. In a burner, the flame-plate whose outer portion is raised above the inner portion and having arms extending inward over the lower inner portion to distribute the flame, substantially as described.

11. The burner-bowl and a perforated combustion-tube secured thereto, an air-deflector at the top of said tube provided with an opening, and a flame-deflecting plate having an opening, and an air-supplying tube secured to said plate about said opening and projecting into said tube, substantially as described.

479,691. GEAT FOR UMBRELLAS OR PARASOLS. JAMES WILLIS, Rosendale, Bournemouth, England. Filed Dec. 11, 1891. Serial No. 414,731. (No model.)

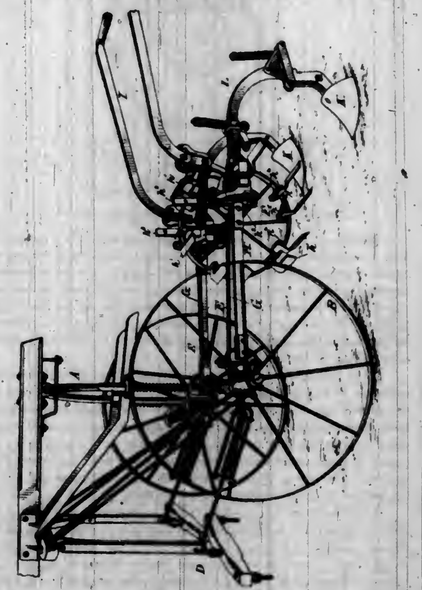
Claim.—A gest for an umbrella or parasol, consisting of a piece of metal having near the middle thereof apturned ears for attachment of the stretcher and made of greater thickness than the intermediate metal to form shoulders beneath which the rib may lie and having at opposite ends ears to embrace the back of the rib and adapted to be bent down into said rib, substantially as and for the purposes described.



479,692. LIFTING-JACK. WILLIAM A. WOLFINGER, Milton, Pa. Filed Apr. 7, 1892. Serial No. 428,161. (No model.)

Claim.—1. In a lifting-jack, the combination of the standard having the apertured rack at its rear edge, the lifting-bar having the rack on its front edge, the lifting-lever fulcrumed to the standard and having the link engaging said lifting-bar rack, the arm rigid with the lifting-bar and located on opposite sides of the standard, and the pawl mounted in the ends of said arms to engage said apertured rack and hold the lifting-bar up, substantially as described.

2. In a lifting-jack, the combination of a standard, a lifting-bar having the vertical rack, the lifting-lever fulcrumed to the standard and having the link to engage said rack, the rack on the rear edge of said standard, the guide rigid with said lifting-bar and embracing the standard, and a pawl carried by said guide and engaging the standard, substantially as described.



3. In a lifting-jack, the combination of the standard having the rack on its rear edge, the lifting-bar having the front-edge rack and

479,692.

the arms rigid with its upper portion and extending rearwardly on each side of the standard, the pawl pivoted between said arms to engage said standard-rack, the upwardly-extending handle carried by said arms, and the lifting-lever and its lifting-link, substantially as described.

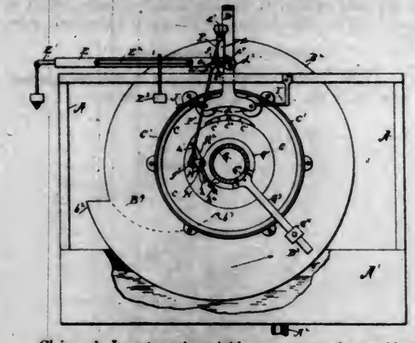
479,693. COTTON-CHOPPER. EDGAR A. WRIGHT, Memphis, Tenn. Filed Dec. 17, 1891. Serial No. 415,380. (No model.)

Claim.—1. In combination with a wheeled frame, two beams jointed to said frame to swing freely laterally, and a wheel sustained by and between said beams to revolve in the direction of travel and provided with transverse knives, substantially as described and shown.

2. In combination with a wheeled frame, two laterally-swinging beams jointed thereto and cross-heads connected to the beams by vertical pivots and adapted to receive a wheel-support, a knife-carrying wheel, and a support for the wheel, said support provided with means by which it may be attached to or detached from the cross-heads at will.

3. In combination with a wheeled frame, two laterally-swinging beams, cross-heads connected thereto by vertical axes, a knife-carrying wheel, a wheel-support attached to the cross-heads, shovel-carrying standards also attached to the cross-heads, and shovels applied to said standards, whereby the shovels are caused to face constantly in a forward direction as they swing laterally with the chopper-wheel.

4. In combination with a wheeled frame, a knife-carrying wheel arranged to rotate in the direction of travel, and suitable connections between the frame and the knife-carrying wheel, constructed to admit of the free bodily movement of the latter in a horizontal direction, whereby the said wheel may be moved laterally at will while the machine is in action.



5. The cotton-chopper attachment for a cultivator, consisting of a wheel with transverse knives and an axle having its ends adapted for connection at will with the cultivator-beams in such manner as to sustain the wheel so that it may rotate in the direction of travel.

6. In a cotton-chopper, a wheel having a rim, in combination with knives provided with slotted shanks and applied horizontally to said rim transversely thereof and the fastening-bolts extending through the slots and around the rim.

7. In a cotton chopper, a wheel having a rim, in combination with a knife having an angular shank doubled upon itself to form a slot, and a fastening device extending through the slot and around the rim.

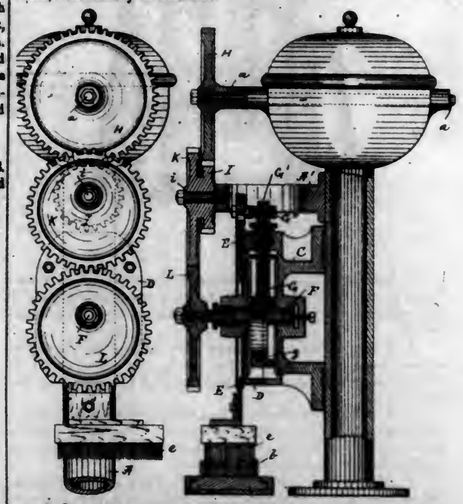
8. In combination with a wheeled frame and two beams provided at their rear ends with vertical sockets, a transverse axle having its ends upturned and extended through the sockets and adjustably connected thereto, and a knife-carrying wheel mounted to rotate on said axle.

479,694. AUTOMATIC WEIGHING APPARATUS FOR LIQUIDS. JOHN P. BALDWIN, New Orleans, La. Filed Sept. 3, 1890. Renewed May 19, 1892. Serial No. 433,536. (No model.)

Claim.—1. In automatic weighing apparatus, the combination, with a rotatable container of the volute or scroll shape variety suspended from a weigh-beam, of an induction-pipe and a sleeve journaled thereon, the latter having a side discharge and adapted to discharge into different sections of the container according as the sleeve is rotated to different positions, and mechanism, substantially as indicated, for oscillating the sleeve and holding the latter in different positions, substantially as set forth.

2. In automatic weighing apparatus, the combination, with a container of the variety specified suspended from a weigh-beam and an induction-pipe and sleeve, substantially as indicated, of a pendulum-lever connected with the sleeve and a toggle adapted to hold the pendulum-lever at the one extreme of its throw, such toggle being connected with an attachment of the weigh-beam with the arrangement such that the tilting of the weigh-beam tilts the toggle and releases the pendulum-lever, substantially as set forth.

3. In combination, a weigh-beam, a container, a feed-pipe, and sleeve, substantially as indicated, a pendulum-lever connected with the sleeve, a toggle operatively connected with the sleeve and with the weigh-beam in position to be tripped by the tilting of the latter, the toggle being adapted to lock the sleeve in the one position of the latter, and a dog for locking the sleeve with the container in the reverse position of the sleeve, the dog being connected with and operated by the toggle, substantially as set forth.

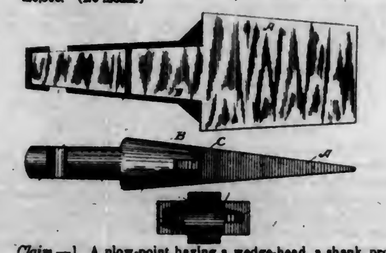


4. The combination of a rotative container, substantially as indicated, with a bent-tube, the bent section being so located inside the container as to be filled with each charge of the container, such tube having a discharge outside the container, the arrangement being such that the tube is emptied with each revolution of the container, substantially as set forth.

479,695. DABBING APPARATUS FOR WOOL-COMBING MACHINES. JAMES L. BALLANTYNE, Newton, Mass., assignor to the Nonantum Worsted Company, same place. Filed Feb. 5, 1892. Serial No. 420,403. (No model.)

Brief.—The invention surrounds with a loose ring the cam or eccentric which actuates the dabbing-brush and by means of eccentrically-disposed gear-wheels between the main driving-shaft and the cam-shaft causes the dabbing-brush to reciprocate at variable speeds.

Claim.—1. In a dabbing apparatus, the combination of a variably-reciprocating dabbing-brush, a driving-shaft, a rotary shaft having a cam or eccentric thereupon, a ring loosely journaled on the cam or eccentric, a reciprocating cam-carrier connected with the dabbing-brush, and gearing between the driving-shaft and the cam-shaft for imparting a variable reciprocating motion to the dabbing-brush substantially as described.

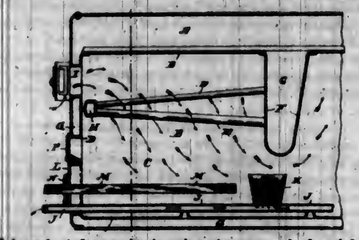


2. In a dabbing apparatus, a variably-reciprocating dabbing-brush, in combination with a rotary shaft having a cam, a driving-shaft, and gear connections between the driving-shaft and cam-shaft for imparting a positive variable reciprocating motion to the dabbing-brush, substantially as described.

3. In a dabbing apparatus, the combination, with a rotary driving-shaft, of a variably-reciprocating dabbing-brush and gearing connecting the driving-shaft and brush for imparting a variable reciprocating motion to the latter, substantially as described.

4. In a dabbing apparatus, the combination, with a rotary comb-circle and a rotary driving-shaft, of a variably-reciprocating dabbing-brush and gearing connecting the shaft and brush for imparting a variable reciprocating motion to the latter, substantially as described.

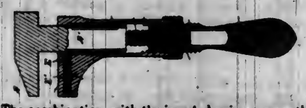
479,696. REVERSIBLE PLOW-POINT. THELUS M. BISSELL and JOHN B. HUBER, South Bend, Ind. Filed Apr. 16, 1892. Serial No. 429,596. (No model.)



Claim.—1. A plow-point having a wedge-head, a shank projecting therefrom, and triangular webs uniting said shank and head, and a tenon on the end of the shank, in combination with a plowshare having a recess to receive the shank, a mortise to receive the tenon, and notches in the edges of said recess to receive the webs, substantially as specified.

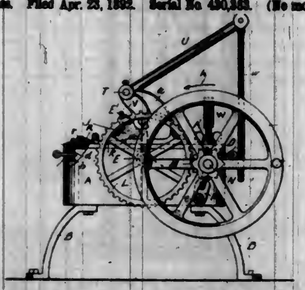
2. The combination of the share having a recess provided with concave sides and a mortise at its rear ends with a point having a shank formed with convex sides to fit in a recess, and a tenon to fit the mortise of the share, and a securing-pin, substantially as and for the purpose described.

3. A plow-point having a wedge-head, a shank projecting therefrom, and webs uniting said shank and head, and a tenon on the end of said shank and having shoulders on its opposite sides, both tenon and shank having tapered sides *s a d*, in combination with a share having a recess in its point and a mortise at the rear end of said recess, both having tapered sides to receive the tenon and shank of the point, and notches at the front end of the recess to receive the webs of the point, and a securing-pin, all constructed and arranged to operate substantially as and for the purpose specified.



479,697. DOWNWARD-DRAFT FURNACE. JAMES P. BLAIR, Boston, Mass. Filed Oct. 31, 1890. Serial No. 369,890. (No model.)

Claim.—1. A furnace having above its grate a draft and feed inlet and below the grate a flame-chamber, as described, in combination with longitudinal water-containing tracks through the lower part of said chamber and a door for insertion and removal of articles to be moved along such tracks, substantially as set forth.



2. In a downdraft-furnace, the combination, with the flame-chamber below the grate, of tracks or supports within each chamber, a door in line therewith for inserting and removing articles to be heated, and a transparent panel for inspection of the interior of such chamber, substantially as set forth.

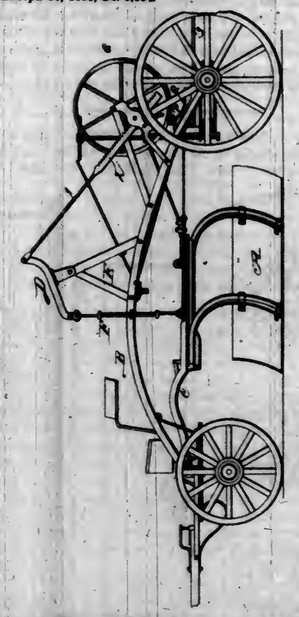
479,698. WRENCH. HENRY BORNSTEIN, Boston, assignor of one-half to John A. W. Seabury, Malden, Mass. Filed Jan. 28, 1892. Serial No. 419,520. (No model.)

Claim.—The combination, with the jaw A, having a smooth shank A', provided with a screw-threaded spindle *a*, of the jaw B, formed integral with the sleeve B', having at its lower end the recess *b*, the handle C, screwed into the recessed end of the sleeve and engaging the threaded spindle of the smooth shank, and the check-nut D, provided with a pin *d* and formed integral with an annular flange D', which receives and incloses the recessed end of the sleeve to prevent dust and dirt entering at this point, said pin on the check-nut entering the recess in the lower end of the sleeve, substantially as and for the purposes described.

479,699. CEMENTING-MACHINE. HENRY W. BRETT, Boston, Mass. Filed Apr. 23, 1892. Serial No. 430,363. (No model.)

Claim.—1. In combination, a receptacle for cement or any suitable adhesive material, a wheel secured to a revolving shaft adapted to turn in said receptacle, and a spring-presser secured to a suitable support and arranged to bear by its free end on the periphery of the wheel.

2. In combination, a receptacle for cement or any suitable adhesive material, a wheel secured to a revolving shaft adapted to turn in said receptacle, a spring-presser comprising a series of spring-fingers secured to a suitable support and arranged to bear by their free ends on the periphery of the wheel.



3. In combination, a receptacle for cement or any suitable adhesive material, a wheel secured to a revolving shaft adapted to turn in said receptacle, a spring-presser secured to a suitable support and arranged to bear by its free end on the periphery of the wheel, and a guide-plate for guiding the article through the machine.

4. In combination, a receptacle for cement or any suitable adhesive material, a wheel secured to a revolving shaft adapted to turn in said receptacle, a spring-presser secured to a rock-shaft and arranged to bear by its free end on the periphery of the wheel, and an arm secured to said shaft connected to means for operating said arm, for the purpose specified.

5. In combination, a receptacle for cement or any suitable adhesive material, a wheel secured to a revolving shaft adapted to turn in said receptacle, a plate secured to the cover on each side of the wheel, and a plate secured to the cover in front of the periphery of said wheel, for the purpose specified.

6. In combination, a receptacle for cement or any suitable adhesive material, a wheel secured to a revolving shaft adapted to turn in said receptacle and having its periphery serrated or grooved transversely, and a spring-presser secured to a suitable support and arranged to bear by its free end on the periphery of the wheel.

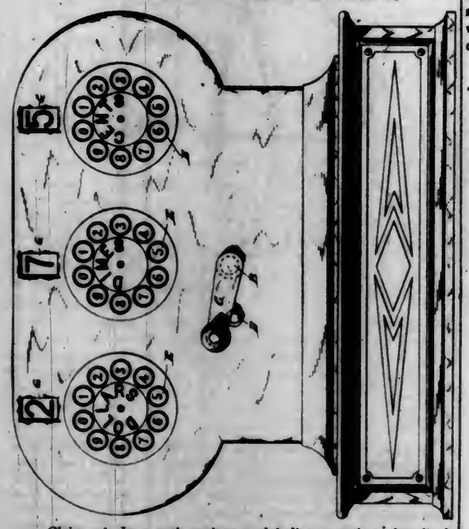
479,700. ROAD-WORKING MACHINE. MORTON G. BUSSELL, Chicago, Ill., assignor to Frederick C. Austin, same place. Original application filed Mar. 24, 1891, Serial No. 386,184. Divided and this application filed Apr. 26, 1892. Serial No. 430,715. (No model.) Patented in Victoria Sept. 16, 1891, No. 9,054.

Claim.—1. The combination, in a road-working machine, of a scraper-blade, a vibratory raising and lowering support from which the scraper-blade is suspended, a tilting and longitudinally-movable rack-bar having a jointed connection with an extended back from said vibratory support, and a hand-wheel gear connected with the rack-bar, the latter being moved longitudinally by the gear and being supported in connection therewith so as to tilt about the gear in conformity with the independent vibratory movement of the support from which the scraper-blade is suspended, substantially as described.

2. The combination, in a road-working machine, of a scraper-blade, an elevated vibratory support from which the scraper-blade is suspended, the inclined longitudinally-movable rack-bar attached to and extended downwardly and rearwardly from the said vibratory support and arranged so that the vibratory action of the latter shall be caused by an independent end-thrust on the part of the rack-bar, and a hand-wheel gear connected with the rack-bar, substantially as described.

3. The combination, in a road-working machine, of the elevated vibratory levers D and the scraper-blade suspended therefrom by hangers, the rack-bars I, having at their forward ends direct jointed connections with the rear ends of said vibratory levers and extended rearwardly from the same, and hand-wheels respectively gear-connected with one and the other of the rack-bars, substantially as described.

4. In a road-working machine comprising a scraper-blade and means suitable for suspending, raising, and lowering the same, a hand-wheel and a rack-and-pinion movement arranged for operating said means for the purpose set forth, and comprising, in combination there-



with, a tilting and longitudinally-movable rack-bar arranged to tilt about the gear, which operates to cause an end-thrust on the part of the rack-bar, and a hand-wheel for actuating the gear, substantially as and for the purpose described.

5. The combination, in a road-working machine, of the scraper-blade, a vibratory support from which the scraper-blade is suspended, the tilting and longitudinally-movable rack-bar having a jointed connection with the vibratory support and extended rearwardly therefrom, a hand-wheel gear connected with the rack-bar, and an anti-friction roll supporting the rack-bar in engagement with the gear and permitting the rack-bar to tilt in conformity with the movement of the vibratory support from which the scraper-blade is suspended, substantially as described.

6. In a road-working machine, the combination, with the scraper-blade, hand-wheel, and suitable connection between the hand-wheel and scraper-blade as a means for raising and lowering the latter, of a spring-supported rocking brake-shoe normally in engagement with the hand-wheel and arranged to rock and operate as a cam or wedge for locking the hand-wheel, substantially as and for the purpose set forth.

7. In a road-working machine, the combination, with the scraper-blade, a hand-wheel, and suitable connection between the hand-wheel and scraper-blade as a means for raising and lowering the latter, of the spring-supported rocking brake-shoe normally in engagement with the hand-wheel and the spring-lever whereon said rocking brake-shoe is pivotally supported, substantially as and for the purpose described.

479,701. CASH REGISTER AND INDICATOR. THOMAS CARNEY, Dayton, Ohio, assignor to the National Cash Register Company, same place. Filed Mar. 5, 1892. Serial No. 423,861. (No model.)

Claim.—1. In a cash register and indicator such as described, the combination of an oscillatory indicating-dial, driving mechanism therefor, having a defined movement back and forth at each operation of the machine, a latch for connecting such mechanism with the indicating-dial to carry it backward to "0" upon one stroke of the driving mechanism and forward from "0" upon the reverse stroke of said mechanism, a series of keys co-operating with the latch to disconnect the dial from the driving mechanism at different points during the reverse stroke of the latter, and an automatic screen co-operating with the driving mechanism to hide the dial at the beginning of the forward movement of the driving mechanism and to expose it at the end of the reverse movement of said mechanism.

2. In a cash register and indicator, the combination of an oscillatory dial arranged within a casing having a reading-opening for the separate exposure of the numbers upon the dial, a driving mechanism for the dial, actuated by a rock-shaft having a definite stroke in each direction at every operation of the machine, a latch for connecting the dial with the driving mechanism to turn the dial backward to "0" upon one stroke of the rock-shaft and forward from "0" upon the reverse stroke of the shaft, a series of keys co-operating with the latch to disconnect the dial from the driving mechanism at different points during the reverse stroke of the shaft, and an automatic screen operated by the rock-shaft and movable into a position behind the reading-opening at the beginning of the forward stroke of the shaft and away from said opening during the backward stroke of the shaft.

3. In a cash register and indicator, the combination of two or more oscillatory indicating-dials arranged side by side, a driving mechanism therefor, operating to turn said dials backward to "0" and thence forward to the new indication, and two automatic screens, one for each dial, operated by the driving mechanism to hide the dials at the beginning of the operation of the machine and to expose them at the end of such operation.

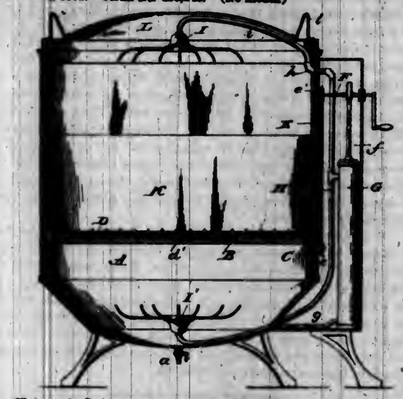
4. In a cash register and indicator, the combination of two or more oscillatory indicating-dials arranged side by side within a casing having two reading-openings for the exposure of their numbers, a driving mechanism therefor, actuated by a rock-shaft and operating to turn said dials backward to "0" during one stroke of the shaft and forward to the new indication during the reverse stroke of the shaft, and two automatic screens, one for each dial, operated by the rock-shaft and movable to a position between the dials and reading-openings at the beginning of the forward stroke of the shaft to hide the dials and away from such position during the reverse stroke of the shaft to expose the dials.

5. In a cash register and indicator, the combination of two or more oscillatory indicating-dials A, arranged side by side within a casing having the reading-openings G, the oscillatory driving-shaft B, the sliding bar I, spring-pressed in one direction and actuated by the shaft B in the other, and the screens N, operated by the bar I and co operating with the dials A and reading-openings G, in the manner described.

6. In a cash-register, the combination of two or more oscillatory indicating-dials A, arranged side by side within a casing having the reading-openings G, the oscillatory driving-shaft B, the sliding bar I, spring-pressed in one direction and actuated by the shaft B in the other, and the screen-plates N, mounted to oscillate upon axes concentric with those of the dials and connected with the bar I, substantially as described.

479,702. GATE. EDWARD A. CASPER, Princeville, Ill. Filed Jan. 22, 1892. Serial No. 418,914. (No model.)

Claim.—1. In a gate, the combination of suitable rollers on which the same is hung and guided with means for automatically opening and closing said gate, consisting of a double rack-bar, a cogged pinion engaged by said rack-bar, a vertical arm attached to said rack-bar, a horizontal lever pivoted to the cross-piece of the main uprights, and the handle for operating said horizontal lever, together with the intervening levers between the cogged pinion and the gate, substantially as described.



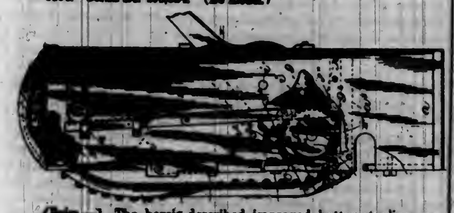
2. The combination, with the gate, of suitable rollers connected thereto, the levers for operating said gate, the cogged pinion for operating said levers, the vertical arm carrying the double rack-bar engaging said pinion and the horizontal lever, and the handles for operating the same, substantially as described.

3. The combination, with the gate A, of the rollers G^2, G^3, and G^4, levers L and N, reciprocating rod I, having the double rack-bar I', the cogged pinion M, horizontal lever J, and handle J' for operating the same, substantially as described.

4. The combination, with the gate A, of the levers L and N, said lever L being bent at its lower end into a right angle, which right-

angled portion is pivoted to the lower part of one of the main standards and having its free end pivoted to the free end of the lever, the other end of said lever N being pivoted to the main frame, the cogged pinion connected rigidly to the right-angled portion of the lever L, the double rack-bar for operating said pinion, said rack-bar being held in brackets secured to the main uprights, and the reciprocating rod for operating said rack-bar, together with the horizontal lever and its operating-handles, substantially as described.

479,703. DISH-WASHER. MARY A. CROSBY, Durand, Wis. Filed Feb. 4, 1892. Serial No. 420,948. (No model.)



Claim.—1. In an apparatus for washing dishes, a vessel provided with a pump connected to the interior of the same, said pump having an eduction-pipe connected to a spraying device I', located near the bottom of the vessel, and a revolving tray having a grated bottom, which tray is geared to the driving-shaft of the pump, substantially as shown, and for the purpose set forth.

2. In a dish-washer, the combination of a vessel having a stationary ledge and a revolving tray-support mounted upon said ledge and gearing connecting the revolving tray-support with a driving-shaft, said driving-shaft also operating a pump having eduction and induction pipes extending into the vessel and receiving a liquid supply therefrom, substantially as set forth.

3. In a dish-washer, the combination of heads I and I', having a plurality of curved hollow discharge-fingers of different lengths, a revolving tray interposed between the same, water-forcing mechanism having a supply-pipe therefor which leads into the vessel, eduction-pipes connecting the water-forcing mechanism with the heads, and mechanism connected with the driving-shaft for revolving the tray, substantially as shown, and for the purpose set forth.

479,704. BUTTON-SETTING MACHINE. CHARLES R. DENTON, Attica, Kans., assignor to Ida M. Denton, same place. Filed Oct. 10, 1891. Serial No. 408,294. (No model.)

Claim.—1. The herein-described improved button-stapling machine, comprising the frame having a chamber, the movable bar or mandrel seated on the bottom of said chamber, the cutting and bending bar or plate, the clincher bar or block movable therewith and having an inwardly-extended flange, the operating-shaft, the toothed wheel secured thereon having shoulders on its periphery designed to engage said bar or mandrel and effect the back-and-forward movement thereof, and a third shoulder, also on its periphery, to engage said flange, the pitman operated by said shaft and connected to said cutting and bending bar or plate, means for operating said wheel, the supply tube or chute, and the clinching-die secured to said frame, substantially as set forth.

2. In a button-stapling machine, the cutting and bending bar or plate having parallel arms, the clincher bar or block loosely secured between said arms, and the link rigidly secured to said bar or block and loosely connected to said bar or plate, in combination with the mandrel with which said clincher bar or block is brought into contact and means for operating said parts, substantially as set forth.

3. In a button-stapling machine, the combination, with the frame, of the button-hopper having a picker-arm movable therein, the bar for imparting motion to said picker-arm, the cutting and bending bar or plate, the crank-wheel having two shoulders, the adjustable stop-block designed to be engaged by said shoulders, and means for cutting and bending and clinching a wire staple, and the pitman connected to said cutting and bending bar or plate and to said crank-wheel, substantially as set forth.

4. The combination, with the frame, of the bar or mandrel, the operating-shaft having a wheel thereon designed to operate said bar or mandrel, the crank-wheel secured on said shaft and having two shoulders on its periphery, the adjustable stop-block designed to be engaged by said shoulders, the cutting and bending bar or plate, the pitman connected thereto and to said crank-wheel, the clincher bar or block movable with said cutting and bending bar or plate, the button hopper and chute, the picker-arm, and the bar for imparting motion to said picker-arm and connected to said crank-wheel, substantially as set forth.

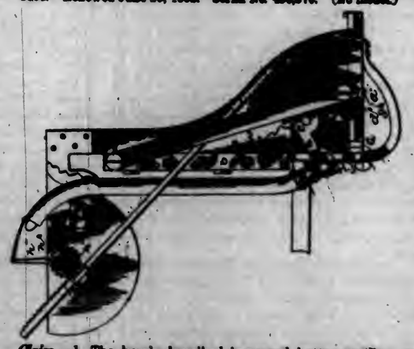
5. The combination, with the frame, of the bar or mandrel having an upwardly-projecting lip, the operating-shaft having a toothed wheel provided with three shoulders, two of which are designed to engage said lip, the crank-wheel secured on said shaft having two shoulders, the slot-block having a slot therein, the set-screw projected therethrough, the cutting and bending bar or plate, the pitman connected thereto and to said crank-wheel, the clincher bar or block movable with said cutting and bending bar or plate and having a flange with which one of the shoulders of said toothed wheel is designed to engage, the button hopper and chute, the picker-arm having its shaft provided with a pinion, the rack-bar engaging said pinion and pivoted at its lower end to said crank-wheel, and the operating-lever having a toothed cam end engaging said toothed wheel, substantially as set forth.

6. The herein-described improved stapling-machine, comprising the frame having a button hopper or receptacle in its upper end and a lower chamber, a shaft extended through said hopper and having a picker-arm, a pinion secured on one end of said shaft, the button-feed tube or chute leading from said hopper and projected through an opening in said frame, the bar or mandrel seated on the bottom of said lower chamber and having a slot in its forward end and an upwardly-projecting lip, an operating-shaft, a toothed wheel secured thereon having shoulders designed to engage said lip, the cutting and bending bar or plate, the clincher bar or block carried thereby and designed to be engaged by said toothed wheel, whereby it is given an additional final movement, the wheel on said shaft, the pitman connected to said wheel and to said cutting and bending bar or plate, the operating-lever having a toothed cam end engaging said toothed wheel, and the rack-bar engaging said pinion and connected to said wheel, substantially as set forth.

7. In a button-stapling machine having a hopper or receptacle, a rotary shaft projected through said hopper and having a picker-arm secured thereto and composed of two parts pivotally and yieldingly connected together, and means for operating said shaft, substantially as and for the purpose stated.

8. In a button-stapling machine, the combination, with the frame, the button-hopper, the cutting and bending bar or plate, and the clincher bar or block having a slot therein, of the tube or chute extended at its upper end into said hopper and having an opening therein facing outward and gradually winding around to the opposite or inner side of said tube or chute at the lower end thereof, said opening being widest at its upper end and gradually decreasing in width to its lower end opposite the slot in said clincher bar or block, said tube or chute also having an outer slot in its lower end, and the plate-spring attached to said tube or chute and extended over said latter slot, substantially as set forth.

9. In a button-stapling machine having a cutting and bending bar or plate, the wire-feeding device herein described, comprising a spring-pressed movable arm, through which the wire is passed, two pivoted jaws engaging said wire, and the plate-spring secured to said arm and bearing against the outer ends of said jaws, the wire being also passed through said plate-spring, said arm being operated at each depression of said cutting and bending bar or plate, substantially as set forth.



10. In a button-stapling machine, the combination, with the frame and the cutting and bending bar or plate having an upper projection, of the curved arm pivotally connected to a stud of said frame and extended into the path of said projection, the spring-pressed arm adjustably connected to said curved arm and through which the wire is passed, the pivoted jaws engaging said wire, and the spring secured to said spring-pressed arm and bearing against said jaws, substantially as set forth.

11. In a button-stapling machine having a cutting and bending impelled wire-feeding device, and the movable plate having a groove

11. In a button-stapling machine having a cutting and bending bar or plate, a rigid wire-holding arm having pivoted jaws engaging and holding a wire as against retraction, a plate-spring bearing against the inner ends of said jaws and through which the wire is passed, and a spring-pressed wire-feeding arm also having pivoted jaws engaging and feeding said wire forward, substantially as set forth.

12. In a button-stapling machine, the combination, with the frame and the cutting and bending bar or plate having an upper projection, of the curved arm pivotally connected to a stud of said frame and extended into the path of said projection, the arm connected to said curved arm, the plate-spring extended from said stud and bearing against said arm, the pivoted jaws carried by said latter arm and between which the wire is passed, the plate-spring secured to said arm and bearing against the ends of said jaws, the rigid arm attached to said frame and having pivoted jaws engaging and holding said wire as against retraction, and a plate-spring secured to said rigid arm and bearing against the pivoted jaws thereof, substantially as set forth.

479,705. BUTTON-ATTACHING MACHINE. CHARLES B. DENTON, Attica, Kans., assignor to Ida M. Denton, same place. Filed Mar. 12, 1891. Renewed June 20, 1892. Serial No. 436,976. (No model.)

Claim.—1. The herein-described improved button-stapling machine, comprising the supply-tube, the clincher bar or block having a slot therein, the cutting and bending bar or plate, the movable bar or mandrel, the shaft, the wheel secured thereon and having pins or shoulders projecting therefrom and engaging said bar or mandrel, and the stationary arm or support having a clinching-die at its outer end, substantially as set forth.

2. The herein-described improved button-stapling machine, comprising the supply-tube, the clincher bar or block having a slot coincident with the lower end of said tube and a cross-bar having projecting ends, the movable cutting and bending bar or plate having front projecting pins with which the ends of said cross-bar engage so as to be moved thereby, the sliding bar or mandrel, the stationary arm or support, and the means for moving said cutting and bending bar and mandrel, substantially as set forth.

3. The herein-described improved stapling-machine, comprising the operating-shaft having a lug secured thereon, the supply-tube having a slot therein for the button-shanks and a lower open end, the spring secured to said latter end, the movable clincher bar or block provided with a vertical slot and a flange or shoulder and having a temporary support, a rigid arm or support carrying a clinching-die at its outer end, and means for cutting and bending the wire, said clincher bar or block having an additional movement after the staple is formed and the temporary support is withdrawn by reason of contact of said lug with said flange or shoulder, substantially as set forth.

4. The herein-described improved button-stapling machine, comprising the frame or support, the stationary knife secured thereto having an oblique end, the movable cutting and bending bar secured to said frame and having lower parallel arms, one of which at its lower end conforms to said stationary knife, the clincher bar or block loosely mounted between said arms of the cutting and bending bar, the movable mandrel located in the lower end of said frame or support, the stationary arm or support having a clinching-die at its outer end, the shaft engaging said clincher bar or block, the wheel on said shaft having pins or shoulders engaging said bar or mandrel, and the pitman connected to said wheel and to said cutting and bending bar, substantially as set forth.

5. The herein-described improved button-stapling machine, comprising the frame or support, the movable cutting and bending bar secured to said frame, the stationary knife having a lug or crest, the clincher bar or block loosely secured to said cutting and bending bar, the mandrel movable beneath said clincher bar or block, the spring-impelled wire-feeding device, and the movable plate having a groove or recess corresponding to said lug or crest for forming a kink in the wire, and means for moving said cutting and bending bar and bar or mandrel, substantially as set forth.

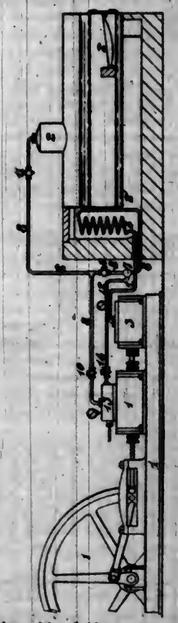
6. In a button-stapling machine, the wire-feeding device herein described, consisting of the tube, the block therein through which the wire is passed, the weighted lever engaging said wire, and the spring bearing against said block and impelling the same forward, substantially as set forth.

7. The herein-described improved button-stapling machine, comprising the frame or support, the movable cutting and bending bar secured thereto and having lower parallel arms, the stationary knife, the clincher bar or block located between said parallel arms and having a cross bar or plate engaging studs or pins on the front of said arms and also having a shoulder projecting from its rear side, the shaft having a lug designed to engage said shoulder, the bar or mandrel moving in the lower end of said frame or support and having a forward reduced end designed to project between said parallel arms and form a temporary support for said clincher bar or block and provided with an arm or projection on one side, the wheel secured on said shaft, having two pins or shoulders for engaging said arm or projection, the pitman secured at its upper end to said cutting and bending bar and having a lower slotted end connected to said wheel, and the rigid arm or support having a clinching-die beneath said clincher bar or block, substantially as set forth.

8. In a button-stapling machine, the combination, with the frame or support, of the button receptacle or chamber, the feed or supply tube leading therefrom and having a slot therein and a lower open end, the spring-plate secured to said lower end, the shaft having a pinion in one end, the picker arm or finger secured to said shaft, the rack bar or rod engaging said pinion, the main shaft, the wheel secured thereon, having teeth on a segment of its periphery and with which said rack bar or rod engages, and the lever and treadle for operating said main shaft, substantially as set forth.

479,706. PLOW. GEORGE H. DEXTER, Jr., Hinsville, Ga. Filed Apr. 21, 1892. Serial No. 430,094. (No model.)

Claim.—1. The within-described improvement in plows, consisting in a shovel or share formed with countersunk slot having beveled surfaces above the bottom surface of the shovel and stay, lugs of homogeneous metal extending below the bottom surface of the shovel, and a fastening-bolt having a head corresponding in form to the slot and set therein so as to have the top of its head flush with the top surface of the shovel, and a standard which receives the lugs, substantially as described.



2. The improved new article of manufacture, consisting of the shovel or share formed with the bolt-hole having a countersunk seat between its top and bottom surfaces and with lugs of homogeneous metal projecting from its under surface immediately at the countersunk seat, substantially as described.

479,707. APPARATUS FOR PRODUCING MIXTURES OF STEAM AND HOT AIR. EDWARD FIELD, London, England. Filed Mar. 10, 1891. Serial No. 384,503. (No model.) Patented in England Mar. 31, 1890, No. 4,623; in France Jan. 26, 1891, No. 210,998; in Belgium Jan. 26, 1891, No. 93,503; in Norway Feb. 17, 1891, No. 2,174; in Switzerland Feb. 17, 1891, No. 3,453; in Germany Feb. 18, 1891, No. 63,600; in Luxemburg Feb. 18, 1891, No. 1,410; in Victoria Mar. 26, 1891, No. 3,615; in South Australia Mar. 26, 1891, No. 1,886; in Italy Mar. 31, 1891, LVII, 300; in Queensland Mar. 31, 1891, No. 1,265; in New South Wales Mar. 31, 1891, No. 2,994; in New Zealand Apr. 11, 1891, No. 4,923; in Brazil Apr. 15, 1891, No. 1,139; in Spain Apr. 24, 1891, No. 11,794; in Austria-Hungary June 17, 1891, No. 9,256, and in India Oct. 5, 1891, No. 90.

Claim.—1. Apparatus for producing mixture of steam and hot air for use as motive fluid, comprising air compressing and heating apparatus, steam-supply apparatus, and a mixing apparatus having a hot-air valve and a steam-valve arranged to open and close together and simultaneously controlling the admission of heated compressed air and steam through separate inlets, substantially as described.

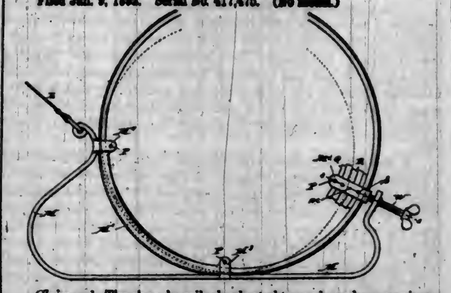
2. Apparatus for producing mixture of steam and hot air for use as motive fluid, consisting of air compressing and heating apparatus, steam-supply apparatus, and mixing apparatus comprising a vessel having separate inlets of unequal area for steam and hot air, a common outlet for mixed steam and air, a steam-valve, and a hot-air valve, said valves being connected together and arranged to open and close together and simultaneously control the passage of hot air and steam through said inlets, substantially as herein described.

3. In apparatus for producing mixture of steam and hot air for use as motive fluid, the combination of air compressing and heating apparatus, steam-supply apparatus, and mixing apparatus connected with said air and steam apparatus, said mixing apparatus having separate inlets for steam and hot air, a common outlet for mixed steam and air, and steam and hot-air valves of unequal area for controlling said inlets, said valves being connected by a vertically movable stem, whereby both valves will open and close together, substantially as described.

4. The combination, with a fluid-pressure engine, of air compressing and heating apparatus, steam-supply apparatus, a mixer having separate inlets connected to said air and steam apparatus, respectively, and a common outlet for mixed steam and air, a steam-valve, and a hot-air valve, said valves being connected together and arranged to open and close together and simultaneously control said inlets, and a mixture-main connecting the outlet of said mixer with said engine, substantially as described.

5. In apparatus for producing mixture of steam and hot air for use in engines, the combination, with air compressing and heating apparatus and steam-supply apparatus, of a mixer provided with differential self-acting valves for admitting steam and hot air simultaneously but separately thereto and a mixture-main into which mixture of heated compressed air and steam is delivered from said mixer.

6. The combination, with a fluid-pressure engine, of air compressing and heating apparatus, steam-supply apparatus, a mixer provided with differential self-acting valves capable of automatically controlling the supply of air and steam from said apparatus, and a mixture-main in communication with said mixer and with said engine.



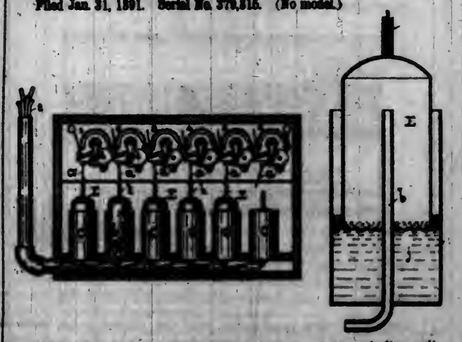
7. The combination, with a fluid-pressure engine, of air compressing and heating apparatus, steam-supply apparatus, and a mixer provided with differential self-acting valves capable of automatically controlling the admission thereto of steam and heated compressed air from said apparatus, a steam-nozzle, and a hot-air passage, for the purposes specified.

8. For producing mixture of steam and hot air for use in fluid-pressure engines, a mixer having inlets for steam and heated compressed air, an outlet for mixture of heated compressed air and steam, and differential self-acting valves of unequal area for simultaneously controlling said inlets for steam and heated compressed air.

9. For producing mixture of steam and hot air for use in fluid-pressure engines, a mixer having inlets 25 and 26 for steam and heated compressed air, respectively, a steam lift-valve 15 and a hot-air lift-valve 16 for simultaneously controlling said inlets, said valves being of unequal areas, a stem 17, connected to said steam-valve and loosely connected to said hot-air valve, a steam-nozzle 21 in communication with said steam-inlet, and a hot-air passage 25, surrounding said steam-nozzle, substantially as herein described, for the purpose specified.

10. The combination of an engine, a steam-generator 2, an air-compressor and means for driving the same, an air-heater in communication with said compressor, a mixer 7, a pipe 8, with valve 9, for connecting said mixer with said steam-generator, a pipe 6, connecting said mixer with said air-heater, a mixture-main 12, with valves 14, for connecting said mixer with said engine, and a pipe 8, with starting-valve 10, for connecting said engine direct with said steam-generator, substantially as herein described.

479,708. WHEEL-SHOE. JOHN FRANKHAM, New York, N. Y. Filed Jan. 9, 1892. Serial No. 417,475. (No model.)



Claim.—1. The shoe described, adapted to apply under a carriage-wheel, having the body M with a long base and turned-up ends, channel-iron M', curved to match a wheel of small diameter and strongly fixed within the body in the position shown, extending from the ears M^3 at the lowest point forward and upward to the ears M^4 at the forward bearing of the shoe on the wheel, three pairs of ears M^3 M^3 M^4, and corresponding bolts P, set in each pair of ears, the rearmost being a sufficient distance from the channel-iron to afford a valuable support independent thereof, as herein specified.

2. The shoe described, adapted to apply under a carriage-wheel, having the body M with a long base and turned-up ends, channel-iron M', curved to match a wheel of small diameter and strongly fixed within the body, three pairs of ears M^3 M^3 M^4, arranged as shown, the bolts P, set in each pair of ears with the outer faces flush, the notched blocks Q, lying in contact with the bolts P, and the block or blocks E, arranged in the required positions within or without the wheel-rim, as shall be required to match wheels of different diameters, substantially as herein specified.

3. The ears M^3 M^3 M^4, with means for engaging the same with the wheel-rim, in combination with the body M of the shoe, channel-iron M', curved to match a wheel of small diameter, and the screw W, connected to one of the pairs of ears, arranged to urge the same inward or outward and tighten the hold on the wheel, as herein specified.

479,709. FIRE-ALARM APPARATUS. ALBERT GOLDSTEIN, Baltimore, Md., assignor of one-half to Anthony A. Lohmann, same place. Filed Jan. 31, 1891. Serial No. 379,815. (No model.)

Claim.—1. In a pneumatic fire-alarm apparatus, a winding call-movement having a trigger, combined with a jar provided with a body of liquid, an inverted cup in the said jar having an extension at its upper end adapted for connection with the said trigger, and a clock-

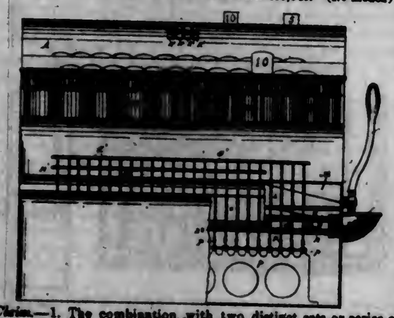
movement with connecting mechanism to lift the said cup out of its body of liquid and admit fresh air to the said cup, substantially as and for the purpose specified.

2. In a pneumatic fire-alarm-telegraph apparatus, a winding call-movement having a trigger, combined with a jar provided with a body of liquid, and an inverted cup with an extension at its upper end, which may be connected to the said trigger when the cup is elevated to prevent the said call-movement from being set in motion, substantially as specified.

3. In a pneumatic fire-alarm-telegraph apparatus, a winding call-movement having a trigger, combined with a jar partially filled with a body of liquid, and an inverted cup in the said jar, having a sleeve adapted for connection with the said trigger, whereby in the falling of the said inverted cup the said sleeve is detached from the said trigger and the call-movement set in operation, substantially as specified.

4. In a pneumatic fire-alarm-telegraph apparatus, a winding call-movement having a trigger, combined with a jar provided with a body of liquid, and an inverted cup in the said jar, having an extension at its upper end adapted for connection with the said trigger, a lever adapted at one end to engage with the said extension or some attachment thereof and at the other end operated by a clock-movement, whereby the said cup is periodically lifted out of its body of liquid and fresh air admitted to the said cup, substantially as specified.

5. In a pneumatic fire-alarm-telegraph apparatus, a series of winding call-movements having triggers, combined with a series of jars provided with liquid, inverted cups in the said jars, with extensions adapted to engage with the said triggers and when in an elevated position prevent the running down of the said call-movements, collars on the extensions of the said jars, a rod situated under the said collars, a lever extending from the said rod, and a clock-movement adapted to periodically operate the said lever and thereby elevate the said rod, and with it the series of cups, and thereby lift them from the liquid and admit fresh air thereto, substantially as and for the purpose specified.



6. In a pneumatic fire-alarm-telegraph apparatus, a tube having an aperture closed by fusible metal and a call-movement whereby on the escape of air from the said tube the said call-movement mechanism is put in operation, an inflated-bulb reservoir, and a weighted lever which bears on the said bulb to retain the air in the said tube at a uniform pressure, and thereby provide for variations in temperature, substantially as specified.

479,710. MANUFACTURE OF DISINFECTANTS. HERMAN HENDEMANN, Chicago, Ill., assignor to William Risser & Co., New York, N. Y. Filed Oct. 24, 1891. Serial No. 409,714. (No specimens.)

Claim.—1. The product herein described, which is composed of beta-naphthol and acetate of soda and which forms a white or almost white powder readily soluble in a large quantity of water, also soluble in alcohol, and which becomes decomposed by benzine.

2. The within-described process of producing the new product above named, which process consists in melting acetate of soda, then adding to the melt about one-third of its weight of beta-naphthol, and finally allowing the mass to harden, substantially as described.

479,711. CASH REGISTER, INDICATOR, AND AUTOMATIC CHANGE-MAKER. JOHN J. HOYE, Minneapolis, Minn., assignor, by direct and mesne assignments, of two-thirds to Wilbur B. Lawrence, same place. Filed Aug. 26, 1891. Serial No. 403,642. (No model.)

Claim.—1. The combination, with two distinct sets or series of pieces, as G and H, located approximately parallel with each other and representing, respectively, possible amounts of purchase and of cash, of a series or set of pieces, as E, located between and transversely to G and H and representing the available elements of change, the pieces G and H being arranged for direct action on one or more of said pieces E, as predetermined for every possible combination of purchase and cash amounts represented, whereby the action of the parts G and H on the parts E may be made to indicate or effect directly or indirectly the proper amount of change.

2. The combination, with two distinct sets or series of pieces, as G and H, arranged parallel with each other and corresponding sets of keys connected therewith marked, respectively, with possible amounts of purchase and of cash, of an intermediate set of pieces, as E, located between and transversely to the pieces G and H, representing available elements of change, the said parts G and H being arranged for action each on one or more of said parts E, as predetermined for every possible combination of cash and purchase amounts, whereby the indication of the purchase on the purchase-key, followed by the indication of the cash on the cash-key, will act on the parts E to indicate or effect directly or indirectly the proper change.

3. The combination, with two distinct sets or series of movable pieces, as G and H, located approximately parallel with each other and representing, respectively, possible amounts of purchase and of cash, of a series of movable pieces, as E, located between and transversely to the pieces G and H, and representing available elements of change, the said parts G and H being arranged for action on one or more of the said pieces E, as predetermined, for every possible combination of purchase and cash amounts represented, whereby the movement of any given purchase representative G, followed by the movement of any given cash representative H, will move all of the change representatives E, except such as, taken individually, represent the available element for and, taken collectively, represent the amount of the proper change.

4. The combination, with a series of coin-founts, as B, containing the available elements of change, of a dropper shifter or operating device, a series of coin-droppers, one for each of said founts, releasably connected to said shifter, two distinct sets or series of pieces, as G and H, representing possible amounts of purchase and of cash, parallel with each other, and a series of pieces, as E, located between and transversely to the pieces G and H, corresponding to the founts or available elements of change, the parts G and H being arranged for action on one or more of the parts E, as predetermined, for every possible combination of purchase and cash amounts to effect through the same the release from the shifter of all the droppers except only such as are required to effect the change.

5. The combination, with the coin-founts, of a dropper shifter or operating device, coin-droppers, one for each fount, releasably connected to said shifter, the parallel sets of movable pieces G and H, representing possible amounts of purchase and cash, and the movable pieces E, located between and transversely to the pieces G and H, corresponding to the founts or change elements, and movable by the said pieces G and H to release the said droppers, substantially as and for the purpose set forth.

6. The combination, with the coin-founts and the dropper shifter or operating device, of the coin-droppers having hinged tail-pieces releasably connected to the shifter, the releasing connections F, the series of movable pieces E for operating said connections, and the movable pieces G and H on opposite sides of the rods E and arranged for action, each on one or more of the rods E, as may be required, and the sets of cash or purchase keys G' and H', respectively, for operating the pieces G and H, substantially as and for the purpose set forth.

7. The combination, with the coin-founts containing the available elements of change, of the dropper-shifter, the coin-droppers releasably connected to the shifter, and the change-indicating sight-pieces operated by such of the droppers as are moved by the shifter, substantially as and for the purpose set forth.

8. The combination, with the sight-pieces having a telescoping connection with their operating-rods for permitting the rods to return to normal position while the sight-pieces may be withheld in view, of a retaining device arranged to engage and hold in view any given set of sight-pieces until another set are thrown into view, substantially as described.

9. In a cash-register, the combination, with the keys, of the sight-pieces having a telescoping connection with their operating-rods, and the retaining device for upholding any given set of sight-pieces, arranged to be tripped by the next set of sight-pieces thrown up from the keys, substantially as described.

10. The combination, with the sight-pieces, of their operating-rods having telescoping connection therewith and provided each with a projection, of the yielding bail adapted to engage under the sight-pieces when in their uppermost position and to be tripped from under the same by the said projections on the rods, substantially as and for the purpose set forth.

479,712. EARTH-CLOSET. HAMILTON A. JOHNS, Winnipeg, Canada. Filed Jan. 14, 1892. Serial No. 418,194. (No model.)

Claim.—The combination, in a dry closet or commode, of the box A, with the opening *c* in rear, the seat *b*, with suitable opening, hinged lid *a*, hinged door *d*, with aperture *c* in or below door, the bucket B with overhanging lip *j*, handle *f*, and lug *g*, the bucket C, with handle *k* and lug *m*, and the pipe D, entering dry closet through aperture *e* to connect with stovepipe or flue, substantially as set forth.

479,712.

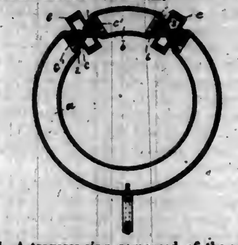
479,713. TRAVERSE-RING. JAMES W. LESLIE, Everett, assignor to the Leslie Manufacturing Company, Boston, Mass. Filed Jan. 23, 1892. Serial No. 419,008. (No model.)

Claim.—1. A traverse-ring composed of two tubular curved parts *a b*, friction-rolls located between the adjacent ends of said parts *a b*, axles for said friction-rolls, and supports for said axles, contained within the hollow ends of said parts, substantially as described.

2. A traverse-ring composed of two separate hollow parts *a b*, axles *c'*, supported by means contained within the part *b* and having reduced end portions, and blocks on said end portions contained within the hollow ends of the part *a*, and friction-rollers on said axles, substantially as described.

3. A traverse-ring composed of two separate hollow parts *a b*, axles *c'*, supported by means contained within the part *b*, and blocks *f* contained within the part *a*, and friction-rollers on said axles, substantially as described.

4. A traverse-ring composed of two separate hollow parts *a b*, axles *c'*, formed on the end of a rod or bar contained within the part *b*, friction-rollers on said axles, and blocks *f* on the ends of said axles adapted to enter the hollow ends of the part *a* and be secured therein, substantially as described.



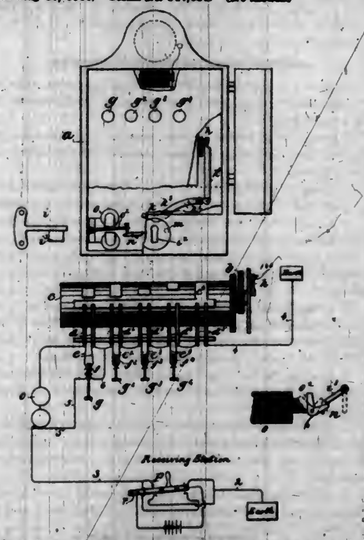
5. A traverse-ring composed of two separate hollow parts *a b*, axles *c'*, blocks *d* on said axles, which enter the hollow ends of the part *b*, friction-rollers freely revoluble on said axles, and blocks *f* on the ends of said axles adapted to enter the hollow ends of the part *a*, substantially as described.

6. A traverse-ring composed of two separate hollow parts *a b*, axles *c'*, blocks *d* on said axles, which enter the hollow ends of the part *b*, friction-rollers freely revoluble on said axles, and blocks *f* on the ends of said axles adapted to enter the hollow ends of the part *a* and having circumferential grooves to receive the material of the part *a* to thereby more securely hold them in place, substantially as described.

7. A traverse-ring composed of two separate hollow parts *a b*, one comprising more and the other less than half a circle, a bent rod or bar *c*, contained in the part *b*, axles *c'*, formed centrally on the ends of said bent rod or bar, and friction-rollers freely revoluble on said axles, blocks *d* on said axles to hold the rod or bar and part *b* assembled, and blocks *f*, secured to the ends of said axles and abutting against the shoulders 3 and adapted to enter the part secured within the hollow ends of the part *a* and thereby complete the ring, substantially as described.

8. A traverse-ring composed of the parts *a b*, with hollow ends, a rod or bar *c*, having reduced end portions *c' c²*, presenting shoulders 2 3, and blocks *d* on said reduced portions *c'* abutting against the shoulders 2 and having flanged ends *d'* abutting against the ends of the part *b*, friction-rollers on said portions *c'*, and blocks *f* on said reduced portion *c²*, having flanged ends which abut against the shoulders 3 at one side and against the ends of the part *a* at the opposite side, substantially as described.

479,714. TRAVERSE-RING. JAMES W. LESLIE, Everett, assignor to the Leslie Manufacturing Company, Boston, Mass. Filed Mar. 2, 1892. Serial No. 423,460. (No model.)



Claim.—1. A traverse-ring composed of the separate parts *a b*, axle *c*, shouldered at 2 2, a friction-roll on each axle, and supports for the ends of the axle, comprising the end or face 3, with a central hole through it, an outer flange or rim 4, and an annular projection 5, located at and concentric with the hole, said supports being connected to the ends of the parts of the ring, substantially as described.

2. A traverse-ring formed to present adjacent end portions, the axle *c*, shouldered at 2 2, and friction-roll on said axle-supports for the ends of said axle, each comprising the end or face 3, with a central hole through it and adapted to abut against the shoulder 2, and also having an annular rim or flange 4 and a central annular projection 5, said supports being connected to the adjacent ends of the ring, substantially as described.

3. A traverse-ring composed of separate tubular parts *a b*, axle-supports secured to the adjacent ends of said parts, axles *c*, shouldered at 2 2, secured to said axle-supports, the shoulders 2 2 thereof abutting against the ends of said supports to prevent them approaching each other, and friction-rolls loosely mounted on said shouldered axles, substantially as described.

479,715. KEY-CONTROLLER AND SIGNAL-TRANSMITTER. MORRIS MARTIN, Malden, assignor to John C. Wilson, Boston, Mass. Filed July 16, 1889. Serial No. 317,951. (No model.)

Claim.—1. A signal-box and signal-transmitter inclosed therein connected in circuit with a central office, said box being provided with an opening to receive a detachable handle or key for operating said signal-transmitter, combined with a detent that engages said key when introduced into the box, and an electro-magnet that operates the said detent, and a circuit-changer at the central office for operating said electro-magnet, substantially as described.

2. The combination of a box and signal-transmitter inclosed therein adapted to be operated by a detachable handle or key introduced from the outside of the box without opening the same, a detent for retaining said key, and an electro-magnet for operating said detent included in the transmitting-circuit of the box, and a normally-closed

sheet for said magnet and circuit-breaker therein, substantially as described.

3. A signal-box containing a signal-transmitter composed of a motor and a number of signaling-surfaces operated simultaneously thereby, said motor being adapted to be operated by a detachable handle introduced without opening the box, combined with a detent for said detachable handle, an electro-magnet included in the transmitting-circuit for operating the said detent, a shunt around said magnet, and circuit-breaker in said shunt operatively connected with the controlling mechanism for one of the signaling-surfaces of the transmitter, as set forth, whereby said shunt is broken when one only of said signaling-surfaces is placed in control of the transmitting-circuit, substantially as described.

4. A signal-transmitting instrument comprising a number of distinct signaling-surfaces connected to move simultaneously and contacts controlled by said surfaces connected in series with one another in the transmitting-circuit, combined with shunt-circuits connecting the co-operating contacts for all of said surfaces but one, which one pair of contacts is normally disconnected except at the co-operating signaling-surface, and an independent circuit-breaker in each of said shunts, substantially as and for the purpose described.

5. In an electric circuit, a multiple-signal transmitter comprising two signaling-surfaces and contacts or breakers co-operating therewith, one of which is normally in said circuit and the other of which is normally shunted out, a movable part or member for opening and closing said shunt, and automatic mechanism for moving said signaling-surfaces, substantially as described.

6. In an electric circuit, a multiple-signal transmitter comprising three signaling-surfaces and contacts or breakers co-operating therewith, one of which is normally in said circuit and each of the others normally shunted out, and two independently-movable parts or members, one for opening and the other for closing each said shunts, substantially as described.

7. In a signal-box, the combination, with a case and door, of a multiple-signal transmitter having several horizontally-sliding independent controlling devices therefor adapted to be drawn out by hand and returned to their normal position by being struck by the door as it is closed, substantially as described.

479,716. LABEL-HOLDER. CHARLES W. MILLER, Clifton, Ariz., assignor of one-half to Charles Royce, same place. Filed Feb. 20, 1892. Serial No. 422,542. (No model.)

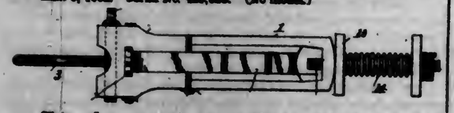
Claim.—1. A tag or label holder having an eye the edges of which are thickened with upset metal of the head of the holder, substantially as specified.

2. A tag or label holder having a rounded eye and a neck-strengthening rib, both consisting of upset material of the holder, substantially as specified.

3. A tag or label holder having integral side flanges and cross-bars upon opposite sides of the center, substantially as specified.

4. A tag or label holder having a cord-eye and side flanges and end cross-bars formed integrally, substantially as specified.

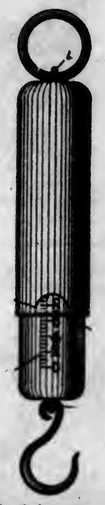
5. A tag or label holder having side flanges, a guiding-lip, and cross-bars near the ends and all formed integrally, substantially as specified.



6. A tag or label holder having a head perforated and struck up to form a rounded cord-eye, a projection struck up from its back, side flanges, cross-bars upon opposite sides of the center, and a guiding-lip, all formed of a single piece, substantially as specified.

7. A blank for forming a tag or label holder, consisting of a back A, cross-bars D, near the ends, neck G, and head F, substantially as specified.

8. A tag-holder having a head struck up and perforated, forming a rounded cord-eye, and a neck-strengthening rib extending therefrom and merged into the back to form a stop for the label, substantially as specified.



9. A label-holder formed of a single piece of metal with side flanges, a beige, and means for retaining a label therein, as set forth.

479,717. CAR-COUPLING. HUGH MOORE, Mauch Chunk, Pa. Filed Mar. 5, 1892. Serial No. 423,882. (No model.)

Claim.—In a car-coupler, the combination of the shank provided with a socket into which a plate-spring may be slid, the short jaw-head pivoted to the shank by a removable pin, the plate-spring which has an eye formed by carving its outer end, and the removable pin which passes through said jaw-head and through the eye in the plate-spring, substantially as described.

479,718. SPRING-BALANCE. FRANCIS H. MORGAN, Manchester, and GEORGE H. SCOTT, of Worcester, Mass., assignors to the Morgan Spring Company, same place. Filed Aug. 24, 1885. Serial No. 175,155. (No model.)

Claim.—1. In a spring-balance, the combination of the telescopic tubes, the inner tube being provided with a graduated scale and the outer tube with an opening disclosing said scale, a spring connecting the end of one tube with the opposite end of the other tube, the outwardly and inwardly turned flanges, whereby the sliding motion of said tubes is limited in one direction, and an index-bar extending across the opening of the outer tube, said index-bar being formed by the inwardly-turned flange of said tube, substantially as described.

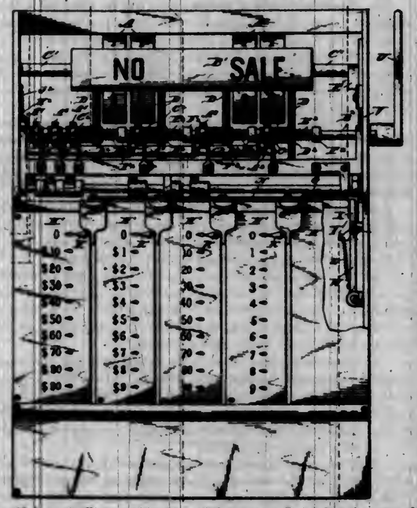
2. In a spring-balance, the combination of the telescopic tubes having their outer and opposite ends closed and provided with slots, a spring connecting said closed ends by means of loops formed in the ends of said spring, said loops passing through said slots, and wires passed through said loops outside the closed ends of said tubes, whereby the end coils of said spring are drawn against the inside of the closed ends of said tube, substantially as described.

3. The combination, with the inner tube having its outer surface graduated, of an outer tube having a flange turned inwardly at its overlapping end and an opening at said end disclosing the graduations on the inner tube, said flange being carried across said opening and forming an index-bar, as and for the purpose set forth.

4. The combination, with the outer and the inner concentric sliding tubes or shells and a spiral spring connecting the same, substantially as described, of a graduated scale on the outer surface of the inner tube, the outer tube or shell having an opening E and an index-bar F, as and for the purpose set forth.

479,719. WARDROBE-BED. FRANK P. PARKER, Goshen, Ind., and SAMUEL C. JONES and NATHAN P. COFFEY, Carrollton, Mo., assignors, by direct and mesne assignments, to the St. Joseph Folding Bed Company, St. Joseph, Mo. Filed Mar. 4, 1892. Serial No. 423,798. (No model.)

Claim.—1. In a folding wardrobe-bedstead, substantially as shown and described, the combination of an upright stationary frame, a pivoted bed-frame, the sectional head-board having the upper part rigid with the stationary frame and the lower part attached to the bed-frame and guided in suitable ways on the stationary frame, the independent weight-frame also guided on the stationary frame and having a direct pivotal connection with the sliding part of the head-board, and the two double pulleys carried by the weight-frame and each pulley having one cord attached to the stationary frame and another cord connected to a vertically-movable weight, as and for the purposes set forth.



2. In a folding wardrobe-bedstead, the combination, with a stationary upright frame and a pivoted bed-frame, of the sliding head-board attached to the bed-frame and guided at its free end in suitable ways on said stationary frame, the independent weight-frame also guided in ways on said stationary frame above the free end of the sliding head-board, the two double pulleys carried by said weight-frame, a weight, and two cords for each double pulley, which are wound reversely on the different-sized sections thereof, one of said cords being connected to the weight and the other cord secured to the stationary frame, as and for the purposes set forth.

3. In a folding wardrobe-bedstead, substantially as shown and described, the combination, with a stationary upright frame and a pivoted bed-frame, of the divided head-board having its upper part attached to the stationary frame and its lower member attached to the bed-frame and guided at its free end in ways on the stationary frame, an independent sliding weight-frame also guided in ways on the stationary frame above the sliding part of the head-board and having a direct pivotal connection therewith, and a weight sustained or carried by the sliding weight-frame, as and for the purposes described.

4. In a folding wardrobe-bedstead, the combination of a stationary upright frame, a folding bed-frame, a sliding head-board attached to the bed-frame and having its free end guided in ways on the stationary frame, an independent sliding weight-frame arranged above said free end of the head-board and having a direct pivotal connection with said end of the head-board, said weight-frame being guided in ways independently of the head-board, and a weight sustained or carried by the weight-frame, as and for the purpose set forth.

5. In a folding wardrobe bedstead, substantially as shown and described, the combination, with a stationary upright frame, a folding bed-frame, and a sliding head-board guided at its free end on the stationary frame, of the independent sliding weight-frame also guided in ways on the stationary frame above the free end of the sliding head-board and bearing directly thereon and a weight carried or sustained by the sliding weight-frame, as and for the purpose described.

479,720. CASH REGISTER, INDICATOR, AND RECORDER. JOHN PFEIFER, Dayton, Ohio, assignor to the National Cash Register Company, same place. Filed Feb. 26, 1892. Serial No. 423,881. (No model.)

Claim.—1. The combination of the sectors D, having the curved arms F, and the reciprocating keys or handles H, connected with the arms F, substantially as described.

2. The combination of the indicator-wheels A, the sectors D, geared thereto and having the curved arms F, and the reciprocating keys or handles H, connected with the arms F, substantially as described.

3. The combination of the sectors D, having the curved arms F, the inclined guide-rods G, and the keys H, mounted upon said rods and connected with the arms F, substantially as described.

4. The combination of the sectors D, having the curved arms F, the inclined guide-rods G, and the keys H, mounted upon the rods G, said keys having finger-pieces upon their forward sides and arms I upon their rear sides, said arms I carrying friction-rollers J, bearing against the sides of the sector-arms F, substantially as described.

5. The combination of the sectors D, having the curved arms F, the inclined rods G, and the keys H, mounted thereon, said keys consisting of a middle body portion carrying friction-rollers bearing against the rods G and a forwardly-projecting finger-piece and having on their rear sides rearwardly-extending forked arms I, embracing the sector-arms F and carrying friction-rollers J, bearing against the rear sides of said arms F, substantially as described.

6. The combination of the sectors D, having the curved arms F, the reciprocating keys H, connected with the arms F and carrying pointers K, and the indicor H', co operating with said pointers, substantially as described.

7. The combination of the indicator-wheels A, the sectors D, geared thereto and having the curved arms F, the reciprocating keys H, connected with the arms F and carrying the pointers K, and the indicor H', co-operating with the pointers, substantially as described.

8. The combination of the sectors D, having the curved arms F, the pinions D^2, driven by the sectors, the reciprocating keys H, connected with the arms F, and the registering-wheels moving with the pinions in one direction but not in the other, substantially as described.

9. The combination of the gear-toothed sectors D, having the curved arms F, the reciprocating keys H, connected with the arms F, the sliding pinions D^2, meshing with the sectors D and provided with clutch-teeth at one end, and the registering-wheels having hubs provided with clutch-teeth co-operating with those on the pinions D^2, substantially as described.

10. The combination of the gear-toothed sectors D, having the curved arms F, the reciprocating keys H, connected with the arms F, the shaft B^2, the pinions D^2, splined thereon and provided with clutch-teeth at one end, the registering-wheels having hubs provided with clutch-teeth co-operating with those on the pinions D^2, the springs E^2, pressing the pinions against the hubs of the registering-wheels, and means for preventing backward movement of the registering-wheels, substantially as described.

11. The combination of the reciprocating keys H, carrying the pawls P, and the ratchet-bars L, co-operating with the pawls P and movable into and out of engagement therewith.

12. The combination of the reciprocating keys H, carrying the pawls P, and the ratchet-bars L, co-operating with the pawls P' and movable into and out of engagement therewith.

13. The combination of the reciprocating keys H, each carrying a pawl P and a pawl P', and the bars L, each provided with two ratchets co-operating alternately with the pawls P and P' and movable out of engagement with one and into engagement with the other.

14. The combination of the reciprocating keys H, provided with the pawls P, the ratchet-bars L, co-operating with the pawls P, means for simultaneously moving the ratchet-bars out of engagement with the pawls P, and springs for resetting the keys.

15. The combination of the reciprocating keys H, provided with the pawls P, the pivotally-supported ratchet-bars L, co-operating with the pawls P, and the bar N, co-operating with the ratchet-bars L to simultaneously swing them out of engagement with the pawls P.

16. The combination of the reciprocating keys H, provided with the pawls P, the pivotally-supported ratchet-bars L, co-operating with the pawls P, the bar N, co-operating with the ratchet-bars L to simultaneously swing them out of engagement with the pawls P, and the springs for resetting the keys.

17. The combination of the reciprocating keys H, provided with the pawls P, the pivotally-supported ratchet-bars L, co-operating with the pawls P and having the bell-crank plates M at one end, the bar N, connected to the plates M, and the spring O for resetting the bar N and ratchet-bars L.

18. The combination of the reciprocating keys H, mounted upon the rods G and provided with the pawls P, the ratchet-bars L, hung upon the rods G and having the bell-crank plates M at one end, the bar N, connected with the plates M, and the spring O for resetting the bar N and ratchet-bars L.

19. The combination of the reciprocating keys H, provided with the pawls P', the ratchet-bars L, co-operating with the pawls P' and movable into and out of engagement therewith, and the bar N, co-operating with the bars L to simultaneously move the same.

20. The combination of the reciprocating keys H, provided with the pawls P and P', the bars L, each provided with two ratchets co-operating with the pawls P and P', respectively, and means for simultaneously moving the bars L into position to engage both of their ratchets with the pawls P and P' and thereby lock the keys.

21. The combination of the reciprocating keys H, provided with the pawls P and P', the bars L, each provided with two ratchets co-

operating with the pawls P and P', respectively, means for simultaneously moving the bars L out of engagement with the pawls P and into engagement with the pawls P', and springs for resetting the keys.

22. The combination of the sectors D, having the arms F, the reciprocating keys H, provided with the pawls P and connected with the arms F, the ratchet-bars L, co-operating with the pawls P and movable into and out of engagement therewith, and springs for resetting the keys and sectors.

23. The combination of the indicator-wheels A, the sectors D, geared thereto and having the arms F, the reciprocating keys H, connected with the arms F and provided with the pawls P, the ratchet-bars L, movable into and out of engagement with the pawls P, and springs for resetting the keys, sectors, and indicator-wheels.

24. The combination of the sectors D, having the arms F, the reciprocating keys H, connected with the arms F and provided with the pawls P, the ratchet-bars L, co-operating with the pawls P, means for simultaneously moving said bars out of engagement with the pawls, and springs for resetting the keys and sectors.

25. The combination of the sectors D, having the arms F, the reciprocating keys H, connected with the arms F and provided with the pawls P and P', the ratchet-bars L, co-operating with the pawls P and P', means for simultaneously moving the ratchet-bars out of engagement with the pawls P and into engagement with the pawls P', and springs for resetting the keys and sectors.

26. The combination of the reciprocating keys H, provided with the pawls, the ratchet-bars L, co-operating with the pawls and movable into and out of engagement therewith, the hand-lever U, and connections between said lever and the bars L for moving the latter by the operations of the lever.

27. The combination of the reciprocating keys H, provided with the pawls P and P', the ratchet-bars L, co-operating therewith, the hand-lever U, connections between said lever and the bars L, operating at one stroke of the lever to move the bars into engagement with both sets of pawls and operating upon the opposite stroke of the lever to disengage the bars from the pawls P, and springs for resetting the keys.

28. The combination of the reciprocating keys H, provided with the pawls P, the ratchet-bars L, co-operating therewith, the bar N, connected with the bars L for simultaneously moving the same, the hand-lever U, connections between said lever and the bar N for moving said bar and the bars L in one direction, and a spring for moving them in the opposite direction.

29. The combination of the keys H, provided with pawls P, ratchet-bars L, bar N, spring O, arm W, rack-bar V, gear T, and lever U.

30. The combination of the keys H, provided with pawls P, ratchet-bars L, bar N, spring O, arm W, trip Y, rack-bar V, gear T, and lever U.

31. The combination of the keys H, provided with the pawls P and P', ratchet-bars L, bar N, spring O, arm W, trip Y, rack-bar V, gear T, and lever U.

32. The combination of the indicator-wheels A, the sectors D, geared thereto and having the arms F, the reciprocating keys H, connected with arms F, the screen-plate B', movable to and from a position in front of the indicator-wheels to alternately hide and expose the numbers thereon, and a lever U for operating the screen-plate.

33. The combination of the reciprocating keys H, movable over indices H', the oscillatory hand-lever U, and a lock for the lever, operating to lock the same when the keys H are all in normal position and thrown out of operation by the movement of any key H from such position.

34. The combination of the sectors D, having the arms F, the reciprocating keys H, connected with the arms F, the rock-shaft K', the arms L', fast thereon and provided with notches co-operating with pins M' on the sectors D, the rock-shaft E, having the lever U fast thereon, and the arm O', fast on the rock-shaft K' and co-operating with a stop or shoulder Q' on the rock-shaft E.

35. The combination of the reciprocating keys H, movable over indices H', the oscillatory hand-lever U, and a lock co-operating with the lever U and controlled by the keys H, said lock being thrown out of operation to release the lever whenever the operated key is moved to a point opposite a number upon its index and thrown into operation to lock the lever whenever the operated key stands at a point between two numbers upon its index, whereby the lever is locked, except when the operated key is moved to the proper point to make an exact indication and registration.

36. The combination of the sectors D, having the arms F, the reciprocating keys H, connected with the arms F, the rock-shaft E, having the lever U fast thereon, the rock-shaft R', the notched arms S', fast thereon and co-operating with pins T' on the sector-arms F, the arm V', fast on the shaft R', and the hooked arm X', hung on the shaft K' and co-operating with the arm V' and with a lug Y' on the rock-shaft R.

37. The combination of the reciprocating keys H, movable over indices H', the oscillatory hand-lever U, and a lock co-operating therewith and controlled by the keys H, said lock being thrown into operative position by the movement of any key from normal position and thrown out of operative position by the return of all the keys to such position, whereby after one or more keys have been operated and the lever U has been given a stroke in one direction it cannot be given a full stroke in the opposite direction until all of the keys are returned to normal position.

38. The combination of the sectors D, having the arms F, the reciprocating keys H, connected with the arms F, the rock-shaft E, having the lever U fast thereon, the rock-shaft K', the arms L', fast thereon and co-operating with pins M' on the sectors D, the arm O', provided with the pin Z^2, and the arm Z', hung on the shaft K' and co-operating with the pin Z^2 and with a shoulder Z^3 on the rock-shaft E.

39. The combination of the type-wheels O^3, the platen D^3, co-operating therewith, the inclined guide-rods G, the keys H, embracing said rods and reciprocating thereon, and connections between the keys and type-wheels for turning the latter as the keys are moved.

40. The combination of the concentric sleeves B^3, the type-wheels O^3, fast thereon, the platen D^3, co-operating with the type-wheels, the guide-rods G, the keys H, embracing said rods and reciprocating thereon along indices H', and connections between said keys and the sleeves B^3 for turning the type-wheels as the keys are moved.

41. The combination of the indicator-wheels A, the type-wheels O^3, moving with the wheels A, the platen D^3, co-operating with the type-wheels, the guide-rods G, the keys H, mounted to reciprocate thereon along indices H', and connections between the keys and indicator-wheels for turning the latter and the type-wheels as the keys H are moved.

42. The combination of the indicator-wheels A, secured upon the concentric sleeves B^3, the type-wheels O^3, fast upon said sleeves, the platen D^3, co-operating with the type-wheels, the reciprocating keys H, movable over indices H', and connections between the keys H and respective indicator-wheels for turning the latter as the keys are moved.

43. The combination of the indicator-wheels A, the reciprocating keys H, movable over indices H', connections between the keys and indicator-wheels for turning the latter as the keys are moved, the type-wheels O^3, turning with the indicator-wheels, the platen D^3, co-operating with the type-wheels, the rock-shaft E, and the cam G^3 thereon for actuating the platen.

44. The combination of the indicator-wheels A, secured upon the concentric sleeves B^3, the type-wheels O^3, also secured upon said sleeves, the reciprocating keys H, movable over the indices H', connections between said keys and the indicator-wheels for turning the latter as the keys are moved, the platen D^3, co-operating with the type-wheels, the rock-shaft E, the cam G^3 thereon for actuating the platen, and the lever U for rocking the shaft.

45. The combination of the sectors D, having the arms F, the reciprocating keys connected with the arms F, the type-wheels O^3, geared to the sectors D, and the platen D^3, co-operating with the type-wheels.

46. The combination of the sectors D, having the arms F, the reciprocating keys connected with the arms F, the indicator-wheels A and type-wheels O^3, geared to the sectors D, and the platen D^3, co-operating with the type-wheels.

47. The combination of the sectors D, having the arms F, the reciprocating keys H, connected with the arms F, the indicator-wheels A, secured upon the concentric sleeves B^3 and geared to the sectors D, the type-wheels O^3, fast on the sleeves B^3, the platen D^3, co-operating with the type-wheels, and the cam G^3 for actuating the platen.

48. The combination of the indicator-wheels A, the inclined guide-rods G, the keys H, embracing said rods and adapted to reciprocate longitudinally thereon, and connections between the keys and indicator-wheels for turning the latter as the keys are moved.

49. The combination of the indicator-wheels A, the guide-rods G, the indices H', the keys H, embracing and adapted to reciprocate lengthwise of the rods G and provided with pointers K, co-operating with the indices H', and connections between the keys and indicator-wheels for turning the latter as the keys are moved.

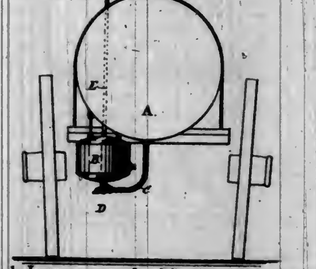
50. The combination of the indicator-wheels A, the reciprocating keys H, connections between said keys and wheels for turning the latter as the keys are moved, catches for temporarily holding the keys and wheels in the positions to which they are moved to make an indication, means for simultaneously releasing all the catches, and springs for resetting the keys and wheels.

51. The combination of the indicator-wheels A, the type-wheels O^3, moving with the indicator-wheels, the platen D^3, co-operating therewith, the reciprocating keys H, connections between the latter and the indicator and type wheels for turning the latter as the keys are moved, catches for temporarily holding the keys and wheels in the positions to which they are moved to make an indication, means for simultaneously releasing all the catches, and springs for resetting the keys and wheels.

52. The combination of the sectors D, having the arms F, the reciprocating keys H, connected with the arms F, the indicator-wheels A, geared to the sectors D, the screen-plate E', movable to and from a position in front of the indicator-wheels, a lever U, and connections between the same and the screen E' for operating the latter.

53. The combination of the drawer-bolt N^3, the lever L^3, link S^3, rock-shaft E, arm T^3, fast thereon, and plate U^3, pivoted upon said arm and provided with a cam V^3, co-operating with the lug W^3 upon the link S^3.

54. The combination of the gong O^3, lever L^3, link S^3, rock-shaft E, arm T^3, fast thereon, and plate U^3, pivoted upon said arm and provided with a cam V^3, co-operating with a lug W^3 upon the link S^3.



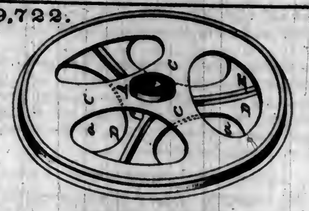
55. In a registering-machine, the combination, with a registering-wheel and a primary moving part of said machine which has to be moved at each operation thereof, of a locking device thrown by the registering-wheel into position to lock such primary part when the wheel has completed a predetermined portion of a revolution, whereby the machine becomes automatically locked when the registering-wheel reaches such position.

56. In a registering-machine, the combination, with a registering-wheel and a shaft which has to be moved at each operation of the machine, of a locking-bar co-operating with said wheel and shaft and moved by the wheel into the path of a projection upon the shaft to lock the same when the wheel has completed a predetermined portion of a revolution.

57. In a registering-machine, the combination, with a registering-wheel provided with a cam and a shaft provided with a shoulder, of a locking-lever movable into the path of the shoulder on the shaft to lock the same and actuated by the registering-wheel to move into such position when the wheel has completed a given portion of a revolution.

58. The combination of the registering-wheel A^7, having its hub provided with the cam K^3, the rock-shaft E, having the shoulder Z^3, and the lever H^3, co-operating with the cam K^3 and shoulder H^3.

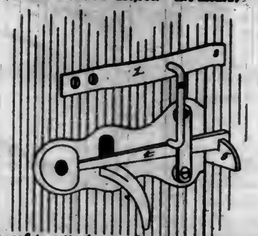
479,721. REGISTERING AND MEASURING FAUCET. HARRY F. REAM, Baltimore, Md., assignor of one-half to Levi A. Dodd, same place. Filed Aug. 19, 1891. Serial No. 403,144. (No model.)



Claim.—1. In an apparatus for delivering and registering oil or other fluids, the combination, with the main tank, the delivery-tank, and the interposed three-way cock actuating a register, substantially as described, of a combined vent-pipe and stop-valve consisting of a tube E in the delivery-tank, containing a float-valve *n*, a valve-seat *o*, an oil-inlet *t* in the tube below the float, and one or more air-vents *p p* in the tube above the float, substantially as described.

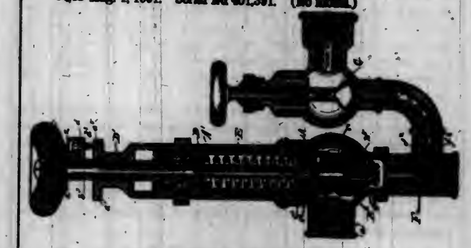
2. A vent-pipe for oil-tanks or other receptacles for fluids, consisting of a tube E, containing a float-valve *n*, a valve-seat *o*, an oil-inlet *t* in the tube below the float-valve, and an air-vent *p p* in the tube above the float-valve, substantially as described.

3. A vent-pipe for oil-tanks or other receptacles for fluids, consisting of a tube E, containing a float-valve *n*, a valve-seat *o*, an oil-inlet *t* in the tube below the float-valve, an air-vent *p p* in the tube above the float-valve, and one or more sight-openings *s s*, substantially as described.



479,722. WHEEL. FRANS H. RUNDQUIST-WARNER, Stockholm, Sweden. Filed Jan. 16, 1892. Serial No. 418,215. (No model.)

Claim.—1. The combination, in a wheel, of the hub A, rim B, and spoke-webs C and D, alternately merging into one another in hypercycloidal curves *a* between the hub and the rim, substantially as set forth.



2. As an improved article of manufacture, a metallic wheel having the hub and rim connected by a central part or body comprising the alternating spoke-webs C and D and their connecting oblique rim-webs *c* and *d*, constructed and arranged substantially as and for the purpose shown and set forth.

479,723. ATTACHMENT FOR LATCHES. GEORGE G. RUPERT, Decatur, Ill., assignor of one-half to William H. Logan, same place. Filed Jan. 8, 1892. Serial No. 417,333. (No model.)

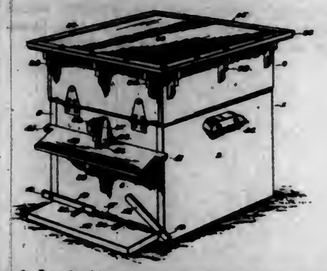
Claim.—A safety attachment for door-latches, consisting of a spring-bar adapted to be secured to a door and having a projecting end to engage the door-casing and a hook or latch-support secured to the spring-bar and adapted to sustain the latch when the door is not closed, as set forth.

479,724. AUTOMATIC RELIEF-VALVE. FRANK SHERIDY, Mansfield, Ohio, assignor to the Safety Cylinder Valve Company, same place. Filed Aug. 1, 1891. Serial No. 401,391. (No model.)

Claim.—1. The combination of the valve-case, a spring-pressed relief-valve within said case, a housing for the valve-spring, rigidly secured to and movable with the valve, and means, such as shown, for adjusting the tension of the spring and locking the tension when adjusted, substantially as shown and described.

2. The combination of the outer case, the valve, and the valve-spring housing connected together and fitted to slide within said case, the follower D within the housing and having a stem extending to the outside, the tube D', screw-threaded through the case and forming part of the plunger-stem, whereby the follower is moved within the spring-housing, the spring compressed between the follower and the valve, and means to lock the adjustment of the spring for the purpose of holding it to the desired tension, substantially as shown and described.

3. The combination of the two-part outer case A A', the spring-housing C, and attached valve B, fitted to slide therein, the follower D, having divided hollow stem *d* D', the part D' being screw-threaded through the neck of the part A' and having laterally-extending lug d^2, the screw-pin d^3, tapped into said lug and adapted to interlock with the case, and the stem *b*, extending to the outside of the case and provided with cap-nut b^2, substantially as shown and described.



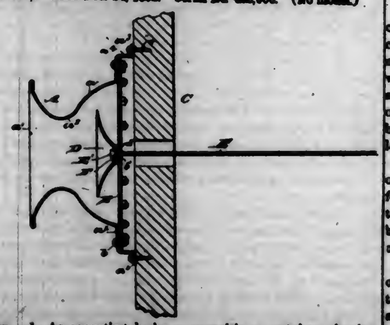
4. The combination of the valve-case, a spring-pressed relief-valve within said case, a housing for the spring and follower, provided with a screw-threaded stem to compress or relax the spring, a supplemental valve, as b^4, forming part of the spring-pressed valve but movable independent of it, and the stem b^3 and hand-wheel B^3 to move said supplemental valve independent of the main valve, substantially as and for the purpose set forth.

5. The combination of the outer case, the spring-pressed relief-valve therein, means for adjusting the spring and locking the tension

when adjusted, and a graduated index to indicate the pressure with which the relief-valve is held to its seat, substantially as shown and described.

6. The combination of the valve-case, a spring-pressed relief-valve within it, and an auxiliary relief and indicator valve, as G, adapted to connect directly with the cylinder and having a screw-threaded exhaust branch, as *g*, for attaching an indicator, said auxiliary valve being arranged to act independently of the spring-pressed relief-valve, substantially as shown and described.

479,725. BEEHIVE. HENRY F. SNOWHAM, Newark, Ohio. Filed Apr. 25, 1892. Serial No. 429,563. (No model.)



Claim.—1. In a beehive, the combination of the body provided with an inclined bottom board extended beyond the front side to form an alighting-ledge, said body being provided with a bee-opening 17, the strips having their outer ends pivoted to the body and folding inward to close partially the bee-opening when in a horizontal position and having extended ends 19, arranged to engage the extended portion of the bottom board when in a perpendicular position, and the blocks so secured to the upper face of the alighting-ledge and arranged at intervals, substantially as described.

2. In a beehive, the combination of the brood-frames 8 and 8^a, the upper bars of which have recesses, the L-shaped guide-plates secured to the brood-frames 8^a, and the rows of honey-sections having upper and lower recesses and secured together and arranged to engage the recesses of the guide-plates, whereby the recesses in the honey-sections are readily made to register with the recesses in the brood-frames, substantially as described.

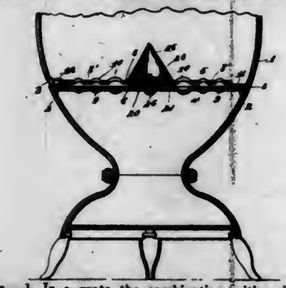
3. In a beehive, the combination of the series of honey-sections arranged in rows, the dividing-plates interposed between the rows and partially separating the sections and providing at their upper and side edges with flanges engaging the faces of the sections, the metallic end plates 20, closing the open faces of the honey-sections of one end row and provided at its top and side edges with flanges, and the transparent plate closing the sections of the other end row, substantially as described.

479,726. ACOUSTIC TELEPHONE. ALFRED L. SIMPSON, New York, N. Y. Filed Feb. 24, 1892. Serial No. 422,602. (No model.)

Claim.—1. An acoustic telephone comprising a metal case having a bell-shaped mouth, a flaring resonating-body, an annular diaphragm-seat, a neck extending from the seat and an attaching-flange extending from the neck parallel with the said seat, a diaphragm secured near its periphery only to the seat, and a bell-like resonator held to the outer face of the diaphragm by the tension of the line-wire only, substantially as described.

2. In an acoustic telephone, the combination, with a case having a bell-shaped mouth and a flaring resonating-body and a diaphragm held to the rear of the resonating-body, of a bell-shaped resonator of a size greater than the diameter of the neck formed by the junction of the mouth and body and held to the diaphragm by the tension of the line-wire, substantially as and for the purpose set forth.

479,727. ALTERNATING-CURRENT MOTOR. WILLIAM STANLEY, Jr., and JOHN F. KELLY, Pittsfield, Mass. Filed Mar. 8, 1892. Serial No. 424,249. (No model.)



Claim.—1. The combination, with an alternating-current motor having independent energizing-circuits, of a polarization-coil included in one circuit and a self-induction device in the other, as set forth.

2. The combination, with an alternating-current motor having independent energizing-circuits, of a polarization-coil included in one circuit adapted by its electro-motive force to advance the phase of the current in its circuit with respect to that of the current in the other circuit, as set forth.

3. In an alternating-current motor having energizing-circuits adapted by predetermined relations of self-induction and capacity to produce a difference in phase between the currents therein, the combination, with one or both circuits as the means for neutralizing the lag of self-induction, of conducting-plates immersed in an electrolyte and connected in series in the same, as herein set forth.

4. The combination, with a main circuit and branches from the same of different self-induction and capacity, whereby a difference in phase will be produced in the currents passing therein, of a polarization-coil included in the main circuit and adjusted or adapted to neutralize the resultant lag of the two branch circuits.

479,728. GRATE. WILLIAM W. SWEETLAND, Edwardsburg, Mich. Filed Oct. 19, 1891. Serial No. 409,166. (No model.)

Claim.—1. In a grate, the combination, with a lower member consisting of a central body, radial arms having downward beads, and concentric projections secured at their centers to said arms, of an upper member comprising similar body and arms, the latter being provided with upward beads registering with the downward beads in the lower arms, concentric projections on the arms, secured to the latter slightly out of the centers of the projections, a pivot at the centers of said members, and means for oscillating the upper member and supporting the lower.

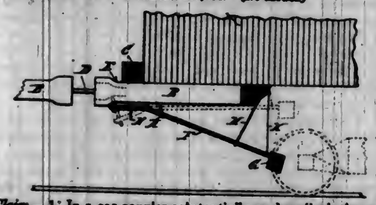
2. In a grate, the combination, with a lower member consisting of a central body and radial arms having downward beads and means for supporting said member, of an upper member consisting of a central body and radial arms having upward beads registering with the beads in the lower arms, a pivot at the centers of said bodies, and means for oscillating the upper member.

3. In a grate, the combination, with a lower member consisting of a central body, radial arms, and concentric projections secured at their centers to said arms, and means for supporting this member, of an upper member consisting of similar body, arms, and projections, the latter being secured to the arms slightly out of the centers of the lengths of said projections, a pivot at the centers of said bodies, and means for oscillating the upper member.

4. In a grate, the combination, with a lower member consisting of a central body, radial arms, and concentric projections secured at their centers to said arms, means for supporting this member, a step rising from its center, and a fixed washer adjacent said step and provided with an arc-shaped notch, of an upper member consisting of similar body, arms, and projections, the latter being secured to the arms slightly out of the centers of the lengths of said projections, a cavity in the upper member fitting said step and having a lug adjacent engaging said notch, the combined length of the projections in each member forming a half-circle, and said notch being of a length to permit the movement of each upper projection from above its corresponding lower projection nearly but not quite off the same, and means for oscillating the upper member.

5. In a grate, the combination, with a lower member consisting of a central body, radial arms, and projections, a step rising from said body, and means for supporting this member, of an upper member comprising similar body, arms, and projections, the body having a cavity turning on said step and of a depth to hold the adjacent faces of the members out of contact, and means for oscillating the upper member.

6. In a grate, the combination, with a lower member consisting of a central body, radial arms, and projections, a step rising from said body and having a central hole, and means for supporting this member, of an upper member comprising similar body, arms, and projections, the body having a cavity turning on said step and of a depth to hold the adjacent faces of the members out of contact, a hollow cone on the upper side of the body of this member, a screw passing upwardly through said hole in the lower member and into the upper member, and means for oscillating the latter.

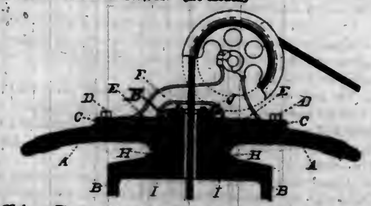


7. In a grate, the combination, with a lower member consisting of a central body having a central hole, radial arms, and projections, and means for supporting this member, of an upper member comprising similar body, arms, and projections, a hollow cone on the upper side of the body, a screw passing loosely through said hole in the lower member and into the upper member, and means for oscillating the latter.

8. In a grate, the combination, with a lower member consisting of a central body, radial arms, and concentric projections secured at their centers to said arms and means for supporting this member, of an upper member consisting of similar body, arms, and projections, the latter being secured to the arms slightly out of the centers of the lengths of said projections, a pivot at the centers of said bodies, means for oscillating the upper member, and means for permitting the movement of each upper projection from above its corresponding lower projection nearly but not quite off the same.

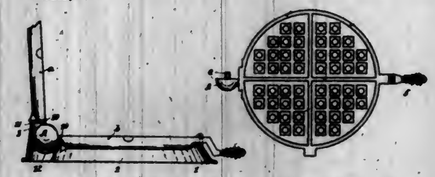
9. In a grate, the combination, with a lower member consisting of a central body, radial arms, and projections, means for supporting this member, a step rising from its center, and a fixed washer adjacent said step and provided with an arc-shaped notch, of an upper member consisting of similar body, arms, and projections and a cavity in the upper member, fitting said step and having a lug adjacent engaging said notch, and means for oscillating the upper member.

10. In a grate, the combination, with a lower member consisting of a central body, radial arms, and projections, means for supporting this member, a step rising from its center and having a central hole, and a fixed washer adjacent said step and provided with an arc-shaped notch, of an upper member consisting of similar body, arms, and projections, the body having a cavity turning on said step and of a depth to hold the adjacent faces of the members out of contact, a hollow cone on the upper side of the body of this member, a screw passing upwardly through said hole in the lower member and into the upper member, and means for oscillating the latter.



479,729. CAR-COUPLING. ROBERT R. WILSON, New Orleans, La., assignor of one-half to W. H. Bolinger and Arthur Burbank, same place. Filed Mar. 14, 1892. Serial No. 424,860. (No model.)

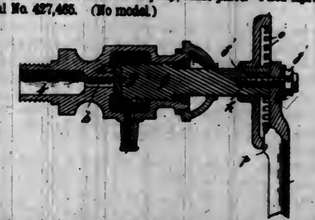
Claim.—1. In a car-coupler substantially as described, the combination, with the draw-head having aligned apertures in its top and bottom walls adjacent to its mouth, of a lever fulcrumed at an intermediate point in its length beneath the draw-head and carrying the weight at its rear end, the pin connected to and carried by the forward end of the lever and adapted to play through the aligned apertures in the draw-head, and a suitable means for raising and lowering the weighted end of the lever, all substantially as and for the purpose set forth.



2. In a car-coupler substantially as described, the combination, with the draw-head having aligned apertures in its top and bottom walls adjacent to its mouth, of a lever fulcrumed at an intermediate point in its length beneath the draw-head and carrying the weight at its rear end, the pin connected to and carried by the forward end of the lever and adapted to play through the aligned apertures in the draw-head, the guide-hangers H for guiding and limiting the movements of the lever, and a suitable means for raising and lowering the weighted end of said lever, all substantially as and for the purpose set forth.

479,730. DERRICK-CRANE. JOHN R. ANDERSON, Montpelier, Vt., assignor to the Lane Manufacturing Company, same place. Filed Sept. 10, 1891. Serial No. 405,312. (No model.)

Claim.—The combination of the flat circular guy-plate to which the guy-ropes are adapted to be fastened, said guy-plate having on its under side a circular flange serving as a hub, the mast-cap having a circular depression in which the aforesaid hub rests and turns and having also a central forward extension which lies within a central opening in the guy-plate and projects therefrom, being provided on its upper end with a horizontal plate, circular gib secured on the upper side of the guy-plate and having its inner peripheral edge inclined, the sheave-hanger having its bottom plate likewise provided with an inclined edge and fitting under the circular gib, and the sheave journaled in said hanger, all the parts being arranged so that by simply loosening the gib the hanger and its sheave can be horizontally adjusted so as to locate the sheave in the desired plane, substantially as described.



479,731. COMBINED BALL-JOURNAL AND HINGE. ROBERT O. BEDEMAN, Sydney, Ohio, assignor to the Wagner Manufacturing Company, same place. Filed Feb. 23, 1892. Serial No. 422,494. (No model.)

Claim.—1. A combined hinge and journal for uniting and supporting duplex sections, as *a b*, consisting of a semi-spherical ball upon each of said sections, one of said semi-spherical balls provided with a pivot and the other of said balls having a recess to receive said pivot, substantially as described.

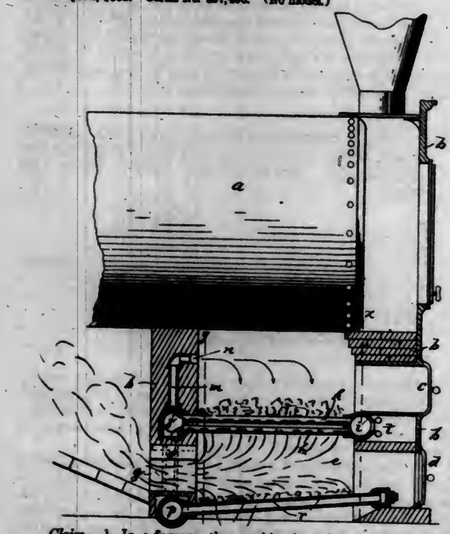
2. The combination of a base 1, having a concave socket-bearing 3, the sections *a b*, a semi-spherical ball formed on the section *a*, a semi-spherical ball formed on the section *b*, a horizontal pivot formed on one of said semi-spherical balls, the other of said semi-spherical balls having a recess to receive said pivot, a vertical flange on the base 1, and an annular flange on each section *a b*, substantially as described.

479,732. GAGE-COCK. THOMAS R. BUTMAN, Chicago, Ill., assignor to the Butman Furnace Company, same place. Filed Apr. 2, 1892. Serial No. 427,465. (No model.)

Claim.—1. A gage-cock having the screw valve-stem, the weighted lever controlling the movement of said stem and adjustably secured

thereon, so as to be capable of turning independently thereof, and means, substantially as described, whereby said lever is rigidly held in the desired position to turn with said valve-stem, substantially as described.

2. A gage-cock consisting of the casing or shell having a single discharge-nozzle and the valve-seat, the rotary screw-threaded valve-stem having the end valve to engage said seat, and the laterally-extending lever screwed to the outer end of said valve-stem and having its outer end weighted, substantially as described.



3. The gage-cock consisting of the shell having the valve-seat, the rotary screw valve-stem having the valve to engage said seat, and the weighted lever-arm adjustably secured to and extending laterally from the outer end of said valve-seat, as described.

4. A gage-cock having a rotary valve-stem, a laterally-extending lever adapted to receive weights and adjustably secured to the end of said valve-stem, and a disk rigid with the valve-stem having notches to receive and hold said levers.

5. The gage-cock having a rotary valve-stem, the notched disk rigid with the outer end of the valve-stem, the lever adapted to be weighted and engaged and be held by said projections, and a screw passing through the end of said lever into the valve stem to hold the lever in a notch.

6. A gage-cock having the rotary valve-stem provided with a disk rigid with the outer end thereof and having a lateral notched rim, the weighted lever having a feather to fit in one of said notches, and a screw passed through the end of said lever into said stem to hold the feather in the notch.

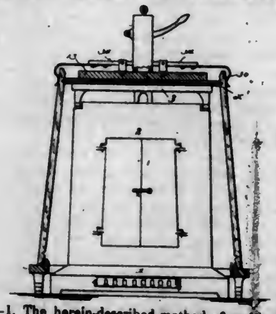
479,733. STEAM-BOILER FURNACE. THOMAS R. BUTMAN, Chicago, Ill., assignor to the Butman Furnace Company, same place. Filed Apr. 2, 1892. Serial No. 427,466. (No model.)

Claim.—1. In a furnace, the combination of the tubes forming the grate-bars, having supply-pipes, connections from said tubes, arranged to discharge the heated steam and air therefrom over the fire and produce a downdraft, and connections for conveying part of the heated steam and air from said tubes and discharging the same in the combustion-chamber beneath the said grate-bars, substantially as described.

2. In a furnace, a grate, a combustion-chamber beneath the grate, having a discharge, means, substantially as described, for heating air and steam, connections for discharging a portion of said heated air and steam over and onto the fire, and connections for conveying the remainder of the heated steam and air and discharging the same in the combustion-chamber beneath the grate, whereby the flame-consuming gases, &c., meet and are consumed in said chamber, substantially as described.

3. In a furnace, the combination of the heating-tubes in proximity to the fire, supply connections therefor, distributing-pipes in the combustion-chamber beneath the fire, and connections from said tubes to convey a portion of the heated air and steam to said distributing-pipes and to discharge the remainder thereof onto and above the fire and produce a downdraft, substantially as described.

4. In a furnace, the combination of the tubes forming grate-bars, steam and air supply for said tubes, connections from said tubes, arranged to distribute a portion of the heated air and steam therefrom over the fire on said tubes, and thereby produce a downdraft, and a series of perforated tubes beneath and supplied with heated air and steam from said grate-bars, for the purpose described.



5. In a furnace, the means, substantially as described, for heating air and steam and discharging the same over the fire to produce a downdraft and distributing-pipes beneath the fire to distribute air and steam into the downwardly-passing burning gases and flame, substantially as described.

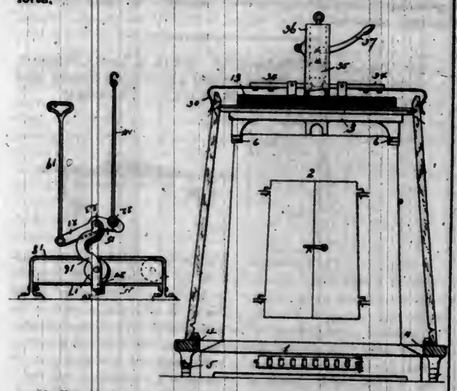
6. In a furnace, the combination of the hollow grate-bars, the rear header thereof, means for supplying air and steam to said bars, the perforated pipes in the combustion-chamber beneath the grate-bars, the header for said perforated pipes, and the pipes connecting said headers, substantially as described.

7. In a furnace, the combination of the hollow grate-bars, the headers therefor, air and steam supply openings in one header, and the water-nozzles projecting into said header and having a supply pipe or pipes, substantially as described.

8. In a furnace, the bridge-wall having the bottom opening, the furnace-front, a header in the furnace-front, having steam and air injectors in its ends, a header in the bridge wall, the hollow grate-bars connecting said headers, and the distributing-pipes in the bridge-wall from the rear header to produce a downdraft, substantially as described.

479,734. METHOD OF MAKING BARRELS, &c. HENRY CAMPBELL, Baltimore, Md., assignor to the Campbell Barrel Machine Company, same place. Filed Jan. 28, 1892. Serial No. 419,508. (No model.)

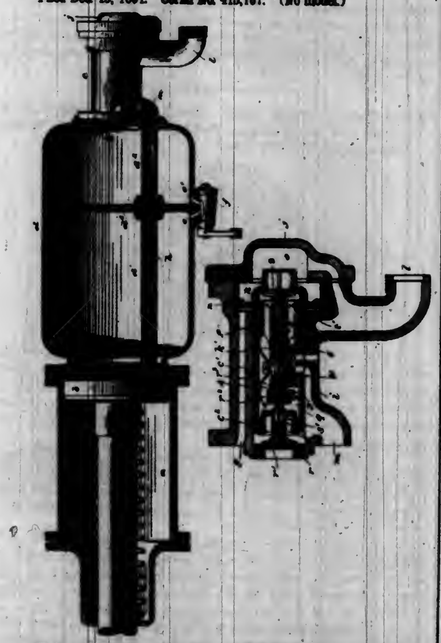
Claim.—1. The herein-described method of making barrels and similar articles, which consists in first crozing the staves individually or when uncombined permanently in the barrel, then setting up the staves around one of the heads of the barrel and forming the latter, then applying permanently the hoops to that end of the barrel containing said head, then, the partly-finished barrel having been fired, forcing in the staves at the other end of the barrel, the other head being at the same time inserted, then applying the head-hoop to secure the last-mentioned head, and applying the remaining hoops, substantially as set forth.



2. The herein-described method of making barrels and similar articles, which consists in first crozing the staves individually or when uncombined in the barrel, then setting up the staves around one of the heads of the barrel and forming the latter and simultaneously firing the barrel, then applying permanently the hoops to that end of the barrel containing said head, then forcing in the staves at the other end of the barrel, the other head being at the same time inserted, then applying the head-hoop to secure the last-mentioned head, and lastly applying the remaining hoops, substantially as set forth.

3. The herein-described method of making barrels and similar articles, which consists in first crozing the staves individually or when uncombined in the barrel, then consecutively setting up a series of barrels, applying to each one or more of its permanent hoops, and beginning the firing of each barrel when its setting up is begun, and then consecutively wiodlassing and finishing said barrels, substantially as set forth.

479,735. BARREL SETTING-UP AND FIRING MACHINE. HENRY CAMPBELL, Baltimore, Md. Filed Feb. 8, 1892. Serial No. 420,773. (No model.)



Claim.—1. In a setting-up and firing machine for the manufacture of barrels and similar articles, the combination, with a heater, of a plate or former supported above said heater and within the space included by the upper ends of the staves and adapted to receive the inner sides of the upper ends of the staves, substantially as set forth.

2. The combination, with a heater or firing device, of a table or support above the same and adapted to receive a barrel-head and means for temporarily holding said head in place, substantially as set forth.

3. The combination, with a heater or firing device, of a table situated above the same, a support for the lower ends of the staves, and a means for adjusting the distance apart of said support and table, substantially as set forth.

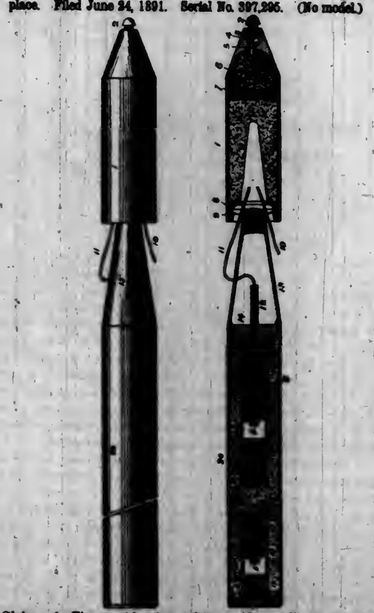
479,736. AIR-BRAKE. JESSE F. CARPENTER, Washington, D. C. Filed Dec. 15, 1891. Serial No. 415,167. (No model.)

Claim.—1. An auxiliary reservoir divided into two chambers, combined with a passage between said chambers, a valve in said passage, and an operating hand-lever for the valve within convenient reach of trainmen, to be actuated by hand in making up trains, substantially as described, and for the purposes specified.

2. In an automatic valve for train-brakes, the combination of the main piston, the check-valve therein, and the slide-valve connected with and operated by the piston for releasing the brakes, with the valve *r*, carried by the piston and controlling a small passage to the brake-cylinder, and the valve *s*, in which the valve *r* and its passage are located and itself controlling a large passage to the brake-cylinder, substantially as described.

3. The combination of the piston and the slide-valve *u* for releasing the brakes, the valves *r* and *s* for controlling the passage of air to the brake-cylinder, the former seating within the latter and both actuated by the piston, the chamber *q*, the check-valve in the piston, and the passage *p* between the auxiliary reservoir and the chamber *q* and made larger than the passage through the valve *r*, but smaller than the passage through the valve *s*, substantially as described.

479,737. SCISSORS-SHARPENER. GEORGE S. COLLUM, Hartford, Conn., assignor to Charles H. Russell and William H. Collum, same place. Filed Feb. 5, 1892. Serial No. 420,432. (No model.)

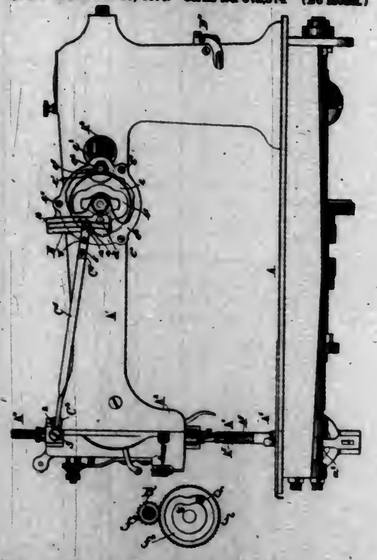


Claim.—1. As an article of manufacture, a scissors-sharpener consisting of a wide cylindrical body portion or hub and at each end thereof an outwardly-flaring smooth guiding-flange, substantially as described.

2. As an article of manufacture, a scissors-sharpener consisting of a wide roughened cylindrical body portion or hub and at each end thereof an outwardly-flared smooth guiding-flange, substantially as described.

3. As an article of manufacture, a scissors-sharpener consisting of a wide cylindrical body portion or hub and at each end thereof an outwardly-flaring smooth guiding-flange having a pocket to protect the finger and thumb, substantially as described.

479,738. DYNAMITE ROCKET. PATRICK CUNNINGHAM, New Bedford, Mass., assignor to the American Carrier Rocket Company, same place. Filed June 24, 1891. Serial No. 397,295. (No model.)



Claim.—1. The combination, with a self-propelling projectile or rocket, of a tube forming the tail of the rocket, adapted and arranged to carry explosives, percussion firing devices connected with an explosive-chamber of the device, firing weights or hammers adapted to be actuated by the arrest of the flight of the rocket, and a time fuse connecting the rocket-chamber with the explosive-chamber, arranged substantially as shown and described.

2. The combination, with a self-propelling projectile or rocket having a rearwardly-open propelling-chamber charged with a gradually-burning propelling compound, of a tube forming the tail thereof, arranged for carrying explosives, and a time-fuse connected therewith and with the rocket propelling chamber, substantially as shown and described.

3. The combination, with the rocket having a rearwardly-open chamber charged with a gradually-burning propelling compound, an explosive carried in the apex of the rocket-head, and means for exploding the same, operated by the arrest of the flight of the rocket, of the tubular tail and an explosive carried thereby, substantially as set forth.

4. The combination, with a self-propelling projectile or rocket having a rearwardly-open chamber charged with a gradually-burning propelling compound, of a receptacle for explosive, forming the tail of the rocket, and a percussion or concussion piece and cap communicating with and adapted to fire the explosive, arranged substantially as shown and described.

479,739. SEWING-MACHINE. GEORGE H. DUNHAM, Bridgeport, Conn., assignor to The Wheeler & Wilson Manufacturing Company, same place. Filed Nov. 26, 1890. Serial No. 372,574. (No model.)

Claim.—1. The feed-bar C, the feed-dog attached thereto, the rock-shaft D, the feed-adjusting link D^3, jointed thereto, a rock-shaft D^4, parallel to the rock-shaft D, said rock-shaft having a grooved segmental arm D^4, which is entered by a stud of the said link, means to move the said link D^3 and place its stud more or less near the center of said rock-shaft to thereby regulate the length of stitch, an arm f, connected to the rock-shaft D^4 and provided with a stud f', a pattern-cam having a groove to receive said stud f' and having a series of teeth, the shaft E', means to rotate it, a loop-taker, devices between it and the said shaft to rotate the loop-taker, and a gear f^5 on the shaft E' to engage the teeth of and rotate the pattern-surface to determine the direction of feed, substantially as described.

2. The feed-bar C, the feed-dog attached thereto, the rock-shaft D, the feed-adjusting link D^3, jointed thereto, a rock-shaft D^4, parallel to the rock-shaft D, said rock-shaft having a grooved segmental arm D^4, which is entered by a stud of the said link, means to move the said link D^3 and place its stud more or less near the center of said rock-shaft to thereby regulate the length of stitch, a rotating needle-bar-actuating shaft having a gear e^5, a needle-bar having an eye-pointed needle, a horizontally-swinging needle-bar frame, connections between said shaft and needle-bar to reciprocate the latter vertically in said frame, the shaft E', means to rotate it, a loop-taker, devices between it and the said shaft to rotate the loop-taker, a pattern-surface, gearing connecting said pattern-surface and the gear e^5, connections comprising a vibrating slotted segment and block adjustable thereon between the pattern-surface and the said needle-bar frame to move the latter intermittingly in a lateral direction, a feed-bar-actuating mechanism therefor, an arm f, connected to the rock-shaft D^4 and provided with a stud f', a pattern-cam having a groove to receive said stud f' and having a series of teeth, and a gear f^5 on the shaft E' to engage the teeth of and rotate the pattern-surface between some stitches and not between other stitches, the combination being and operating, substantially as described, to enable a variety of stitches to be made, as set forth.

479,740. SEWING-MACHINE. GEORGE H. DUNHAM, Bridgeport, Conn., assignor to The Wheeler & Wilson Manufacturing Company, same place. Filed Nov. 5, 1891. Serial No. 411,113. (No model.)

Claim.—1. The combination, with the bed-plate of a sewing-machine, of a detachable throat-plate having a raceway and a spur to hold the material at the center of the needle-hole, a feed-wheel placed in the said raceway and having points at its upper side, a cap or plate to retain the said feed-wheel in the said raceway, a reciprocating pawl-carrier resting in a groove made in the upper side of said throat-plate, a pawl carried thereby to engage and rotate the feed-wheel step by step, the feed-bar B^{10}, means to reciprocate it, connections between it and the said pawl-carrier, a presser-foot or clamp to hold the material upon the feed-wheel, and stitch-forming mechanism adapted to make an overseaming stitch, all to operate substantially as described.

2. In a sewing-machine, the throat-plate a^3, provided with a raceway and with a guideway a^6, having in its bottom a slot, as a^{20}, the hub a^4, and spur located at the center of the raceway, and a feed-wheel placed in said raceway and having ratchet-teeth at its periphery and pins at its upper side, combined with a reciprocating pawl-carrier provided with a pawl and with a stud extended through said slot a^{20}, the feed-bar, and a plate attached thereto having an opening to receive the stud to reciprocate the said pawl-carrier to operate substantially as described.

479,741. POCKET-LAMP. JOHN H. FARRER, Camden, N. J., assignor to J. Walter Douglass, Philadelphia, Pa. Filed Dec. 15, 1890. Serial No. 374,763. (No model.)

Claim.—1. A lighting device having an oil-receptacle provided with a wick, an igniter in proximity thereto, a rotatable carrier, a disk applied thereto and having drops, bits, or pellets of explosive material, and means for rotating said carrier and bringing the drops, bits, or pellets of said disk into contact with said igniter, substantially as and for the purposes set forth.

2. A lighting device having a wick, an igniter, a rotatable carrier, and a disk having drops, bits, or pellets of explosive material applied thereto, the construction being such that when the carrier is revolved the drops, bits, or pellets of said disk are ignited, substantially as and for the purposes set forth.

3. A lighting device having an igniter, a rotatable carrier provided with pins or studs, and a disk having bits, drops, or pellets of explosive material applied thereto and holes formed therein, the construction being such that the disk may be removed from and applied to the carrier and revolved therewith, for the purposes set forth.

4. A lighting device having an oil-receptacle provided with a wick, a rotatable carrier supporting a removable disk having bits, drops, or pellets of explosive material applied thereto, a spring interposed between said disk and carrier, and an igniter, the construction being such that the pellets, drops, or bits are successively presented to the igniter, substantially as and for the purposes set forth.

5. A lighting device having an oil-receptacle provided with a wick and a boss formed integral with the inner wall of said receptacle, a rotating carrier supporting a removable disk having bits, drops, or pellets of explosive material applied thereto, a spring interposed between said carrier and disk, and an igniter, the construction being such that the disk is normally in contact with the boss, substantially as and for the purposes set forth.

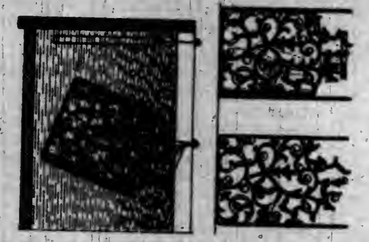
6. A lighting device having a cylindrical casing provided with a lid, an oil-receptacle attached to a plate closing one extremity of said casing, a wick, an igniter, a carrier removably fitted to the other extremity of said casing, and a disk having explosive material applied thereto and removably attached to said carrier, the construction being such that the carrier may be rotated within the casing, substantially as and for the purposes set forth.

7. The combination, in a lighting device, of a cylindrical casing provided with a lid closed at one extremity thereof, with an oil-receptacle, a wick, an annulus having a flange and fitted into the other extremity of said casing, a carrier provided with lugs engaging said flange and closing one extremity of said casing, an igniter, and a removable disk having explosive material applied thereto, substantially as and for the purposes set forth.

8. The combination, in a lighting device, of a cylindrical casing provided with a lid closed at one extremity thereof, an oil-receptacle provided with a boss, a wick, an annulus fitted into the other extremity of said casing, a carrier engaging said annulus, an igniter, a removable disk having explosive material applied thereto and attached to said carrier by pins or lugs engaging in slots, and a spring interposed between said disk and carrier, substantially as and for the purposes set forth.

479,742. CONVEYER AND SCREEN. RICHARD L. HASKELL, Chicago, Ill. Filed Feb. 3, 1892. Serial No. 420,196. (No model.)

Claim.—1. The combination of a reciprocating conveyer-trough moving with an increasing speed toward the end of the forward stroke and having a curved motion at the end of its forward stroke and a bearing or series of bearings for giving the conveyer-trough a curved motion at the end of its forward stroke, substantially as and for the purpose specified.

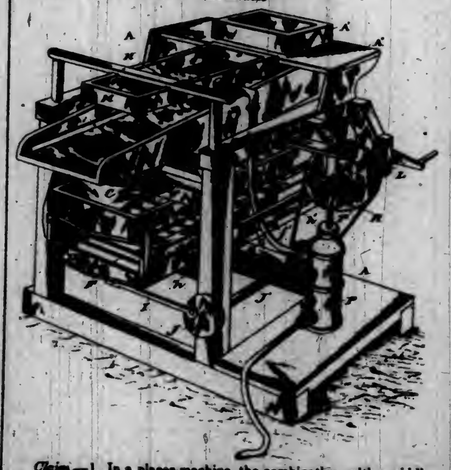


2. The combination of a reciprocating conveyer-trough moving in a slot or runway curved at the end nearest to the discharge end of the conveyer and a slotted bearing or frame having its slot or runway curved at the end nearest to the discharge end of the conveyer, substantially as and for the purpose specified.

3. The combination of a slotted bearing or frame having its slot or runway curved at the end nearest to the discharge end of the conveyer, a reciprocating conveyer-trough moving in said slot or runway, and a spring 34, substantially as and for the purpose specified.

4. In combination with a reciprocating conveyer, the driving mechanism specified, consisting, substantially, of the driving-shaft 27, the disk 26, the bearing 28, the slotted bar 23, and the crank-arm, whose center of rotation is placed to one side of the center of the driving-shaft 27.

479,743. PROCESS OF MOUNTING METALLIC ORNAMENTS UPON GLASS, &c. CHARLES B. HEARLY and JOHN S. GARROW, Philadelphia, Pa. Filed Feb. 13, 1892. Serial No. 421,499. (No specimens.)



Claim.—1. The within-described process of ornamenting glassware or similar material, said process consisting in casting the metallic open-work ornamental design, fitting it to the article to be ornamented, soldering it together at the joints, subjecting it to an electroplating solution, which will plate the metallic ornamentation and the solder joints without plating the article, substantially as set forth.

2. The within-described process of ornamenting glassware or similar material, said process consisting in casting the metallic open-work ornamental design, fitting it to the article to be ornamented in such a manner that it can be withdrawn from the article, soldering it together at the joints, removing it from the article, subjecting it to a plating solution in order to plate the back of the ornamentation, mounting it again upon the article, turning down and fitting and soldering together the remaining portion of the ornamentation so as to confine it to the article, and, finally, immersing the article, with the ornamentation, in an electroplating solution which will plate the metallic ornamentation without plating the article, substantially as specified.

3. The process herein described of ornamenting glassware or similar material, said process consisting in first casting a design in white-metal and having tapered portions to fit over a shoulder, mounting said ornamentation upon a form, securing the edges together by solder, immersing the article, with the ornamentation, in an electroplating-bath, whereby the ornamentation and soldered joints are plated without plating the article, substantially as specified.

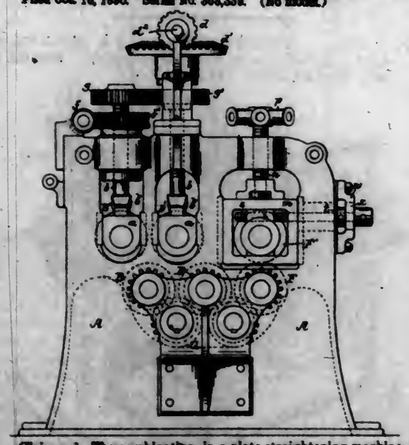
479,744. PLACER-MACHINE. WILLIAM M. JEWELL, Pipe, assignor of one-half to George Robertson, Durango, Colo. Filed Dec. 24, 1891. Serial No. 416,081. (No model.)

Claim.—1. In a placer-machine, the combination, with a riddle-box having a screen therein and the inclined removable tank having a perforated bottom and an elongated opening at one end discharging into said riddle-box, of the riffle-boxes arranged to receive the discharge through an opening in the bottom of said riddle-box and mechanism for imparting a reverse rocking reciprocating motion to said riddle and riffle boxes, substantially as specified.

2. In a placer-machine, the combination, with a riddle-box having a perforated screen therein and a solid bottom below said screen, said bottom having an opening therein near its lower end, of the riffle-boxes, one above the other, under said riddle-box and arranged to receive the discharge from the opening in the bottom thereof, mechanism for imparting a reverse rocking reciprocating movement to said riddle and

riffle boxes, the inclined removable tank having an elongated opening at its lower end discharging into said riddle-box, and means for supplying said tank with water, substantially as specified.

3. The combination, with the tank, the riddle-box, the riffle-boxes, the swinging supporting-frame for said box, the cranked rock-shafts connected to said frame, and the driving-shaft, of the pump for supplying water to said tank, said pump having in the upper portion of its piston-rod a slot engaged by a pin on the driving-shaft, substantially as specified.

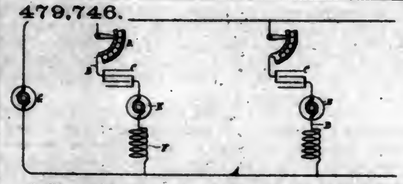


4. The combination, with the frame and the riddle and riffle boxes, of the inclined removable tank having a perforated bottom and provided with a transverse elongated discharge at its lower forward end, substantially as specified.

5. The combination, with the rocking reciprocating riddle-box having the screen and the discharge-opening therein, of the riffle-boxes supported below the riddle-box and having a reverse movement thereto, said boxes being held rigidly but removably together and having their lowest points at the central portion, substantially as specified.

6. The combination, with the frame, of the inclined perforated tank having an elongated transverse discharge-opening at its lower end, the inclined riddle-box underneath said tank, the hopper underneath, a discharge-opening in said box, the oppositely-inclined riffle-boxes rigidly and removably secured together, the rock-shafts having opposite crank-arms connected to the upper and lower portions of a swinging frame, on which said riddle and riffle boxes are supported, the driving-shaft, and the operating-shaft having crank-rods connected to said swinging frame, substantially as specified.

7. The combination, with the main frame, the rock-shafts journaled therein, and the crank-arms of said shafts, of the swinging frames carried by said crank-arms, the riffle-boxes supported in the lower portion of said swinging frame, the riddle-box supported on the upper portion of said frame, the mechanism for operating said crank-shafts, the spring connected at one end to the frame, and the link connecting the other end of said spring to the riddle-box, substantially as specified.

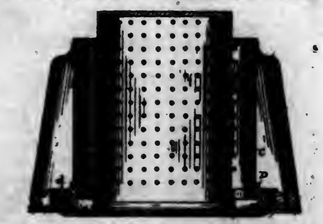


479,745. PLATE-STRAIGHTENING MACHINE. HENRY C. JOHNS, Wilmington, Del., assignor to the Hilles & Jones Company, same place. Filed Oct. 16, 1890. Serial No. 368,339. (No model.)

Claim.—1. The combination, in a plate-straightening machine, of the upper and lower sets of non-reducing straightening-rolls offset so as to act alternately upon the plate with a pair of straight-faced compression and drawing rolls set so as to act simultaneously upon the plate, whereby the length of the plate is extended, substantially as specified.

2. The combination, in a plate-straightening machine, of the upper and lower sets of straightening-rolls with a pair of compression-rolls and means for adjusting one of said rolls both vertically and laterally with respect to the other, substantially as specified.

479,746. ELECTRO-MAGNETIC MOTOR. JOHN F. KELLY, New York, N. Y., and WILLIAM STANLEY, Jr., Pittsfield, Mass. Filed May 28, 1891. Renewed Mar. 5, 1892. Serial No. 423,964. (No model.)



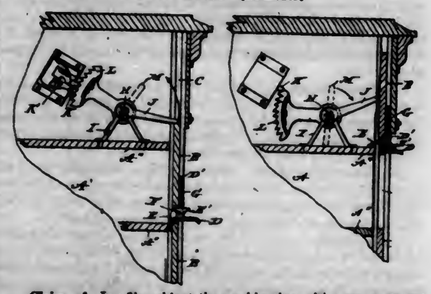
Claim.—1. The combination, with a generator of alternating currents and a motor, both of the elements of which are energized by the directly-impressed electro-motive force of the generator, of a condenser in series with each motor and adapted to neutralize its self-induction, as herein set forth.

2. The combination, with a generator of alternating currents and a series-wound motor or motors connected therewith, of a condenser in series with each motor and of a capacity or value capable of neutralizing the self-induction of the motor with which it is associated.

3. The combination, with a generator of alternating currents and one or more series-wound motors connected therewith, of a condenser in series with each motor and of a capacity or value capable of neutralizing the self-induction of the same, and a variable resistance associated with each motor, adapted to regulate the amount of current passing through said motor, as set forth.

479,747. OIL AND VAPOR BURNER. JOHN A. LAMBERT and WILLIAM B. JEAVONS, Cleveland, Ohio, and WILLIAM H. WILDER, Florence, Mass. Filed Mar. 20, 1892. Serial No. 426,471. (No model.)

Claim.—1. A vapor-burner having combustion-tubes and a hood fixed firmly at its lower end and connected with the top of the outer of said tubes and holding it upon its seat, substantially as described.



2. A vapor-burner having combustion-tubes, a base for supporting the outer of said tubes, and a hood connecting the said base and the said outer tube, substantially as described.

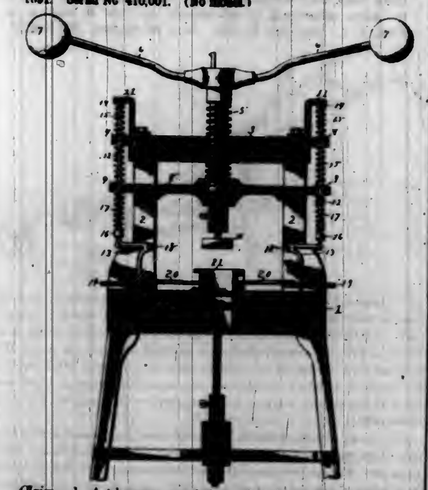
3. A vapor-burner provided with concentric combustion-tubes and a vapor-bowl, a base for supporting the outer of said tubes, and a hood locked on the said base and the top portion of the outer combustion-tube, substantially as described.

4. In a vapor-burner constructed substantially as described, the base and the outer tube seated thereon, and a hood bent inward at its top and engaging the said tube and locked on the said base at its lower portion, substantially as described.

5. In a vapor-burner of the kind described, the base for supporting the outer tube having a projection about its outside, the hood constructed to engage on the said projection and to hook over the top of the outer tube, and the said outer tube, substantially as described.

479,748. CABINET. WILFRED I. OHMER, Dayton, Ohio. Filed Nov. 27, 1891. Serial No. 413,184. (No model.)

Claim.—1. In a file-cabinet, the combination, with a compartment-case and sets of slidable doors for said compartments, of a rotatable cross-bar mounted adjacent to said doors and adapted to engage with the upper door of each series to lock all the doors in that set, a segment ratchet carried by said rotatable bar and operating in an arc about the center of said bar, and a stop-catch passing said segment with a ratchet



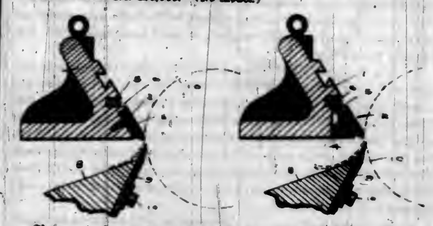
action when the bar is turned downward on the side next to the doors and key-operated to free the segment on a reverse movement of the said bar.

2. In a file-cabinet, the combination, with a compartment-case and sets of slidable doors for said compartments, of a rotatable cross-bar mounted adjacent to said door and having projecting arms to lock said doors down, the said arms being thrown into locking position by rotating the cross-bar by hand toward said door and reversely thrown out of locking position by lifting said doors and remaining in such inoperative position till the bar is again rotated, and key-operated means to secure said bar against said reverse rotation and lock said doors.

3. In a file-cabinet, the combination, with a compartment-casing, slidable doors mounted to close said compartments, and means to lift them and support them in a lifted position, of a rotatable cross-bar adapted to be turned into engagement with the upper door of each series to hold them down, the reverse movement of said bar being effected by raising said doors, and key-operated locking means to prevent said reverse movement of said bar, and thus lock said doors when desired.

4. In a file-cabinet, the combination, with a compartment-casing and slidable doors for said compartments, of intermittent locking means for said doors, consisting of a cross-bar adapted to be rotated by hand to engage with said doors and lock them and reversely rotated out of engagement, ratchet means for said bar, consisting of a ratchet-piece and a key-operated catch therefor, the rotation of said bar into locking engagement with said doors effecting a ratchet action of the said ratchet means till the doors are fully locked, and a reverse rotation of the bar being effected only after operating said ratchet-catch, whereby the doors may slide freely up and down without engagement with the locking mechanism till it is desired to lock said doors.

479,749. TILE-PRESS. ANDERS M. STRANDLAN, Woodbridge, N. J., assignor of one-half to Robert W. Lyle, New York, N. Y. Filed Oct. 27, 1891. Serial No. 410,001. (No model.)



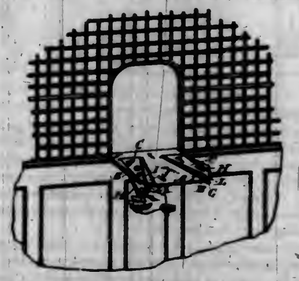
Claim.—1. A tile-press consisting of a descending cross-bar 8, having perforated ends, upright rods 12 12, working through the perforations in cross-bar 8, said rods having their upper ends threaded and provided with the nuts 14 14 and their lower ends provided with the adjustable collars 16 16 and pivoted to the levers 13 13, springs 15 15, working around rods 12 12 between the under face of nuts 14 14 and the upper face of cross-bar 8, springs 17 17, working around rods 12 12 between the under face of cross-bar 8 and the upper faces of collars 16 16, pivoted crank-levers 18 18, the lower ends engaging the bars 19 19, and forks 20 20 secured to the bars 19 19, substantially as shown and described.

2. In a tile-press, the combination, with a movable cross-bar 8, carrying a die thereon, of sliding forks and a spring connection between the forks and the descending cross-bar, substantially as described.

3. In a tile-press, the combination, with a mold, of a movable cross-bar carrying a die thereon, sliding rods, forks projecting into the said mold, crank-levers connecting the said rods and forks, and springs secured to the said rods and bearing on the said cross-head, substantially as described.

4. In a tile-press, the combination, with a mold, of a movable perforated cross-head carrying a die thereon, rods having enlargements thereon passing through the perforations in the said cross-head, springs surrounding the said rods and interposed between the said cross-head and the said enlargements, forks adapted to be projected into the said mold, and crank-levers having their opposite arms connected with the said rods and forks, respectively, substantially as described.

479,750. ADJUSTABLE PRESSURE-BAR FOR VENEER-CUTTING MACHINES. MARSHALL D. WILLIAMSON, Indianapolis, Ind., assignor to Geo. P. Adams and Marshall D. Williamson, same place. Filed Feb. 6, 1892. Serial No. 420,609. (No model.)



Claim.—1. In a veneer-cutting machine, a pressure-bar secured to the cap thereof by screws, and bolts provided with tapered heads seated in such cap, such heads adapted to come in contact with the pressure-bar, whereby it is adjustable, in combination with a cutting-knife secured to the bed-plate of the machine, substantially as shown and described.

2. In a veneer-cutting machine, a pressure-bar secured to the cap thereof and adjustable in relation to the edge of the knife by means of bolts seated in such cap, such bolts provided with tapered heads adapted to bear against the under side of the pressure-bar, in combination with a cutting-knife secured to the bed-plate of the machine, substantially as shown and described.

3. In a veneer-cutting machine, a cap having a pressure-bar secured to the face thereof by set-screws, recesses formed in the rear of such bar, and bolts seated in the cap, their beveled heads within such recesses and bearing against the under side of the pressure-bar, whereby the latter may be laterally adjusted, in combination with a cutting-knife secured to the bed-plate of the machine, substantially as shown and described.

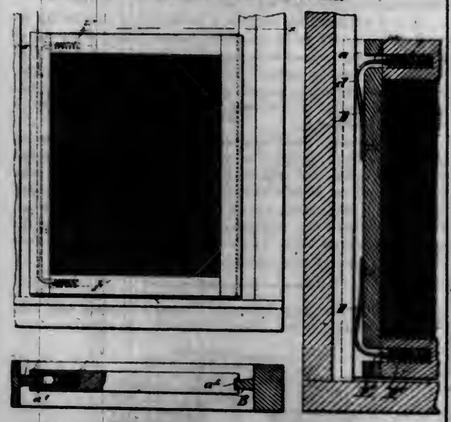
4. In a veneer-cutting machine, a cap having a pressure-bar attached to its face by means of screws, recesses formed in the cap between such screws, and bolts seated in the cap and provided with beveled heads, the latter working within such recesses, the beveled heads of such bolts bearing against the under side of the pressure-bar, whereby the latter may be adjusted in relation to the edge of the knife-blade, in combination with a cutting-knife secured to the bed-plate of the machine, substantially as shown and described.

479,751. CHANGE-RECEIVER. CELESTIN BERGERON, New York, N. Y. Filed Oct. 1, 1891. Serial No. 407,365. (No model.)

Claim.—1. A change-receiver comprising a pivot, a chute hung on said pivot and extending at angles therefrom, a spring pressing on the said chute to hold the same in flush with the change-table, and flanges held on the sides of the said chute and diverging rearwardly from the free end of the chute toward the pivot, substantially as shown and described.

2. In a change-receiver, the combination, with a change-table provided in its top with an opening, of a chute fitting into the said opening, a pivot for the said chute and held on the said change-table, the said pivot extending at angles to the chute, a spring pressing on the said chute to hold the same flush with the change-table, and flanges

held on the sides of the said chute and diverging rearwardly from the free end of the chute toward the pivot, substantially as shown and described.



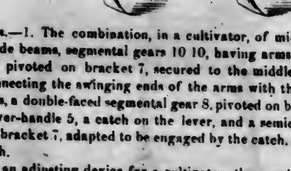
3. In a change-receiver, the combination, with a change-table provided with an opening, of a chute fitting into said opening and pivoted to the said change-table, a spring pressing on the under side of the said chute to hold the same flush with the change-table, but to permit of its being depressed, and a finger-piece held on the said chute, substantially as described.

4. In a change-receiver, the combination, with a change-table provided with an opening, of a chute fitting into the said opening and pivoted to the said change-table, a spring pressing on the under side of the said chute to hold the same flush with the change-table, but to permit of its being depressed, a finger-piece held on the said chute, and flanges held on the sides of the said chute and extending upward, substantially as described.

5. In a change-receiver, the combination, with a change-table provided with an opening, of a chute fitting into the said opening and pivoted to the said change-table, a spring pressing on the under side of the said chute to hold the same flush with the change-table, but to permit of its being depressed, a finger-piece held on the said chute, flanges arranged on the sides of the said chute and extending upward, and stops held on the said change-table and serving to limit the upward and downward swinging motion of the said chute, substantially as shown and described.

6. In a change-receiver, the combination, with a change-table provided with an opening, of a chute fitting into the said opening and pivoted to the said change-table, a spring pressing on the under side of the said chute to hold the same flush with the change-table, but to permit of its being depressed, a finger-piece held on the said chute, flanges arranged on the sides of the said chute and extending upward, and a flange forming a guide for the said chute and formed on the under side of the said change-table, substantially as shown and described.

479,752. WINDOW-SCREEN. WILLARD E. COBB, Portland, Me. Filed Dec. 15, 1891. Serial No. 415,087. (No model.)



Claim.—1. The combination, with a window-screen frame having a vertical groove in one of its side edges and transverse recesses extending from the inner or bottom wall of said groove, of plate-springs secured at one end to the frame within the groove and bent to extend at their opposite ends into the transverse recesses, spiral springs housed within the said recesses and engaging the inwardly-bent ends of the plate-springs, the latter forming an efficient contact-surface, and the protected spiral springs serving to force the plate-springs outward at all times, substantially as described.

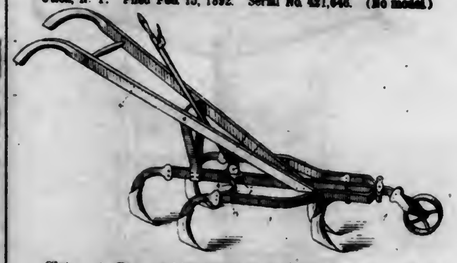
2. The combination, with a window screen frame having vertical grooves in its side edges and transverse recesses extending from the grooves into the frame, of plate springs secured in the grooves and formed with an outward bend and inbent at one end, the extreme end being formed with dovetail or undercut projections, and spiral springs housed in the recesses mentioned and engaging the dovetail projections of the plate springs, substantially as described.

479,753. SECONDARY BATTERY. ARTHUR E. COLLATZ, New York, N. Y., assignor of one-half to Lowell Mason, same place. Filed Apr. 26, 1892. Serial No. 430,717. (No model.)

Claim.—1. A plate for secondary batteries, consisting of an assemblage of strands composed of flat strips or ribbons of lead twisted in the manner described.

2. A plate for secondary batteries, consisting of an assemblage of strands composed of flat strips or ribbons of lead, corrugated and twisted in the manner described.

3. A plate for secondary batteries, consisting of an assemblage of strands composed of lead strips perforated and twisted, as described.



4. A plate for secondary batteries, consisting of an assemblage of strands composed of lead strips perforated, corrugated, and twisted, as set forth.

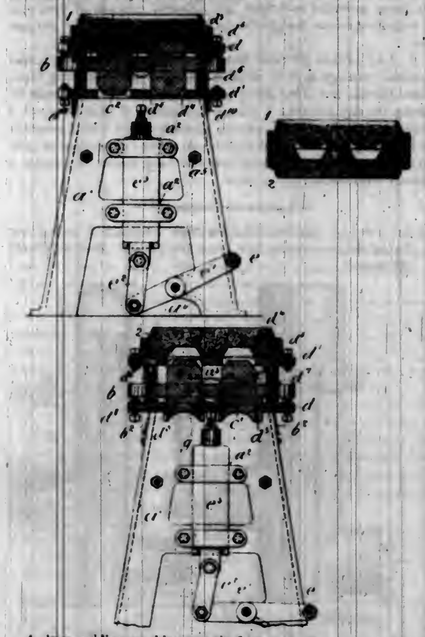
5. A plate for secondary batteries, consisting of a woven lead fabric, the strands of which are composed of lead strips perforated, corrugated, and twisted, as set forth.

6. The combination, with a lead frame provided with a terminal, of a woven fabric of perforated, corrugated, and twisted lead strands contained within said frame and having its edges fused to the same, as set forth.

7. The combination, with two or more secondary-battery plates composed of lead frames surrounding a woven lead fabric, of interposed corrugated insulating-frames for separating the plates and permitting the circulation of the electrolyte between them, as set forth.

479,754. ADJUSTING DEVICE FOR CULTIVATORS. HENRY H. DURR, Utica, and HENRY D. BABCOCK, Leonardsville, assignors, by direct and mesne assignments, to said Babcock, and Chas. H. Childs & Co., Utica, N. Y. Filed Feb. 15, 1892. Serial No. 421,646. (No model.)

Claim.—1. The combination, in a cultivator, of middle and adjustable side beams, segmental gears 10 10, having arms 9 9, respectively, and pivoted on bracket 7, secured to the middle beam, links 13 13, connecting the swinging ends of the arms with the adjustable side beams, a double-faced segmental gear 8, pivoted on bracket 7 and having lever-handle 5, a catch on the lever, and a semicircular rack 16 on the bracket 7, adapted to be engaged by the catch, substantially as set forth.



2. In an adjusting device for a cultivator, the combination of a pair of swinging arms pivotally connected with a beam of the cultivator and lying in the same plane with the beams, each arm provided with a segmental gear concentric with the pivotal point thereof, links connecting the swinging ends of the arms with the adjustable beams of the cultivator, a vertical pivoted segmental gear meshing with the two gears of the arms, an operating lever connecting with the vertical pivoted sector, a catch on the lever, and a rack adapted to be engaged by the catch, substantially as set forth.

479,755. MOLDING-MACHINE. WILLIAM EVANS, Philadelphia, Pa. Filed Oct. 20, 1891. Serial No. 410,171. (No model.)

Claim.—1. A molding-machine provided with a rotatable pattern-carrying plate, templets carried by the rotatable pattern-plate and afforded a range of play transversely thereof, and reciprocating mechanism arranged in position to act on one of the templets and shift both of them relative to the pattern-plate, substantially as and for the purposes set forth.

2. A molding-machine provided with a rotatable pattern-plate, templets rigidly connected together by distance-pieces working in apertures in the pattern-plate, and reciprocating mechanism arranged in position to act on one of the templets and shift both of them relative to the pattern-plate, substantially as and for the purposes set forth

3. In a molding-machine, a rotatable pattern carrying plate having a pattern extending through the same and projecting from the respective faces thereof, templets located on opposite sides of said pattern carrying plate, distance-pieces working in apertures in said pattern-carrying plate and rigidly connected at the respective extremities thereof with said templets, and means engaging one of said templets to shift the other templet with relation to its corresponding pattern, substantially as and for the purposes set forth.

4. In a molding-machine, a main frame, a pattern-carrying plate journaled in said frame and provided with lugs adapted to contact with said frame, templets rigidly connected together and afforded a range of play transversely of said pattern-carrying plate, and catches for locking said lug in contact with said frame, substantially as and for the purposes set forth.

5. A molding-machine comprising a main frame provided with travelers and complemental treadle mechanism for reciprocating said travelers, a pattern-carrying plate journaled to said frame, and templets rigidly connected together and afforded a range of play transversely of the pattern-plate, the construction being such that one of said templets is shifted into range of the travelers by the rotation of the pattern-carrying plate, substantially as and for the purposes set forth.

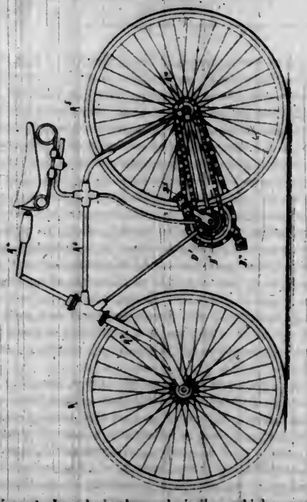
6. A molding-machine comprising a main frame provided with travelers and complemental treadle mechanism for reciprocating said travelers, a pattern-carrying plate journaled to said frame, templets rigidly connected together and afforded a range of play transversely of said pattern-plate, and adjusting-screws engaging said travelers and having their heads in range of one of said templets, substantially as and for the purposes set forth.

7. A molding-machine provided with a rotatable pattern-carrying plate having portions of the pattern projecting from the respective faces thereof, templets located on opposite sides of said pattern-carrying plate and having openings corresponding, respectively, with the contour of the adjacent portions of the patterns, distance pieces working in apertures in said pattern-carrying plate and connected with said templets, screw-bolts extending through said templets and adapted to contact with said pattern-carrying plate, and means for shifting said templets with relation to said pattern-carrying plate, substantially as and for the purposes set forth.

479,756. COMBINED POCKET-LIGHTER AND MATCH-SAFE. ANDREW J. FREDERICKS, Grand Rapids, Mich., assignor of one-half to John Tournell, same place. Filed Feb. 26, 1891. Serial No. 382,912. (No model.)

Claim.—1. The combination of a short cylinder having one head attached, an opposite head having an annular flange provided with L-shaped channels in its outer surface, and lugs projecting from the inner surface of said cylinder and engaging said channels, substantially as described.

2. The combination of a cylinder having one head attached, an opposite head having an annular flange, L-shaped channels in said flange, lugs on said cylinder engaging said channels, openings in the side of said cylinder and flange, and a spring and lighter adjacent to said openings, substantially as described.



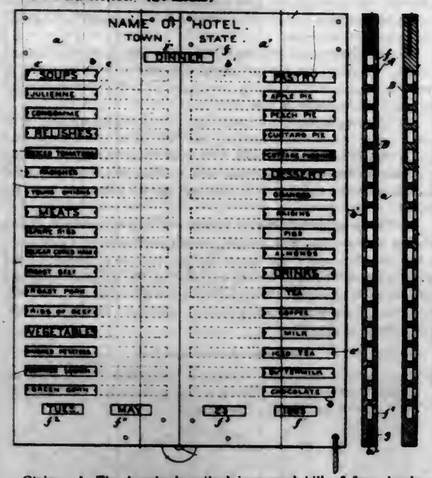
3. The combination of a case having an opening in the side thereof, a lighter near said opening, openings each side of said lighter, a chamber beneath the same, and a spring adapted to press against said lighter, substantially as described.

4. The combination of a case having an opening in the side thereof, a lighter near said opening, openings at each side of and a chamber beneath the same, a spring pressing upon the same, and a stop-hook near the same, substantially as described.

5. The combination of a cylindrical case having an opening in its side, a spring opposite said opening, and lugs on its inner surface, an annular flange adapted to rotate within said case having an opening in its side, a lighter attached near said opening, and circumferential channels with the ends of which said lugs engage, substantially as described.

6. The combination of a cylindrical case having an opening in its side and one head attached, a spring opposite said opening, a stop-hook at one side of the same, and lugs on its inner surface, an opposite head having an annular flange having an opening, and a lighter attached near said opening, adapted to engage said spring, L-shaped channels in the surface of said flange, having concave seats and engaging said lugs, substantially as described.

479,757. BICYCLE. WALTER L. FRUEN, Minneapolis, Minn., assignor of one-third to William H. Fruen, same place. Filed Sept. 15, 1891. Serial No. 405,772. (No model.)



Claim.—1. In velocipedes and similar vehicles, a shaft having oppositely-connected pedals, a traction-wheel, two independent sets of gearing connecting said pedal-shaft with the axle of said traction-wheel, and two clutches connected together and adapted to be engaged with and disengaged from said gearing by the act of holding the pedals in different positions.

2. In velocipedes and similar vehicles, a shaft having oppositely-connected pedals, a traction-wheel having two chain-wheels upon its axle, two chain-wheels loose upon said pedal-shaft and with clutch members upon or connected thereto and connected to the chain-wheels

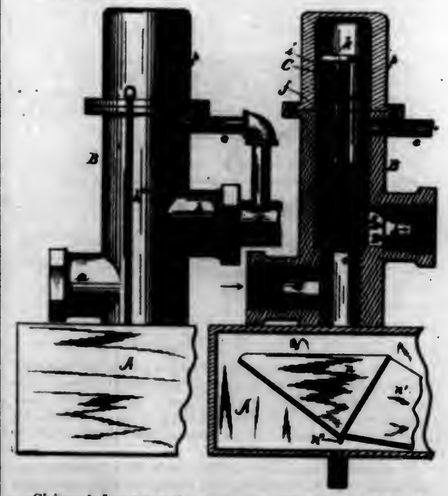
upon said axle by chains, and two clutch members connected together and adapted to be engaged with or disengaged from either of the clutch members of said chain-wheels by holding the pedal-shaft in different positions.

3. In velocipedes and similar vehicles, a shaft having oppositely-connected pedals, a traction-wheel having two chain-wheels upon its axle, two chain-wheels loose upon said pedal-shaft and with clutch members upon or connected thereto and connected to the chain-wheels upon said axle by chains, and two clutch members connected together and adapted to be engaged with or disengaged from either of the clutch members of said chain-wheels by holding the pedal-shaft in different positions, the teeth of said clutch members being undercut in opposite relations to cause them to retain their engaged relations, substantially as and for the purpose set forth.

479,758. BILL OF FARE. JOHN A. GUNN, Spearfish, S. D., assignor of one-half to Abraham L. Maxim and Ivor L. Brind, Omaha, Nebr., and Daniel C. Dwinnell, Spearfish, S. D. Filed Sept. 14, 1891. Serial No. 405,668. (No model.)

Claim.—1. The herein-described improved bill of fare, having front and back boards provided each with a column of openings, the openings of one column being contiguous with the openings of the adjacent columns, and one or more series of indicating-blocks having corresponding names or marks on its opposite sides and capable of being moved from the openings of one column to the openings of the next adjacent column, and thus being visible on the other side of the bill of fare and concealed from view on the side at which first visible, and a pivoted bar or arm adjacent to one of said columns of openings for limiting the movement of said blocks in one direction, as set forth.

2. The herein-described bill of fare, composed of two parts or sections pivotally connected together at their lower meeting edges and capable of being locked together and having front and back boards, said front boards being provided with two columns of openings adjacent to their longitudinal edges and said back boards with two columns of openings adjacent to the said meeting edges of said parts or sections, and two series of indicating-blocks normally exposed to view through the said columns of openings in said front boards, substantially as set forth.



3. The herein-described improved bill of fare, composed of two parts or sections pivotally connected together at their lower meeting edges, a pivoted bar or arm located between said meeting edges, each of said parts or sections having an outer front column of openings and an inner back column of openings contiguous with said former columns of openings, and indicating-blocks capable of being moved from one column of openings to the other or adjacent column, the blocks of one part or section being held in place by said bar or arm while the blocks are being placed in the other part or section, substantially as set forth.

4. The herein-described improved bill of fare, composed of two parts or sections pivotally connected together at their lower meeting edges, a pivoted bar or arm located between said meeting edges, each of said parts or sections having an outer front column of openings and an inner back column of openings contiguous with said former columns of openings, indicating-blocks capable of being moved from one column of openings to the other or adjacent column, the blocks of one part or section being held in place by said bar or arm while the blocks are being placed in the other part or section, and a spring-catch projecting from one of said parts or sections for engaging and locking the other part or section, substantially as set forth.

5. The herein-described improved bill of fare, composed of two parts or sections having each front and back boards with an intervening space, the hinge pivotally connecting said parts or sections together at their lower meeting edges, an arm extending from one of said parts or sections, and a plate-spring secured thereto and designed to engage a shoulder of the other part or sections, said parts or sections being provided each with two adjacent columns of openings, and indicating-blocks designed to be operated as and for the purpose stated.

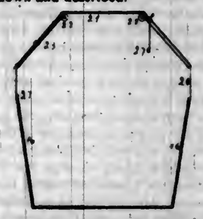
6. A bill-of-fare indicator formed in sections and having upper coincident openings at their meeting edges, a meal-indicating block located therein, and lower series of openings with blocks therein indicating the day and date, a column or columns of front openings, a column or columns of back openings adjacent to said former openings, and indicating-blocks located in said front column or columns of openings and capable of being moved into said back column or columns of openings, substantially as set forth.

479,759. PROPORTIONAL METER. WILLIAM D. HAWLEY and SILAS J. HOBAN, Syracuse, N. Y. Filed Aug. 31, 1891. Serial No. 404,259. (No model.)

Claim.—1. In a meter, the combination, with the meter-body provided with induction and eduction ports and the main valve seated therein and normally closing the eduction-port and provided with a vertical stem and an arm upon its upper end, of a separate valve-chamber supported within the meter-body above the main valve and provided with induction and eduction ports and piping connected therewith and a valve in said chamber connected to the arm upon the main-valve stem.

2. In a meter, the combination, with the meter-body provided with induction and eduction ports and the main valve seated therein and normally closing the eduction-port and provided with a vertical stem and an arm upon its upper end, of a separate valve-chamber supported within the meter-body above the main valve and provided with induction and eduction ports and piping connected therewith and a valve in said chamber connected to the arm upon the main-valve stem and means for measuring the discharge from the latter valve-chamber.

3. In a meter, the combination, with the meter-body provided with eduction and induction ports and the valves therein, of a pipe connecting the eduction-pipe with the chamber in the body above the main valve.



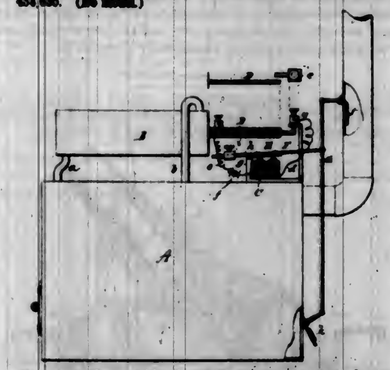
4. In a meter, the combination, with the main valve operated to open and close a rectangular eduction-port, of an auxiliary valve connected to and simultaneously operated by the main valve to open and close another eduction-port from the auxiliary-valve chamber, an inlet-pipe thereto, and an eduction-pipe therefrom, and tilting buckets receiving the discharge from the latter eduction-pipe, as and for the purpose set forth.

479,760. ASH-CART. DANIEL M. HOLMES, Arlington, N. J. Filed Oct. 30, 1891. Serial No. 410,312. (No model.)

Claim.—1. The combination of a cart supporting and inclosing

frame mounted upon an axle, said frame having upwardly-projecting stops at each side thereof, and a cart-body supported within said frame at the front and upon rocking trunnions secured to the sides of the body, as set forth, whereby when the body is tilted the trunnions will rock backward in a fixed course upon the sides of the body inclosing the frame, substantially as shown and described.

2. The combination, with a cart-body having a closed top, of curtains mounted upon spring-rollers and forming a portion of said top, substantially as shown and described.



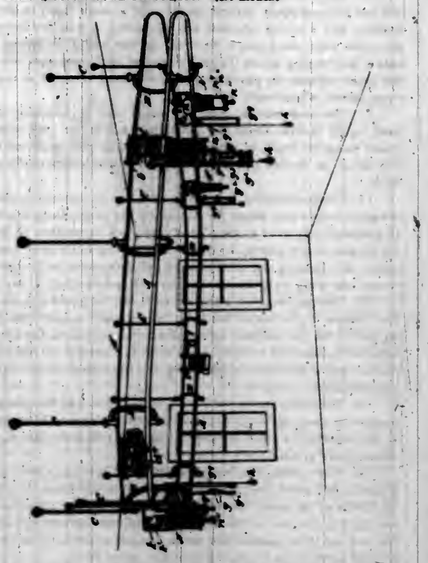
3. In a cart-body of the character herein specified, the combination, with the fixed portions of the top of the body, of curtains mounted upon spring-rollers, said curtains being held in place and arranged to operate substantially as shown and described.

4. In a running-gear and supporting-frame for carts, shafts secured to a cross-piece, downwardly and backwardly extending bars connected to the cross-piece and shafts and to a bent axle, and brace-bars extending from the shafts around the cross-piece to which the shafts are connected and thence to the axle near the wheels, the whole combined and arranged substantially as shown and described.

5. A running-gear and support for cart-bodies, in which is comprised a bent axle, braces passing from the highest parts of the axle to the sides of the shafts, a cross-piece and shafts secured thereto, bars extending from the shafts and cross-pieces downward and then backward to the depressed portion of the axle, and braces passing from the lower sides of the shafts to said bars, the whole combined and arranged substantially as shown and described.

6. The combination, with the cart-body and the supporting-axle, of stop-hooks upon the body, adapted and arranged to bear against the axle and pass thereabeneath when the body is tipped, substantially as shown and described.

479,761. TEMPERATURE-REGULATOR. WASHINGTON H. KILBOURN, Greenfield, Mass., assignor to Albert J. Smart and J. E. Hubbard, same place. Filed May 13, 1891. Renewed June 30, 1892. Serial No. 438,695. (No model.)



Claim.—1. The combination, with a water-heater and a tank or radiator connected therewith, of a thermostat-bar extending into and projecting beyond the tank or radiator, an electro-magnet, an electric circuit including the thermostat-bar, the electro-magnets and a contact, and dampers connected with the armature of said electro-magnet, so that when the electric circuit is opened or closed by the thermostat-bar one of said dampers will be open and the other closed, substantially as set forth.

2. The combination, with a water heater and a tank or radiator connected therewith, of a thermostat-bar extending into and beyond the tank or radiator, an electro-magnet, an electric circuit including said electro-magnet, a contact, and the thermostat-bar, a rod or bar secured to the armature of said electro-magnet, a rod connected at a point between its ends to the end of said rod or bar, and dampers connected to the ends of said rod, substantially as set forth.

3. The combination, with a furnace, a water-tank or radiator, a smoke-pipe, and doors or dampers in the smoke-pipe and furnace, of a thermostat-bar extending into and beyond the tank or radiator, an electro-magnet, an electric circuit including said electro-magnet, a contact, and the thermostat-bar, a rod or bar secured to the armature of the electro-magnet, and a rod connected at a point between its ends to the end of said rod or bar, said rod being connected at one end to the damper of the furnace and at the other end to the damper in the smoke-pipe, substantially as set forth.

479,762. CASH-CARRIER APPARATUS. MARY A. B. LIVERMORE, Providence, R. I., executrix of Charles W. Livermore, deceased, assignor to the Kenney Electrical Cash Carrier Company, Portland, Me. Filed June 4, 1890. Serial No. 354,259. (No model.)

Claim.—1. In a cash-carrier apparatus, the combination, with a track and a pouch supported near the track, of a carriage adapted to move along the track, the said carriage being provided with a pair of parallel bars located upon the side thereof and extending in the direction of the movement of the carriage in position to engage the supported pouch, substantially as set forth.

2. In a cash-carrier apparatus, the combination, with a track, a pouch-support near the track, and a pouch, of a stop upon the opposite side of the track to release a pouch and a carriage adapted to move along the track, the said carriage being provided upon each of its opposite sides with a pouch collector and distributer, the said collector and distributer extending longitudinally in the direction of the path of movement of the carriage and having vertically-separated bearings for engaging the pouches and preventing them from swaying laterally, substantially as set forth.

3. In a cash-carrier apparatus, the combination, with a carriage having a collector and distributer bar secured thereto, of a stop seated in the bar and having a reciprocatory sliding movement transversely thereto and a lever for operating the stop, substantially as set forth.

4. In a cash-carrier apparatus, the combination, with a carriage having a collector and distributer bar secured thereto, of a stop seated in the bar and having a reciprocatory movement transversely thereto and a lever fulcrumed to the bar and loosely connected with the stop to operate it, substantially as set forth.

5. The combination, with the collector and distributer bar, of a stop seated therein and having a reciprocatory sliding movement transversely to the bar and means for applying friction to the stop to hold it in the desired adjustments, substantially as set forth.

6. The combination, with the collector and distributer bar, of a stop seated therein and having a reciprocatory movement transversely to the bar, the stop being held in its adjustment by friction, and a device for regulating the friction of the stop, substantially as specified.

7. The combination, with the pouch-support at the side of the track, the collector and distributer on the carriage, and the grasping device at the opposite side of the track, of the pouch separable from the support, carriage, and grasping device and provided with separate

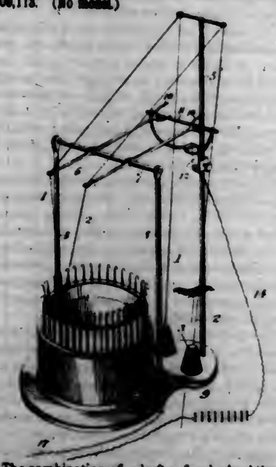
retaining devices corresponding, respectively, to the said support, collector and distributer, and grasping device, substantially as set forth.

8. The combination, with the pouch-support at the side of the track, the collector and distributer on the carriage, and the grasping device at the opposite side of the track, of the pouch provided with an attachment, from which the receptacle portion of the pouch is suspended, the said attachment comprising a device to engage the support at the side of the track, a device to engage the collector and distributer and a device to engage the said grasping device, substantially as specified.

9. The combination, with the pouch provided with its attachment for supporting it, of a pouch-supporting bar and a guide located over the bar and spaced therefrom for preventing the improper suspension of the pouch, substantially as specified.

10. The combination, with the bracket adapted to rise and fall and the pouch-support carried thereby, of a catch fixed to the said bracket, and a spring-actuated arm supported in position to engage the catch when the pouch is elevated, the free end of the spring-actuated arm extending across the path traversed by the carriage, whereby the latter releases the pouch-support and allows it to fall as the carriage passes, substantially as set forth.

11. The combination, with the pouch and its releasing-tongue fixed rigidly thereto above the pouch and means for conveying the pouch along the track, of grasping-jaws fixed at the side of the track in position to receive the tongue on the pouch, substantially as set forth.



12. The combination, with the pouch and its laterally-projecting releasing-tongue and means for conveying the pouch along the track, of grasping-jaws fixed at the side of the track in position to receive the tongue on the pouch, one of the jaws having an inclined face, and means for adjusting the jaws toward and away from each other and toward and away from the plane of the rails, substantially as set forth.

13. The combination, with the track and the pouch-grasping device located at the side of the track, of a pocket beneath the grasping device for the reception of the pouch, the pocket having a spring-actuated bottom free to move away from and toward the body of the pocket, and guide-rods for directing the movement of the bottom, substantially as set forth.

14. The combination, with the grasping-jaws and the track, of a support for the grasping-jaws fixed rigidly to the upper and lower rails of the track and a receiving-pocket suspended from the said support, substantially as set forth.

15. The combination, with the track, the carriage provided with a distributer, and a reciprocating stop on the distributer, of a grasping device at the side of the track and inclines located at points along the track in the path of the stop, one of the inclines tending to throw the stop out of the path of the pouch and the other to throw the stop into the path of the pouch, substantially as set forth.

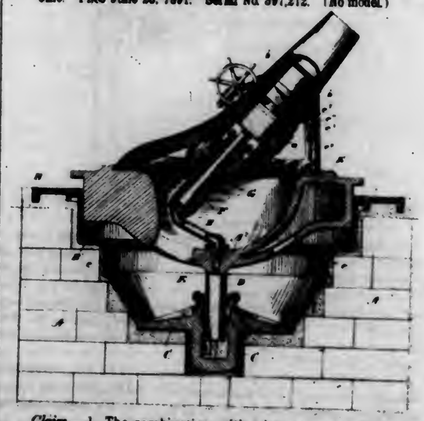
479,763. STOP-MOTION FOR KNITTING-MACHINES. GEORGE J. MANDERFIELD, Royer's Ford, Pa., assignor of one-half to J. M. Lewin, Samuel Lewin, W. S. G. Finkbiner, and A. R. Saylor. Filed Oct. 19, 1891. Serial No. 408,113. (No model.)

Claim.—1. The combination of a shaft, a fixed wheel thereon having a notched rim, a driving-wheel loose upon the shaft and having a tooth to engage the notched rim of the fixed wheel, a spring encircling the shaft and holding the wheels normally apart, a cam projection on the bearing for the shaft, and a cam-shaped lever working between the bearing and the hub of the loose wheel, substantially as described.

2. The combination of a shaft, a fixed wheel thereon, a loose wheel thereon, a spring encircling the shaft between the wheels and holding them normally apart, a cam-shaped projection on the shaft-bearing nearest the loose wheel, a pivoted lever having a cam-surface co-operating with the cam on the shaft-bearing, and a spring encircling the pivot-pin of the lever and holding the latter up to the cam on the bearing, substantially as described.

3. In a stop-motion for knitting-machines and the like, the combination of an operating-shaft, a drive-wheel normally loose thereon, a wheel fixed on the shaft and adapted to be engaged with the loose wheel, a cam-shaped lever for forcing and holding the wheels together, a spring-catch for holding the lever up to its work, a weight arranged to strike and release the spring-catch, a guide through which the yarn passes, and an electric circuit, including the guide and the mechanism for dropping the weight, substantially as described.

4. The combination of a shaft, a wheel fixed thereon and having notches, a driving-wheel normally loose on the shaft, a spring encircling the shaft between the wheels and holding them normally apart, a weighted cam-shaped lever for forcing and holding the wheels together, and a spring-catch for holding the lever up to its work, substantially as described.



5. The combination of a shaft, a wheel fixed thereon, a driving-wheel loose thereon, a spring encircling the shaft between the wheels and holding them normally apart, a cam on the shaft-bearing adjacent to the loose wheel, and a wedge-shaped cam working between the bearing and the loose wheel for causing it to engage the fixed wheel, substantially as described.

6. The combination of a shaft, a wheel fixed thereon, a driving-wheel loose thereon, a spring encircling the shaft between the wheels, a cam on the shaft-bearing adjacent to the loose wheel, a pivoted lever having a wedge-shaped cam and adapted to work between the shaft-bearing cam and the loose wheel, and a catch for holding the lever up to its work, substantially as described.

7. The combination of a shaft, a wheel fixed thereon, a drive-wheel loose thereon, a spring encircling the shaft between the wheels, a cam on the shaft-bearing adjacent to the loose wheel, a pivoted lever having a wedge-shaped cam and adapted to work between the shaft-bearing cam and the loose wheel, and a catch for holding the lever up to its work, the lever being weighted to fall upon the release of the catch, substantially as described.

8. In a stop-motion for knitting-machines and the like, the combination of an operating-shaft, a drive-wheel normally loose thereon, a fixed wheel on the shaft, a spring interposed between the wheels and holding them normally apart, a weighted cam-shaped lever for forcing the wheels together and holding them in engagement, a spring-catch for holding the lever up to its work, a weighted trip-arm for the catch, a magnet whose armature is arranged to hold the trip-arm elevated, a guide through which the yarn passes, and an electric circuit including the guide and the magnet, substantially as described.

479,764. MORTAR-MOUNTING. THOMAS R. MORGAN, Sr., JOHN R. MORGAN, THOMAS R. MORGAN, Jr., and WILLIAM H. MORGAN, Alliance, Ohio. Filed June 23, 1891. Serial No. 397,212. (No model.)

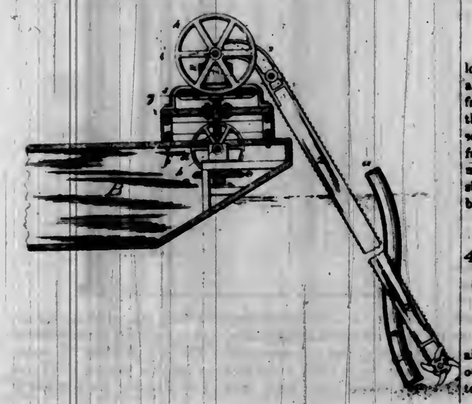
Claim.—1. The combination, with a base or support, a carriage resting thereon, a gun, upper plungers supporting the gun and adapted to be moved by the recoil thereof, and hydraulic cylinders in which said upper plungers move, of a cylinder and plunger located below the carriage, and fluid passage-ways between the upper and lower cylinders, substantially as set forth.

2. The combination, with a base or support, a carriage resting thereon, and a gun mounted on the carriage, the said gun being normally above the base or support and the said carriage being laterally supported at all times by the base, of means for elevating the carriage, and devices for turning the carriage while thus elevated.

3. The combination, with a base or support, a carriage normally resting thereon, a gun, upper plungers supporting the gun, and hydraulic cylinders in which said upper plungers move, of a cylinder and plunger located below the carriage and adapted to support same when in an elevated position, the said last-mentioned cylinder adapted to receive the fluid displaced by the upper plungers for elevating the carriage, substantially as set forth.

4. The combination, with a carriage, a gun located thereon, upper plungers for supporting the gun and adapted to be actuated by the recoil of the gun, and hydraulic cylinders in which said upper plungers move, of a cylinder and plunger located below the carriage, fluid passage-ways between the upper and lower cylinders, and a check-valve in said passage-way for preventing a return of the fluid to the upper cylinders, substantially as set forth.

5. The combination, with a carriage, a gun located thereon, upper plungers in operative connection with said gun and adapted to be actuated by the recoil of the gun, and hydraulic cylinders in which said upper plungers move, of a cylinder and a plunger located below the carriage, fluid passage-ways between the upper and lower cylinders, a check-valve in said passage-way for preventing a return of the fluid to the upper cylinders, a by-pass pipe or shunt around said valve, and a valve in said by-pass or shunt, substantially as set forth.



6. The combination of a gun-carriage carrying cylinders, plungers actuated by the recoil of the gun, and a cylinder and plunger located below the carriage, the said cylinders having therein a fluid under pressure and so connected that when the plungers which are actuated by the recoil of the gun are forced into their cylinders the fluid in said cylinders is forced into the lower cylinder and the carriage elevated above its seat, and when the lower cylinder is opened for the escape of the fluid therein the weight of the elevated carriage forces the fluid in said lower cylinder into the upper cylinders, thereby elevating the gun, substantially as set forth.

7. The combination, with a ring having an inwardly-projecting horizontal flange, of a gun-carriage seated within the ring and resting on the flange, a cylinder and plunger located below the carriage, and means actuated by the recoil of the gun for forcing a liquid into the cylinder, substantially as set forth.

8. The combination, with a gun-carriage and a support therefor, of a hydraulic cylinder and plunger located below the carriage, hydraulic devices supporting the gun and adapted to receive the force of the recoil, and passage-ways between the hydraulic devices which receive the force of the recoil, and the hydraulic cylinder below the carriage, whereby the fluid which receives the impact is forced into the cylinder below the carriage and elevates said carriage above its support, substantially as set forth.

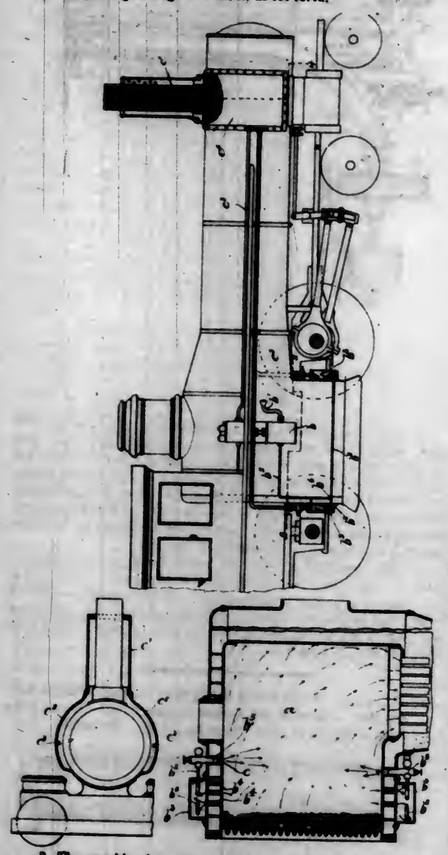
479,765. DREDGING-PUMP. JOHN D. MCRAE, Baldwinsville, N. Y. Filed Jan. 2, 1892. Serial No. 416,784. (No model.)

Claim.—1. A frame, a stationary vertical post, a sleeve thereon, wings upon the sleeve, upon which the frame is pivoted, stirrers secured upon a shaft journaled in said frame, and means to rotate said stirrers, in combination.

2. A drive-shaft and gear, a vertical shaft, bevel-gears upon said shaft, engaging with each other, a horizontal shaft, bevel-gears upon the latter and upon said vertical shaft, engaging with each other, and sprockets upon the horizontal shaft, a frame, a shaft journaled therein and provided with sprocket-gears, belting connecting said gearing and leading to and driving a shaft in the lower end of said frame to rotate the stirrers thereon, and a suction-pipe supported by the frame carrying the stirrers, in combination, as set forth.

3. The combination, with the pump and its suction-pipe, of a frame to which the pipe is connected, a shaft across the lower end of said frame, a pivot-post, a sleeve around it and wings upon said sleeve, upon which the frame is hinged, a stirring apparatus upon said frame, and gearing and belting leading from a source of power to and actuating the stirring apparatus.

479,766. WINDOW-SHADE FIXTURE. JUDSON C. PERKINS, Meriden, Conn., assignor to the Meriden Curtain Fixture Company, same place. Filed Jan. 31, 1891. Serial No. 379,760. (No model.)



Claim.—In a window-shade fixture, the combination of the following-named instrumentalities, viz: a shade roller suitably mounted, a shade attached to and adapted to be wound upon and unwound from said roller, a roller-locking mechanism thrown into and out of the roller-locking condition by the action upon it of the shade, and some suitable stationary part—such, for instance, as the window-frame—or some fixture thereon with which the said roller-locking mechanism is caused to engage by the action on the latter of the shade, the combination being and operating substantially as hereinbefore described, for the purpose set forth.

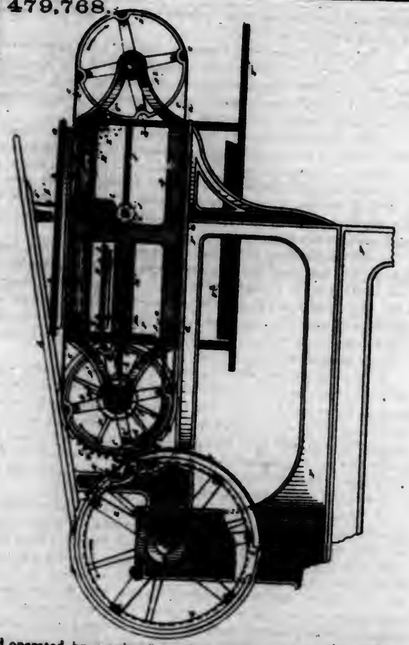
479,767. SMOKE-CONSUMING APPARATUS FOR BOILER AND OTHER FURNACES. WESLEY SMITH, Toledo, Ohio, assignor, by direct and mesne assignments, to Charles W. Morris, Jr., trustee, and Charles W. Morris, Boston, Mass. Filed Mar. 10, 1892. Serial No. 424,285. (No model.)

Claim.—1. The combination, with a furnace or fire-box, of an air-compressor, a conduit connecting said compressor with the interior of the fire-box, and a secondary air-conduit arranged to conduct external air to the delivering end of the compressed-air conduit, said

secondary conduit being arranged to subject the air passing through it to heat, as set forth.

2. The combination, with a furnace or fire-box, of an air-compressor, a conduit connecting said compressor with the interior of the fire-box and arranged to subject the air passing through it to heat, and a secondary air-conduit adapted to conduct external air to the delivering end of the compressed-air conduit and arranged to subject the air passing through it to heat, as set forth.

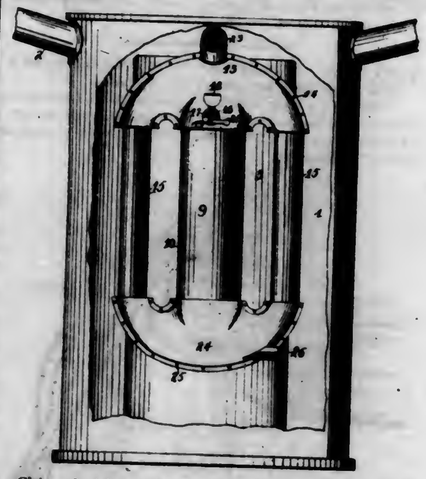
3. The combination, with a fire-box or furnace, of an injector comprising an inner and an outer nozzle, air-conduits connected with said nozzles and arranged to heat the air passing through them, and an air-compressor connected with the conduit communicating with the inner nozzle, as set forth.



479,768. COMBINED PAPER-FOLDING AND SHEET-DELIVERING MECHANISM FOR PRINTING-PRESSES. JOHN H. STONEMETZ, Erie, Pa. Filed Jan. 2, 1886. Serial No. 187,371. (No model.)

Claim.—1. The combination, with a printing-press, of a paper-folding machine provided with a set of conveyer-tapes, bands, or chains having sheet-grippers thereon and adapted to convey sheets from the press into and over and beyond the folder, and two sets of gripper-trippers, one of which is adapted to be adjusted to open the grippers and release the sheet over the first set of folding-rolls and the other to open the grippers and release the sheet after it has passed over the folder, substantially as and for the purpose set forth.

2. The combination, in a paper-folding machine, of conveyer-tape wheel at each end of said machine with conveyer-tapes having grippers thereon, said tapes operating on said tape-wheels and passing over the folder in one direction and back under the folder in the other, and gripper-tripping mechanism for opening the grippers and releasing the sheet, substantially as and for the purpose set forth.

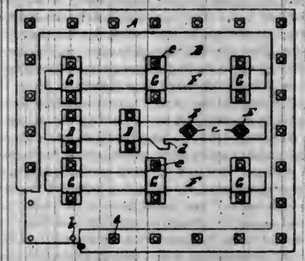


3. The combination, with a printing-press, of a paper-folding machine having conveyer tape-wheels adjacent to the impression-cylinder

479,768.

and operated by gearing from the press, carrier-tapes having sheet-grippers thereon and passing around said tape-wheels and over the folding-machine in one direction and back under it in the other, and adjustable mechanism for opening the tape-grippers and releasing the sheet on the top of the folder, and also mechanism for opening the tape-grippers as they pass under the folder for releasing a sheet and for gripping another sheet, substantially as and for the purpose set forth.

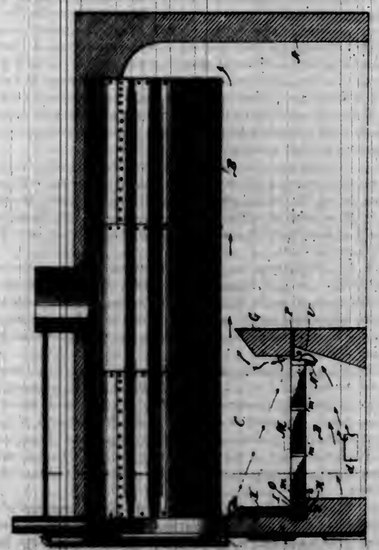
479,769. HOT-AIR FURNACE. WILLIAM THURNER, Jr., and PAUL HERCKENBACH, St. Louis, Mo., assignors to the Star Cornice and Furnace Company, same place. Filed Mar. 15, 1892. Serial No. 425,067. (No model.)



Claim.—1. A hot-air furnace comprising two couplings, the upper one of which is in communication with the chimney or other source, three pipes or flues in communication with said couplings, the larger or center one in direct communication with the furnace, a valve or damper located in the upper coupling for directing the products of

combustion, and a suitable opening also formed in the said upper coupling and provided with a suitable door through which the air is allowed to pass when it is desired to cut off the draft of air from the furnace, substantially as described.

3. A hot-air furnace consisting of a large central flue 10, in communication with the furnace, side flues 15, located on either side of the said flue 10 and in communication with the same, couplings 16 and 24, composed of sections bolted together, into which the ends of the pipes are adapted to be fitted, an opening, such as 26, for removing the soot or other accumulations, a damper 20, located in the coupling 16 and adapted to close the upper end of the pipe 10, a pipe 17, in communication with the said coupling, through which air is adapted to pass, and a door 18, attached to said pipe and adapted to close the opening formed therein, substantially as described.



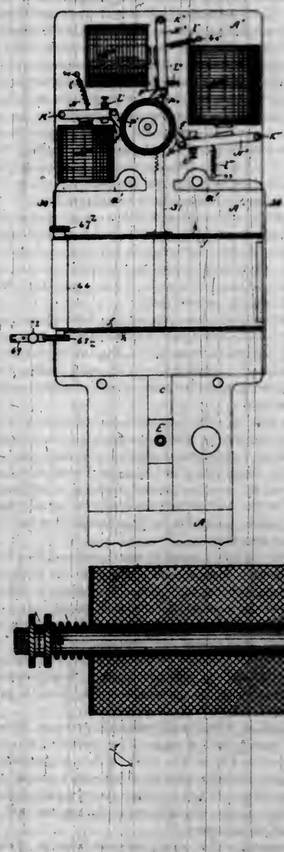
479,770. SHEET-METAL-OVEN BOTTOM FOR RANGES. WILLIAM H. WHITEHEAD, Erie, Pa. Filed Mar. 21, 1892. Serial No. 425,969. (No model.)

Claim.—1. The combination, in a sheet-metal-oven bottom, of a sheet-metal plate, as B, and a frame, as A, secured to the periphery thereof, with longitudinal bars secured to the under side of said sheet-metal plate in such a manner as to provide for the unequal expansion and contraction of the sheet-metal plate and the bars secured thereto, substantially as and for the purpose set forth.

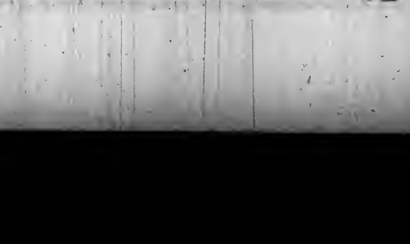
2. The combination, in a sheet-metal oven, of a bottom consisting of a plate of sheet metal, with longitudinal bars secured thereto by means of bolts passing through slotted holes in said bars, substantially as and for the purpose set forth.

479,771. FURNACE. WILLIAM WALTERS, Chicago, Ill., assignor of one-fourth to George D. Garland, same place. Filed Oct. 20, 1891. Serial No. 409,275. (No model.)

Claim.—1. In a furnace, the combination, with a fire-box and the ash-pit, of the injector-nozzles arranged to direct a stratum of fluid across the fire-box, and hollow grate-bars communicating with the ash-pit at one end and with such injector-nozzles at their other ends, substantially as set forth.



2. In a furnace, the combination, with the fire-box and ash-pit, of hollow grate-bars communicating with the ash pit and an injector arranged withi the fire-box and having communication with said grate-bars and having its nozzle so aimed as to direct a current across the fire-box in a downward direction, substantially as set forth.



3. In a furnace, the combination, with the fire-box and ash-pit, of hollow grate-bars communicating with the ash-pit at their inner ends, a manifold chamber with which said bars communicate at their other ends, upright branch pipes leading from said manifold chamber, and injector-nozzles on said branch pipes aimed across the fire-box, substantially as set forth.

4. In a furnace, the combination, with the fire-box and ash-pit, of hollow grate-bars communicating with the ash-pit at their inner ends, a manifold chamber with which said bars communicate at their other ends, upright branch pipes leading from said manifold chamber, and injector-nozzles on said branch pipes aimed in a downward direction across the fire-box, so as to project fluid passing therethrough toward the base of the bridge-wall, substantially as set forth.

5. In a furnace, the combination, with the fire-box and ash-pit, of hollow independently-removable grate-bars having communication at their inner ends with said ash-pit, a manifold chamber with which said bars communicate at their outer ends, branch pipes projecting upwardly from said manifold chamber, and steam-injectors on the upper ends of said pipes aimed toward the base of the bridge-wall, substantially as set forth.

479,772. MATRIX-MAKING MACHINE. GEORGE A. GOODSON and ALEXANDER S. CAPEHART, Minneapolis, Minn., assignors, by mesne assignments, to Thomas S. Beauford, New York, N. Y., receiver of the Minneapolis Electro-Matrix Company. Filed May 31, 1887. Serial No. 239,735. (No model.)

Claim.—1. In a matrix-making machine, the combination, with a movable matrix-material carriage, of character-selecting devices classified into groups according to the space required by the characters to which they correspond, independent and complete automatic feed mechanisms less in number than the characters and each adapted to effect a movement of said carriage a determinate distance in the same direction, and connections between the character-selecting devices and said feed mechanisms, whereby the appropriate feed mechanism for each group will be brought into operation by the manipulation of any of the character-selecting devices of said group, substantially as described.

2. The combination, with the movable matrix-material carriage, of a character-board representing a series of characters, said characters being classified on the board into groups according to the space required by each character, independent and complete automatic feeding devices for the matrix-material carriage less in number than the characters represented on said board, said feeding devices being adapted to move the matrix-material carriage a determinate distance in the same direction, and a different connection between each group of the character-board and the feeding devices, substantially as described.

3. In a matrix-making machine, the combination, with a movable matrix-material carriage, of character-selecting devices classified into groups according to the space required for each character, independent and complete electrically controlled feed mechanisms less in number than the character-selecting devices and each adapted to move the matrix material carriage a determinate distance in the same direction, and different electrical connections between each group of the selecting devices and the feed mechanisms, substantially as described.

4. The combination, with a movable matrix-material carriage, of a character-board representing a series of characters, said characters being classified on said board into groups according to the space required for each character, independent and complete feeding devices comprising two or more electric motors, each adapted to move the matrix-material carriage a determinate distance in the same direction, and different electric connections between each group of the character-board and the feeding devices, said electric connections being provided with circuit-controlling devices, substantially as described.

5. The combination, with the movable matrix-material carriage, of a character-board representing a series of characters, said characters being classified on said board into groups according to the space required for each, as many independent and complete automatic feeding devices as there are groups of characters, each feeding device adapted to move said carriage a different distance in the same direction, and a suitable connection from each group of characters to the corresponding feeding device, substantially as described.

6. The combination, with a movable matrix-material carriage, of two or more electrically controlled independent and complete feeding devices, each adapted to effect the movement of said carriage a determinate distance in the same direction, and electric connections for said feeding devices, said electric connections being provided with circuit-controllers, substantially as described.

7. The combination, with a movable matrix-material carriage, of electrically-controlled independent and complete feeding devices, each feeding device being adapted to move said carriage a different distance in the same direction, and a different circuit for each feeding device, each of said circuits being provided with circuit-controlling devices, substantially as described.

8. In a matrix-making machine, the combination, with a movable matrix-material carriage, of character-selecting devices classified into groups according to the space required for each character, electrically-controlled independent and complete feed mechanisms, each adapted to move the matrix-material carriage a different distance in the same direction, and electric circuits including said feeding devices, said circuits being controlled by said character-selecting devices, substantially as described.

9. The combination, with a movable matrix-material carriage, of feeding devices comprising two or more electric motors, each motor being adapted to move said carriage a different distance in the same direction, a different electric connection for each motor, and a character-board representing a series of characters, said characters being classified on said board into groups or classes according to the space required for each character, each of said connections being provided with circuit-controlling devices, one part of said circuit-controlling devices in each of said circuits being connected with one of the groups of the character-board, substantially as described.

10. The combination, with a matrix-material carriage, of electric feeding devices for moving said carriage, a bar provided at one end with a series of type-dies and at the other with a single hand-key having a contact-point, an index-plate provided with key-seats corresponding to said type-dies and having contact-points adjacent thereto, and electrical connections between said contact-points and said feeding devices, substantially as described.

11. The combination, with a matrix-material carriage, of electric feeding devices for the same and electric connections for said feeding devices, a die-carriage, an electric hammer for depressing the dies, an electric circuit for said hammer, and an electric circuit-controlling device for the hammer-circuit, located in the electric connections for said feeding devices, said electric connections for the feeding devices being provided with circuit-controlling devices, substantially as described.

12. The combination, with a matrix-material carriage, of two or more electric motors in different circuits adapted each to move said carriage a different distance, a die-carriage, an electric hammer for depressing said dies, an electric circuit for said hammer, and an electric-circuit-controlling device for the hammer-circuit, located in each of said motor-circuits, said motor-circuits being provided with a circuit-controlling device or devices, substantially as described.

13. The combination, with a matrix material carriage, of electric feeding devices for the same and electric connections for said feeding devices, a die-carriage and electric hammer for depressing the dies, an electric circuit for said hammer, a hand circuit breaker in said hammer-circuit, and an electric-circuit-controlling device for said hammer-circuit, located in the electric connections for the said feeding devices, the electric connections for the feeding devices being provided with a circuit-controller, whereby the said hammer may be operated from the feeding circuits or the feeding devices be worked independently of said hammer, as desired, substantially as described.

14. The combination, with a matrix-material carriage, of two or more electric motors adapted each to move said carriage a different distance in the same direction, a lever provided with a die-carriage at one end and a hand-key at the other, said hand-key having a contact-point, an index-plate provided with key-seats corresponding to the dies of said die carriage and having contact-points adjacent thereto, electric circuits through each of said contact-points, an electric die-depressing device, and an electric-circuit controller for said electric die-depressing device located in the feeding-circuit, substantially as described.

15. The combination, with a matrix-material carriage, of a character-board representing a series of characters, said characters being classified on said board into groups according to the space required for each character, feeding devices comprising two or more electric motors each adapted to move said carriage a certain distance in the same direction, an electric die-depressing device, different electric connections from each group of characters to the corresponding feeding device, an electric connection for said die-depressing device, the said connections for the feeding devices being provided with circuit-controllers, and a circuit-controller for the connections of the die-depressing device, substantially as described.

16. The combination, with a matrix-material carriage, of a die-carriage seat, a bar capable of movement in all directions in a plane parallel with the plane of the carriage-seat, provided with type-dies at one end classified according to the space required for each, and with a hand-key at the other having a contact-point, an index-plate having key-seats and contacts corresponding to said type-dies, feeding devices consisting of two or more electric motors each adapted to move said carriage a certain distance in the same direction, an electric die-depressing device, different electric connections from each group of contacts to the corresponding feeding device or devices, an electric circuit through said connections, hand-key, and contacts, an electric circuit through said die-depressing device, and an electric-circuit controller for said depressing device located in the connections of the electric feeding devices, substantially as described.

17. In combination, the electro-magnet 19, provided with a hollow axis, the armature 20, serving as a hammer, provided with a retracting-spring 22, the die depressing pin 17, the cap-plate 3, the brass bushing 16, an electric circuit through said magnet, and means, substantially as described, for opening and closing said circuit, as and for the purposes set forth.

18. In combination, magnet 19, provided with a hollow axis, closely-fitting armature-hammer 20, provided with the head 24, the sleeve 23, the bushing 16, and the pin 17, resting in said bushing and provided with a head closely fitting the interior of said sleeve, whereby an air-cushion is provided preventing jarring contact between said hammer and said sleeve.

19. In a matrix-making machine, the combination, with a matrix-material carriage, of a rack attached thereto, a pinion engaging said rack, a ratchet-wheel connected with the pinion, a series of actuating-pawls engaging said ratchet, each having a different range of movement of fixed extent, the movement of each greater pawl being a multiple of the movement of the pawl moving the least distance, and an independent electro-magnet for actuating each pawl, substantially as described.

20. The combination, with a matrix-material carriage and a rack attached thereto, of a pinion engaging said rack and its shaft, a ratchet-cylinder having a smooth surface adjacent to the ratchet-teeth, keyed on the pinion-shaft rotating therewith, and movable longitudinally thereon, and an actuating pawl engaging said ratchet, substantially as described.

21. In feeding devices for matrix-making machines, a ratchet-cylinder keyed to and movable lengthwise of its supporting-shaft and revolving therewith, having a smooth surface adjacent to its ratchet-teeth, the said smooth portion and the broader faces of the teeth being connected by inclines, and an actuating-pawl engaging said ratchet when at one extreme of movement, substantially as described.

22. In feeding devices for matrix-making machines, a cylinder keyed to and movable lengthwise of its supporting-shaft and having on its periphery a series of ratchet-teeth the outer tips of which extend to the periphery of the cylinder, the larger faces of said ratchet-teeth being connected with the smooth portion of the cylinder by inclines, and an actuating-pawl engaging said ratchet-teeth when in one extreme of movement, substantially as described.

23. The combination, with a matrix-material carriage provided with a rack, of a pinion engaging said rack, having a hub extending on one side of the same, a cap-sleeve mounted on the axis of the pinion, movable lengthwise of the same, a cylinder having ratchet-teeth and a smooth peripheral portion adjacent to its ratchet-teeth keyed to said extending hub and said sleeve, and an actuating-pawl engaging said ratchet, substantially as described.

24. The combination, with a matrix-material carriage provided with a rack, of a pinion engaging said rack, having a hub extended on one side of the same, a cap-sleeve keyed to the axis of the pinion and movable lengthwise of the same, a cylinder having a smooth peripheral portion adjacent to its ratchet-teeth keyed to said extended hub and mounted on said sleeve, an actuating-pawl engaging said ratchet-teeth, and a band-spring attached at one end to said cap-sleeve and at the other to the interior of the cylinder, substantially as described.

25. In a matrix-making machine, the combination, with type-dies, an impression device, and an oscillating and sliding lever adapted to present said dies successively to the impression device, of a carriage for a matrix-body thereunder, and suitable electrical devices for moving said carriage and actuating the impression device upon the closing of a circuit by the operation of said lever.

26. In a matrix-making machine, a die-carrier adapted to present the dies in sequence to an impression device, a matrix-carriage thereunder, a rack connected thereto, a pinion engaging the rack, a ratchet-wheel and pawls arranged to turn the pinion, armatures actuating the pawls and having different degrees of movement, and electro-magnets therefor, substantially as set forth.

27. In combination, in a matrix-machine having means for presenting type-dies in succession to an impressing device, a matrix-carriage provided with side pieces having guides for the edges of a matrix-strip, and a central bridge constituting an anvil, feed-rolls, and ratchet and pawl devices for turning them to slide the strip in its guides to separate lines of impressions, and means for advancing the carriage to space the impressions in the lines, substantially as set forth.

28. In a matrix-machine, the combination of a die-carrier provided with a series of type-dies movable in guides in said carrier, a matrix-carriage movable laterally, a lever controlling the movement of the die-carrier for locating the type-dies opposite the impression-point, a feed mechanism for advancing the matrix-carriage, an impressing device for engaging each type-die when brought to the impression-point, a character-index co-operating with the controlling-lever for locating the type-dies, electro-magnetic devices operating the impressing device and the feed mechanism of the matrix-carriage, circuit connections, and circuit-controlling devices operated by the lever which adjusts the position of the type-dies, substantially as set forth, whereby as the dies are successively brought into position at the impression point the matrix-carriage is advanced and the impressing device operated to project the type-dies into the matrix-strip.

29. In a matrix-machine, an impressing device, type-dies mounted to reciprocate in guides in a movable die-carrier, a plate provided with a centering-aperture opposite the impressing device, a matrix-carriage movable laterally of the central aperture, variably-feeding devices for actuating said matrix-carriage, and a lever controlling the motions of the die-carrier and determining the position of the type-dies relatively to the impressing device and centering-aperture, electro-magnetic devices controlling the feed mechanism and circuits, and circuit connections controlled by the lever which locates the die-carrier, substantially as set forth.

30. In a matrix-machine, an impressing device, a laterally-movable die-carrier provided with type dies, a plate provided with a centering-aperture, a matrix-carriage movable laterally of and below the said plate and providing guides for a matrix-strip, and a feeding device movable with said matrix-carriage and engaging the matrix-strip borne thereby, substantially as set forth.

31. In a matrix-machine, the combination of a laterally-movable die-carrier provided with movable type-dies, a matrix-carriage, and devices for intermittingly advancing said carriage, a lever or arm moving with the die-carrier and serving to locate the type-dies opposite the impression-point, electro-magnets and circuit connections governing the devices for advancing the matrix-carriage, an index-plate with which the arm on the die-carrier co-operates to locate the type-dies, and circuit-controlling devices in circuit with the said electro-magnets, arranged to be operated by the movement of the arm connected with the die-carrier as said arm is moved to engage with the index-plate to position the type-dies, substantially as set forth.

32. In a matrix-machine, the combination of a series of type-dies movable toward a common impression-point, an anvil toward which the type dies are reciprocated in making an impression, a matrix carriage movable laterally of the impression-point and provided with edge guides between which the matrix-strip is received, and a feeding device mounted upon said carriage and engaging the matrix-strip to advance the latter between the guiding-strips, substantially as set forth.

33. In a matrix-machine and in combination with type-dies adapted to be brought to a common impression-point, a carriage for the matrix-strip movable laterally of the impression-point and carrying an anvil and edge guides for the matrix-strip, substantially as set forth.

34. In a matrix-machine, the combination of the following elements: A movable die-carrier provided with a series of type-dies movable toward a common impression-point, an impressing device, a movable matrix-carriage, feeding devices for advancing the matrix-carriage intermittingly, electro-magnets controlling said feeding mechanism, an electro-magnet controlling the application of the impressing device, circuit connections for the said electro-magnets, including circuit-controlling devices, an arm moving in unison with the die-carriage and co-operating with an index-plate, and the circuit-controlling devices for locating the type-dies and setting in action the impressing and feeding mechanism.

35. In a matrix-machine, an impressing device, a matrix-carriage, a die-carriage, an oscillating sliding lever, one arm attached to the die-carrier and the other carrying a circuit-closer, and devices for determining the position of the type-dies, electro-magnets controlling a feeding mechanism for the matrix-carriage, an electro-magnet controlling the impressing device, circuit connections for said electro-magnets, and contacts in said circuits co-operating with the circuit-closer of the oscillating sliding lever, substantially as set forth.

36. In a matrix-machine, the combination of an impressing device reciprocated in guides, a matrix-carriage movable laterally of said impressing device and provided with feeding mechanism for advancing the matrix-strip on said carriage, a series of type-dies movable laterally of the impressing device between the latter and the matrix-carriage, a feeding mechanism connected to the matrix-carriage, and devices for actuating the feed mechanism and locating the position of the type-dies, substantially as set forth.

37. In a matrix-machine, an impressing device, a series of type-dies movable laterally of the impressing device, a movable carriage, upon which the matrix-strip is supported beneath the type-dies, a feed mechanism for advancing said carriage, electro-magnetically controlled, an electro-magnetic device controlling the impressing device, a lever carrying the type-dies, an index-plate with which said lever co operates to locate the type-dies, circuit connections, including the electro-magnets of the impressing and feeding devices, and a pin carried by said lever for engaging both the index-plate and a circuit controlling device, substantially as set forth.

38. In a matrix-making machine, a sliding oscillating lever carrying type-dies adapted to present them in succession at a common point, an impression device operating at such a point, a perforated index-plate, a circuit-closing pin carried by the lever-arm, contact-points coinciding with perforations of the index-plate, a matrix-carriage, a ratchet attached thereto, a pinion, armatures, and connecting devices for rotating the pinion variable distances, electro-magnets, and electro connections between said contact-points and the appropriate magnet, and also between the contact-points and the impression-device mechanism, for the purposes set forth.

39. The combination, with a matrix-carriage of a matrix-making machine, of a rack, a pinion, a ratchet-wheel, a retracting-spring therefor, pawls, armatures, and electro-magnets for turning the ratchet-wheel in one direction, a locking-dog, and a lever for sliding the ratchet-wheel out of engagement with pawls and dog to permit said spring to reverse the movement and retract the rack, substantially as set forth.

40. The combination, with a matrix-carriage of a matrix-making machine, of a rack, a pinion, a post therefor, a ratchet-wheel arranged to turn with and slide on the hub of the pinion, a sliding sleeve on the post, a spring connected thereto and to the ratchet-wheel, pawls, and means for reciprocating them, and a lever for sliding said sleeve and ratchet-wheel to release the pawls and permit said spring to reverse the wheel movement and cause the retraction of said rack, substantially as set forth.

41. In a matrix-machine, an oscillating and reciprocating lever carrying type-dies on one arm and a circuit-closer on the other arm, a character-index, and corresponding contact points, a matrix-carriage, variable-feed device therefor, an impression device, electric magnets for operating the feed device and the impression device, and suitable

electrical connections between said contact-points and said electro-magnets, substantially as set forth.

42. In a matrix-machine, the combination, with a series of movable type-dies and devices for bringing each type to a common impression-point, of an anvil located opposite the said impression-point, a carriage for the matrix-trip, a plurality of feeding devices connected to said carriage, each of said feeding devices producing a different feed movement from the others, electro-magnets controlling the application of said feed mechanism, a separate circuit for each of said electro-magnets, and circuit-controlling devices in each circuit for throwing either one of the feed mechanisms into action, substantially as set forth.

43. In a matrix-machine, the combination, with a series of type-dies movable toward a common impression-point, of a lever movable with the type-dies and co-operating with an index-plate to determine the position of the type-dies relative to the impression-point, an anvil upon which the matrix-strip is impressed by the type-dies, a movable carriage for the matrix-strip, differential-feed mechanism operating upon the carriage to intermittingly advance the latter, a series of electro-magnets operating upon the feed mechanism to determine the degree of feed movement, circuit connections for electro-magnets, and circuit-controlling devices for each electro-magnet, co-operating with the lever moving with the type-dies, substantially as set forth.

44. In a matrix-machine, a die-carrier adapted to locate type-dies successively at the printing-point and carrying, also, a circuit-controlling device, a series of contacts arranged to co-operate with said circuit-controller, a series of electro-magnetic levers having circuit connections with said contacts, a differential-feed mechanism operated thereby, and an impressing device also operated thereby, substantially as set forth.

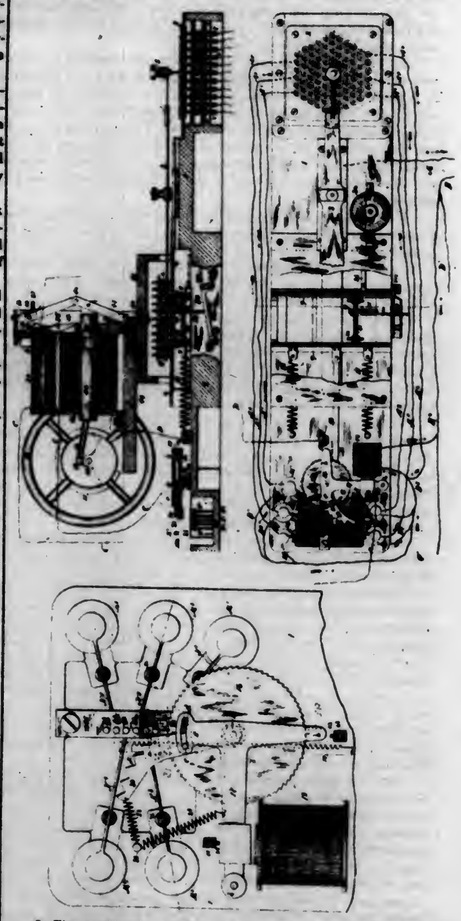
45. In a variable-feed mechanism for a matrix-machine, a rack and pinion for propelling the matrix-carriage, a ratchet-wheel arranged to turn with and slide on the axis of the pinion, detents, and means for engaging and disengaging them by the axial movement of the ratchet-wheel, substantially as described.

46. In a feed mechanism, a propelling-gear and a ratchet-wheel turning on a common axis, pawls for turning the ratchet-wheel, and means for the ratchet-wheel's axial movement to engage and disengage said pawl, substantially as set forth.

47. In a matrix-machine, a die-carrier adapted to locate type-dies successively at the printing-point and carrying, also, a circuit-controlling device, a series of contacts arranged to co-operate with said circuit-controller, a series of electro-magnetic devices having circuit connections with said contacts, and a differential-feed mechanism operated thereby, substantially as set forth.

48. In a matrix-machine, a die-carriage adapted to locate type-dies in succession at the printing-point and carrying, also, a circuit-controlling device, a series of contacts arranged to co-operate with said circuit-controller, a series of electro-magnetic devices having circuit connections with said contacts and serving to actuate pawls varying distances, and a ratchet-wheel actuated thereby to provide variable-feed movements substantially as set forth.

49. In a matrix-making machine, the combination, with a die-carrier having different-spaced dies classified into groups according to the space required by each, of corresponding groups of character-selecting devices, a matrix-material carriage, a variable-feed mechanism for the same, and connections from said groups of character-selecting devices to the feed mechanism, whereby the extent of feed is dependent on the group of characters to which the selected die belongs.



50. In a matrix-making machine, the combination, with a die-pressing device, of a die-carrying lever carrying differently-spaced dies, classified into groups according to the space required by each, adapted to present the dies in succession to the depressing device, a character-board having its characters classified into groups corresponding to the groups of dies forming with said lever, the means of selecting the characters, a matrix-material carriage, a variable-feed mechanism for the same, and connections between said feed mechanism and the groups of characters, whereby the extent of feed depends upon the group of characters to which the selected die belongs.

51. In a matrix-making machine, the combination, with a die-pressing device, of a carrier for bringing the dies in succession to the die-depressing device, having its dies classified into groups according to the space required for each a matrix-material carriage, a variable electro-magnetic feed mechanism for the same, electrical contacts corresponding to each group of dies, and connections from the same to the feed mechanism, through which are produced the requisite feed movements for each group of dies.

479,778. MATRIX-MAKING MACHINE. GEORGE A. GOODSON, Minneapolis, Minn., assignor, by mesne assignments, to Thomas S. Bamford, New York, N. Y., receiver of the Minneapolis Electro-Matrix Company. Filed Mar. 30, 1888. Serial No. 267,796. (No model.)

Claim.—1. The combination, with a matrix-material carriage under tension, of character-selecting devices classified into groups, according to the space required by the characters to which they correspond, movable stops for limiting the movement of said carriage, allowing it to move a greater or less distance in the same direction, electric controlling devices for said stops, a branched circuit including said electric controlling devices for said stops, and circuit-controllers for the branches of said circuit, each adapted to be operated by a single group of the character-selecting devices, substantially as described.

2. The combination, with a matrix-material carriage under tension, of electrically-controlled stops for variably limiting the travel of said carriage, a bar provided with a series of type-dies at one end and a hand-key at the other having a contact-point, an index-plate having key-seats corresponding to said type-dies and having contact-points adjacent thereto, and an electric circuit through the stop-controllers, hand-key, and contacts adjacent to the key-seats, normally open at the index-plate, but capable of being closed by said hand-key, substantially as described.

3. The combination, with a matrix-material carriage under tension, of an escapement for locking and releasing said carriage, an electro-magnet for operating said escapement, two or more movable stops for variably limiting the travel of said carriage, electro-magnets for actuating said stops, and a common electric circuit through said escapement-magnet and said stop-magnets, said circuit being provided with a circuit-controller for closing said circuit through said escapement-magnet and one of said stop-magnets, substantially as described.

4. The combination, with a matrix-material carriage under tension, of a rack secured to said carriage, a pinion engaged by said rack, a ratchet-wheel connected to said pinion, a pivoted armature having arms on its free end projecting into the vicinity of said ratchet-wheel and provided one with a pawl for engaging with and locking

said wheel and the other with a slot, an electro-magnet for operating said armature, a stop-lever pivoted to said armature and having a lug working in said slot, retraction-springs attached, respectively, to said stop-lever and said armature at one end and to a fixed resistance at the other, and one or more movable stops for limiting the movement of said stop-lever, electro-magnets for operating said stops, an electric circuit through said escapement-magnet with branches through said stop magnets normally open, and a circuit-controller adapted to close said circuit through the escapement-magnet and one of said branches, substantially as described.

5. The combination, with a matrix-material carriage under tension, of electrically-controlled stops for variably limiting the travel of said carriage, a die-carriage, an electrically-controlled die-depressing device, an electric circuit with branches normally open through the controllers of the electrically-controlled stops and die-depressing device, a circuit-controller for making and breaking a circuit through one of said electric stop-controllers, and an electric circuit-closer on the common return-wire of the branch circuits through said controllers for closing the branch through the die depressing device, substantially as described.

6. The combination, with a matrix-material carriage under tension, of an electrically-controlled escapement for locking and releasing said carriage, a series of electrically-controlled stops for variably limiting the travel of said carriage, a die-carriage, an electrically-controlled die-depressing device, an electric circuit with branches normally open through said stop and escapement controllers, an electric circuit normally open through the controller of the die-depressing device, a circuit-controller for making and breaking a circuit through said escapement-controller and one or another of the controllers of said stops at will, and a circuit-closer actuated by said escapement for closing a circuit through said die depressing device.

7. The combination, with a matrix-material carriage under tension, of an escapement for locking and releasing the same, a magnet for actuating said escapement, a series of electrically controlled stops for variably limiting the travel of said matrix-carriage, a die-carriage, a die-depressing device, a magnet for controlling said die-depressing device, an electric circuit through the controlling magnet of the said die-depressing device and said escapement normally open at the escapement-contacts and provided with a circuit-breaker, an electro-magnet for closing the contacts of said circuit-breaker, and an electric circuit through said escapement, and said circuit-closing magnet normally closed at the escapement-contacts, and a circuit-controller for making and breaking a circuit through said escapement-magnet and one or another of the controllers for said stops at will, substantially as described.

8. In a matrix-machine having a variable-feed mechanism and an impressive device, means for operating them by a single electric circuit.

9. In a matrix-machine, an impressive device, a magnet therefor, a feed-escapement and magnets therefor, a die-carrying lever provided with a circuit-maker, and a single circuit for all of said magnets.

10. The combination, with the feed-wheels, their shaft, the friction-wheel, and its pawl and lever, of a pivoted pendent arm on the lever, and an adjustable incline on which said arm rides during the return matrix carriage movement, substantially as and for the purpose set forth.

11. The combination, in a matrix-carriage, with the lever for feeding the matrix body to space for lines, of the pendent arm pivoted thereto, and a grooved incline therefor adjustable to different angles and arranged to cause said arm to pass free of the incline during the forward carriage movement and to ride up the incline during the return movement, substantially as and for the purposes set forth.

12. In a matrix-making machine, the combination, with the matrix-carriage having a spring-tension for moving it to space for impressions, of a rack, pinion, and escapement for controlling said movement, an electrically-actuated lever carrying one of the pawls and a pivoted stepped lever carrying the other pawl, and electrically-controlled stops for the latter arranged in a course substantially radial to the wheel, for the purpose set forth.

13. The combination, with an escapement for controlling the feed in a matrix-making machine, of a pivoted stepped lever carrying one of the pawls of the escapement, radially-arranged stops therefor, and means for moving the stops to engagement, as required, substantially as set forth.

14. A matrix-making machine having an escapement for controlling the degree of matrix-feed, a spring-lever, an armature and electro-magnet for operating the holding-pawl, a second lever pivoted to the former and carrying the free pawl, retreating steps thereon, radially-arranged stops therefor, and levers and electro-magnets for lifting the stops singly to engagement for permitting different measures of movement of the escape-wheel, substantially as set forth.

15. In combination, an escape-wheel for controlling the feed of the matrix-carriage, a T-shaped lever having its stem pivoted, a pawl on one of its shorter arms and a slot in the other, a second lever fulcrumed to the first having a pin in said slot, a pawl for engaging the wheel, and retreating steps on its outer end portion, movable stops for engaging said steps, and means for operating said levers and stops, substantially as set forth.

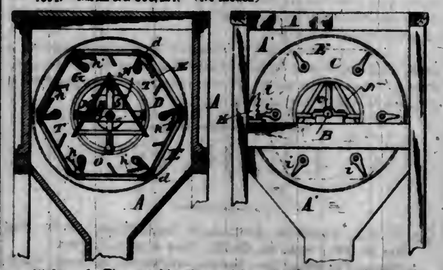
16. In a matrix-machine, the combination, with a matrix-strip, supporting devices, and intermitting feed mechanism provided with a ratchet-wheel, of a reciprocating bar carrying a detent engaging the ratchet-wheel when the bar is at one extreme of its movement, an arm movable transversely thereto, said arm being provided with a detent or pawl engaging the ratchet when the bar is moved to the opposite extreme of its movement, a series of stops located at different distances from said arm in the direction of its movement, and devices for projecting any one of said stops into the path traversed by the arm to arrest the movement of the latter and the ratchet with which it is engaged, substantially as set forth.

17. In a matrix-machine, a reciprocating matrix-carriage carrying a matrix-strip supporting and guiding frame, toothed feed-wheel on a shaft mounted in said frame for engaging the under surface of the matrix-strip to advance it transversely to the carriage movement, a pawl carrying lever for rotating said shaft, a pivoted arm of the lever, and an adjustable incline arranged to engage it to operate the lever while the matrix-carriage is making a return movement, substantially as set forth.

18. The combination, with the matrix-carriage and a rack for moving the same, of a rotating graduated disk and a rack-and-pinion connection between the same and the matrix-carriage, as set forth.

19. In a matrix-machine, a magnet controlling the operation of an impressive device, a series of magnets separately controlling a variable-feed mechanism, a circuit including the impressive-device-controlling magnet and having branches to each of the feed-controlling magnets, and a circuit-closer for completing the circuit through the former magnet and any one of the latter, substantially as set forth.

20. In a matrix-machine, a die-impressing device, a controlling mechanism therefor including an electro-magnet, a matrix-feed escapement, mechanism for producing the varying feed movements thereof and including a separate electro-magnet for each measure of movement, and suitable circuit connections between the escapement controlling the magnet and the impressing-device magnet, substantially as set forth.



479,774. INKSTAND. HANS H. SCHIVE, Christiania, Norway. Filed June 20, 1891. Serial No. 396,998. (No model.) Patented in England Sept. 23, 1890, No. 15,064; in Denmark Nov. 24, 1890; in Norway Feb. 18, 1891, No. 1,978; in Austria-Hungary Feb. 20, 1891, No. 57,314 and No. 59,974, and in France July 15, 1891, No. 212,315.

Claim.—1. The combination, with an inkstand, of a yielding valve adapted normally to close the pen-opening and an adjustable stop for regulating the extent to which the valve may yield, substantially as shown and described.

2. The combination, with an inkstand provided with the usual pen-opening, of the internal valve for closing said opening, the shank attached at one end to the valve, the screw *d*, tapped in the opposite end of the shank, and the spiral spring encircling the said shank and screw and acting on the valve, substantially as described.

479,775. FLOUR-BOLT. CLARK S. FULLER, Lafayette, Ind., assignor to Rufus H. Emerson and Zenas C. Eldred, Jackson, Mich., receivers of the G. T. Smith Middlings Purifier Company. Filed June 16, 1891. Serial No. 396,421. (No model.)

Claim.—1. The combination, with a bolting-reel, of elevating buckets or plates movable independent of the reel and arranged on

the inner side of the bolting-surface and means whereby said buckets or plates are automatically caused to discharge the material resting therein, substantially as set forth.

2. In a flour-bolt, the combination, with the bolting-reel, of a series of internal oscillating elevators hung thereon and mechanism connecting each elevator with the end of the bolt, whereby the rotation of the reel causes a positive oscillation of the elevators to discharge the material, substantially as set forth.

3. In a flour-bolt, the combination, with the bolting-reel, of a series of elevators journaled therein and each provided at one end with a crank-arm and a cam engaging with the crank-arm, whereby the revolution of the reel causes the oscillation of the elevators to discharge the material, substantially as set forth.

4. The combination, with a bolting-reel, of buckets *g*, provided with springs *h* and arms *i*, and a stop whereby the buckets are turned or depressed, substantially as set forth.

5. The combination, with a bolting reel, of buckets or plates *g*, provided with a spring *h* and arms *i*, and a stop having a face constructed with a series of shoulders or ratchets, substantially as set forth.

6. The combination, with a bolting-reel, of buckets or plates arranged on the inner side of the bolting-surface, mechanism whereby the buckets are automatically depressed, turned for discharging the material thereon, fixed buckets secured to the discharge of the reel, and a discharge-trough which receives tailings elevated by the buckets at the discharge end of the reel, substantially as set forth.

7. The combination, with a bolting reel, of buckets or plates arranged on the inner side of the bolting-surface, mechanism whereby said buckets or plates are automatically depressed or turned to discharge the material resting thereon, and a deflecting-plate whereby the material which has not been discharged over the outer edges of the buckets is collected and returned to the working side of the reel, substantially as set forth.

8. In a flour-bolt, the combination, with a bolting-reel provided with a shaft *b*, of elevators movable independently of the reel and arranged on the inner side of the bolting-surface and a deflecting-plate hung loosely on the shaft and provided with a weight whereby it is held in position, substantially as set forth.

9. In a flour-bolt, the combination, with the shaft *b*, of the deflector provided upon its upper surface with bearings, the upper and lower edges of the deflector being arranged upon opposite sides of the axis of the reel, and a weight attached to the under side of the deflector at both ends by the brackets, substantially as set forth.

10. In a flour-bolt, the combination of a reel-frame and elevator arranged within the reel and adapted to be automatically tilted into different positions as the reel rotates, substantially as set forth.

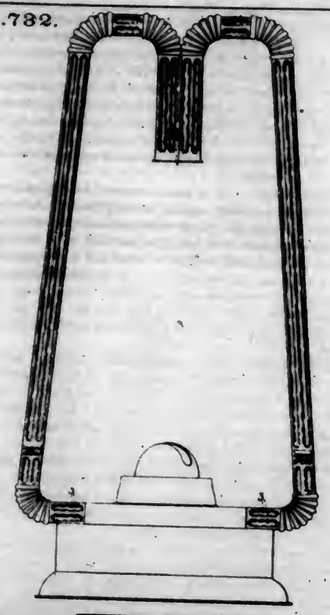
11. In a flour-bolt, the combination, with a bolting-reel, of an eddy-chamber having its lower side open and having one inclined side facing and adjacent to the downward-moving side of the reel, substantially as set forth.

12. In a flour-bolt, the combination, with a bolting-reel provided upon its inner surface with a series of elevators, of a deflector having the lower edge of one of its sides in close proximity to the elevators on the upward-moving side of the reel and having the opposite edge in close proximity to the elevators on the downward-moving side of the reel, substantially as set forth.

REISSUES.

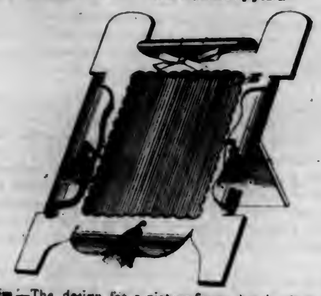
11,255. PAINT. JOHN H. PALMER, West New Brighton, N. Y. Filed Oct. 13, 1887. Serial No. 252,763. Original No. 360,765, dated Oct. 12, 1886.

Claim.—1. The herein-described composition of matter constituting a paint, consisting of the residuum of linseed-oil resulting from the purification of such oil by forced filtration, combined with linseed-oil, substantially as specified.



2. The herein-described composition of matter constituting a paint, consisting of the residuum of linseed-oil resulting from the purification of such oil by forced filtration, combined with linseed-oil, in proportions substantially as specified.

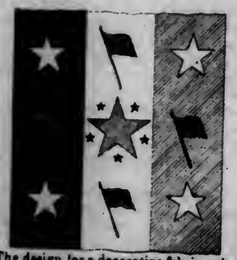
DESIGNS.



21,732. LANTERN. ARCHIBALD W. PAULL, Wheeling, W. Va. Filed May 16, 1892. Serial No. 433,293. Term of patent 14 years.

Claim.—The design for a lantern, substantially as herein shown and described.

21,732.



21,733. PICTURE-FRAME. ALBERT SELTER, Hoboken, N. J., assignor to William Johansen & Co., New York, N. Y. Filed June 18, 1892. Serial No. 437,207. Term of patent 3½ years.

Claim.—The design for a picture-frame, herein shown and described.

21,734. DECORATIVE FABRIC. SAMUEL M. SCHWAB, Jr., New York, N. Y. Filed June 27, 1892. Serial No. 438,215. Term of patent 7 years.

Claim.—The design for a decorative fabric, substantially as herein shown and described.

21,735. DECORATIVE FABRIC. SAMUEL M. SCHWAB, Jr., New York, N. Y. Filed June 27, 1892. Serial No. 438,216. Term of patent 7 years.

21,735.

Claim.—The design for a decorative fabric, substantially as herein shown and described.

21,736. BOTTLE. FRANK H. THUEMLER, Chicago, Ill. Filed Jan. 18, 1892. Serial No. 418,508. Term of patent 7 years.

Claim.—The design for a flask or bottle, substantially as shown and described.

21,737. SPOON. KALLIE I. WRIGHT, Washington, D. C. Filed July 2, 1892. Serial No. 438,528. Term of patent 3½ years.

Claim.—The design for a spoon, as herein described and illustrated.

TRADE-MARKS

REGISTERED JULY 26, 1892.

21,511. LINIMENT. WILLIAM F. GRELL, New York, N. Y. Filed June 27, 1892.

DOCTOR STANLEY'S AFRICAN CURE

Essential feature.—The words "DOCTOR STANLEY'S AFRICAN CURE." Used since January 1, 1891.

21,512. LINIMENTS OR LOTIONS FOR EXTERNAL AND INTERNAL USE FOR MAN AND ANIMALS. POWELL & GILBERT, Amsterdam, N. Y. Filed June 28, 1892.

WITCH WASH.

Essential feature.—The words "WITCH WASH." Used since March 28, 1892.

21,513. HARDWARE. CASH BUYERS' UNION, Chicago, Ill. Filed June 13, 1892.

Essential feature.—The representation of a wreath inclosing a disk, which is encircled by radiating lines. Used since May 1, 1892.

21,514. WHISKY. AGNES COWAN, Belfast, Ireland. Filed June 24, 1892.

Essential feature.—The representation of a shield having on it a St. Andrew's cross with a ribbon underneath bearing the motto "SICITUR IN ALTUM" and a barrel with "No. 4" thereon and surmounted by a regal crown. Used since 1871.

21,515. SAWS, TOOLS, FILES, AND STEEL. HENRY DISSTON & SONS, INCORPORATED, Philadelphia, Pa. Filed June 30, 1892.

Essential feature.—The representation of the key-stone in connection with the words "ALUMINUM STEEL." Used since January 1, 1891.

21,516. REMEDY FOR NERVOUS DISORDERS. WILLIAM H. GARNETT, Augusta, Me. Filed June 29, 1892.

OXIEN

Essential feature.—The word "OXIEN." Used since January 10, 1888.

21,517. PREPARED FOODS, MALT EXTRACTS, AND MEDICATED WINES. JOHANNES P. LIEBE, Dresden, Germany. Filed June 4, 1892.

Essential feature.—The representation of a stork. Used since 1866.

21,518. POLISHING PREPARATION. THE ZUCKER & LEVETT CHEMICAL COMPANY, New York, N. Y. Filed June 21, 1892.

WHITE ROUGE

Essential feature.—The words "WHITE ROUGE." Used since March 1, 1892.

21,519. MEDICINE FOR CERTAIN NAMED DISEASES. ARTHUR L. WORDEN, Detroit, Mich. Filed May 11, 1892.

PROTECTIO

Essential feature.—The word "PROTECTIO." Used since April 28, 1892.

21,520. ARTIFICIAL FERTILIZERS. BALDWIN FERTILIZER COMPANY, Savannah, Ga., and Port Royal, S. C. Filed May 21, 1892.

Essential feature.—A transverse stripe (or two stripes) produced in the material of a bag by successive threads of blue, red, and yellow extending around the said bag and being in contrast to the color of the bag. Used since May 1, 1867.

21,521. DRESS-BINDINGS. THE BERMAN & MCCARTHY COMPANY, Syracuse, N. Y. Filed May 31, 1892.

VELVENA

Essential feature.—The word "VELVENA." Used since May 1 1891.

21,522. TOILET-SOAP, FACE-POWDER, FACE-CREAM, TOOTH-POWDER, AND PERFUMES. RUPUS & BRINDENBACH, Dayton, Ohio. Filed June 20, 1892.

EMPRESS JOSEPHINE

Essential feature.—The words "EMPRESS JOSEPHINE." Used since January 1, 1892.

21,523. LARD. J. M. CEBALLOS & CO., New York, N. Y. Filed July 2, 1892.

PELAYO

Essential feature.—The word "PELAYO." Used since May 1892.

21,524. MEDICATED PLASTERS. DR. DAVID KENNEDY CORPORATION, Kingston, N. Y. Filed June 25, 1892.

Essential feature.—A circular band encircling the picture of a building, with the words "GOLDEN PLASTERS" upon the band. Used since 1870.

21,525. REMEDY FOR DISEASES OF THE STOMACH AND BOWELS AND OTHER PAINFUL DISORDERS. DR. DAVID KENNEDY CORPORATION, Kingston, N. Y. Filed June 30, 1892.

[OLD 897]

Essential feature.—The words "GOLDEN DROPS." Used since 1870.

21,526. BEER. FRANK FEHR BREWING COMPANY, Louisville, Ky. Filed May 27, 1892.

21,526.

Essential feature.—The representation of the head of a beer-cask having winged supports provided with arms. Used since May 1, 1892.

21,527. BEER. CARL A. LAEMMER, Denver, Colo. Filed June 4, 1892.

Silver-State-Cabinet

Essential feature.—The words "SILVER-STATE-CABINET." Used since September 1, 1891.

21,528. MEDICINE FOR INTERNAL USE FOR DYSPEPSIA, NAUSEA, AND ALL DERANGEMENTS OF THE ENTERIC AND URINARY SYSTEMS. SALITONIA PHARMACAL COMPANY, St. Louis, Mo. Filed June 3, 1892.

Salitonia

Essential feature.—The word "SALITONIA." Used since April 5, 1891.

21,529. MEDICINAL COMPOUND THE BASIS OF WHICH IS THE CHLORIDES OF GOLD AND SODIUM. MCCROSKY & TAYLOR, Pueblo, Colo. Filed June 11, 1892.

Essential feature.—The arbitrary words "SILVER STATE GOLD CURE." Used since May 24, 1892.

21,530. BOXES, BOTTLES, TUBES, ATOMIZERS, AND POWDER-DISTRIBUTERS USED FOR DISPENSING POWDERS, LIQUIDS, AND SEMI-LIQUIDS. MCKESSON & ROBBINS, New York, N. Y. Filed June 30, 1892.

ALBOLENE.

Essential feature.—The word "ALBOLENE." Used since January 1, 1890.

21,531. CORDED COTTON FABRICS. SHARPLESS BROS., Philadelphia, Pa. Filed Mar. 5, 1891.

21,581. PERSIAN

Essential feature.—The word "PERSIAN." Used since January 1, 1891.

21,582. PERFUMERY. ALFRED WRIGHT, Rochester, N. Y. Filed July 1, 1892.

21,583.

MARY STUART

Essential feature.—The name "MARY STUART." Used since February, 1872.

PHOTO-LITH WASHINGTON D.C. THE NORRIS PETERS CO.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISION OF SECRETARY OF THE INTERIOR.

EX PARTE NOAKES.

NO APPEAL LIES TO THE SECRETARY OF THE INTERIOR FROM THE COMMISSIONER'S REFUSAL TO PERMIT THE AMENDMENT OF A PRELIMINARY STATEMENT.

A decision of the Commissioner of Patents denying an interfering party's motion to amend his preliminary statement is a judicial rather than a ministerial act, and consequently one over which the Secretary of the Interior has no appellate jurisdiction. (Citing *Petithomme v. Bedbury*, 52 O. G., 605.)

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., July 15, 1892.

SIR: The appeal of William H. Noakes, by his attorney, Charles Turner Brown, from your decisions of May 12 and June 8, 1892, respectively, denying motion made by Noakes to amend his preliminary statement in the interference case entitled Henderson *v.* Noakes, applicants for patent for improvement in metallic bars for window-sashes, etc., is dismissed for the reason that the Secretary of the Interior has no appellate jurisdiction in matters judicially determined by the Commissioner of Patents.

A copy of Department letter of this date addressed to Mr. Brown advising him as to the disposition of the case is herewith transmitted.

Very respectfully,

JOHN W. NOBLE,
Secretary.

The Commissioner of Patents.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., July 15, 1892.

SIR: Referring to your appeal as attorney for William H. Noakes from the decisions of the Commissioner of Patents, dated May 12, 1892, and June 8, 1892, respectively, denying motion made by Noakes to amend his preliminary statement filed in the interference case entitled Henderson *v.* Noakes, applicants for patent for metallic bars for window-sashes, etc., I have to inform you that the Secretary of the Interior has no jurisdiction over the actions of the Commissioner of Patents in his judicial capacity.

A full statement of the views of the Department on this subject will be found in the opinion of the Assistant Attorney-General for the Interior Department, dated May 21, 1890, in the matter of the appeal of Joseph Petithomme from the action of the Commissioner of Patents in refusing to direct the filing, etc., of a certain deposition taken in the interference proceedings between the applications of Petithomme and George W. Bedbury for a patent for improvement in car axle boxes, reported in volume 52, OFFICIAL GAZETTE, page 605.

The appeal is accordingly dismissed,

Very respectfully,

JOHN W. NOBLE,
Secretary.

MR. CHARLES TURNER BROWN,
Chicago, Ill.

COMMISSIONER'S DECISIONS.

EX PARTE SHEPARD.

Decided July 14, 1892.

PRACTICE—SUBSTITUTE DRAWING—CANCELLATION REQUIRED WHEN SUPERFLUOUS AND UNCALLED FOR.

An applicant of his own motion filed a substitute sheet of drawings, which was entered as a part of the application. The Examiner subsequently held it to be unwarranted by the specification, and required cancellation. On appeal, *Held* that while the better course would have been to refuse to enter the new drawing until after the final determination of the question as to its admissibility, yet, it being clear that the drawing was uncalled for and superfluous, the requirement of cancellation must be sustained.

ON petition.

STOVE-POLISHING MITTEN AND DAUBER.

Application of Albert A. D. Shepard filed February 18, 1889, No. 300,368.

Mr. Sylvenus Walker for the applicant.

SIMONDS, *Commissioner:*

This is a petition taken from the action of the Examiner requiring applicant to cancel a sheet of drawings filed January 11, 1892.

The history of the case is, briefly, as follows: On May 27, 1889, a letter was written to the applicant calling attention to certain informalities in the specification and citing a certain patent held by the Examiner to anticipate the alleged invention. On February 20, 1891, applicant appointed his present attorney, and on April 15, 1891, a substitute specification was filed. On June 10, 1891, the claims were rejected, and on January 11, 1892, a new sheet of drawings was filed as a substitute for the sheet then on file. On February 12, 1892, the Examiner wrote to applicant as follows:

> The new drawing forwarded as a substitute for the drawing originally filed cannot be accepted, because it not only wholly fails to show the construction originally shown and described, but is not warranted by anything contained in the application when originally filed.
>
> As applicant can only make such changes by amendment as are authorized by Rule 70, he is required to cancel the substitute drawing and confine the application to the invention originally shown and described.

Thereupon applicant requested that the original drawing be restored and that the new sheet be made supplemental thereto. The Examiner repeated his requirement that the new sheet be canceled, whereupon the present petition was filed.

The record shows that neither a substitute nor an additional drawing was called for by the Office, either directly or by implication, but it also shows that the new sheet of drawings was actually entered as a part of the application.

It is obvious that the better course would have been to have refused to enter the new drawing and the amendment to the specification relating thereto pending the final determination of the question raised by the present petition.

Upon examination of the drawings it appears that the original figures fully and clearly illustrate the alleged invention as set forth in the specification. Furthermore, the original drawing illustrates and the specification describes (though imperfectly) a flanged plate riveted to the back of the polishing-mitten, and to this plate the dauber is shown as pivotally attached by means of a bent rod or wire. In the new drawing the said flanged plate is not shown, and the dauber is shown only in a detached view. It appears from a letter filed by applicant that he now desires to separately illustrate the polishing-mitten and dauber because he now manufactures and sells them as separate devices. This is clearly inconsistent with the original illustration and description; but apart from such consideration there is no valid reason why the Office should receive and incorporate into the records of a case an additional drawing, which is uncalled for and superfluous, merely because an applicant for some reason best known to himself chooses to present such a drawing.

The petition is denied.

EX PARTE HINES.

Decided July 14, 1892.

1. PRACTICE—DIVISION.

On appeal from Examiner's decision requiring division between claims for a printing block or plate and the process of making it, *Held* that no wider range of search being required under the present practice of the Office for both groups of claims than for one of them division should not be required.

2. SAME.

Where on a question of division applicant alleges that his article cannot be produced except by his process, and the Examiner says it can, without pointing out the mode, the Examiner's position is not tenable.

ON petition.

PRINTING PLATE OR BLOCK FORMED BY PHOTOGRAPHIC MEANS.

Application of Joseph Hines filed April 19, 1892, No. 429,778.

Messrs. W. P. Thompson & Co. and *Messrs. Dodge & Sons* for the applicant.

SIMONDS, *Commissioner:*

This is a petition taken from the action of the Examiner requiring division between claims 1, 2, and 3 for a printing block or plate, on the one hand, and claims 4 to 8, inclusive, for the process of making such block or plate, on the other hand.

There is nothing of record to indicate whether or not the process and its product or either of them are new, except the statement of the Examiner that the article—

can be *made* by *several old processes* well known to any one skilled in the art of photography.

It would seem that if one or more old processes for producing this product are in existence the product itself must be old; but in the absence of anything showing such a state of things, except the statement of the Examiner above quoted, it must be assumed for the purpose of deciding the question here presented that both process and product are new.

That the process covered by the second group of claims will, if practiced, produce the article covered by the first group and that it will produce no other product is not disputed. Such being the case, it remains to be determined whether or not the product may be produced by any other process, and, if so, whether a wider range of search is required for both process and product than would be required for one of them.

As stated above, the Examiner alleges that the article may be made by other processes. This allegation is denied by the applicant. In the absence of any demonstration of the Examiner's statement in this connection, the question is not sufficiently free from doubt to warrant the finding that the process and product are distinct inventions.

Assuming, however, for the purpose of considering the second branch of the question stated above, that the process and its product are distinct inventions, as alleged by the Examiner, it is not clear that if presented in separate applications such applications would be assigned to and examined in different divisions of the Office. In fact, it is believed that under the existing classification the reverse would be true and that substantially no wider range of search would be required for both groups of claims than for one of them.

The petition is granted.

EX PARTE SCHOTTEN & CO.

Decided June 13, 1892.

TRADE-MARK—PRACTICE—WHAT THE OATH MUST EMBRACE.

An applicant for Trade-Mark registration, relying upon commerce with Indian tribes to bring him within the statute, will be required in his oath to specify by name the tribe or tribes with which such commerce is carried on.

ON petition.

TRADE-MARK FOR COFFEE.

Application of William Schotten & Co. filed April 21, 1892.

Mr. Charles F. Benjamin for the applicants.

FROTHINGHAM, *Assistant Commissioner:*

This is a petition requesting the Commissioner—

to waive in this case the literal or technical enforcement of that part of Rule 12 quoted in the Office letter of May 11, 1892, and to accept the original declaration, together with the supplementary declaration, as answering the requirement of the statute for "a written declaration, verified."

The letter above referred to is as follows:

The informal amendment to the oath * * * cannot be admitted into the case, as Rule 12, Rules of Practice, says: "The declaration cannot be amended. If that filed with the application is faulty or defective, a substitute declaration may be filed." Therefore an entire new oath is required, in conformity, as nearly as practicable, to the illustration (b) page 15 of the Rules, omitting therefrom all reference to former declarations or amendments.

The record shows that the original oath to the application contains, among other things, the following:

That said Trade-Mark is used * * * in commerce between the United States and foreign nations or Indian tribes, (particularly with the tribes located in the Indian Territory;)

that the Examiner required a substitute oath setting forth "commerce with some particular foreign nation or Indian tribe;" that applicant, after said requirement had been repeated, filed a supplemental oath, in which he stated as follows:

In addition to the declaration heretofore made by him and filed in said case, and which declaration is made a part hereof, as though the same were fully repeated herein, he declares that the said Trade-Mark is particularly used by said firm in lawful commerce with the Cherokee Indian tribe, domiciled in said Indian Territory;

that thereupon the Examiner wrote the letter of May 11, 1892, above quoted, which led to the bringing of the present petition.

If the first oath is defective, it is clear, under the rule, that it cannot be cured by amendment. (Rule 12.) If the first oath is not defective, then there is no necessity for a substitute declaration. The question to be decided, then, is whether or not the first oath is a sufficient compliance with the practice and the rules. While it is undoubtedly true that the rules should not be construed in such a manner as to make them oppressive, and while it may be true that the first declaration under oath may, in a general way, comply with the spirit of the law, yet it it is not advisable as a matter of policy to relax the rules and practice to such an extent as would tend to make them indefinite and loose. It would be difficult to draw the line just where the Commissioner would be satisfied that applicant was using his mark in foreign commerce between the United States and Indian tribes other than by requiring that he should specify by name the tribe or tribes with which the commerce is being carried on. This has been the practice since the present Trade-Mark law was enacted, and as there is no hardship connected with it I see no good reason for departing from it. (See *Ex parte Strasburger & Co.*, C. D., 1881, 23, and case cited therein.)

The petition is denied.

DECISIONS OF THE U. S. COURTS.

Circuit Court of Appeals—Sixth District.

KILBOURNE *et al. v.* W. BINGHAM COMPANY.

Decided June 6, 1892.

1. PATENT—PROCESS AND ARTICLE OF MANUFACTURE—METAL SINKS.

Claim 1 of Letters Patent No. 240,146, issued April 12, 1881, to James Kilbourne, is for "the herein-described sink, made of a single sheet of wrought steel or iron, without joint, seam, or interior angle, substantially as set forth," and the specification sets forth that the invention consists of a "sink swaged or struck up from a single sheet of wrought iron or steel, without joint, seam, or interior angle." The method of construction not being further referred to in the patent, *Held* that the patent does not cover a process.

2. SAME—CERTAIN FEATURES NOT SHOWING INVENTION.

The use of a single sheet of metal and the absence of "joint, seam, or interior angle" do not confer patentability, since these features are old in analogous devices.

3. SAME—SUBSTITUTION OF MATERIALS.

The use of wrought iron or steel in lieu of cast metal is a mere substitution of materials and is not patentable, notwithstanding the superior results obtained.

APPEAL from the Circuit Court of the United States for the Northern District of Ohio, Eastern Division.

STATEMENT OF THE CASE.

Suit by James Kilbourne and the Kilbourne & Jacobs Manufacturing Company against the W. Bingham Company for infringement of patent. The circuit court dismissed the bill, and complainants appeal. Affirmed.

Appellant Kilbourne is the patentee and owner of and the corporation appellant the exclusive licensee under Letters Patent No. 240,146, issued April 12, 1881, on application filed December 28, 1880, for certain new and useful improvements in sinks. This suit was brought to restrain the alleged infringement of that patent. The patentee in his specification states the nature of his invention thus:

My invention consists of a sink swaged or struck up from a single sheet of wrought iron or steel, without joint, seam, or interior angle.

He then sets forth various defects in sinks made of cast metal, saying:

Sinks of this kind are neither strong nor durable. They break easily and frequently in shipping or in storing them, and also in placing or setting them up in position for use. They are also liable to fracture or break if water should freeze in them, and in order to give them the modicum of strength which they possess a considerable amount of metal must be used in their construction, making them cumbersome and heavy, and increasing expense of manufacture.

He gives this description of his invention:

I have discovered that the above-specified defects can be completely removed by making the sink of wrought iron or steel, said sinks being swaged or struck up from a single sheet of such metal, as hereinbefore first specified. Such a sink is, of course, stronger than one of cast metal, and is not liable to be fractured or broken by a sudden jar or blow. It is cheaper than a cast-metal sink, for the reason that much less metal is required in its construction, and it can, by the swaging operation—as, for instance, by being struck up in a drop-press—be made more rapidly and economically. * * * The sink, being, as seen in the drawings, without interior angle, has practically equal strength at all points, and has no corners, where sediment or dirt can gather.

The issue between the parties is confined to the first claim of the patent, which is thus stated:

Having described my invention, what I claim, and desire to secure by Letters Patent, is—

1. The herein-described sink, made of a single sheet of wrought steel or iron, without joint, seam, or interior angle, substantially as set forth.

The answer denies the infringement charged, the value and utility of the alleged invention, and that the patentee was the original and first inventor or discoverer of any material or substantial part of the thing patented. It gives the names and residences of numerous persons who knew and used the thing patented prior to its alleged invention by Kilbourne. It also alleges that the article had been patented and described prior to its supposed invention by Kilbourne in some thirty prior American patents and one English patent, and specifies several printed publications circulated in the United States in which it had been described, and pleads that the patented article had been in public use and on sale in this country for more than two years prior to Kilbourne's application. It also insists that in view of the state of the art of manufacturing sinks, bath-tubs, and many like articles long before said alleged invention the Letters Patent fail to disclose any invention and that the means claimed as original by said Kilbourne under his patent were common and well known.

Before JACKSON, *Cir. J.*, and SWAN, *Dis. J.*

Messrs. Watson, Burr & Livesay and *Mr. M. D. Leggett* for the complainants.

Messrs. Briesen & Knauth, Mr. H. M. Turk, and *Mr. Arthur von Briesen* for the defendant.

SWAN, *J.:*

Complainants claim the monopoly of making and vending under Kilbourne's patent the single article of sinks—

swaged or struck up from a single sheet of wrought steel or iron, without joint, seam, or interior angle.

The conceptions claimed as original, on which the

validity of the patent is predicated by the argument, are: first, the mode of construction; second, the entirety of the material composing the completed article; third, the use of the wrought steel or iron in the manufacture of the sink; fourth, the interior form, without joint, seam, or angle.

First. If the first element of this claim were a new process, it is not sufficiently described to meet the requirements of section 4888, Revised Statutes of the United States, that an inventor shall make and file in the Patent Office a written description of his invention and—

of the manner and process of making, constructing, compounding, and using the same, in such full, clear, concise, and exact terms as to enable any person skilled in the art or science to which it appertains, or with which it is most nearly connected, to make, construct, compound, and use the same.

The antiquity of the process and the fact that the patentee does not expressly or by implication claim it save the patent from this objection. The art of swaging metals into any required form was venerable long anterior to this patent. The drop-press, drop-hammer, dead-stroke hammer, dishing-ram, dies, die-press, forcers, and stamping-machines have long been familiar to metal-workers as implements by which hollow ware in all its forms and varieties has been manufactured for over half a century, and are regarded in the art as simply equivalent machines or tools for swaging—that is, beating or drawing the ductile metals into desired shapes. The use of one or the other of these agencies is merely a preferential application by the workman of the power required for the work in hand. The variety of manufactures by this process has been limited only by the art of designing, the ductility of metals, and the possibilities of machinery. The inventor of a new design or material for an article of manufacture or of a new device for the application of the power needed in this art, or the discoverer of a process for the treatment of refractory metals, is entitled to the monopoly assured by the patent laws. These would be additions to our knowledge and contributions to the industry evolved from the inventive faculty. The appreciation and utilization of the efficiency of old methods, means, and material for the manufacture of domestic, mechanical, and agricultural wares—

does not spring from that intuitive faculty of the mind put forth in the search for new results or new methods creating what had not before existed or bringing to light what lay hidden from vision, but, on the other hand, are the suggestions of that common experience which arose spontaneously and by a necessity of human reasoning in the minds of those who had become acquainted with the circumstances with which they had to deal. (*Hollister* v. *Manufacturing Co.*, 113 U. S., 72; 5 Sup. Ct. Rep., 717.)

It is not enough that the new manufacture, because of the fitness of the material to the purposes of the article, has obviated innumerable objections inherent in prior manufactures and superseded them in the trade. It must possess an advantage and novelty in form or construction beyond the ability of a mechanic of ordinary skill and intelligence or be the resultant of means or methods devised by the maker.

The law—

says Judge Woodruff in *Smith* v. *Elliott*, (1 O. G., 331; 9 Blatchf., 408)—

gives no monopoly to industry to wise judgment or to mere mechanical skill in the use of known means, nor to the product of either, if it be not new. These are within the proper field of competition and open to all. In general they will in that competition be justly appreciated and will command their proper remuneration if usefully employed. It is invention of what is new, and not comparative superiority or greater excellence in what was before known, which the law protects, and it is that alone which is secured by patent.

The state of the art of metal-working conclusively disproves Kilbourne's claim to a monopoly for the process used in this manufacture and remits him for his reward to the quality of his wares. He has contributed nothing to its resources or machinery unknown before to the craft. He obtained his patent April 12, 1881. No model accompanied his specification. From that date until some time in 1883 the sum of his achievements in this line of industry was the abstract conception of the adaptability and fitness of wrought steel and iron to this article of household furniture. He admits that during this interval he expended thousands of dollars and ruined thousands of plates in endeavoring to make the sink. He says:

I made first small dies and then large ones; had to change and change again the shape of the dies, and almost despaired of success; but I had spent so much time and money on it that I persevered and finally succeeded.

This confession not only demonstrates that the patentee has failed to disclose the secret of his process and specify his invention in such a way that others of the same trade would be enabled to do the thing for which the patent was granted without any new invention or addition of their own—has merely "set them a problem to solve," to use the phrase of Baron Alderson in *Morgan* v. *Seaward*, (Webs. Pat. Cas., 174)—but also that the process was a mystery to himself which for two years after his patent had issued baffled solution. The result of his experiments has justified his faith in the adequacy of "the swaging operation" to this manufacture; but the necessity for the experiments proves that the machinery of his success, which is patentable if original, was obviously a hard-born afterthought which he had not conceived. But beyond this there is no language in this patent which can by any latitude of construction be held a claim for the process beyond the curt references to the swaging operation, and one of its tools—the drop-press—which are alluded to as well-known agencies or machinery equal to the manufacture of the article.

The argument that under the case of *Smith* v. *Vulcanite Co.* (11 O. G., 246; 93 U. S., 492) the process detailed is made as much a part of the invention as are the materials of which the product is composed has no applicability. There, as is said—

the properties of vulcanite were well known; but how to make use of them for artificial sets of teeth remained undiscovered and apparently undiscoverable until Cummings revealed the mode.

The patent was sustained as a combination of process and product, both of which were new, though the materials were old. The process was fully detailed. The distinctions between that case and this are obvious. For the reasons stated the claim for the process is untenable.

Second. The record shows that neither the entirety of the material of which the sink is made nor the absence of joint, seam, and interior angle is a new feature in this class of manufactures. Butlers' trays, plumbers' sinks, flanged baking-pans, bidet-pans, and numerous other domestic and mechanical utensils were made by the swaging operation from single sheets of metal long anterior to the plaintiffs' patent. All of these articles were jointless, seamless, without

interior angles, strong, durable, cheap, and light as compared with like utensils of cast metal; so elastic as largely to obviate injury to dishes placed or dropped therein; could be safely and easily handled, shipped, and set in position; subjected without detriment to extremes of heat and cold; were not affected by the freezing of their contents, non-odorous, and easily cleansed. In short, they remedied every objection to cast-metal utensils which experience has developed and the specification of this patent and the proofs of complainants have particularized.

Defendant's exhibit bidet-pans is a small bathing-vessel stamped or swaged from sheet metal, without joint, seam, or interior angle. These were made by Hodges, Taylor & Hodges, in Brooklyn, N. Y., as early as 1854, and also as early by Ketchum, of New York. They were usually from eighteen to twenty inches long, ten or eleven inches wide, and from six to eight and one-half inches in depth. The size was limited by the demand, not by difficulty of construction.

Defendant's exhibit baking-pan is a type of an utensil which has been manufactured and sold at least since 1850, and has been made with and without flanges. Many sizes and varieties of this dish were made, and they were used for different purposes. Sheet-tin was the material commonly used; but where that was not obtainable of sufficient size sheet-iron was substituted. They were formed of a single sheet of metal, without joint, seam, or interior angle, by the wheeling process, which is defined as—

simply raising articles of various forms and depths out of one flat piece of material—copper, iron, brass, or any other material whatever in the form of sheets—

by means of two co-operating wheels, one of which is adjustable, so arranged that by their pressure the metal forced between them could be given any desired form. The capacity of this process for the manufacture of household utensils of any depth or shape is practically unlimited. The usual depth of its manufactures was from eight to eight and and a half inches.

Defendant's exhibit butler's tray is another exemplification of these wares. It is, in fact, a portable sink for use in the dining-room, formed of—

a single sheet of wrought-iron, without joint, seam, or interior angle—

by the swaging operation. In shape, material, and manner of construction it is strikingly suggestive of the Kilbourne sink. The proofs are convincing that these were made as early as 1878, if not in 1876. Between the basin of this tray and defendant's flanged baking-pan, which is as old as the tray, there is but little difference in shape. They were made in the same manner before the year 1880. They were twenty inches in length and sixteen inches in width.

As long ago as 1846 British Letters Patent No. 11,073 were granted to Thomas F. Griffiths for an improvement in the form of dies and a combination of the processes of shaping sheet metal by stamping and burnishing into required shapes and designs.

Speaking in his specifications of stamping plate and sheet metal in accordance with his process, he says:

A great variety of articles, it is well known, are now made by stamping and by stamping combined with burnishing to form, and both these processes are well known.

He appends to the specifications three illustrative drawings of articles stamped from single pieces of sheet metal and iron plate of the same shape as the sinks made by complainant, and thus verifies his claim that—

the workman will only have to vary his dies, forcers, and chucks in order to make articles of other sizes and forms.

December 21, 1869, J. G. Knapp obtained Letters Patent for an improvement in sheet metals, flour, grain, and other scoops. His invention consisted—

in forming the bowls in one piece of metal, without seams or joints, by stamping up sheets of metal into the form of troughs, with a flange around the top, etc.

Letters Patent were granted James Kidd, December 19, 1876, for an improvement in metal wheelbarrows, which consists in making the tray or body of the barrow of a single sheet of steel struck up or stamped from a plate of steel or any other sufficiently ductile metal by a dishing-ram. On the same day Kidd took out another patent for an improvement in dishing metals, by which plates of sheet metal—

can be stretched or stamped into a dished or concave form, with any desired outline of the concave and with a surrounding flange or strengthening edge

Farrington and Armstrong's patent, of November 18, 1873, for improvement in sheet-metal coffins furnishes another anticipation of Kilbourne's use of the single sheet of metal. They made these caskets of two pieces of wrought-iron by dishing or distorting the plain sheets or plates of iron by means of dies into the required shape and depth.

T. E. Rowland's patent, of May 30, 1876, for an improvement in wrought-iron vessels for buoys, etc., consisted in forming a complete hollow welded vessel of two hemispheres struck up by dies from entire circular plates. These hemispheres were flanged by the same process, so that they could be welded to form the buoy or hollow vessel.

Under Morris Wells's patent, of January 2, 1866, for sheet-metal dies seamless hollow ware was struck up from single sheets of metal by a series of dies.

November 4, 1879, Hiram W. Ball received a patent for an improvement in road-scrapers, under which the scoops of those implements were constructed of a single piece of steel—

having upturned sides and back, without seams, joint, or interior angle—

swaged or formed to the required shape. Of this patent Kilbourne is the assignee.

The similitude of language and ideas in Ball's and complainants' specifications and the fact that Kilbourne is the assignee of the Ball patent are at least suggestive of his appreciative apprehension of the prior manufacture. With Ball's patent before him his ingenuity would not be taxed to discern the efficacy of the swaging operation to strike up a blank sheet of wrought steel or iron into a four-sided vessel—

without seam, joint, or interior angle—

the Kilbourne sink in short—with as much facility as it produced Ball's three-sided scoop from the same metals.

William G. Avery obtained a patent November 4, 1879, for an elevator-bucket, without joint or seam, struck up from a single piece of metal and formed with a flat bottom, curved front and sides, and flat back. It is useless to multiply examples of manufactures from single sheets of wrought metals possessing every merit and peculiarity claimed for this sink.

The list might be indefinitely prolonged. The catalogue of patented machines and process for swaging, stamping, and striking up household and miscellaneous utensils and conveniences which were jointless and seamless and preserved the entirety of the material of the article is as voluminous. The instances cited of the application of this art to common uses deprive these features of this sink to all claim to novelty.

While an exact counterpart of Kilbourne's sink in shape had not been produced in wrought metal, its prototype in form appears in Bignall's cast-iron sink, for which Letters Patent were issued January 1, 1867, to L. C. and M. C. Bignall. This is without joint, seam, or interior angle and has a grooved or recessed flange in its upper and outer edge, projecting horizontally, into which the upholding framework or inclosure is fitted. The flat flange of complainants' sink serves the same purpose. The form or pattern therefore lacks originality.

Third. The use of wrought steel or iron in lieu of cast metal is mere substitution of materials, which, whatever the degree of superiority given to the manufacture thereby, is not patentable. (*Hotchkiss* v. *Greenwood*, 11 How., 248; *Hicks* v. *Kelsey*, 5 O. G., 94; 18 Wall., 670; *Phillips* v. *Detroit*, 17 O. G., 191; 111 U. S., 604; 4 Sup. Ct. Rep., 580; *Gardner* v. *Herz*, 35 O. G., 999; 118 U. S., 180–192; 6 Sup. Ct. Rep., 1027; *Brown* v. *District of Columbia*, 47 O. G., 398; 130 U. S., 87; 9 Sup. Ct. Rep., 437; *Florsheim* v. *Schilling*, 53 O. G., 1737; 137 U. S., 64; 11 Sup. Ct. Rep., 20.)

The decree of the circuit court dismissing the complainants' bill is clearly correct, and is affirmed, with costs.

Supreme Court of the District of Columbia—General Term.

ODELL, ADMINISTRATOR, *v.* THE COMMISSIONER OF PATENTS.

Decided February 1, 1892.

PATENTS FOR INVENTIONS—PATENTABLE NOVELTY—INDEXED LETTER-FILES.

An applicant for a patent for an improvement in letter-files already held a patent for an indexed letter-file consisting of a series of perforated index-sheets arranged at one end to hinge and slide upon an upright rod and being free at the other end to permit of their being lifted from their position. The perforations in the sheets were circular and little larger than the rod itself. *Held*, that an improvement which consisted merely in making these perforations elliptical to admit of freer action upon the rod does not constitute patentable invention.

APPEAL from the Commissioner of Patents denying the appellant's application for a patent for an improvement in indexed letter-files. Commissioner affirmed.

STATEMENT OF THE CASE.

Appellant's decedent held a patent of the same character the only improvement urged over which in the present application was that the perforations in the filing-sheets were elliptical in form, so as to permit the sheets to slide easily on the rod, whereas in the patent the perforations were circular and were found in practice to bind and rub upon the rod when the sheets were tilted at any angle.

Messrs. Poole & Brown for the appellant.

Mr. W. S. Case for the Commissioner.

The Chief-Justice and Justices COX and JAMES present.

COX, *J.:*

This is an appeal from the Commissioner of Patents in the name of J. J. P. Odell, administrator, seeking a patent for an invention by his intestate, which is claimed to be patentable. The claims as described in the brief of the claimant are for a—

combination, with the receptacle comprising the bottom and back and a vertical rod parallel with the back, of a series of index-sheets [of this character, indicating] provided with coincident apertures for the rod but little wider than the rod in a direction parallel with the back and materially longer than the diameter of the rod in a direction at right angles with the back, substantially as described.

The combination, with the receptacle comprising a bottom and back and a vertical rod parallel with the back, of a series of index-sheets provided with coincident apertures for the rod materially larger than the rod in a direction at right angles with the back and located at substantially the same distance as the rod from the back, whereby the rod occupies the inner part of the aperture when the sheets are horizontal, substantially as described.

The invention claimed is for combining with the back, two ends and the bottom, and a vertical rod or pin certain stiff sheets, which work up and down in this way [indicating] by means of a slot or hole elliptical in form at right angles to the back.

The application for this patent was filed in 1883 and never came to final hearing until recently, when the Commissioner rejected the application on two (2) references: one a patent to one T. Towndrow, May 29, 1860, and another patent to the deceased claimant, T. H. Brown, Jr., October 30, 1877. The Towndrow patent was one where there were several apertures that were elliptical in form but parallel to the back. It does not strike us that the object of that was the same as the object of this alleged invention. It seems, further, that the object of those holes elliptical in form was simply to avoid any trouble in sliding the leaf off the pin. We do not think that that anticipates the present alleged invention; but we think that the first Brown patent does. As we understand it, the first patent in 1877 was for exactly the same thing as this, except that the hole by which the sheets worked on the pin was round and close to the pin, whereas these are elongated in a direction at right angles to the back. The inventor says that he found a defect in this; that when he undertook to raise the sheet the edge of the hole would catch against the pin and the paper would become torn and the sheets were put in that position, [indicating.] He proposes to remedy that by elongating that aperture, making it larger in shape and at right angles to the back, so that it can be raised up without rubbing against the pin or tearing a sheet or shortening it. Now, it seems to us that the first Brown patent anticipated this and that it did not require any invention to do what is done in this, as it would occur to anybody having this first patent, if he found that the paper caught there, to take his penknife and slit that and make the aperture longer. It would be natural for any one to do that. It did not require any skill or invention to do it. It would be the first thing that would attract the attention of any one. Suppose that the Government patented this arrangement. What would be the consequence if people who are provided with the boxes constructed under the first patent with a round hole should take something and elongate the hole in the manner I have described? The effect would be that nobody could take a penknife, as I have observed, and elongate that hole without paying a royalty. The patent, which was issued in 1877, had seventeen years to run, which will soon expire, and to grant the one applied for would virtually be extending it for seventeen years longer, which is opposed to the policy of the patent law. The first patent must be considered as anticipating the present one, and the decision of the Commissioner will therefore have to be affirmed.

(ORDER No. 741.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., February 29, 1892.

With the approval of the Secretary of the Interior, Henry J. Ennis, of Washington, D. C., is hereby disbarred from practice before the Patent Office, pursuant to section 487 of the Revised Statutes.

W. E. SIMONDS,
Commissioner.

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1890, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Vol. 7. Appendix No. 7, July 1, 1887, to June 30, 1888. One volume, 68 pages. In paper covers, $1.50.

Vol. 8. Appendix No. 8, July 1, 1888, to June 30, 1889. One volume, 73 pages. In paper covers, $1.50.

Vol. 9. Appendix No. 9, July 1, 1889, to June 30, 1890. One volume, 84 pages. In paper covers, $1.50.

Vol. 10. Appendix No. 10, July 1, 1890, to June 30, 1891. One volume, 98 pages. In paper covers, $1.50.

World's Columbian Exposition.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 8, 1892.

To the Inventors and Manufacturers of the United States:

It is the intention of the Patent Office to make at the World's Columbian Exposition at Chicago in 1893 an exhibit which will show that great advance in the several arts which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as is possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions, embodied in concrete form and properly arranged, will, it is believed, constitute a grand historical exhibit of the progress of the useful arts and one which will be of great interest not only to inventors and manufacturers, but to the public generally.

The Office collection of models has been seriously impaired by fire, and is further incomplete by reason of the fact that models have not generally been required or received during the last ten years. The Office is not, therefore, in possession of the models of many valuable inventions which might properly be included in such an exhibit, and without which, indeed, the exhibit would be incomplete. The limited appropriation for this exhibit will not permit the Office to make such models. An urgent appeal is therefore made to all inventors and manufacturers to come to the assistance of the Office in this matter, either by loans of models already built or by the construction of such models not in the possession of the Office as should properly be placed in such a collection. Of course, where models are loaned to the Office all proper credit will be given both in labels and catalogues to the parties by whom the loans are made, and such disposition will be made of the models after the close of the exhibit as the owners shall direct. Many inventors and manufacturers have already indicated a willingness to co-operate with the Office in this matter, and it is confidently expected that such a response will be made to this general appeal as will assure the unparalleled success of this attempt to graphically and concretely show the development of American invention.

W. E. SIMONDS,
Commissioner.

Notice.

All solicitors, agents, or attorneys who, in circulars or advertisements or otherwise, refer to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

Women Inventors.

The Patent Office has published and has for sale a volume containing a list of women inventors to whom patents have been granted by the United States from 1790 to July 1, 1888. 44 pages. Paper covers, 50 cents.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of August 2, 1892.

PATENTS

GRANTED AUGUST 2, 1892.

479,776. CASH-REGISTER. HARVEY R. ADAMS, Marseilles, Ill. Filed Aug. 24, 1891. Serial No. 403,506. (No model.)

Claim.—1. In a cash-register, a recording-cylinder mounted on the shaft by which it is turned and movable lengthwise thereon, in combination with clock-work whereby said shaft is rotated, a recording-strip upon said cylinder, spaced to correspond with the indicating-keys, each of said spaces being subdivided circumferentially, and change mechanism whereby at the end of one revolution the said cylinder is released and slipped forward on its shaft half the distance of one of said spaces, thereby adjusting it for operation during another revolution, substantially as described.

2. In a cash-register, the recording-cylinder E, movable lengthwise on its shaft *c* and provided at its inner end with a halved sleeve-hub e^2, in combination with the sleeve-clutch F, mounted loosely on the cylinder-shaft and notched at each end, as described, the fixed sleeve e^3 on the cylinder-shaft, also halved at its inner end, the clutch-spring f^3, a stop to arrest the rotation of the clutch at the end of each revolution of the shaft, and a spring E', adapted to slide the cylinder forward on its shaft when released from the clutch, substantially as described.

3. In a cash-register, a recording-cylinder E, adapted to slide on its shaft *c*, in combination with the spring E', arranged to slide the cylinder on its shaft, the sleeve-clutch F, notched as described and provided with a pin f^2, the cylinder-hub e^2 and fixed sleeve e^3, notched as described, the clutch-spring f^3, the yielding stop F', the stop-removing arm e^4, and clock-works applied to rotate said cylinder-shaft, substantially as described.

4. In a cash-register, a recording-cylinder, in combination with the clock-work for rotating the same, a recording-strip applied to said cylinder and divided to indicate hours and subdivisions thereon, and a series of indicating-levers, each provided with a series of movable indicating-points arranged in different vertical planes and adjustable to operate separately and in succession, substantially as described.

5. In a cash-register, a recording-cylinder, in combination with a suitably-spaced recording-strip applied thereto, key-levers H, short shafts I, mounted thereon and provided with indicating-points *i*, arranged circumferentially around said shaft and in different vertical planes, and a device for giving the said shaft a turn at each operation of the lever to change the position of the said points, substantially as described.

6. In a cash-register, a recording-machine, in combination with key-levers H, constructed with loops h^3, square shafts I, mounted in said loops and provided with indicating-points *i*, arranged one on each face of the shaft but in different vertical planes, the holding-spring f', the ratchet-wheel i^3, fixed on the shaft, and a spring-pawl i^4, adapted to engage with said ratchet-wheel to turn the shaft upon the upward movement of the lever after depression, substantially as described.

7. In a cash-register, the case lid or cover *a*, in combination with the key-levers H, pivoted thereto in slotted lugs h^4, the springs *h'*, the perforating-points mounted on the levers, and the recording-cylinder E, arranged below the levers, substantially as described.

8. In a cash-register, a series of vertically-sliding tablet-rods provided with yielding stops or springs in combination with mechanism whereby said rods are lifted by the depression of the key-levers, a stop-bar mounted on vibrating springs, a cash-box arranged to press back said springs to hold the said bar out of engagement with the stops on the rods when the drawer is closed, and mechanism whereby the drawer is released by the depression of any one of the keys, thereby releasing the said springs from tension and swinging the stop-bar into operative position, substantially as described.

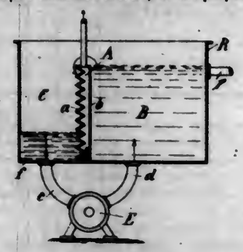
9. In a cash-register, the suspension-springs *m*, with their free ends arranged behind the cash-drawer, in combination with a stop-bar M, mounted on said springs, the sliding tablet-rods K, provided with stop-springs *k'*, adapted to yield as they pass the said bar when the rods are raised, and a sliding cash-drawer B, arranged to move the suspension-springs backward to carry the stop-bar out of working position when closed and to permit the springs to move forward, bringing the bar into working position when opened, whereby two or more tablet-rods may be lifted without closing the drawer and all will be released together whenever the latter is closed, substantially as described.

479,777. HAWSER-CLAMP. ROBERT ASHWORTH, St. Cloud, Minn. Filed Apr. 30, 1892. Serial No. 431,237. (No model.)

Claim.—1. A guy clamp consisting of two members and a screw-nut, one member having three parallel perforations and the other member being in the form of a T-headed bolt having its body passing through the central perforation and through the nut and its arms through the other perforations, substantially as described.

2. In a guy-clamp, the combination of a metal block having three perforations parallel with each other and grooves in the bottom thereof between said perforations, a T-headed bolt having its screw-threaded body passing through the central perforation and its arms through the perforations on the sides of the central one, with a nut on said body, substantially as described.

479,778. APPARATUS FOR COOLING LIQUIDS. PETER ESSNER, Mannheim, Germany. Filed Feb. 23, 1892. Serial No. 422,466. (No model.) Patented in Belgium Dec. 23, 1891, No. 97,754; in France Dec. 29, 1891, No. 218,251, and in Switzerland Dec. 30, 1891, No. 4,469.



Claim.—1. A cooling apparatus comprising a tank or vessel divided into feed and exhaust chambers by a hollow partition of less height than the vessel and means for supplying a cooling agent to and exhausting the same from the hollow partition, for the purposes set forth.

2. A cooling apparatus comprising a tank or vessel divided into feed and exhaust chambers by a hollow partition provided with an irregular cooling-surface, said hollow partition being of less height than the vessel, and means for supplying a cooling agent to and exhausting the same from the hollow partition, for the purposes set forth.

3. A cooling apparatus comprising a vessel divided into feed and exhaust chambers by a hollow partition of less height than the vessel,

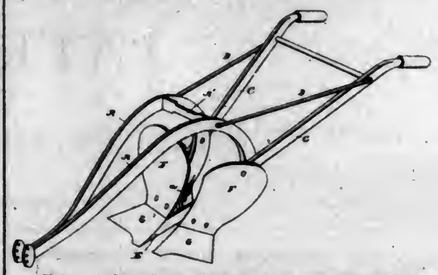
means for feeding the liquid to be cooled to one of said chambers, and means for causing the liquid to continuously circulate from one chamber to the other, comprising a pump having its suction connected with the exhaust-chamber and its discharge with the feed-chamber of the vessel, and means for supplying a cooling agent to the hollow partition, as and for the purposes set forth.

4. A cooling apparatus comprising a vessel divided into feed and exhaust chambers by a hollow partition of less height than the vessel and a pipe connected with the last-named chamber for injecting air or a gas into the liquid contained therein, for the purpose set forth.

5. A cooling apparatus comprising a closed vessel divided into feed and exhaust chambers by a hollow partition of less height than the vessel, a pump having its suction connected with the exhaust-chamber and its discharge with the feed-chamber, a supply and an exhaust pipe connected at different levels with the hollow partition for supplying thereto and exhausting therefrom a cooling agent, and a perforated pipe within the exhaust-chamber, near the bottom thereof, for the introduction of air or a gas into the liquid, for the purpose set forth.

6. A cooling apparatus comprising a vessel divided into feed and exhaust chambers by a hollow partition of less height than the vessel and means for supplying cooling agents of different temperatures to the inner faces of the opposite walls of the hollow partition, comprising two supply-ducts arranged at the upper end of the hollow partition and having ports opening toward the opposite inner faces of the walls of said partition and suitable feed-pipes for feeding cooling agents of different temperatures to said ducts, for the purpose set forth.

7. A cooling apparatus comprising a vessel divided into feed and exhaust chambers by a hollow partition having zigzag-shaped vertical walls *b* and *a* and means for supplying cooling agents of different temperatures to the inner faces of said zigzag walls, comprising two ducts arranged at the upper end of the hollow partition, said ducts having ports *c'* and *c''* facing said opposite inner faces of the walls of the partition, and suitable feed-pipes connected with the ducts, as set forth.

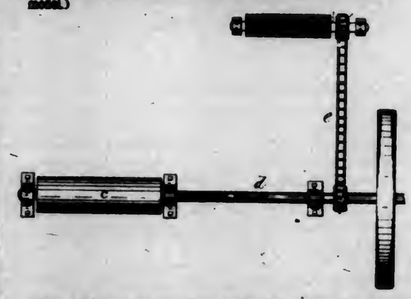


8. In an apparatus of the class described, the combination, with the cooling-chamber A, having two supply-ducts at its upper end, of the T-coupling H, provided with the three-way valve *z'*, pipes *y''* *x''*, connected with the supply-ducts of the chamber A and with the horizontal branch *z* of the T-coupling on opposite sides of the valve, the feed-pipes *x* and *y*, connected with the vertical branch of the T-coupling and provided with a suitable valve, and a valved branch connecting pipe *y* with branch *y''*, as and for the purpose set forth.

9. A cooling apparatus comprising a cylindrical vessel, a hollow cylindrical partition, of less height than the vessel, dividing the same into a cylindrical inner feed-chamber, a like outer exhaust-chamber, a concave bottom for said inner chamber, and an exhaust-pipe extending axially through and adjustable in said bottom, for the purpose set forth.

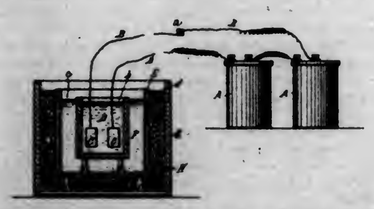
10. A cooling apparatus comprising a vessel, a hollow partition of less height than the vessel and dividing the same into feed and exhaust chambers, means for supplying a cooling agent to and exhausting the same from the partition, and means for causing the liquid to circulate from one chamber to the other, comprising a pump having its suction connected with the exhaust-chamber and its discharge with a pipe *d*, extending into the feed-chamber above the upper edge of the partition, and a receiving-pipe *e*, open at both ends and encompassing the pipe *d*, substantially as and for the purpose set forth.

11. A cooling apparatus comprising a cylindrical vessel, a like hollow partition of less height than the vessel and dividing the same into an outer cylindrical exhaust-chamber and a like inner feed-chamber, a substantially V-shaped bottom for the outer chamber below the hollow partition, a concave bottom for the inner chamber, also below the hollow partition, means for feeding a cooling agent to and exhausting the same from the hollow partition, a pump having its suction connected with the exhaust-chamber and its discharge with the feed-chamber, and an exhaust-pipe extending through the concave bottom and adjustable vertically therein, substantially as and for the purpose set forth.



479,779. LISTING-PLOW. BENNETT BLANKENSHIP, Belleville, Kans. Filed Feb. 26, 1892. Serial No. 422,889. (No model.)

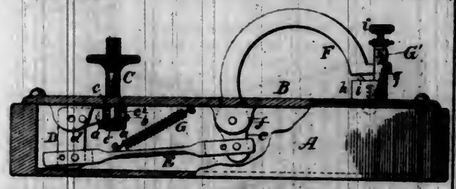
Claim.—1. In a plow for listing corn, the combination of a beam made in two parts diverging from each other rearward and continued downward and bent outwardly and then curved inwardly to increase the size of the throat between the said lower portions of the diverged parts of the beam and mold-boards and landsides connected to said diverged parts of the beam, thereby forming an intervening space between the opposing situated landsides, substantially as described.



2. In a plow for listing corn, the combination of the beam made of two parts diverging rearwardly and which are curved outward, bent outwardly, and then curved inwardly at their rear lower ends and downward for attachment to landsides arranged parallel with each other and having an intervening space between them, mold-boards attached to said beam, and curved angularly-bent braces extending from the mold-boards and plow-points thereof to said landsides, substantially as described.

479,780. PROCESS OF SCALING SHEET METAL. JOSEPH W. BRITTON, Cleveland, Ohio. Filed Nov 20, 1891. Serial No. 412,577. (No model.)

Claim.—The herein-described method of scaling sheet metal by passing the heated sheets through two sets of rolls, the faces of the first set being corrugated lengthwise and the faces of the second set smooth, substantially as set forth.



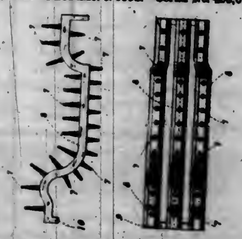
479,781. PROCESS OF PURIFYING LIQUIDS. COURTLAND W. BRUNSON, Hamilton, Ohio. Filed Nov. 9, 1891. Serial No. 411,416. (No specimens.)

Claim.—1. The process of purifying spirituous liquor or other liquid by means of the application thereto of electrolysis while said liquor or liquid is kept in a state of frigidity approximating its freezing-point.

2. The process of purifying spirituous liquor or other liquid, consisting in first reducing the temperature thereof to near its freezing-point and then submitting it to the action of electricity.

479,782. MECHANICAL TELEGRAPH-INSTRUMENT. BENJAMIN F. BUTLER, Logansport, Ind. Filed May 16, 1892. Serial No. 433,175. (No model.)

Claim.—1. The combination, with a base-plate, of a key pivotally connected therewith, a sounder pivotally connected with said base-plate, a rod or bar pivotally connected with said sounder, a bell-crank lever pivotally connected with the other end of said rod or bar, and means for connecting said bell-crank lever with the key, and a single spring for retaining the key and sounder in their normal positions, substantially as set forth.



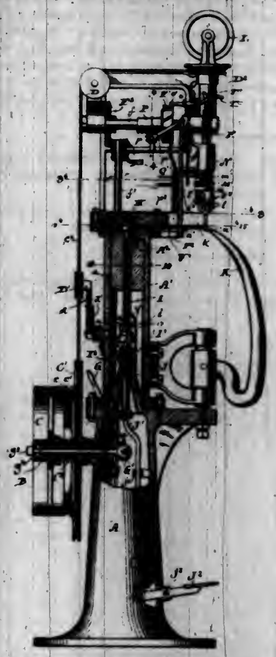
2. The combination, with a base-plate, of a key pivotally connected therewith, a sounder pivotally connected with said base-plate, a bell-crank lever, a rod or bar connecting one arm of said bell-crank lever with the sounder, an arm connecting the other arm of the bell-crank lever with a key, and a spring for maintaining the key and sounder in their normal positions, substantially as set forth.

3. The combination, with a base-plate, of lugs on the under face thereof, a key pivoted between said lugs, flanges on the under face of the base-plate adjacent to said lugs, an arm projecting from the key and guided between said flanges, a sounder, and means for connecting said arm with the sounder, whereby the operation of the key will operate the sounder, substantially as set forth.

4. The combination, with a base-plate, of a key pivotally connected therewith, a sounder also pivotally connected with the base-plate, lugs on the under face of the base-plate and provided with a series of transverse perforations for the reception of a pivot-pin, a bell-crank lever pivoted between said lugs, an arm on the key and connected with one arm of said bell-crank lever, and a rod or bar provided in each end with a series of perforations for the reception of pivot-pins, one end of said rod or bar being connected with the other arm of said bell-crank lever and the other end of said rod or bar being connected with an arm of the sounder, substantially as set forth.

5. The combination, with a base-plate, of a key pivotally connected thereto, an arm projecting from said key, a bell-crank lever, a pin in the end of one arm of said bell-crank lever, a loop or eye on the arm of the key adapted to embrace said pin, a sounder, and devices connecting said sounder with the other arm of the bell-crank lever, substantially as set forth.

479,783. SKELETON FRAME FOR SAND-CORES. WILLIAM H. CASE, Buffalo, N. Y. Filed Apr. 6, 1892. Serial No. 428,011. (No model.)



Claim.—A skeleton frame for supporting a green-sand core for molding journal-boxes for railroad-cars, consisting of a series of longitudinal bars secured together by transverse pieces at the ends, each longitudinal bar being curved to conform substantially to the bottom of the core and provided with a series of upward and downward projecting pins, and downwardly-projecting supporting-pieces at each end, for the purposes described.

479,784. SHOE-NAILING MACHINE. EDWARD D. CHILDS, Milwaukee, Wis., assignor of one-half to George W. Strohmeyer and John F. Strohmeyer, same place. Filed July 21, 1891. Serial No. 400,248. (No model.)

Claim.—1. The combination, with the feeding mechanism of a shoe-nailing machine, of a vertical shaft, a vertically-movable head carried by said shaft, said shaft being screw-threaded at its lower end and engaged with a nut, means for giving a continuous rotation to the said shaft, means for holding said nut from rotation at certain portions of the revolution of said shaft, and a support for holding the work in position to receive the nails, substantially as and for the purposes described.

2. The combination, in a shoe-nailing machine, of a vertical shaft carrying a vertically-movable head provided with wire-feeding mechanism, said shaft being screw-threaded at its lower end and engaged with a nut, a movable step for supporting the lower end of said shaft, means for giving a continuous rotation to said shaft, means for holding said nut from rotation at certain portions of the revolution of said shaft, and means for raising and lowering said movable step, substantially as and for the purposes described.

3. The combination, in a shoe-nailing machine, of a shaft extending vertically through the inside of the machine-frame and carrying at its upper end a vertically-movable head provided with wire-feeding mechanism, said shaft having a screw-threaded engagement with a rotary nut at its lower end, a spring-pawl adapted for engagement with said nut, and a cam upon the said shaft adapted for engagement with said spring-pawl upon the rotation of said shaft to free said nut, substantially as and for the purposes described.

4. In a shoe-nailing machine, the combination, with a vertically-movable head carrying feeding-rolls for advancing the strand of wire, of a cam-wheel rotated by the driving-gears, a lever engaged with said cam-wheel at one end and operatively engaged at its other end, and means for throwing said feeding-rolls into and out of operation at successive portions of the rotation of said cam-wheel, substantially as described.

5. In a shoe-nailing machine, the combination, with a vertically-movable head provided with feeding-rolls for advancing the strand of wire, of a cam-wheel rotated by the driving-gears and provided upon its surface with alternate raised portions and depressions extending from face to face of said cam-wheel and made tapering from end to end, a lever adapted to engage with the surface of said cam-wheel at one end and connected at its other end with means for throwing said feeding-rolls into and out of operation at successive stages of the rotation of the said cam-wheel, and means for moving said cam-wheel longitudinally upon the shaft, substantially as described.

6. In a shoe-nailing machine, the combination, with a vertically-movable head provided with feeding-rolls for advancing the strand of wire of a cam-wheel constantly rotated by the driving-gears, said cam-wheel being provided with alternate raised portions and depressions in its surface, said raised portions and depressions being tapered from end to end, a lever pivoted to the frame of the machine and engaged at one end with the surface of said cam-wheel and at its other end connected with means for throwing the feeding-rolls into and out of oper-

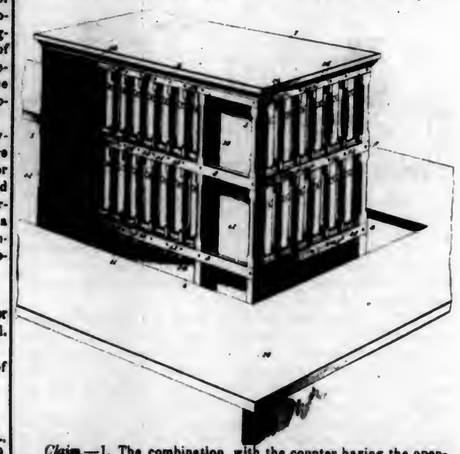
ation by the vibration of said lever, a longitudinally-movable collar engaged with said cam-wheel and provided with rack-teeth upon one of its sides, and a pinion journaled upon the movable upper portion of the machine and engaged with said rack-teeth, said pinion being provided with a radial arm engaged at its outer end with a connecting-rod, which rod is secured at its other end to a stationary portion of the machine frame, whereby said pinion is rotated by an upward movement of the movable portion of the machine-frame, so as to advance said cam-wheel upon its shaft to a distance corresponding to said upward movement of said head, substantially as described.

7. In a shoe-nailing machine, the combination, with a vertically-movable head carrying feeding-rolls for advancing the strand of wire to form the nails, of a cam-wheel rotated by the driving-gears, a lever engaged at one end with said cam-wheel and engaged at its other end with means for throwing the feeding mechanism into and out of operation at successive portions of the rotation of said cam-wheel, and a detent adapted for engagement with said lever to hold it out of engagement with the cam-wheel, substantially as and for the purposes described.

479,785. PAINT. SAMUEL P. CITIZEN, Terre Haute, Ind., assignor to himself and C. M. Wellabrd, Guthrie, Oklahoma. Filed July 3, 1891. Serial No. 398,243. (No specimens.)

Claim.—The improved paint consisting of resin-oil, sulphate of copper, and Chattanooga red, substantially as specified.

479,786. GALVANIC BATTERY. MARTIN M. CLARK, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Jan. 9, 1892. Serial No. 417,443. (No model.)

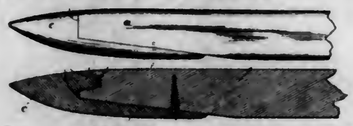


Claim.—In an electric battery, the combination, with a cup-shaped positive element adapted to surround and inclose the electrolyte and negative element, of a porous cup immersed in said electrolyte, a negative element within said porous cup and surrounded by a depolarizing substance, a packing of fibrous material above the electrolyte, a suitable sealing material adapted to close the battery, and a tube secured to the positive element and extending through the sealing and packing material to the electrolyte, said tube being provided with a removable closing-cap, substantially as described.

479,787. CORNICE DRAPERY-FIXTURE. MERRILL E. CLARK and FLORENTINE S. SHAW, Worcester, Mass., assignors to the Clark Moulding Works, same place. Filed Mar. 4, 1891. Serial No. 383,662. (No model.)

Claim.—In a drapery-fixture, the usual cornice thereof, in combination with the block *g*, having longitudinal guide-openings for the rods *f f* and fastened centrally to the back of said cornice, slide-blocks *c c*, arranged at each end of and back of the cornice in alignment with said central stationary guide-block *g* and having means, substantially as described, for holding them in position when moved in the cornice and for fastening the same after adjustment, also being adapted to rest and be held on the supporting-brackets of the fixture, and the longitudinal rods *f f*, fastened one at each outer end in said slide-blocks and at their inner ends fitted to slide in a central stationary guide-block, substantially as and for the purpose set forth.

479,788. BOOK-RACK. EDWIN G. COOK and HENRY H. EYMAN, Fullerton, Nebr. Filed Dec. 4, 1891. Serial No. 414,025. (No model.)



Claim.—1. The combination, with the counter having the opening, the vault or storage-chamber, and the track leading from the vault to the opening in the counter, of the book-rack mounted upon wheels fitting the track, the width of said rack approximating that of the opening in the counter, substantially as specified.

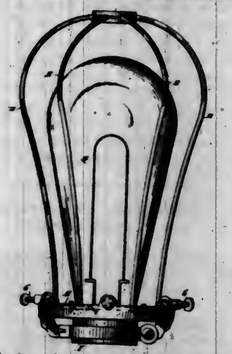
2. In a book-rack, the combination, with the opposite sides, a front horizontal connecting-bar, and an inner partition, of a series of cleats connected at their ends to the cross-bar and partition and arranged parallel to each other, a series of shafts extending through the partition, and series of loose rolls mounted on the shafts between the partitions, the inner or rear series of rolls being provided with convexed bosses at their centers, substantially as specified.

3. In a book-rack, the combination, with the opposite sills, the transverse connecting-sills located some distance from the ends of the first sills, the pair of vertical transverse partitions, the four posts rising from the ends of the first sills, and the intermediate posts located at the edges of the partitions and rising from the first-mentioned sills, of the series of horizontal post-connecting strips, the top, the central longitudinal partition connecting the transverse partitions, the series of cleats having their outer ends recessed to receive the cross-bars and their inner ends connected to the partitions and extending above and below the cross-bars, the series of loose rolls mounted between the cleats, and the upper series of cleats depending from the roof and corresponding with those heretofore described, substantially as specified.

479,789. RAKE-TOOTH. JOSEPH DAIN, Jr., Carrollton, Mo. Filed Feb. 23, 1892. Serial No. 422,426. (No model.)

Claim.—As a new article of manufacture, a rake-tooth point having a substantially flat surface arranged vertically at the rear and adapted to fit snugly against the end of the rake-tooth, a projecting piece adapted to fit against one side of the rake-tooth for securing the point to the tooth, and a conical dowel projecting from said flat surface and adapted to fit into a suitable recess in the rake-tooth, whereby the greater part of the surface of the tooth will remain uncovered and the accumulation of water around the end of the tooth and consequent decaying of the tooth will be prevented, substantially as described.

479,790. RUBBER-TREAD HORSESHOE. WARREN DAVIS, Crawfordsville, Ind. Filed Feb. 29, 1892. Serial No. 423,171. (No model.)



Claim.—1. The herein-described horseshoe, consisting of the metal shoe proper channeled upon its under side between its edges and provided at intervals at its center with perforations and having its outer wall at intervals cut away and registering with nail-holes, the rubber tread fitted between the flanges and within the channel, and a securing device passed through the openings in the shoe and through the perforations registering therewith and formed in the tread, substantially as specified.

2. The herein-described horseshoe, the same consisting of the metal shoe proper, the under side of which is provided with a channel, perforations formed in the shoe and nail-holes formed in the outer edge of the shoe, the rubber tread or sole molded to fit within the channel and provided with perforations registering with those of the shoe and with transverse recesses at its under side registering with the perforations, and split or T rivets passed through the perforations in the shoe and tread and having their terminals upset within the recesses of the tread, substantially as specified.

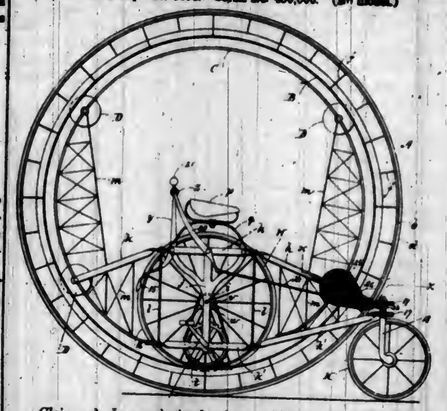
3. The herein-described horseshoe, consisting of the metal shoe proper provided upon its under side and between its edges with a channel and at intervals with perforations, a molded rubber tread seated in the channel, and securing devices passed through the tread and perforations of the shoe, the walls of the channel being inwardly bent near the heel portions of the shoe, so as to overlap or embrace the sides of the tread and prevent lateral displacement, yet permit of longitudinal retraction, the said walls or flanges beyond said heel portions standing at a right angle to the face of the shoe and permitting of lateral withdrawal of the tread, substantially as specified.

479,791. INCANDESCENT-LAMP GUARD. GEORGE W. DEMMICK, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed June 22, 1889. Serial No. 315,187. (No model.)

Claim.—1. An incandescent-lamp guard consisting of flexible or elastic wires, strips, or rods permanently secured together at one end and free at their other to permit them to be spread or sprung apart for application to the lamp, in combination with a suitable clamp for holding the free ends together after the guard has been placed over the lamp-bulb.

2. An incandescent-lamp guard consisting of a series of wires B, permanently fastened together at one end and provided at their opposite free ends with hooks, in combination with a fastening ring or clamp for holding them against spreading when the guard is applied in position on the lamp bulb.

3. The combination, with the lamp-guard composed of wires, strips, or rods attached together at one end and provided at their opposite free ends with hooks, of a ring adapted to encircle the free ends, and a cup-shaped holder for receiving the ring and free ends and provided with suitable fastening screws.

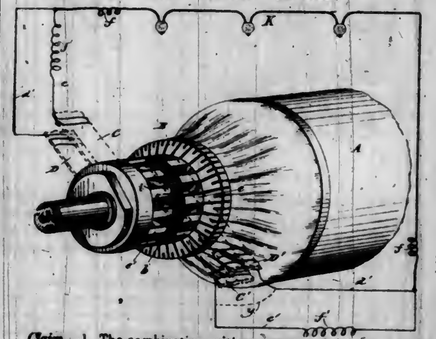


4. As a new article of manufacture, an incandescent-lamp guard composed of a number of wires fastened together at one end and provided at their opposite free ends with hooks, and a detachable ring encircling the free ends.

5. The combination, with a lamp-guard having hooks on the ends of the wires of which it is composed, of a removable ring encircling the free ends and engaged by the hooks and means for supporting the ring on a suitable holder, as and for the purpose described.

6. The combination, with an electric or other lamp, of a protector consisting of a number of wires, strips, or rods attached together at one end and adapted to be bent apart at the other end, and suitable means for securing and supporting said protector over the lamp, substantially as and for the purpose described.

7. A protector for electric or other lamps, consisting of a ring or spider having wires, strips, or rods supported at its periphery, said wires, strips, or rods being secured together at one end and being adapted to be spread apart at their opposite end, as and for the purpose specified.



479,792. VELOCIPEDE. WILLIAM A. W. EAGER, West Gardner, Mass. Filed Sept. 18, 1891. Serial No. 406,066. (No model.)
